XXII. ASSO'NIA (in honour of Ignatius de Asso, a distinguished Spanish botanist, who wrote on the plants of Arragon,) Cav. diss. 3. p. 120. D. C. prod. 1. p. 498.

LIN. SYST. *Monadélphia, Polyándria.* Calyx permanent, 5-parted, girded by a 1-leaved, 3-crenated, lateral involucel. Petals 5. Stamens 15, bearing anthers, that is, 3 fertile ones between each sterile one. Styles 5, very short. Carpels 5, 2-seeded, closely joined together into a capsule. Seeds somewhat triquetrous, not winged. Trees with undivided leaves, and axillary, bifid, subcorymbose peduncles. Flowers white or red.

1 A. POPU'LNEA (Cav. diss. 3. p. 120. t. 42. f. 3.) leaves cordate, acuminated, smooth, a little serrated; peduncles scarcely longer than the petioles. ♄. S. Native of the island of Bourbon. Flowers red? disposed in a terminal, bifid corymb.

Poplar-leaved Assonia. Clt. 1820. Tree 10 to 20 feet.

2 A. VIBURNOI'DES (D. C. prod. 1. p. 498.) leaves cordate, somewhat acuminate, crenated, tomentose beneath, as well as younger leaves; peduncles 3 times longer than the petioles. ♄. S. Native of the island of Bourbon. Flowers white?

Viburnum-like Assonia. Clt. 1822. Tree 10 to 20 feet.

Cult. These trees will grow freely in any light rich soil, or a mixture of loam and peat. Young cuttings planted in mould under a hand-glass, in heat, will soon strike root.

XXIII. DOMBE'YA (in honour of Joseph Dombey, a French botanist, and traveller in Peru and Chili, companion of Ruiz and Pavon.) Cav. diss. 3. p. 121. Gært. fruct. 2. p. 259. t. 137. but not of Lam. D. C. prod. 1. p. 498.

LIN. SYST. *Monadélphia, Polyándria.* Calyx 5-parted, permanent, girded by a 3-leaved, unilateral involucel. Petals 5. Stamens 15-20. Filaments joined together at the very base, 5 sterile, with 2-3 fertile ones between each of the sterile ones. Style 1, divided at the top into 5 somewhat reflexed stigmas. Carpels 5, 2-valved, 1 or many-seeded, closely joined together into a capsule. Cotyledons twisted, bifid. Flowers in bifid corymbs, with a single-stalked flower in the fork.

§ 1. *Leaflets of involucel broad, ovate or cordate.*

1 D. PALMA'TA (Cav. diss. 3. p. 122. t. 38. f. 1.) leaves smooth, palmate, 7-cleft, 7-nerved, with lanceolate, serrated lobes; corymbs bifid. ♄. S. Native of the island of Bourbon. There is a variety with 5-cleft, 5-nerved leaves. Flowers at first white, then pale-yellow, but at last rust-coloured.

Palmate-leaved Dombeya. Tree 20 feet.

2 D. ACUTA'NGULA (Cav. diss. 3. p. 122. t. 38. f. 2.) younger leaves tomentose, at length smooth, cordate, 5-7-nerved, roundish, crenated, with 3-5 angles, angles or lobes acute, when 5 the 2 lower ones are very small; corymbs bifid, with racemose branches. ♄. S. Native of the island of Bourbon. Flowers red, larger than those of the preceding.

Acute-angled-leaved Dombeya. Shrub 20 feet.

3 D. ANGULA'TA (Cav. diss. 3. p. 123. t. 39. f. 1.) leaves tomentose, cordate, roundish, toothed, obsoletely 3-lobed; umbels simple; peduncles shorter than the leaves. ♄. S. Native of the island of Bourbon. Flowers red. Calyx tomentose.

Angular-leaved Dombeya. Shrub 10 feet.

4 D. TILIÆFÒLIA (Cav. diss. 3. p. 124. t. 39. f. 2.) younger leaves tomentose, adult ones smoothish, cordate, 7-nerved, crenate; corymbs bifid. ♄. S. Native of Bourbon. Flowers probably red.

Lime-tree-leaved Dombeya. Fl. 1820. Shrub 10 feet.

5 D. TOMENTÒSA (Cav. diss. 3. p. 125. t. 39. f. 3.) leaves tomentose, roundish, cordate, acuminate, 5-nerved, transversely veined, crenated; umbel bifid. ♄. S. Native of Madagascar. Flowers white or red. Peduncles, petioles, and branches beset with long hairs.

Tomentose Dombeya. Shrub 10 feet.

6 D. HAMILTONIA'NA (Wall. pl. rar. asiat. 1. p. 69. t. 77.) shrub densely clothed with tomentum; leaves ovate, subcordate, obtuse, unequally and acutely toothed; peduncles axillary, 3-flowered, twice the length of the petioles. ♄. S. Native of the East Indies on the banks of Irawaddi near Melloon, also on Mount Taong Dong near Ava. Flowers large, yellow, involucrated.

Hamilton's Dombeya. Fl. Nov. Shrub 2 to 4 feet.

7 D. CORDIFÒLIA (D. C. prod. 1. p. 499.) leaves smooth, cordate, acuminate, serrated, 5-7-nerved, sometimes 3-lobed, lateral lobes small; peduncles rather longer than the petioles. ♄. S. Native of the East Indies. D. tiliæfòlia and angulàta, Roxb. hort. beng. Hook, bot. mag. 2905. Involucre soon falling off. Anthers 10. Flowers large, red, in dichotomous crowded corymbs. Calyx reflexed. Leaves pubescent beneath.

Heart-leaved Dombeya. Clt. 1820. Shrub 10 feet.

§ 2. *Leaflets of involucel narrow, lanceolate, or linear.*

8 D. UMBELLA'TA (Cav. diss. 3. p. 127. t. 41. f. 1.) leaves smooth, cordate, ovate-oblong, acuminated, somewhat repand; umbels globose, simple; peduncles twice as long as petioles. ♄. S. Native of Bourbon. Lam. ill. t. 576. f. 2. Flowers at first white, then rust-coloured.

Umbel-flowered Dombeya. Shrub 10 feet.

9 D. FERRUGÍNEA (Cav. diss. 3. p. 128. t. 42. f. 2.) leaves tomentose beneath, smooth above, ovate-oblong, 7-nerved, somewhat peltately cordate, toothed; corymbs 2-parted; peduncles twice as long as petioles. ♄. S. Native of the Mauritius. Leaves rusty beneath, as well as the branches.

Rusty-leaved Dombeya. Clt. 1815. Shrub 10 feet.

10 D. GRANDIFÒLIA (Lamb. herb.) leaves broad, cordate, slightly lobed, smooth; peduncles panicled. ♄. S. Native of the Mauritius. Flowers red?

Great-leaved Dombeya. Tree 20 feet.

11 D. PUNCTA'TA (Cav. diss. 3. p. 125. t. 40. f. 1.) leaves rather downy beneath, roughly dotted above, somewhat cordate, ovate-oblong, acuminated, 5-nerved, entire; corymbs crowded; peduncles longer than the leaves. ♄. S. Native of Bourbon. Flowers white or red.

Dotted-leaved Dombeya. Clt. 1820. Shrub 10 feet.

12 D. OVA'TA (Cav. diss. 3. p. 127. t. 41. f. 2.) leaves clothed with white tomentum beneath, smoothish above, 3-5-nerved, ovate, acute, toothed; corymbs bifid; style very small. ♄. S. Native of Bourbon. Shrub clothed with rusty hairs. Flowers whitish, or pale red.

Ovate-leaved Dombeya. Clt. 1822. Tree 16 feet.

Cult. All the species of *Dombèya* thrive well in sandy loam; and young cuttings will root freely in sand, under a hand-glass, in a moist heat.

XXIV. MELHA'NIA (from Mount Melhan in Arabia Felix, the habitation of *M. velutìna*). Forsk. descr. 64. Ait. hort. kew. ed. 2. vol. 4. p. 146. D. C. prod. 1. p. 499.

LIN. SYST. *Monadélphia, Decándria.* In every respect the same as *Dombèya*, but with 10 stamens, 5 fertile, and 5 sterile, each of the fertile ones bearing either 1 or 2 anthers. Sufficiently distinct from *Dombèya*.

§ 1. *Fertile filaments bearing 2 anthers each.*

1 M. DECANTHE'RA (D. C. prod. 1. p. 499.) leaves smooth, elliptical, acuminated at both ends, repandly-toothed; peduncles many-flowered, umbelliferous. ♄. S. Native of Madagascar. Dombèya decanthèra, Cav. diss. 3. p. 126. t. 40. f. 2. Flowers small, white?

Ten-anthered Melhania. Tree 10 feet.

§ 2. *Fertile filaments, bearing 1 anther each.*

2 M. ERYTHRO'XYLON (Ait. hort. kew. ed. 2. vol. 4. p. 146.) leaves ovate-cordate, somewhat peltate, acuminate, crenulated, tomentose beneath, netted; peduncles usually 3-flowered. ♄. S. Native of St. Helena in groves. Flowers large, white. Pentápetes erythróxylon, Ait. hort. kew. ed. 1. vol. 2. p. 138. Dombèya erythróxylon, Sims, bot. mag. t. 1000. This tree flowers even when only $1\frac{1}{2}$ foot high.

Red-wooded Melhania. Fl. May, Aug. Clt. 1772. Tree 15 ft.

3 M. MELANÓXYLON (Ait. hort. kew. ed. 2. vol. 4. p. 146.) leaves cordate, quite entire, tomentose on both surfaces, even; peduncles usually 3-flowered. ♄. S. Native of St. Helena. —Pluk. mant. 6. t. 333. f. 5. The involucel in this and *M. erythróxylon* soon fall off. Flowers white.

Black-wooded Melhania. Fl. July, Aug. Clt. 1800. Tree 20 feet.

4 M. DENHA'MII (R. Brown, in Denh. et Clapp. trav. appen. p. 27.). ♄. G. Native of the north of Africa near Soudan. This species differs from all the others in having its bracteas regularly whorled, and at the same time longer and much broader than the divisions of the calyx.

Denham's Melhania. Shrub.

5 M. VELUTI'NA (Forsk. descr. 64.) leaves ovate-lanceolate, serrated, tomentose; umbels axillary, simple, 4-flowered. ♄. G. Native of Arabia Felix on Mount Melhan, whence the generic name. Pentápetes velutìna, Vahl. symb. 1. p. 49. Dombèya velutìna, Willd. spec. Flowers yellow.

Velvety Melhania. Shrub 3 to 6 feet.

6 M. BURCHE'LLII (D. C. prod. 1. p. 499.) leaves oblong-linear, bluntish, somewhat serrated, velvety and hoary on both surfaces; pedicels axillary, 1-flowered, length of petioles. ♄. G. Native of the Cape of Good Hope. Melhània, Burch. cat. no. 2417. Flowers white?

Burchell's Melhania. Clt. 1818. Tree 15 feet.

7 M.? PROSTRA'TA (D. C. prod. 1. p. 499.) leaves linear, entire, smooth above, hoary beneath; pedicels axillary, 1-flowered, twice or thrice as long as the petioles. ♄. G. Native of the Cape of Good Hope. Dombèya prostràta, Burch. cat. no. 2153. Flowers not seen.

Prostrate Melhania. Shrub prostrate.

Cult. *Melhània* is a beautiful genus of shrubs and trees. They will grow well in a mixture of loam, peat, and sand, and cuttings will root in the same kind of soil, under a hand-glass, in heat. They are all liable to be covered with insects, such as the mealy bug, scale, and red spider, which should be carefully cleaned off, or the plants will not thrive.

XXV. TROCHE'TIA (in memory of M. Du Trochet, a vegetable physiologist). D. C. mem. mus. 10. p. 106. prod. 1. p. 499.

LIN. SYST. *Monadélphia, Polyándria.* Calyx 5-parted (f. 92. *a.*), spreading, naked. Petals 5 (f. 92. *b.*). Stamens 20-25, monadelphous at the base (f. 92. *c.*), 5-7 of which are sterile (f. 92. *d.*). Ovary (f. 92. *e.*) 1, roundish, scaly. Style filiform (f. 92. *f.*). Capsule 5-celled, 5-valved. Seeds small, roundish, wingless. Shrubs with entire leaves, which are rusty or scaly beneath and axillary, 1-3-flowered, drooping peduncles.

1 T. UNIFLÒRA (D. C. mem. mus. 10. p. 106. with a figure). leaves ovate, somewhat acute, twice as long as broad; peduncles 1-flowered. ♄. S. Native of the Island of Bourbon. Flowers white or pale-red (f. 92.).

FIG. 92.

One-flowered Trochetia. Tree 20 feet.

2 T. TRIFLÒRA (D. C. l. c. with a figure) leaves ovate-lanceolate, acuminated, 4-times as long as broad; peduncles 3-flowered; flowers rising from the top of the peduncle, middle pedicel naked, lateral ones each furnished with a bractea. ♄. S. Native of the Island of Bourbon. Flowers white or pale-red?

Three-flowered Trochetia. Tree 20 feet.

Cult. These trees will succeed well in a mixture of loam and peat; and young cuttings will strike root freely in the same kind of soil under a hand-glass, in a moist heat.

XXVI. PTEROSPE'RMUM (from πτερον, *pteron*, a wing, and σπερμα, *sperma*, a seed; in allusion to the seeds being winged). Schrœb. gen. no. 1124. D. C. mem. mus. 10. p. 111. prod. 1. p. 500.

LIN. SYST. *Monadélphia, Polyándria.* Calyx 5-parted, somewhat tubular at the base, naked or involucrated. Petals 5, usually shorter than the sepals. Stamens 20, 5 of these are sterile. Style cylindrical. Stigma thickish. Capsules woody, 5-celled. Seeds drawn out into a wing. Albumen sparing or wanting. Trees with large leaves, which are usually hoary beneath, and large, axillary or terminal, solitary flowers.

SECT. I. VELA'GA (meaning unknown). Adans. fam. 2. p. 389. D. C. prod. 1. p. 500. Involucel wanting.

1 P. ACERIFÒLIUM (Willd. spec. 3. p. 729.) leaves broad, peltately-cordate, obtuse, with a short acumen, toothed, tomentose beneath; pedicels shorter than the petioles. ♄. S. Native of the East Indies. Sims, bot. mag. t. 620. Pentápetes acerifòlia, Lin. spec. 939. Cav. diss. 3. p. 131. t. 44. Velàgo 'xylocárpa, Gært. fr. 2. p. 245. t. 133.—Amm. act. petr. 8. t. 16 and 17. Flowers white.

Maple-leaved Pterospermum. Fl. July, Sept. Clt. 1790. Tree 25 feet.

2 P. SUBERIFÒLIUM (Willd. spec. 3. p. 728.) leaves oblong, acuminated, obliquely cordate at the base, coarsely toothed at

the apex, tomentose beneath; pedicels hardly length of the petioles, but crowded at the tops of the branches. ♄. S. Native of the East Indies. Sims, bot. mag. t. 1526. Pentápetes suberifòlia, Lin. spec. 959. Cav. diss. 3. t. 43. f. 2. —Amm. act. petr. 8. t. 14. Flowers white, axillary, solitary, twin or tern at the tops of the branches.

Cork-tree-leaved Pterospermum. Fl. Sept. Oct. Clt. 1783. Tree 15 feet.

3 P. lanceæfòlium (Roxb. hort. beng. 50.) leaves unequal-sided, oblong-lanceolate or oval-oblong, acuminated, quite entire, tomentose beneath; pedicels much longer than the petioles. ♄. S. Native of the East Indies. Flowers white.

Lance-leaved Pterospermum. Clt. 1820. Tree 60 feet.

4 P. rubiginòsum (Heyne, mss. in Lin. soc. herb.) leaves ovate, quite entire, oblique, very unequal-sided, acuminate, clothed with rusty tomentum on the under surface as well as branches and calyx; peduncles longer than the petioles. ♄. S. Native of the East Indies. Leaves small.

Rusty-leaved Pterospermum. Tree.

5 P. Heyne'num; leaves oblong, or obovately oblong, quite entire, usually oblique at the base, abruptly acuminated at the apex, sometimes so as to appear tricuspidate, clothed with white tomentum on the under surface; peduncles axillary, short, 2-3-flowered, sometimes twin. ♄. S. Native of the East Indies. P. suberifòlium, Heyn. mss. herb.

Heyne's Pterospermum. Tree.

Sect. II. Pterolæ'na (from *πτερον, pteron*, a wing, and *χλαινα, chlaina*, a covering; in allusion to the flower being involucrated). D. C. mem. mus. 10. p. 111. prod. 1. p. 500. Involucel 3-leaved; leaflets large, cordate-roundish, fringed or jagged.

6 P. semisagitta'tum (Roxb. hort. beng. p. 50.) leaves oblong, acuminated, entire, cordate at the base, with unequal lobes, one of which is short and obtuse, the other is drawn out into a long point. ♄. S. Native of the East Indies. Link. enum. 2. p. 200. D. C. mem. mus. 10. p. 111. with a figure. Eriolæ'na Roxbúrghii, Spreng. This is a very shewy tree with dark-red flowers. Stipulas palmate, fringed.

Semisagittate-leaved Pterospermum. Clt. 1820. Tr. 20 ft.

7 P. diversifòlium (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 655.) leaves oblong, broadest above, serrated, obliquely cordate at the base, with rounded entire lobes, younger ones peltate, 3-5-lobed. ♄. S. Native of Java. Eriolæ'na diversifòlia, Spreng. Flowers white?

Diverse-leaved Pterospermum. Tree 23 feet.

† *Species, the name of which is only known.*

8 P. cane'scens (Roxb. hort. beng. p. 50.). ♄. S. Native of Ceylon. Flowers white?

Hoary Pterospermum. Clt. 1823. Tree 20 feet.

Cult. This is a genus of fine broad-leaved trees. They will thrive well in a mixture of loam, sand, and peat, and cuttings, not deprived of their leaves, will root readily in sand, under a hand-glass, in a moderate heat.

XXVII. VISE'NIA (probably from the name of some botanist). Blum. bijdr. ex Schlecht. Linnæa. 1. p. 654. Glossospérmum, Wall. in herb. soc. Lin.

Lin. syst. *Monadélphia, Pentándria.* Calyx 5-cleft. Petals 5. Stamens 5, all fertile, monadelphous at the base. Carpels 5, connate, 2-valved, 1-seeded. Seeds fixed to the bottom of the cells, ending in a wing at the apex. Albumen amygdalaceous. Embryo with leafy cotyledons and an inferior radicle.

1 V. umbella'ta (Blum. l. c.). ♄. S. Native of Java A tree with cordate, acuminated, obtusely-serrated leaves, which are canescent, and axillary, stalked, umbellate corymbs of flowers.

Umbellate-flowered Visenia. Tree 20 feet.

Cult. This tree may be propagated and cultivated in the same manner as recommended for *Pterospérmum*.

XXVIII. ASTRAPÆ'A (from *αστραπη, astrape*, lightning; brightness of flowers). Lindl. coll. bot. t. 14. D. C. prod. 1. p. 500.

Lin. syst. *Monadélphia, Polyándria.* Flowers umbellate, girded by a many-leaved involucel; leaflets roundish, ovate, with the 2 outer ones opposite. Calyx of 5 sepals, with 1 bractea on the outside of each. Petals 5. Stamens joined into a long tube, 5 sterile, 20 fertile. Ovary 5-celled. Style 1. Stigmas 5. Ovulæ few in each cell. Elegant trees, with large angular leaves, and drooping umbels of scarlet flowers.

1 A. Walli'chii (Lindl. coll. bot. t. 14.) leaves large, cordate, angularly lobed; stipulas leafy, ovate, acuminated; peduncles long, hairy; umbels drooping. ♄. S. Native of Madagascar. Ker. bot. reg. t. 691. A. Wallíchii and A. penduliflòra, D. C. Flowers scarlet. Anthers yellow.

Wallich's Astrapæa. Fl. July, Aug. Clt. 1820. Tree 30 ft.

2 A.? visco'sa (Sweet, hort. brit. p. 58.) leaves large, cordate, with 5 angular lobes, clammy, as well as the young branches. ♄. S. Native of Madagascar.

Clammy Astrapæa. Clt. 1823. Tree 30 feet.

3 A. tiliæfo'lia (Sweet, hort. brit. p. 58.) ♄. S. Native of the island of Bourbon. Perhaps a species of *Dombèya*.

Lime-tree-leaved Astrapæa. Clt. 1824. Tree 10 feet?

Cult. *A. Wallíchii* is one of the finest plants that ever was introduced into Britain; when in flower nothing can exceed it in beauty. All the species will grow well in a rich soil or a mixture of loam and peat; and young cuttings planted in mould, and placed under a hand-glass in heat, will soon strike root.

† *Uncertain Dombeyàceæ.*

XXIX. KY'DIA (in memory of Colonel Robert Kyd, whose love for botany induced him, at the desire of the East India Company, to begin a botanical garden and nursery at Calcutta, which he conducted with much success during his life.) Roxb. cor. 3. p. 11. D. C. prod. 1. p. 500.

Lin. syst. *Monadélphia, Polyándria.* Calyx campanulate, 5-lobed, surrounded by a 4-6-leaved involucel, with the leaflets of the involucel adhering to the calyx at the base. Petals 5, obliquely obcordate, longer than the calyx. Stamens monadelphous in a long tube; anthers disposed in 5, 4-anthered bundles on the top of the teeth of the staminiferous tube. Ovary 1. Style trifid. Stigmas dilated. Capsules 3-celled, 3-valved, 3-seeded. Seeds fixed to the bottom of the cells.—East India trees, with alternate 5-nerved and somewhat 3-5-lobed, or almost entire leaves, which are tomentose beneath, and diffuse panicles of white flowers. The proper place of this genus is uncertain.

1 K. calyci'na (Roxb. cor. 3. t. 215.) involucel 4-leaved, much longer than the calyx. ♄. S. Native of the East Indies, on the Coromandel coast. Flowers white. Anthers almost sessile on the top of the tube. Style protruding beyond the tube of stamens.

Large-calyxed Kydia. Clt. 1818. Tree 25 feet.

2 K. frate'rna (Roxb. cor. 3. p. 216.) involucel 6-leaved, shorter than the calyx. ♄. S. Native of the East Indies on the Circar mountains. Flowers white. Anthers aggregate on

the top of filaments, which are drawn out a long way beyond the tube of the stamens. Style length of tube.

Brotherly Kydia. Clt. 1823. Tree 40 feet.

Cult. These trees grow freely in any rich soil, or in a mixture of loam, peat, and sand; and young cuttings not deprived of their leaves, planted in mould, and placed under a hand-glass in heat, will root readily.

XXX. GLU'TA (from *gluta*, glue, in allusion to the petals being glued to the stipe-formed torus,) Lin. mant. 293. D. C. prod. 1. p. 501.

LIN. SYST. *Monadélphia, Polyándria.* Calyx campanulate, membranaceous, deciduous, naked. Petals 5, lanceolate, longer than the calyx, glued to a long stipe-formed torus. Stamens monadelphous, glued around the torus, exserted, and free at the apex. Anthers roundish, turning like a weather-cock. Ovary obovate. Style 1. Fruit?—A tree, with broad, lanceolate, naked leaves, and panicles of white flowers, almost as in *Clématis flámmula*.

1 G. BE'NGHAS (Lin. mant. 293.) ♄. S. Native of Java, where it is called *Benghas*. Branches and buds pubescent. Leaves obtuse, entire, even and smooth on both surfaces.

Benghas Gluta. Tree 30 feet?

Cult. *Glùta* will thrive well in a mixture of loam, peat, and sand; and young cuttings, not stripped of their leaves, will root freely in mould under a hand-glass, in heat.

XXXI. MARA'NTHUS (from *μαραινω, maraino*, to fade, and *ανθος, anthos*, a flower; the withered flowers are permanent.) Blum. bijdr. ex Schlecht. Linnæa. 1. p. 656.

LIN. SYST. *Monadélphia, Polyándria.* Calyx 5-parted, permanent. Petals 5, hardly longer than the calyx. Stamens numerous, rather connate at the base, all fertile, and marcescent. Anthers 2-celled. Ovary didymous, villous, 2-celled. Style 1, lateral, permanent, crowned by a simple stigma. Drupe oval, villous, 2-celled; cells 1-seeded. Seeds fixed by their base.

1 M. CORYMBO'SA (Blum. l. c.) ♄. S. Native of Java. A tree, with alternate, oblong, entire leaves, with 2 glands at the base instead of stipulas, and axillary and terminal corymbs of flowers.

Corymbose-flowered Maranthus. Tree 20 feet.

Cult. This tree will grow in a mixture of loam and peat, and cuttings taken off at a joint will root readily if planted in a pot of sand, placed under a hand-glass, in heat.

Tribe V.

WALLICHIE'Æ (plant agreeing with *Wallichia* in important characters). D. C. mem. mus. 10. p. 102. prod. 1. p. 501.

Calyx 5-lobed, surrounded by a 3 or 5-leaved involucel, which is rather distant from the flower. Petals 5, flat. Stamens indefinite; filaments in a long monadelphous tube, outer ones shortest. Anthers erect, bilocular. Fruit 5-10-valved, 5-10-celled; cells 1-8-seeded.

XXXII. ERIOLÆ'NA (from *εριον, erion*, wool, and *χλαινα, chlaina*, a cloak; in allusion to the woolly involucel and calyx.) D. C. mem. mus. 10. p. 102. prod. 1. p. 501.

LIN. SYST. *Monadélphia, Polyándria.* Calyx tomentose, 5-parted, acuminate, surrounded by a 5-leaved involucel; leaflets tomentose, jagged, the 3 inner ones largest, 2 outer ones smaller, all shorter than the calyx. Petals 5, unguiculate, shorter than the calyx. Stamens in many series around the column from top to bottom, monadelphous, outer ones shortest, all fertile. Style villous. Stigmas 10, aggregated into a head. Capsule 10-celled, 10-valved; cells 8-seeded, with a dissepiment in the middle of each valve bearing the seeds. Structure of the involucel resembling that of section *Pterolæ'na* of *Pterospérmum*.

1 E. WALLI'CHII (D. C. mem. mus. 10. p. 102. pl. 5.) leaves stalked; cordate, acuminate, toothed, pubescent above, villous beneath; pedicels villous, 1-flowered, 3-times as long as the petioles; involucre of 5-leaves. ♄. S. Native of the East Indies. Branches round. Flowers yellow. Resembles a species of *Hibíscus* in habit.

Wallich's Eriolæna. Clt. 1823. Tree 30 feet.

2 E. CANDO'LLII (Wall. pl. asiat. rar. 1. p. 51. t. 64.) leaves ovate-cordate, acuminated, entire, hoary-tomentose beneath; flowers terminal, panicled; involucre of 3 oblong-linear leaves. ♄. S. Native of the East Indies on the mountains of Prome, on the banks of the Irawaddi. Stigmas 10. Capsule 10-celled, 10-valved; cells 8-seeded, with a dissepiment in the middle of each valve, bearing the seeds. The species differs from *E. Wallíchii*, in the leaves and inflorescence being covered with stellate, grey tomentum, whereas they are densely hairy in that species. Petals yellow, emarginate. The involucre in the figure appears to be of many jagged leaves.

De Candolle's Eriolæna. Tree 40 feet.

Cult. These trees should be cultivated and treated in the manner recommended for *Kýdia*.

XXXIII. WALLI'CHIA (in honour of Nathaniel Wallich, M. D. F. R. and L. S. superintendant of the East India Company's botanical garden at Calcutta.) D. C. mem. mus. 10. p. 104. prod. 1. p. 501.

LIN. SYST. *Monadélphia, Polyándria.* Involucel 3-4-leaved, distant from the flower, small. Calyx 4-parted, with oblong-linear lobes. Flower-bud oblong. Petals 4, spreading, reflexed, with thick velvety claws. Stamens about 20, monadelphous into a conical tube, outer ones shortest. Ovary ovate, 8-celled. Style 1. Stigmas 8. Capsule 8-celled, 8-valved, with 1-seeded cells.

1 W. SPECTA'BILIS (D. C. mem. mus. 10. p. 104. t. 6.) ♄. S. Native of Nipaul. Jáckia spectábilis, Spreng. syst. 3. p. 85. Branches velvety. Leaves stalked, broad-ovate, somewhat cordate, serrated, velvety beneath. Peduncles axillary and terminal, longer than the leaves, many-flowered, constituting as if it were a leafy panicle. Flowers probably white, smaller than those of *Málva sylvéstris*. This tree resembles a species of *Tìlia* in habit.

Shewy Wallichia. Tree 36 to 40 feet.

Cult. This is a beautiful tree. A mixture of loam, peat, and sand will suit it best, and young cuttings not deprived of their leaves will root readily if planted in the same kind of soil under a hand-glass, in heat.

XXXIV. GOETHE'A (in honour of the celebrated Baron Goethe of Weimar.) Nees and Mart. nov. act. bonn. xi. p. 91. D. C. prod. 1. p. 501.

LIN. SYST. *Monadélphia, Polyándria.* Calyx campanulate, short, 5-cleft (f. 93. *a.*), surrounded by a large bladdery involucel (f. 93. *b.*). Petals 5, somewhat joined together at the base (f. 93. *c.*), spirally twisted in the bud. Filaments numerous, joined into a long column at the base (f. 93. *e.*). Anthers ovate, bilocular. Style elongated, cleft at the apex into 8-10 stigmas (f. 93. *g.*). Carpels 5, coriaceous, 1-seeded.—Trees and shrubs, with smoothish coriaceous leaves, and bearded petioles. Stipulas narrow. Flowers shewy, nodding. Peduncles axillary, 1-flowered. Involucel coloured, netted, bladdery.

1 G. SEMPERFLO'RENS (Nees and Mart. l. c. p. 92. t. 7.) leaves elliptical, serrated at the apex; flowers usually terminal; involucel 6-cleft (f. 93. *b.*) ♄. S. Native of Brazil in woods nigh to the road to Felisbert, at the temple of Ferreira Campos. Involucrum brown. Flowers purplish, with a white disk.

Ever-flowering Goethea. Fl. year. Tree 30 feet.

2 G. CAULIFLÒRA (Nees and Mart. l. c. p. 93. t. 8.) leaves oblong, quite entire; flowers rising laterally from the trunk; involucel 4-parted. ♄. S. Native of Brazil at the river called Ilheos, and in Maranham by river sides. Leaves large. Flowers with a scarlet involucel. We have seen this plant at Maranham in Brazil, or another species, which grows to a large tree.

Stem-flowered Goethea. Fl. Dec. Shrub 4 feet.

Cult. *Goethèa* is a genus of beautiful trees. A mixture of loam, sand, and peat, will suit them well, and young cuttings with their leaves on will root in sand under a hand-glass, in heat.

FIG. 93.

ORDER XXXIV. TILIA'CEÆ (plants agreeing with *Tìlia* in important characters). Juss. gen. p. 290, exclusive of Genera, Kunth, malv. p. 14. nov. gen. amer. 5. p. 354. D. C. prod. 1. p. 503.

Calyx usually naked on the outside, of 4-5 sepals (f. 94. *a.*), rarely of 4-7 lobes, valvate in æstivation. Petals equal in number to the sepals, and alternating with them (f. 94. *b.*), entire, usually foveolate at the claw, rarely absent. Stamens hypogynous, free, usually indefinite in numbers (f. 94. *d.*), rarely definite. Anthers oval or roundish, 2-celled, bursting lengthwise by a double chink. Glands equal in number to the petals, and opposite them, adhering to the stipe of the ovary. Ovary 1, constantly composed (f. 94. *g.*) of 2-10 closely joined carpels, crowned by an equal number of styles, which are joined together in 1, terminated by as many, usually free, stigmas (f. 94. *g.*). Capsule many-celled (f. 94. *f.*); cells many-seeded (f. 94. *f.*). Albumen fleshy, rarely wanting. Embryo straight, with flat, leafy cotyledons. This order differs from *Malvàceæ*, *Bombàceæ*, *Sterculiàceæ*, and *Byttneriàceæ*, in the filaments being free; from *Elæocárpeæ* in the petals being entire, not fringed, nor lobed, in the anthers being oval or roundish, not filiform and tetragonal, in bursting lengthwise, not by an oblong pore at the apex of the cells, as in that order. The order is composed of herbs, shrubs, and trees. Some of them are remarkable for their beauty, with alternate, simple, bistipulate leaves, which are usually serrate or toothed, and axillary, solitary, racemose or panicled flowers. The *Lime Tília*, from which the order derives its name, is a genus of fine trees, with fragrant flowers, the inner bark of which is tough and separable, and supplies the material whence the Russia mats, used by gardeners and others, are prepared. *Córchorus olitòrius* is cultivated in Egypt as a garden vegetable; the fibres of the bark of *Córchorus capulàris* are twisted into fishing-lines, and the roasted nuts of the lime tree are reported to bear some resemblance to chocolate. The *Sparmánnia* and *Entelèa* are elegant, broad, maple-leaved, green-house shrubs. The seeds retain their power of vegetation for many years.

Synopsis of the Genera.

1 SPARMA'NNIA. Sepals and petals 4. Stamens numerous, intermixed with sterile threads. Capsule echinated, 6-valved, 6-celled; cells 2-seeded.

2 ENTELE'A. Sepals and petals 4-5. Stamens numerous, all fertile, not intermixed with sterile threads. Capsule spherical, echinated, half 6-valved, 6-celled, many-seeded.

3 HELIOCA'RPUS. Sepals and petals 4. Stamens 12-20. Style 1, bifid, with recurved segments. Capsule stipitate, somewhat compressed, radiated lengthwise on all sides, 2-valved, 2-celled, 2-seeded.

4 ANTICHO'RUS. Sepals and petals 4. Stamens 8. Style 1. Capsule awl-shaped, 4-valved, 4-celled; cells many-seeded.

5 CO'RCHORUS. Sepals and petals 5. Stamens numerous. Style almost wanting. Stigmas 2-5. Capsule awl-shaped or roundish, 2-5-valved, 2-5-celled; valves with a dissepiment in the middle of each. Seeds in 2 series.

6 HONCKE'NYA. Sepals and petals 5. Stamens 8, with numerous capillary threads. Style crowned by a 6-toothed stigma? Capsule echinated, 5-valved, 5-celled. Valves with a dissepiment in the middle of each. Seeds numerous, arillate.

7 TRIUMFE'TTA. Sepals and petals 5. Stamens 10-30, sometimes a little connected at the base. Style 1. Carpels 2-4, closely joined together into a head, echinated by bristles, which are hooked at the apex. Seeds twin, or solitary in the cells.

8 PO'RPA. Calyx 5-parted. Petals 5. Stamens 26-30, girded by a membranous ring. Style 1, crowned by a 3-toothed stigma. Capsule hairy, 8-celled; cells 1-seeded.

9 GRE'WIA. Sepals 5. Petals 5, with a scale at the base of each on the inside. Stamens numerous, rising from the apex of the torus. Anthers roundish. Style 1, crowned by a 4-lobed stigma. Drupe 4-lobed, containing 2-4 nuts, which are 2-celled and 2-seeded, rarely 1-seeded.

10 MI'CROCOS. Sepals 5. Petals 5, destitute of scales on the inside. Stamens numerous, inserted on the top of the torus. Anthers roundish. Style crowned by a bluntish stigma.

11 VINCE'NTIA. Sepals and petals 5, the last bifid. Stamens numerous. Style crowned by a 4-lobed stigma. Capsule globose, indehiscent, containing 4 4-celled nuts, or from abortion only 1-celled and 1-seeded.

12 COLU'MBIA. Sepals and petals 5. Stamens numerous. Style 1. Torus pentagonal. Fruit globose, 4-celled, 4-winged, but perhaps composed of 2 2-winged, 2-seeded carpels.

13 TI'LIA. Calyx 5-parted. Petals 5. Stamens numerous, free, or somewhat polyadelphous. Ovary globose, villous, 1-styled, 5-celled; cells 2-seeded. Nut coriaceous, 1-celled, 1-2-seeded from abortion.

14 BROWNLO'WIA. Calyx 5-parted. Petals 5, with 5 linear

scales around the stigma. Stamens numerous, inserted round the apex of a turbinate receptacle. Style crowned by a 3-lobed stigma. Capsule of 1 to 5 2-valved, 1-2-seeded carpels.

15 DIPLOPHRA'CTUM. Sepals and petals 5 (f. 94. *a*. *b*.). Stamens numerous (f. 94. *d*.). Style 1, crowned by 5 aggregate stigmas (f. 94. *g*.). Capsule globose, indehiscent, 5-winged (f. 94. *e*.), 10-celled; cells parted into 1-seeded divisions by a transverse dissepiment. Seeds arillate, fixed to the sides of the valves.

16 MICROSTE'MMA. Sepals 5-6. Petals 10-12. Stamens 30, rather connected at the base. Style 1, crowned by 5-6 aggregate stigmas. Capsule globose, 5-6-winged, 5-6-valved, with a dissepiment in the middle of each valve. Seeds solitary, placed at the top of the valves.

17 MUNTI'NGIA. Calyx 5-7-parted. Petals 5-7. Stamens numerous. Ovary sessile, globose, girded by hairs at the base, crowned by a capitate-rayed stigma. Berry 5-celled, many-seeded. Seeds small, imbedded in pulp.

18 APEI'BA. Calyx 4-5-parted. Petals 4-5, unquiculate, smaller than the calyx. Stamens numerous, short. Anthers long, ending in 2 leafy lobes. Style 1, dilated at the apex into a funnel-shaped stigma. Capsule spherical, depressed, scabrous from soft bristles, or rigid tubercles, 8-24-celled. Seeds minute, numerous, fixed to the central fleshy receptacle.

19 SLOA'NEA. Calyx 4-7-lobed. Petals wanting. Stamens numerous; filaments almost wanting; anthers very long, crowned by a small acumen. Ovary 1. Style 1, filiform. Capsule ligneous, roundish, echinated with crowded prickles, 4-5-valved, 4-5-celled; cells 1-3-seeded. Seeds covered with fleshy aril.

20 ESENBE'CKIA. Calyx saucer-shaped, girded by a 3-parted, deciduous involucel. Petals 5. Stamens numerous; anthers twin. Style 1, crowned by a capitate, 5-angled stigma. Capsule woody, 5-angled, 5-valved, 5-celled; valves with a dissepiment in the middle of each. Seeds 3-6 in each cell, adhering to the dissepiment.

21 ABLA'NIA. Calyx 4-5-parted. Petals wanting. Stamens numerous; anthers roundish. Ovary ovate. Styles 2, bifid. Capsule 4-valved, 1-seeded, hispid from rigid bristles. Seeds numerous, arillate, fixed to a free central placenta.

22 GYROSTE'MON. Flowers dioecious. Calyx 6-7-lobed. Stamens numerous, disposed in a concentric circle; anther seated on a naked receptacle, without filaments, 2 or somewhat 4-celled. Capsule of numerous 2-valved, 1-seeded carpels, disposed in a whorl around the central axis. Perhaps belonging to *Euphorbiàceæ*.

23 CHRISTIA'NA. Calyx 3-lobed. Petals 5. Stamens indefinite. Capsule of 5, 1-seeded carpels, which are connected at the base. This genus is hardly known.

24 LUHE'A. Calyx 5-parted, girded by a 6-9-12-parted involucel. Petals 5. Stamens numerous, somewhat connected at the base in 5 bundles, with 5 pencilled or fringed scales opposite each bundle. Style thick, crowned by a 5-lobed stigma. Capsule 5-angled, 5-celled, 5-valved, with a dissepiment in the middle of each valve. Seeds winged at the apex, disposed in 2 rows on the margin of the dissepiment.

25 MO'LLIA. Sepals and petals 5. Stamens collected into many sets, disposed in many series, outer series in 5 sets, inner series indeterminately joined. Style simple. Capsule 2-celled, 2-valved, without a central column. Seeds numerous, awl-shaped, disposed in 2 series in each cell.

26 VA'TICA. Calyx 5-cleft. Petals 5, twisted in the bud. Anthers 15, sessile, ovate, 4-celled, 3 in front of each petal. Ovary 5-angled. Style crowned by a 3-lobed stigma. Capsule 3-celled? cells 1-seeded. A doubtful genus.

27 ESPE'RA. Calyx 4-parted, spreading. Petals long, permanent. Stamens numerous, capillary. Style 1. Stigma 1. Capsule oblong, 4-6-winged, 4-6-celled; cells 1-seeded. Seeds round, hairy.

28 BE'RRYA. Sepals and petals 5. Stamens numerous, rather connected at the base. Style crowned by a trigonal, capitate stigma. Capsule roundish, 3-celled, 3-valved, 6-winged, with 2 horizontal wings on the back of each valve, with a dissepiment in the middle of each on the inside. Seeds large, ovately-globose, covered with stiff hairs, 2 in each cell.

29 EUTHE'MIS. Sepals and petals 5. Stamens 5. Anthers oblong, acuminated, bursting at the apex by 2 pores. Style filiform, crowded by a simple stigma. Berry 5-seeded; seeds disposed round the central axis, covered with a fibrous aril. This genus differs from the rest of *Tiliàceæ* in the dehiscence of the anthers.

30 XEROPE'TALUM. Calyx 5-cleft. Petals 5, emarginate. Stamens about 20, 5 of which are sterile. Capsule 3-celled, 3-valved.

I. SPARMA'NNIA (in honour of Andrew Sparmann, M.D. a Swedish botanist, who went round the world with Captain Cook in his second voyage in 1772 to 1775.). Thunb. nov. gen. 88. Lin. fil. suppl. 41. D. C. prod. 1. p. 503.

LIN. SYST. *Polyándria, Monogýnia*. Calyx of 4 sepals. Petals 4, roundish. Stamens numerous, intermixed with numerous threads, which are tomentose and rather adhering at the base. Capsules echinated, 5-angled, 6-celled, 6-valved; cells 2-seeded. —A shrub, with large leaves, resembling those of *Kitaìbelia vitifòlia*.

1 S. AFRICA'NA (Lin. fil. suppl. 265.) ♄. G. Native of the Cape of Good Hope on the sides of mountains. Vent. malm. t. 78. Sims, bot. mag. t. 726. or 516. Leaves angular, hairy, as well as the younger branches. Flowers white with the sterile threads yellow, mixed with brown.

African Sparmannia. Fl. Mar. Jul. Clt. 1790. Tr. 20 ft.

Cult. A beautiful shrub, flowering early in spring. It thrives best in a mixture of loam and peat; and cuttings root freely in sand under a hand-glass.

II. ENTELE'A (from εντελης, *enteles*, perfect; alluding to the stamens being all fertile). R. Br. in bot. mag. t. 2480.

LIN. SYST. *Polyándria, Monogýnia*. Calyx of 4-5-sepals. Petals 4-5. Stamens indefinite, all fertile, without any sterile threads. Capsule spherical, echinated, 6-celled, half-6-valved, many-seeded.—A tree, with cordate, angular, double-crenated, 5-nerved leaves, furnished with small permanent stipulas. Flowers white, in simple, lateral, or terminal stalked umbels. Involucel many-leaved, short. Pedicels bractless. Anthers purplish or yellow. The genus differs from *Sparmánnia* in the stamens being all fertile, and in the capsule being undivided to the base, not as in that genus opening into 6 distinct valves, as well as in the cells being many-seeded.

1 arbore'scens (R. Br. in bot. mag. t. 2480.) ħ. G. Native of New Zealand near Tigado, Tolagi, and Oporagi. The wood is very soft and very light, and from this property it is used by the inhabitants to float their fishing nets with.

Arborescent Entelea. Fl. May. Clt. 1820. Tree 20 feet.

Cult. This is an elegant shrub, well adapted for a greenhouse conservatory. It will thrive in a mixture of loam and peat, and large cuttings, not too much ripened, will root in sand under a hand-glass.

III. HELIOCA'RPUS (from ἡλιος, *helios*, the sun, and καρπος, *karpos*, a fruit; the valves of the capsule are elegantly ciliated around on all sides, which gives them the appearance of a little sun.) Lin. gen. no. 606. D. C. prod. 1. p. 503.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx of 4 sepals. Petals 4. Stamens 12 to 20. Style 1, bifid, with the segments recurved. Capsules stipitate, somewhat compressed, rayed lengthwise on all sides, 2-celled, 2-seeded.—Trees, with cordate, serrate, 3-lobed, simple leaves, and cymes of small, yellowish-green flowers.

1 H. America'nus (Lin. spec. 643.) leaves smooth; branches and cymes smooth. ħ. S. Native of Vera Cruz. Móntia, Houst. Heliocárpus, Lin. hort. cliff. 211. t. 16. Trew. ehr. t. 45. Leaves cordate, somewhat 3-lobed, serrated. Flowers of a yellowish-green colour.

American Sun-fruit. Fl. July. Clt. 1733. Tree 14 to 20 ft.

2 H. Popayane'nsis (H. B. et Kunth, nov. gen. amer. 5. p. 341.) nerves and veins of leaves hairy beneath; branches and cymes clothed with flocky down. ħ. S. Native of New Granada on the mountains near Popaya. Flowers of a yellowish green-colour. Perhaps only a variety of *H. Americànus*.

Popaya Sun-fruit. Tree 14 feet.

Cult. The species of *Heliocárpus* thrive best in a mixture of loam, peat, and sand; and young cuttings will root if planted in sand under a hand-glass, in a moderate heat.

IV. ANTICHO'RUS (from αντι, *anti*, a Greek preposition, which often signifies in composition resemblance to the word that follows, and *chorus*, abridged from *Córchorus*, in allusion to the resemblance in plants). Lin. fil. fasc. p. 3. t. 2. D. C. prod. 1. p. 504.

Lin. syst. *Octándria*, *Monogýnia*. Calyx of 4 sepals. Petals 4. Stamens 8. Style 1. Capsule awl-shaped, 4-valved, 4-celled; cells many-seeded. Resembles *Córchorus*.

1 A. depre'ssus (Lin. mant. 64.). ⊙. H. Native of Arabia. Jussiæ'a édulis, Forsk. descr. 210. Caríctera, Scop. Córchorus antichòrus, Rausch. A small, prostrate plant with coarsely toothed, oval leaves, and small, axillary, twin, yellow flowers, and reflexed fruit. The whole plant is boiled as a pot-herb.

Depressed Antichorus. Pl. trailing.

Cult. This is a trifling annual, the seeds of which will require to be sown in the beginning of May in a sheltered situation, where it will grow and ripen its seed freely.

V. CO'RCHORUS (κορχορος, in Greek a pot-herb, which comes from κορεω, *koreo*, to purge, and κορη, *kore*, the pupil; laxative qualities of *C. olitòrius*). Lin. gen. no. 675. D. C. prod. 1. p. 504.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx of 5, deciduous sepals. Petals 5. Stamens numerous. Style tubular, almost wanting. Stigmas 2-5. Capsules awl-shaped and round, 2-5-valved, 2-5-celled, with a dissepiment in the middle of each valve. Seeds disposed in 2 rows. Small shrubs or herbs with simple, serrated leaves covered with simple or stellate hairs. Peduncles opposite the leaves, or axillary, 1-flowered, or 2-3-parted, bearing 2-3 or many flowers. Corolla small, yellow, convolute in æstivation. Corchórus Japónicus now forms a separate genus among the *Rosàceæ* under the name of *Kérria*.

Sect. I. Core'ta (from κορεω, *koreo*, to purge; qualities of plants). P. Browne and Kunth, D. C. prod. 1. p. 504. Capsules silique-formed, 2-valved, 2-celled, but not ending in horns at the apex.

1 C. siliquòsus (Lin. spec. 746.) capsules linear, compressed, 2-valved, smooth; leaves lanceolate, equally serrated; stem smoothish, much branched; peduncles usually 2-flowered. ħ. S. Native of South America, Jacq. vind. 3. p. 34. t. 59.—Plum. ed. Burm. t. 103. f. 1. The flowers, according to Linneus, are of 4 sepals and 4 stamens, and without petals in the spring, but in the autumn they bear 5 sepals and 5 petals and numerous stamens. C. lineàris, Mill. dict. no. 5. C. secundiflòrus, Moc. et Sess. fl. mex. icon. ined. Flowers pale-yellow. This plant is used for besoms by the negroes in the West Indian colonies. Leaves sometimes truly ovate.

Silique-capsuled Corchorus. Fl. June, Aug. Clt. 1732. Shrub 2 to 6 feet.

2 C. foliòsus (Spreng. syst. 2. p. 583.) leaves small, crowded, ovate-oblong, crenulated, smooth; peduncles 1-flowered; capsule terete, rough, 2-valved; stem shrubby. ħ. S. Native of Cuba. C. siliquòsus, Poppig.

Leafy Corchorus. Fl. June, July. Shrub 1 foot.

3 C. hi'rtus (Lin. spec. 747.) capsules linear, compressed, 2-valved, and are as well as the stem hairy; leaves oblong, equally serrated. ⊙. S. Native of South America. Jacq. vind. 3. t. 58.—Plum. ed. Burm. t. 103. f. 2. Flowers yellow.

Hairy Corchorus. Fl. June, Aug. Clt. 1820. Pl. 1 to 2 ft.

4 C. ala'tus; plant pilose, branched; leaves ovate, acute, serrated, lower serratures setaceous; stipulas setaceous; pedicels 2-3 together, short, axillary; capsule long, flat, winged. ⊙. S. Native of Guinea. Flowers small, yellow.

Winged-capsuled Corchorus. Pl. ¾ foot.

5 C. pilo'lobos (Link. enum. hort. berl. 2. p. 72.) capsules linear, compressed, somewhat falcate, hairy, younger ones acuminated with the style; leaves oblong, somewhat cordate, acutely crenated, smoothish; stem hairy above. ♃. S. Native of? C. lasiólobus, Spreng. syst. 2. p. 583. Flowers yellow. This plant is often confused with *C. hírtus* in the gardens.

Cap-podded Corchorus. Fl. Ju. Sept. Clt. 1818. Pl. 1 to 2 ft.

6 C. Orinoce'nsis (H. B. et Kunth. nov. gen. amer. 5. p. 337.) capsules siliquose, rather terete, 2-celled, hairy; leaves lanceolate-oblong, upper ones linear-lanceolate, acute, crenated, smooth or a little ciliated; stem almost simple, erect. ⊙. S. Native on the banks of the river Orinoco, near Angustura. Flowers yellow.

Orinoco Corchorus. Pl. 1 to 2 feet.

7 C. villosi'ssimus (St. Hil. fl. bras. 1. p. 280.) stem densely pilose at the apex; leaves ovate, usually acute, crenate-toothed, villous, younger ones densely silky-villous; pedicels opposite the leaves, twin; capsule compressed, hairy. ħ. S. Native of Brazil in the province of Minas Geraes. Flowers yellow.

Very villous Corchorus. Fl. Aug. Shrub 1 foot.

8 C. argu'tus (H. B. et Kunth, nov. gen. amer. 5. p. 337. St. Hil. fl. bras. 1. p. 282.) stem lined with villi; leaves linear-lanceolate, sharply serrated, smooth, scabrous above; pedicels twin, rising from the side of the axils; capsule tetragonal, compressed, puberulous, erect. ħ. S. Native of Brazil, in the province of Minas Geraes and of New Granada. Flowers yellow.

Var. β, *austràlis* (St. Hil. 283.) stem more slender, leaves more oblong, less acute, less erect, with the nerves hardly white. In the province of the Missions.

Sharp-toothed-leaved Corchorus. Fl. Aug. Shrub 2 to 3 ft.

9 C. pilòsus (H. B. et Kunth, nov. gen. amer. 5. p. 338. t. 487.) capsules siliquose, 2-celled; peduncles opposite, the leaves simple, hairy; leaves ovate, acute, or ovate-lanceolate, acute, serrate-toothed, puberulous, and beset on both surfaces as well as the branches with long, soft hairs; stem hispid. ⊙. S. Native of New Granada near Ibague, and of Brazil in the province of Minas Geraes. Flowers yellow. Capsule pilose.

Pilose Corchorus. Shrub ½ to 1 foot.

10 C. hu'milis (St. Hil. fl. bras. 1. p. 280.) stem soft, hispid; leaves oblong, ovate, deeply crenate-toothed, pubescent; pedicels opposite, the leaves twin, 2-parted, 2-flowered; capsule compressed, hispid, spreading. ⊙. H. Native of Brazil in the province of Minas Geraes. Flowers yellow.

Humble Corchorus. Fl. Aug. Pl. ½ to 1 foot.

11 C. to'rtipes (St. Hil. fl. bras. 1. p. 281. t. 55.) stem rather scabrous, with lines of villi; leaves ovate, acute, unequally serrated, pilose; pedicels twin, rising from the sides of the axils of the leaves, twisted; capsule compressed, erect, with a few hairs. ♄. S. Native of Brazil about Rio Janeiro. Flowers yellow on a furcate peduncle.

Twisted-pedicelled Corchorus. Fl. Aug. Shrub 2 to 3 feet.

12 C. Mompoxe'nsis (H. B. et Kunth, nov. gen. amer. 5. p. 338.) capsules siliquose, straight, 2-edged, 2-celled, hairy; leaves oblong-lanceolate, each ending in a narrow acumen, serrated, smoothish; branches smooth, with a pubescent line. ♄. S. Native of South America on the banks of the river Magdalena, near Mompox. Flowers yellow.

Mompox Corchorus. Shrub 2 to 4 feet.

Sect. II. Coretoìdes (alluding to the resemblance which the plants of this section have with those of the preceding *Corèta*). D. C. prod. 1. p. 504. Capsules silique-formed, 3-6-valved, 3-6-celled, but not ending in horns at the apex as in the following section.

13 C. trilocula'ris (Lin. mant. 77.) capsules awl-shaped, trigonal, 3-valved, scabrous; leaves ovate-oblong, serrated, with the lower serratures usually setaceous. ⊙. S. Native of Arabia. C. æ'stuans, Forsk. descr. 101. Petals pale-yellow. The whole plant is eaten as a pot-herb.

Three-celled-capsuled Corchorus. Fl. July, Aug. Clt. 1790. Pl. 1 foot.

14 C. olitòrius (Lin. spec. 746.) capsules oblong-cylindrical, obtuse-angled, smooth, 5-celled; leaves ovate-oblong, serrated, with the lower serratures long and setaceous; peduncles nearly sessile, solitary. ⊙. S. Native of Asia, Africa, and America between the tropics in gardens and among rubbish. Lam. ill. t. 478. f. 1.—Com. hort. 47. t. 12.—Mor. hist. 2. p. 283. f. 3. t. 15. f. 4. Flowers yellow. Rauwolf says this plant is sown in great plenty about Aleppo as a pot-herb, the Jews boiling the leaves to eat with their meat, whence in French it is called *mauve-de-juif*.

Pot-herb Corchorus. Fl. Ju. Aug. Clt. 1640. Pl. 1 to 2 ft.

15 C. longica'rpus; suffruticose, erect, branched; leaves ovate-lanceolate, acute, serrated; lower serratures bristly; petioles pilose; peduncles short, 1-flowered; stipulas setaceous; capsule long, acuminated, smooth, nearly sessile; 5-celled. ♄. S. Native of Guinea. Flowers small, yellow.

Long-fruited Corchorus. Pl. 1 foot.

16 C. æ'stuans (Lin. spec. 746.) capsules oblong, 3-valved, 6-furrowed; leaves somewhat cordate, ovate, acuminated, serrated, with the lower serratures long, and setaceous. ⊙. S. Native of South America. Jacq. vind. t. 85.—Pluk. phyt. t. 127. f. 3.—Brown. jam. 232. t. 25. f. 1. under *Triumfétta*.

Scorching Corchorus. Fl. June, July. Clt. 1731. Pl. 1 ft.

17 C. prismatoca'rpus (St. Hil. fl. bras. 1. p. 282.) stem lined with villi; upper leaves oblong-lanceolate, serrate-toothed, rather pubescent; pedicels twin, opposite the leaves; capsule prismatic, 4-5-angled, hairy, erect, 2-3-valved. ♄. S. Native of Brazil in the province of the Missions. Flowers yellow.

Prismatic-fruited Corchorus. Fl. Feb. Shrub ½ to 1 foot.

18 C. serræfòlius (Burch. cat. geogr. no. 1962. voy. 1. p. 537.) capsules linear, terete, scabrous, usually twisted, 6-valved peduncles lateral, trifid, 3-flowered; leaves linear, coarsely serrated. ♃. G. Native of the Cape of Good Hope in a plain near Gattskamma beyond the river Gariep. Stems procumbent, elongated, villous. Flower-bud acute. Petals yellow.

Saw-leaved Corchorus. Pl. procumbent.

19 C. lanceola'tus; plant erect, twiggy, simple, smooth; leaves lanceolate, equally serrated, lower serratures setaceous; petioles hairy; stipulas setaceous; pedicels axillary, solitary, 1-flowered; capsule long, 3-5-celled? ♄? ⊙? S. Native of Guinea. Flowers small, yellow.

Lanceolate-leaved Corchorus. Pl. 1 to 2 feet.

20 C. asplenifòlius (Burch. cat. geogr. no. 1737. voy. 1. p. 400.) capsules? peduncles opposite the leaves, trifid, 3-flowered; leaves elongated, ovate, simply crenate-serrated; flower-bud somewhat globose. ♃. G. Native of the Cape of Good Hope on the banks of the river Gariep. This is probably only a variety of *C. serræfòlius*.

Spleen-wort-leaved Corchorus. Pl. procumbent.

Sect. III. Ceratocore'ta (from κερας, *keras*, a horn, and *Corèta*, the name of the first section; in allusion to the carpels ending in horns). D. C. prod. 1. p. 505. Capsules elongated, angular, ending at the apex in 3 and 5 diverging horns.

21 C. tri'dens (Lin. mant. 566. exclusive of the synonym of Burm.) capsules slender, 2-3-valved, 2-3-angled, 2-3-horned; leaves oblong, serrated, lower serratures setaceous. ♄. S. Native of the East Indies and Guinea. C. Senegalénsis, Juss. These are varieties with narrow and broad leaves.—Pluk. phyt. t. 127. f. 4.—Burm. ind. 123. t. 37. f. 2. Flowers yellow.

Trident-capsuled Corchorus. Fl. June, Aug. Clt. 1824. Shrub 1 to 2 feet.

22 C. fascicula'ris (Lam. dict. 2. p. 104.) leaves oblong-lanceolate, unequally-serrated, smooth, mutic at the base; capsule almost sessile, aggregate, woolly, ovate-oblong, 3-valved, 6-celled, and 3-horned at the apex. Native of the East Indies. —Pluk. amalth. t. 439. f. 6. Flowers yellow.

Fascicled-capsuled Corchorus. Shrub 2 feet.

23 C. acuta'ngulus (Lam. dict. 2. p. 104.) capsules oblong, acutely angled, ending in 3-5 entire or bifid horns; leaves ovate, rather hispid, serrated, with one bristle on each side at the base. ⊙. S. Native of St. Domingo and the East Indies.—Pluk. phyt. t. 44. f. 1. C. tetrágonus, Mill. dict. no. 4.? Perhaps two species are confused under this name.

Acute-angled-capsuled Corchorus. Fl. June, Jul. Clt. 1816. Shrub 2 feet.

24 C. pa'tens (Lehm. in nov. act. bon. 12. p. 805.) leaves lanceolate, smooth, serrated, lower serratures setaceous; capsule linear, 3-valved, 6-furrowed, smooth, tricuspidate, spreading; peduncles 1-3-flowered. ⊙. H. Native of Egypt.

Spreading-capsuled Corchorus. Fl. June, July. Pl. 1 foot.

25 C. Guadaloupe'nsis (Spreng. syst. 2. p. 584.) leaves ovate-serrated, mutic at the base; capsule linear, terete, obtuse-angled, 4-valved, 4-horned at the apex. ⊙. S. Native of Guadaloupe. Flowers yellow.

Guadaloupe Corchorus. Pl. 1 foot.

Sect. IV. Ga'nja (the name of the plant in Amboyna). Rumph. amb. 5. t. 78. f. 1. D. C. prod. 1. p. 505. Capsules somewhat globose, depressed, wrinkled, muricated.

26 C. capsula'ris (Lin. spec. 746.) leaves ovate-lanceolate, acuminated, serrated, with the lower serratures setaceous. ⊙. S. Native of the East Indies. Gært. fr. t. 129. Jacq. ecl. 2. t. 120.—Pluk. alm. t. 255. f. 4. Flowers yellow, in clusters, opposite the leaves.

Capsular-podded Corchorus. Fl. June, July. Clt. 1731. Pl. 1 to 4 feet.

Sect. V. Guazumoi'des (from *Guazuma* and *idea*, form; plants agreeing with *Guazuma*, in having prickly capsules). D. C. prod. 1. p. 505. Capsules ovate, somewhat velvety, and echinated with soft prickles. Flowers yellow.

27 C. hirsu'tus (Lin. spec. 747.) capsules ovate, woolly; leaves ovate, obtuse, tomentose, equally serrate-crenated or entire. ♄. S. Native of South America.—Plum. ed. Burm. t. 104.—Jacq. amer. pict. 81. t. 157. C. frutéscens, Lam. dict. 2. p. 105. Peduncles umbellate, many-flowered.

Var. β, *oblongifòlius;* leaves oblong. ♄. S. Native of Jamaica, &c. C. hirsùtus, Jacq. hort. vind. t. 57. f. 2.

Hairy Corchorus. Fl. June, July. Clt. 1752. Shrub 4 to 5 feet.

28 C. arena'rius (H. B. et Kunth, nov. gen. amer. 5. p. 339.) capsules oblong, 3-sided, 3-celled; leaves small, in fascicles, oblong, blunt at both ends, undulately-crenated, rather complicated, coriaceous, tomentose; branches clothed with flocky down. ♄. S. Native of New Andalusia in sandy places.

Sand Corchorus. Shrub 8 to 12 feet.

29 C. tomentòsus (Thunb. fl. jap. 228.) capsules oblong, woolly; leaves ovate, obtuse, tomentose, equally serrated. ♄. G. Native on the mountains of Japan. Flowers orange-coloured, usually solitary.

Tomentose Corchorus. Shrub 2 to 4 feet.

† *Species not sufficiently known.*

30 C.? sca'ndens (Thunb. in Lin. trans. 2. p. 335.) leaves opposite, ovate, with setaceous serratures; stem and branches flexuous-scandent; flowers terminal, solitary. ♄. ◡. G. Native of Japan. Flowers yellow.

Climbing Corchorus. Shrub climbing.

31 C. serra'tus (Thunb. l. c.) leaves oblong, serrated; serratures pointed; branches smooth. ♄? G. Native of Japan. Branches purple. Flowers yellow, terminal.

Serrate-leaved Corchorus. Shrub 2 feet.

32 C. flexuòsus (Thunb. l. c.) leaves doubly serrated, acuminated, obliquely cordate, villous; stem flexuous. ♄? S. Native of Japan. Flowers yellow.

Flexuous-stemmed Corchorus. Shrub 2 feet.

33 C.? Java'nicus (Burm. ind. 123. t. 36. f. 3.) capsules roundish, hispid; leaves ovate-lanceolate, equally serrated; calyxes awned. ♄? S. Native of Java. Perhaps this plant is nearer *Melòchia*.

Java Corchorus. Shrub?

34 C. Burma'nni (D. C. prod. 1. p. 505.) capsules awl-shaped, trigonal, 3-celled, 3-valved; leaves linear-oblong, serrated, with the lower serratures setaceous. ♄. S. Native of the East Indies. C. triloculàris, Burm. ind. p. 123. t. 37. f. 2. This plant is probably referable to *C. triloculàris* or to *C. trídens*, but according to the figure it is distinct from both.

Burmann's Corchorus. Shrub 1 to 2 feet.

35 C. bifurca'tus (Mill. dict. no. 6.) capsules linear, compressed, forked at the apex; leaves cordate, serrated. ⊙. S. Native of Jamaica. Flowers pale-yellow. Capsules 2-celled.

Two-forked-capsuled Corchorus. Pl. 2 to 3 feet.

36 C. furca'tus (Roxb. hort. beng. p. 42.). ⊙. S. Native of the East Indies. Flowers yellow.

Forked-capsuled Corchorus. Pl. 1 to 2 feet.

37 C. decemangula'ris (Roxb. hort. beng. p. 42.) capsules 10-angled. ⊙. S. Native of the East Indies in Bengal.

Ten-angled-capsuled Corchorus. Pl. 1 to 2 feet.

38 C. quadrangula'ris; erect, smooth, branched; leaves lanceolate, acute, serrated, with the lower serratures setaceous; stipulas setaceous; flowers nearly sessile; capsule long, quadrangular. ⊙? ♄? H. Native of Sierra Leone.

Quadrangular-capsuled Corchorus. Pl. 1 foot.

Cult. This is a genus of trifling plants with small yellow flowers; therefore they are not worth cultivating, except in botanic gardens. They will thrive best in a light sandy soil, and cuttings of the shrubby kinds will readily root in sand, under a hand-glass, in a moderate heat. The annual species require to be sown on a hot-bed in spring, and when the plants are of sufficient size they should be potted off into separate pots, and then placed in the greenhouse or stove, or they may be planted out in the open border in a warm sheltered situation about the middle of May, where they will probably ripen seed.

VI. HONCKE'NYA (in honour of G. A. Honckeney, a celebrated German cultivator of plants.) Willd. in Ust. del. op. p. 201. t. 4. D. C. prod. 1. p. 506.

Lin. syst. *Octándria, Monogýnia.* Calyx of 5 sepals, coriaceous, hairy on the outside, coloured on the inside. Petals 5, oblong. Stamens 8, with oblong anthers, intermixed with numerous capillary threads. Ovary oblong. Style 1. Stigma 6-toothed. Capsules echinated with prickles, 5-celled, 5-valved, with a dissepiment in the middle of each valve. Seeds numerous, arillate. This shrub is allied on the one side to *Sparmánnia*, and on the other to *Apeìba*.

1 H. ficifòlia (Willd. l. c.) ♄. S. Native of Guinea. Leaves clothed on the under surface with brownish tomentum, upper ones spatulate-oblong, toothed, lower ones obtusely 3-5-lobed. Flowers terminal in threes, of a bluish-violet colour.

Fig-leaved Honckenya. Shrub or Tree.

Cult. This plant will thrive in a mixture of loam and peat; and young cuttings will root in sand under a hand-glass, in heat.

VII. TRIUMFE'TTA (in honour of John Baptist Triumfetti, an Italian botanist, author of observations on the vegetation of plants; died 1707. It must also distinguish Lælius Triumfetti his brother, once professor of botany at Rome.) Lin. gen. no. 600. D. C. prod. 1. p. 506.

Lin. syst. *Deca-Polyándria, Monogýnia.* Calyx 5-sepalled, blunt, or usually with a point just under the apex. Petals 5, with the claws ciliated, rarely wanting. Stamens 10-30, free, girded by a narrow urceolus at the base. Glands 5 on the receptacle, opposite the petals. Ovary roundish. Style 1, 2-5-toothed at the apex. Carpels 2-5, more or less closely joined into a single fruit, which is beset with hooked prickles. Seeds 1 or 2 in each cell or carpel, hairy. Embryo straight. Shrubs, rarely herbs, with simple or 3-lobed leaves, for the most part 3-nerved at the base. Peduncles solitary, axillary, 2-3-flowered, but usually crowded, frequently joined at the base, commonly opposite the leaves, or disposed in clustered interrupted racemes on the tops of the branches. Corolla yellow. Pili stellate.

Sect. I. La'ppula (a dim. of *Lappa*, burdock, resemblance in bristly capsules.) D. C. prod. 1. p. 506.—Triumfétta, Gært.

fruct. 111. Flowers apetalous. Carpels closely joined into an undivisible capsule, with a solitary seed in each cell.

1 T. LA'PPULA (Lin. spec. 637.) leaves roundish, unequally toothed, somewhat villous, 5-nerved, 3-lobed; lobes acuminate. ♄. S. Native of the West Indies, Brazil, and the Bermudas. T. Plumièri, Gært. fruct. 2. p. 137.—Plum. ed. Burm. t. 255.

Small-bur Triumfetta. Fl. July, Aug. Clt. 1739. Shrub 3 to 6 feet.

2 T. HETEROPHY'LLA (Lam. dict. 3. p. 420.) leaves undivided at the base, lower ones deeply lobed, upper ones oblong, repand. ♄. S. Native of St. Domingo.—Pluk. amalth. t. 425. f. 3.

Variable-leaved Triumfetta. Fl. July, Aug. Clt. 1824. Shrub 3 to 4 feet.

3 T. PILO'SA (Roth. nov. spec. p. 223.) leaves ovate, acuminated, entire, unequally serrate, hairy, clothed, with silky tomentum beneath, hardly emarginate at the base; prickles of capsule ciliated. ♄. S. Native of the East Indies. Resembles *T. Láppula* very much. Flowers yellow.

Pilose Triumfetta. Fl. July, Aug. Clt. 1824. Shrub 2 to 4 feet.

Sect. II. Bartra'mia (in honour of John Bartram, an Anglo-American botanist,) D. C. prod. 1. p. 506. Bartràmia, Gært. fruct. t. 111. but not of Hedw. Flowers of 5 petals. Carpels 3-4, not closely connected, and therefore when ripe separating into 3-4 parts. Seeds usually 2 in each cell or carpel.

4 T. RUBRICAU'LIS (H. B. et Kunth, nov. gen. amer. 5. p. 342.) leaves oblong, acuminated, pubescent, serrated, with the lower serratures glandular; branches puberulous; peduncles axillary, 2-3-flowered. ♄. S. Native of South America in dry shady places at Caraccas. Branches dark-purple. Stamens 24. Fruit spherical, hairy, 6-celled, indehiscent. Petals 5, yellow. Probably this plant may form a distinct section.

Red-stemmed Triumfetta. Shrub 2 to 4 feet.

5 T. Bogote'nsis (D. C. prod. 1. p. 506.) leaves ovate-oblong, acuminated, sharply and doubly toothed, and are as well as the branches pilose; peduncles 2-3, axillary, at apex 3-flowered. ♄. S. Native of Santa-Fe-de-Bogota. Stamens 10. Fruit globose, 3-celled, echinated. F. pilòsa, H. B. et Kunth, nov. gen. amer. 5. p. 342. but not of Roth.

Bogota Triumfetta. Shrub 3 feet?

6 T. ROTUNDIFÒLIA (Lam. dict. 3. p. 421.) leaves roundish, unequally crenated, covered with white tomentum beneath; flowers somewhat spiked; fruit hairy and echinated. ⊙. S. Native of the East Indies. Leaves 4-5 lines in diameter. Flowers yellow.

Round-leaved Triumfetta. Fl. June, Aug. Clt. 1817. Pl. 2 ft.

7 T. SUBORBICULA'TA (D. C. prod. 1. p. 506.) leaves somewhat orbicular, entire, erosely-crenate, almost naked above, but covered with white down beneath; racemes terminal, loose; fruit covered with hooked bristles. ♄. S. Native of the East Indies. T. rotundifòlia, Roth. nov. spec. 222. but not of Lam. Stem erect. Flowers yellow.

Suborbicular-leaved Triumfetta. Fl. June, July. Clt. 1820. Shrub 2 feet.

8 T. SUFFRUTICÒSA (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 637.) stem suffruticose; leaves ovate, cordate, acuminated, coarsely and unequally serrated, stellately-pilose beneath, younger and lower leaves half trifid; peduncles usually 7, extra-axillary, umbellately 3-4-flowered at the apex; calyx apiculate; fruit pilose, and covered with long hooked bristles. ♄. S. Native of Java. Flowers yellow.

Suffruticose Triumfetta. Shrub 2 to 3 feet.

9 T. GRAVE'OLENS (Blum. bijdr. l. c.) leaves ovate, cordate, acuminated, serrated, pilose on both surfaces; peduncles usually tern, extra-axillary, 3-flowered; calyx apiculated; fruit covered with hooked bristles, without any pubescence. ⊙. S. Native of Java. Flowers yellow.

Strong-scented Triumfetta. Pl. 2 to 3 feet.

10 T. CA'NA (Blum. bijdr. l. c.) leaves ovate-oblong, or ovate-lanceolate, acuminated, cordate and unequally serrated at the base, beset with stellate pili above, but with stellate tomentum beneath; peduncles 4-6 together, extra-axillary, usually 3-flowered; calyx tomentose, apiculated; fruit covered with hooked stiff hairs. ⊙. S. Native of Java. Flowers yellow.

Hoary Triumfetta. Pl. 2 to 3 feet.

11 T. GLANDULÒSA (Lam. dict. 3. p. 421.) leaves roundish or broad-ovate, undivided, clothed with velvety tomentum beneath, toothed, lower teeth glandular beneath; flowers axillary, upper ones disposed as if they were in a spike; calyxes pubescent, acuminated; fruit downy and echinated. ♄. S. Native of the Mauritius. Bartràmia, Lam. ill. t. 400. f. 1. Flowers yellow.

Glandular-leaved Triumfetta. Fl. June, Aug. Clt. 1816. Shrub 2 to 3 feet.

12 T. VA'HLII (Poir. suppl. 3. p. 300.) leaves ovate-lanceolate, serrated, villous on both surfaces from stellate down, hoary beneath, lower teeth of the upper leaves glandular; stipulas awl-shaped. ♄. G. Native of Arabia Felix. T. glandulòsa, Forsk. cat. arab. 297. Vahl. symb. 3. p. 62. Flowers yellow.

Vahl's Triumfetta. Shrub 3 feet.

13 T. OVA'TA (D. C. prod. 1. p. 507.) leaves ovate, undivided, unequally toothed, smoothish above, hoary beneath, glandless, 7-nerved; flowers disposed in interrupted spikes. ♄ ? S. Native of the Caribbee Islands. Flowers yellow.

Ovate-leaved Triumfetta. Shrub 2 to 4 feet.

14 T. TRICHO'CLADA (Link. enum. hort. berl. 2. p. 5.) leaves ovate, acuminated, 7-nerved, serrated, woolly beneath; branches with a hairy line; flowers crowded; calyxes of 4 sepals, hairy at the apex; fruit echinated. ⊙. G. Native of Nipaul. Stem branched. Bracteas and stipulas hairy. Flowers yellow.

Hairy-branched Triumfetta. Fl. Aug. Sep. Clt. 1823. Pl. 2 to 3 feet.

15 T. OBLO'NGA (Wall. mss. D. Don, prod. fl. nep. p. 227.) leaves ovate-lanceolate, unequally serrated, woolly beneath. ⊙. G. Native of Nipaul. Flowers yellow.

Oblong-leaved Triumfetta. Pl. 1 to 2 feet.

16 T. OBLONGA'TA (Link. enum. hort. berl. 2. p. 5.) leaves oblong, serrated, 5-nerved, covered with soft hairs; stem branched, villous towards the top; flowers terminal, crowded. ⊙. G. Native of Nipaul. Hairs brown, and bulbous at the base. Stipulas and bracteas linear, villous. Calyx hairy. Flowers yellow.

Oblongate-leaved Triumfetta. Fl. Aug. Sep. Clt. 1823. Pl. 2 to 3 feet.

17 T. Nipaule'nsis; leaves ovate, acuminated, 3-lobed and serrated, villous on both surfaces. ⊙. G. Native of Nipaul. T. ánnua, D. Don, prod. fl. nep. p. 227. Flowers yellow.

Nipaul Triumfetta. Pl. 1 to 3 feet.

18 T. A'NNUA (Lin. mant. 73.) leaves ovate, acuminated, toothed, undivided, smooth above, rather hairy on the nerves beneath; stipulas and peduncles smooth; calyxes acuminated. ⊙. S. Native of Java. Mill. fig. t. 298. Sims, bot. mag. t. 2296. T. I'ndica, Lam. dict. 3. p. 420? Leaves sometimes somewhat lobed. Peduncles axillary, 3-flowered. Flowers yellow. Fruit clothed with hooked prickles.

Annual Triumfetta. Fl. Aug. Sep. Clt. 1760. Pl. 2 feet.

19 T. SPICA'TA (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 656.) leaves roundish, 3-lobed, somewhat cordate at the base, unequally serrated, pubescent above, but villous beneath; flowers disposed in interrupted spikes. ♄. S. Native of Java.

Spiked-flowered Triumfetta. Shrub 2 to 3 feet.

20 T. VILLOSIU'SCULA (Blum. bijdr. ex Schlecht. Linnæa. 1. p.

656.) leaves 5-nerved, roundish-ovate, 3-lobed, sharply and doubly serrated, with the lower serratures callose, rather villous above, but clothed with stellate tomentum beneath, upper leaves oblong, deeply serrated; peduncles 4-5, extra-axillary, usually 3-flowered; calyx apiculated, covered with stellate down; fruit pubescent, and covered with hooked bristles. ⊙. S. Native of Java. Flowers yellow.

Rather-villous Triumfetta. Pl. 2 to 3 feet.

21 T. trilocula'ris (Roxb. ex Horn. hort. hafn. suppl. 140.) leaves roundish-ovate, half-3-lobed, cordate at the base, coarsely serrated, acuminated, beset with stellate pili on both surfaces, lower serratures glandular, upper leaves ovate-oblong; calyx pubescent, apiculated; capsule 3-valved, 3-celled; prickles of capsule hooked; peduncles aggregate, opposite the leaves, 2-4-flowered. ♄. S. Native of the East Indies.

Three-celled-fruited Triumfetta. Fl. June, July. Clt. 1816. Shrub 2 to 3 feet.

22 T. se'pium (St. Hil. fl. bras. 1. p. 286.) leaves lanceolate, acuminated, serrated, pubescent above, and tomentose beneath; flowers decandrous; teeth of style and cells of ovary 3; fruit pilose, shortly echinated. ♄. S. Native of Brazil near Rio Janeiro in hedges. Lower teeth of leaves glandular. Peduncles commonly tern, opposite the leaves.

Hedge Triumfetta. Fl. Aug. Shrub 1 to 3 feet.

23 T. obscu'ra (St. Hil. fl. bras. 1. p. 286.) leaves ovate, subsinuated or obsoletely 3-lobed, short-acuminated, serrated, pubescent, membranous; flowers with 15 stamens; teeth of style, and cells of ovary 3; fruit hardly pilose, shortly echinated. ♄. S. Native of Brazil near Rio Janeiro. Lower serratures of leaves glandular. Peduncles short, 2-3, opposite the leaves, upper ones disposed in racemes.

Obscure Triumfetta. Fl. Aug. Shrub 1 to 2 feet.

24 T. abutiloi'des (St. Hil. fl. bras. 1. p. 287.) leaves somewhat 3-lobed or ovate, cordate, acuminated, serrated, velvety; flowers with 20 stamens; teeth of style and cells 2; fruit pilose, long-echinated. ♄. S. Native of Brazil in the province of Minas Geraes. Peduncles twin or tern, umbellately 3-flowered. Lower teeth of leaves glandular.

Abutilon-like Triumfetta. Fl. Aug. Shrub 1 to 3 feet.

25 T. tricu'spis (St. Hil. fl. bras. 1. p. 288.) upper leaves ovate or oblong, repand, the rest ovate 3-lobed, acuminated, serrated, velvety; flowers of 20 stamens; teeth of style and cells of ovary 3. ♄. S. Native of Brazil in the province of Minas Geraes, not far from Villa Rica. Peduncles as in the rest of the species. Lower teeth of leaves rather glandular, as in most of the species.

Three-pointed-leaved Triumfetta. Fl. July. Shrub 2 to 3 feet.

26 T. erioca'rpa (St. Hil. fl. bras. 1. p. 288.) upper leaves subovate, the rest cordate and bluntly 3-lobed, coarsely crenate-toothed, nearly smooth; flowers with 15 stamens; teeth of style and ovaries 2; fruit tomentose, shortly echinated. ⊙. S. Native of Brazil near Rio Janeiro. Peduncles 2-4, glomerate, 2-3-flowered, opposite the leaves. Lower serratures of leaves changed into discoid glands beneath.

Woolly-fruited Triumfetta. Pl. 1 foot.

27 T. angula'ta (Lam. dict. 3. p. 421. var. α.) leaves ovate, 5-nerved, angular at the apex, 3-lobed, acuminated, unequally toothed, rather villous beneath, with a glandular tooth on each side at the base; calyxes hispid, acuminated; fruit smoothish, echinated. ♄. S. Native of the East Indies.—Pluk. alm. t. 41. f. 5. Bartràmia, Lam. ill. t. 400. f. 2. Flowers yellow.

Angular-leaved Triumfetta. Fl. June, July. Clt. 1818. Shrub 3 feet.

28 T. pseu'do-angula'ta (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 656.) leaves roundish, half-3-lobed, rather cordate at the base, unequally toothed, pilose on both surfaces, lower teeth glandular; upper leaves ovate-oblong, undivided; calyxes pubescent, apiculate; prickles of capsule hooked and naked. ♄. S. Native of Java. Flowers yellow.

False-angled-leaved Triumfetta. Shrub 2 to 3 feet.

29 T. semitri'loba (Lin. mant. 73.) upper leaves ovate, acuminated, the rest subcordate, 3-lobed, serrate, pubescent on both surfaces, upper ones oblong, undivided; flowers with 30 stamens; calyx pubescent, a little pointed; teeth of style and cells of ovary 3; fruit smooth, echinated, with the bristles covered with retrograde hairs. ♄. S. Native of the West Indies. Flowers yellow, clustered. The leaves and tender buds, infused in water, yield a fine clear mucilage, from whence we may conclude this plant to be a good emollient. The bark is tough and strong, and serves for ropes, and other conveniences of that kind in the inland parts of Jamaica.

Half-three-lobed-leaved Triumfetta. Fl. July. Clt. 1773. Shrub 3 to 5 feet.

30 T. gla'bra (Rottl. ex Spreng. syst. 2. p. 450.) leaves roundish, cordate, acutely 3-lobed, smooth; racemes terminal, elongated; calyx hoary-pubescent; fruit hairy. ♄. S. Native of the East Indies. Flowers yellow.

Smooth Triumfetta. Shrub 2 to 3 feet.

31 T. Havanne'nsis (H. B. et Kunth, nov. gen. amer. 5. p. 345.) leaves obovate, 3-lobed, membranaceous, serrated, and are as well as the branches pubescent; lateral lobes rounded, intermediate one acuminate. ♄. S. Native of Cuba near Havannah. Flowers yellow. Stamens 11. Fruit globose, echinate, 3-celled. Resembles *T. semitríloba*.

Havannah Triumfetta. Fl. June, July. Clt. 1823. Shrub 3 to 6 feet.

32 T. molli'ssima (H. B. et Kunth, nov. gen. amer. 5. p. 345. t. 488.) leaves ovate, cordate, 3-lobed, sharply and doubly serrated, soft and downy-pubescent above, hoary-pubescent beneath, middle lobe with a very long point. ♄. S. Native near Santa-Fe-de-Bogota. Flowers yellow. Stamens 20. Fruit globose, echinated, hoary.

Very-soft-leaved Triumfetta. Shrub 2 to 4 feet.

33 T. veluti'na (Vahl. symb. 3. p. 62.) leaves ovate, acuminate, somewhat angular, unequally serrated, velvety beneath, with the lower teeth glandular; flowers axillary; calyxes pubescent, a little acuminated; fruit echinated, rather hairy.—Native of the Mauritius, and of Guinea in the kingdom of Waree. Resembles *T. glandulòsa*. Stipulas ciliated.

Velvety-leaved Triumfetta. Shrub.

34 T. rhomboi'dea (Jacq. amer. 147. t. 90.) leaves rhomboidal, lower ones somewhat 5-lobed, middle ones somewhat 3-lobed, upper ones oblong, all callosely-serrated, velvety on both surfaces, and cuneated at the base; flowers numerous, axillary; calyx acuminated; fruit echinated, rather pilose. ♄. S. Native of the Caribbee islands, Peru, and Guinea. T. rhombeæfòlia, Swartz, prod. 76. T. rhomboídea, Lindl. coll. t. 29. Flowers yellow. Style tricuspidate at the apex.

Rhomb-like-leaved Triumfetta. Fl. Aug. Sep. Clt. 1818. Shrub 2 to 4 feet.

35 T. hi'rta (Vahl. symb. 3. p. 63.) leaves ovate, 3-lobed, smooth above, velvety beneath; panicle terminal, with forked hairy branches. ♄. S. Native of St. Martha in South America. Flowers yellow.

Hairy-panicled Triumfetta. Shrub 2 feet?

36 T. althæoi'des (Lam. dict. 3. p. 420.) leaves broad-ovate, undivided, acuminated, covered with soft tomentum on both surfaces, unequally serrate, lower serratures exserted, callosely-glandular; flowers axillary; calyxes downy, pointed; fruit echinated, with retrograde hairy bristles. ♄. S. Native of Cayenne. T. macrophýlla, Vahl. symb. 2. p. 34.

Var. β, subtríloba (D. C. prod. 1. p. 508.) leaves obsoletely 3-lobed, pubescent above. ♄. S. Native of New Andalusia near Caripe. T. althæoìdes, H. B. et Kunth, nov. gen. amer. 5. p. 343. Flowers yellow.

Hollyhock-like Triumfetta. Fl. Aug. Sep. Clt. 1820. Shrub 3 feet.

37 T. vesti'ta (Wall. mss. in Lin. soc. herb.) leaves ovate, undivided, coarsely crenate-serrated, villous, pale beneath; peduncles aggregate, 2-3-flowered, opposite the leaves. ♄. S. Native of Silhet. Petals yellow. The whole plant is villous.

Clothed Triumfetta. Shrub 2 to 4 feet.

38 T. acumina'ta (H. B. et Kunth, nov. gen. amer. 5. p. 343.) leaves ovate-oblong, cordate, acuminated, doubly serrated, pubescent above, covered with soft tomentum beneath; branches pilose; flowers axillary. ♄. S. Native of South America in New Granada near Mariquito. Stamens about 20. Flowers yellow. Fruit echinated, downy.

Acuminate-leaved Triumfetta. Shrub 2 to 3 feet.

39 T. grandiflòra (Vahl. ecl. 2. p. 34.) leaves ovate, rather cordate, acuminated, hairy, unequally serrate, lower teeth glandular beneath; calyxes smooth, pointed; fruit echinated, with glabrous bristles. ♄. S. Native of the Caribbee Islands. Flowers yellow, in axillary umbels.

Great-flowered Triumfetta. Fl. June. Clt. 1810. Shrub 3 ft.

40 T. nemora'lis (St. Hil. fl. bras. 1. p. 284. t. 56. A.) leaves ovate-lanceolate or lanceolate, long-acuminated, serrated, nearly smooth; flowers with 30 stamens; teeth of style and cells of ovary 3; fruit smooth. ♄. S. Native of Brazil in the province of Minas Geraes. Leaves with distant glandular serratures at the base. Peduncles usually twin, or disposed in compound racemes at the tops of the branches.

Grove Triumfetta. Fl. April. Shrub 6 to 7 feet.

41 T. longico'ma (St. Hil. fl. bras. 1. p. 285. t. 56. B.) leaves cordate or obliquely ovate, acuminated, serrated, hardly pubescent; flowers with 25 stamens; teeth of style and cells of ovary 5; fruit smooth, echinated. ♄. S. Native of Brazil in the province of Rio Janeiro. Leaves 3-nerved at the base. Peduncles 1, 2, or 3 together, lower ones opposite the leaves, upper ones disposed in compound terminal racemes.

Long-haired-capsuled Triumfetta. Shrub 2 to 4 feet.

42 T. polya'ndra (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 508.) leaves ovate, somewhat cordate, acuminated, rather hairy, serrated; calyxes smooth, acuminated; fruit echinated with long hairy bristles. ♄. S. Native of Mexico. Flowers large, yellow. Genitals seated on a thick stipe. Fruit 5-celled. Resembles *T. grandiflòra*.

Polyandrous Triumfetta. Shrub 2 to 3 feet.

43 T. obova'ta (Deppe in Schlecht. Linnæa. vol. 5. p. 56.) leaves obovate, rather cordate at the base, and acutish at the top, with a small acumen, serrated, densely tomentose beneath, but rather rough above from hairs; flowers polyandrous; fruit large, covered with prickles or strong hairs, these are hardly hooked. ♄. S. Native of Mexico. Flowers large, yellow. Fruit the size of a cherry.

Obovate-leaved Triumfetta. Shrub 4 feet.

† *Species not sufficiently known.*

44 T. procu'mbens (Forst. prod. no. 204.) leaves roundish-cordate, somewhat 3-lobed, tomentose; stem procumbent.—Native of the Society islands. Flowers yellow.

Procumbent Triumfetta. Shrub procumbent.

45 T. I'ndica (Lam. dict. 3. p. 420.) leaves ovate rhomboidal, undivided, hoary beneath; fruit axillary, with naked prickles. ♄. S. Native of the East Indies. Flowers yellow. Perhaps this is the same as *T. ánnua*?

Indian Triumfetta. Shrub 3 feet.

46 T. oxyphy'lla (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 508.) leaves cordate, acuminated, serrated, villous; branches of panicle somewhat forked; sepals linear, acuminated, twice as long as the oblong petals. ♃. S. Native of New Spain on mountains. Flowers yellow.

Sharp-leaved Triumfetta. Pl. 2 feet.

47 T. obli'qua (Roth. nov. spec. p. 224.) leaves obliquely cordate-oblong, acuminated, undivided, unequally serrated, scabrous from starry hairs above, clothed with soft tomentum beneath; prickles of capsule ciliated. ♄. S. Native of? Flowers complete, yellow.

Oblique-leaved Triumfetta. Shrub 2 to 3 feet.

N. B. *Triumfétta Bartràmia* of Lin. spec. p. 638. remains undetermined, as all the synonymes given to it belong to different species. It is probably a species of *Urèna*.

Cult. All the species are uninteresting weed-like plants. They thrive best in a mixture of loam and peat, and cuttings will root readily in sand under a hand-glass, in heat, but as most of the species ripen seeds in abundance this will be unnecessary.

VIII. PO'RPA (from πορπη, *porpe*, a ring; in allusion to the ring round the stamens.) Blum. bijdr. ex Schlecht. Linnæa. 1. p. 659.

Lin. syst. *Polyándria, Monogýnia.* Calyx 5-parted, deciduous. Petals 5, tomentose on the inside at the base, a little shorter than the calyx. Stamens 26-30, free, girded by a membranous rim. Ovary hairy, 8-celled; cells 1-seeded. Capsule globose. A genus allied to *Triumfétta*.

1 P. re'pens (Blum. l. c.) ♄. S. Native of Java. A suffruticose plant, with stalked, 3-lobed, toothed, somewhat cordate, scabrous leaves, opposite lanceolate stipulas, and solitary, usually 3-flowered peduncles, which are opposite the leaves.

Creeping Porpa. Shrub trailing.

Cult. This plant should be propagated and cultivated in the same manner as that recommended for *Triumfétta*.

IX. GRE'WIA (in honour of Nehemiah Grew, M.D. F.R.S. an English physician and vegetable physiologist, died 1711.). Juss. ann. 4. p. 82. D. C. prod. 1. p. 508. Lin. gen.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 5 coriaceous sepals, which are coloured on the inside. Petals 5, with a gland or scale on the inside at the base of each, inserted in the stipe-formed torus. Stamens numerous, rising from the apex of the torus, free; anthers roundish. Style 1. Stigma 4-lobed. Drupe 4-lobed, containing from 1 to 4 nuts. Nuts 2-celled, 2-seeded, or from abortion 1-seeded. Albumen present. Embryo erect. Spreading shrubs with simple serrated leaves, usually resembling those of the elm, with solitary or aggregate few-flowered peduncles. The flowers are downy on the outside, but smooth and usually purple on the inside.

§ 1. *Petals very short or wanting. Leaves 3 rarely 5-nerved. Sepals 1-nerved.*

1 G. ape'tala (Juss. ann. 4. p. 93. t. 49. f. 3.) leaves large, 3-nerved, obovate, cuneated at the base, crenulate, roughish; peduncles usually solitary, branched, racemose; flowers apetalous, 4-cleft. ♄. S. Native of Java.

Apetalous Grewia. Shrub 6 feet.

2 G. cauda'ta (Wall. in herb. soc. Lin.) leaves smooth, oblong, ending in a long acumen, 3-nerved at the base; peduncles axillary, 3-flowered, twin or solitary, about the length of the petioles. ♄. S. Native of Pulo-Penang. G. heteroclìta, Roxb. hort. beng. p. 92. ex Wall. Calyx valvate, not nerved. Petals not evident.

Tailed-leaved Grewia. Shrub 6 feet.

3 G. multiflòra (Juss. ann. 4. p. 89. t. 47. f. 1.) leaves

large, 3-nerved, ovate-lanceolate, serrated, quite smooth; peduncles aggregate, 3-4-flowered. ♄. S. Native of the Philippine Islands.

Many-flowered Grewia. Shrub 6 feet.

4 G. GUAZUMÆFÒLIA (Juss. ann. 4. p. 89. t. 48. f. 3.) leaves large, 3-nerved, elliptic, acuminate, smooth above, tomentose beneath, crenate-toothed, lower teeth glandular; peduncles solitary, 2-3-flowered. ♄. S. Native of Java. G. oblongifòlia, Blume.

Guazuma-leaved Grewia. Shrub 6 feet.

5 G. TOMENTÒSA (Juss. ann. 4. p. 89. t. 49. f. 1.) leaves large, 3-nerved, ovate-lanceolate, oblique at the base, tomentose on both surfaces, unequally toothed; peduncles crowded, short, many-flowered; petals very minute. ♄. S. Native of Java.

Tomentose-leaved Grewia. Clt. 1820. Shrub 6 feet.

6 G. CELTIDIFÒLIA (Juss. ann. 4. p. 93.) leaves large, 5-nerved, ovate-oblong, pilose on the nerves above, tomentose beneath; peduncles 2-3-flowered. ♄. S. Native of Java. Flowers like those of *G. tomentòsa*.

Celtis-leaved Grewia. Shrub 6 feet.

7 G. HIRSU'TA (Vahl. symb. 1. p. 34.) leaves 3-nerved, ovate-lanceolate, acuminate, rounded at the base and oblique, soft and villous on both surfaces; peduncles very short, usually tern or solitary, 3-flowered; petals ciliated. ♄. S. Native of Java.

Hairy Grewia. Clt. 1816. Shrub 8 feet.

8 G. HELECTERIFÒLIA (Wall. mss. in Lin. soc. herb.) leaves lanceolate, tapering to the apex, acute, finely serrated, 3-nerved at the base, tomentose beneath; peduncles short, usually twin, 2-3-flowered, about the length of the petioles. ♄. S. Native of the East Indies. The whole plant villous or tomentose, except the upper surfaces of the adult leaves. G. hirsùta, Roxb. hort. beng. p. 42.

Helecteres-leaved Grewia. Shrub.

9 G. BRACTEA'TA (Roth. nov. spec. 243.) leaves elliptic-lanceolate, bluntly serrated, smooth, nerves, veins, and branches clothed with rusty hairs; peduncles solitary, axillary, 3-flowered; flowers almost sessile, involucrated at the base; petals wanting. ♄. S. Native of the East Indies. Perhaps a species of *Microcos*.

Bracteate-flowered Grewia. Clt. 1820. Shrub 10 feet.

10 G. GLA'BRA (Blum. bijdr. ex Schlecht. Linnæa. 1. p 657.) leaves oblong-lanceolate, 3-nerved at the base, acuminated, obtusely serrated, smoothish; lower serratures glandular; peduncles axillary, solitary or twin, 2-3-flowered, longer than the petioles; pedicels bracteate at the base; petals very short, villously ciliated below. ♄. S. Native of Java. Like *G. bracteàta*.

Smooth Grewia. Shrub 6 to 8 feet.

§ 2. *Petals oblong. Sepals 3-nerved. Leaves 3-nerved at the base and feather-nerved in the middle.*

11 G. MALLOCÓCCA (Lin. fil. suppl. 409.) leaves cordate, ovate-oblong, crenated. scabrous; pedicels axillary, 3-flowered. ♄. S. Native of the island of Tongatabu. Mallocócca crenàta, Forst. gen. t. 39. Flowers pale-purple.

Soft-berried Grewia. Fl. Aug. Sept. Clt. 1792. Sh. 6 ft.

12 G. OPPOSITIFÒLIA (Roxb. hort. beng. p. 42. D. C. prod. 1. p. 227.) leaves ovate, acuminated, serrated, 3-nerved, scabrous, tomentose beneath as well as the branches; peduncles solitary or twin, 3-4-flowered, opposite the leaves. ♄. G. Native of Nipaul. Flowers purple inside.

Opposite-leaved Grewia, Shrub 6 feet.

13 G. UMBELLA'TA (Roxb. hort. beng. p. 42.) leaves elliptic, a little crenated, acuminated, quite smooth; peduncles umbellate, axillary, twice the length of the petioles. ♄. S. Native of the East Indies in Sumatra. Genitals bearing much longer stipes than the other species.

Umbellate-flowered Grewia. Shrub 6 feet.

14 G. ODORA'TA (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 658.) leaves 3-nerved at the base, ovate or elliptic-oblong, rather scabrous beneath, unequally-crenated, with the lower ones glandular; peduncles axillary, solitary or twin, 3-5-flowered; pedicels umbellate; sepals 3-nerved. ♄. S. Native of Java.

Sweet-scented Grewia. Shrub 6 to 8 feet.

15 G. SEPIA'RIA (Roxb. hort. beng. p. 42.) leaves smooth, oblong-lanceolate, acuminated, serrated, 3-nerved at the base, with the midrib below rather hispid, as well as the petioles and young branches; peduncles axillary, umbellate, 3-4-flowered, 3-times longer than the petiole. ♄. S. Native of Bengal.

Hedge Grewia. Shrub 8 feet.

§ 3. *Petals oblong. Sepals nerveless or 1-nerved. Leaves 3-nerved at the base and feather-nerved in the centre.*

16 G. EXCE'LSA (Vahl. symb. 3. p. 35.) leaves oblong, smooth above, covered with hoary tomentum beneath, obtusely serrated; peduncles solitary, 1-3-flowered; petals shorter than the calyx. ♄. S. Native of Egypt and Arabia. Chadàra arbòrea, Forsk. descr. p. 105.

Tall Grewia. Clt. 1816. Tree 20 feet.

Var. β, verrucòsa (Juss. ann. 2. p. 90.) leaves warted above, repand. ♄. S. Native of Java. The warts on the leaves are perhaps formed from a species of *Eríneum*.

Tall Grewia. Clt. 1816. Tree 20 feet.

17 G. BIFLÒRA; branched; leaves alternate, ovate-lanceolate, subcordate at the base, acuminated, smooth, serrated, 3-nerved at the base; petioles and branches hispid; peduncles axillary and terminal, short, solitary or twin, 2-3-flowered; calyx hispid. ♄. S. Native of Guinea. Flowers yellow.

Two-flowered Grewia. Shrub 4 feet.

18 G. BI'COLOR (Juss. ann. 4. p. 90. t. 50. f. 2.) leaves ovate-oblong, sharply serrulated, smooth above, hoary beneath; pedicels solitary, 1-3-flowered. ♄. S. Native of Guinea. Petals a little shorter than the sepals, but equal with the stamens. Fruit smooth, one-half smaller than a common pea.

Two-coloured-leaved Grewia. Clt. 1818. Shrub 6 feet.

19 G. Ro'THII (D. C. prod. 1. p. 509.) leaves ovate, oblong-lanceolate, acuminated, sharply serrated at the top, smooth above, hoary beneath; stipulas lanceolate, longer than the petioles; peduncles usually tern and 3-flowered, bracteate; petals about half the length of the stamens. ♄. S. Native of the East Indies. G. bícolor, Roth. nov. spec. p. 240. but not of Juss.

Roth's Grewia. Clt. 1819. Shrub 6 feet.

20 G. SALVIFÒLIA (Roth. nov. spec. p. 239.) leaves oblong-ovate, obtuse, finely crenulated, rather entire at the base, with pubescent dots above, but clothed with white down beneath; peduncles solitary, 2-3-flowered. ♄. S. Native of the East Indies. Ovaries tomentose. Resembles *G. affìnis*. G. salvifòlia of Lin. is a species of *Alángium*.

Sage-leaved Grewia. Fl. July, Sept. Clt. 1818. Sh. 6 ft.

21 G. ROXBU'RGHII; leaves lanceolate, acuminated, serrated, villous beneath, on very short petioles; peduncles axillary, 2-3-flowered, rather longer than the petioles. ♄. S. Native of Coromandel. G. salvifòlia, Roxb. hort. beng. p. 93. ex Wall. The whole plant is villous, except the upper surface of the adult leaves.

Roxburgh's Grewia. Shrub 6 to 8 feet.

22 G. OBLONGIFÒLIA (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 657.) leaves 3-nerved, oblong, acuminated, obtuse at the base, toothed, with the lower teeth glandular, pubescent above and villous beneath; peduncles axillary, solitary, usually 3-flowered, longer than the petioles; pedicels bibracteolate at the

base; petals very minute, villously ciliated. ♄. S. Native of Java.

Var. β; leaves elliptical-oblong; peduncles twin.

Oblong-leaved Grewia. Shrub 6 feet.

23 G. FLA'VA (D. C. cat. hort. monsp. p. 113.) leaves oval, cuneiform, very blunt, crenulate, hoary pubescent on both surfaces; pedicels 1-flowered; petals bifid, shorter than the calyx. ♄. G. Native of the Cape of Good Hope beyond the Orange River. Flowers yellow.

Yellow-flowered Grewia. Clt. 1819. Shrub 2 feet.

24 G. CUNEIFÒLIA (Juss. ann. 4. p. 90. t. 49. f. 2.) leaves small, wedge-shaped, thickish, smooth, rounded at the apex and crenated, entire at the base; sepals narrow, a little longer than the petals; peduncles solitary, 2-flowered; sepals narrow, exceeding the length of the petals. ♄. S. Native of Madagascar.

Wedge-leaved Grewia. Shrub 6 feet.

25 G. BÍLOBA; leaves ovate, acuminated, coarsely serrated, 3-nerved at the base, smooth above but pubescent beneath; peduncles opposite the leaves, umbellate, about equal in length to the petioles; fruit 2-lobed. ♄. G. Native of China. (v. s. in herb. Lamb.)

Two-lobed-fruited Grewia. Shrub 6 feet.

26 G. DI'DYMA (Roxb. hort. beng. p. 93.) leaves smooth, oblong-lanceolate, 3-nerved at the base, serrated, ending in a long, serrated acumen, cuneated at the base; pedicel 1-flowered? 3-times longer than the petiole; fruit didymous. ♄. S. Native of the East Indies. G. dispérma, Roth.

Didymous-fruited Grewia. Shrub.

27 G. NI'TIDA (Juss. ann. 4. p. 90. t. 47. f. 2.) leaves ovate-oblong, crenulated, smooth, shining; peduncles solitary, short, 1-2-flowered; sepals and petals ovate. ♄. G. Native of China.

Shining-leaved Grewia. Shrub 6 feet.

28 G. MEXICA'NA (D. C. prod. 1. p. 510.) leaves ovate-oblong, somewhat serrulated, smooth above, velvety beneath; peduncles many-flowered, racemose; petals equal in length with the calyx. ♄. S. Native of New Spain. Flower-bud obovate-globose, velvety. This is the only American species.

Mexican Grewia. Shrub 6 feet.

29 G. OVALIFÒLIA (Juss. ann. 4. p. 90.) leaves oval, crenulated, smooth, tapering to the apex; peduncles 2-3-flowered, solitary, or somewhat racemose at the tops of the branches; sepals narrow, twice as long as the petals. ♄. S. Native of Coromandel.

Oval-leaved Grewia. Fl. July, Aug. Clt. 1818. Sh. 6 ft.

30 G. LATERIFLÒRA; branches erect; leaves alternate, obovate, acuminated, distantly toothed, 3-nerved at the base, pale on the under surface, smooth; peduncles axillary, 3-4-flowered, longer than the petioles. ♄. S. Native of Sierra Leone. (v. s. herb. Lamb.)

Side-flowered Grewia. Shrub 6 feet.

31 G. MACROPHY'LLA; leaves large, oblong, acuminated, 3-nerved at the base, villous beneath as well as on the midrib above, entire; peduncles axillary, solitary or twin, sometimes bifid, corymbose; stem very villous. ♄. S. Native of the East Indies. Leaves a span long and 4-5 inches broad. Petals apparently linear.

Long-leaved Grewia. Shrub 10 feet.

32 G. ORIENTA'LIS (Lin. spec. ed. 1. p. 964.) leaves ovate, oblong, crenated, roughish beneath, bluntly acuminated; peduncles axillary, 3-flowered; sepals narrow, thrice as long as the petals, but equal in length with the stamens. ♄. S. Native of the Coromandel coast.—Rheed. mal. 5. t. 46.—Pluk. alm. t. 50. f. 4. Flowers white on the inside and green on the outside. Stamens white, tipped with yellow.

Oriental Grewia. Fl. July, Aug. Clt. 1767. Shrub 6 feet.

33 G. PUBE'SCENS (Beauv. fl. d'ow. 2. p. 75. t. 108.) leaves ovate-lanceolate, acuminated, crenated, smooth above, but pubescent beneath, 3-nerved at the base; peduncles 2-3-flowered, terminal, and axillary. ♄. S. Native of Guinea in the kingdoms of Benin and Waree as well as Sierra Leone. Flowers red. The whole plant is villous, except the upper surface of the leaves.

Pubescent Grewia. Shrub 6 feet.

34 G. COLUMNA'RIS (Smith, in Rees' cyclop. v. 17. no. 5.) leaves ovate-oblong, crenated, scabrous on both surfaces; peduncles 3-flowered; genitals on a very villous elongated stipe. ♄. S. Native of the East Indies. Stipulas awl-shaped, equal in length with the petioles.

Columnar-stiped Grewia. Shrub 6 feet.

35 G. PILÒSA (Lam. dict. 3. p. 43. exclusive of the synonymes,) leaves ovate, thickish and roughish, crenate; peduncles 2-6-flowered, axillary, and terminal; fruit hairy. ♄. S. Native of the East Indies. Roxb. hort. beng. p. 42. G. orientàlis, Gært. Vahl. and Smith in Rees' cyclop. no. 4. Flowers yellow.

Pilose Grewia. Clt. 1804. Shrub 6 feet.

36 G. GLANDULÒSA (Vahl. symb. 1. p. 34.) leaves large, ovate-lanceolate, acuminate, smooth on both surfaces, crenulated, the lower notches glandular; peduncles axillary, somewhat 3-flowered, shorter than the petioles. ♄. S. Native of the Mauritius. Juss. ann. 4. t. 48. f. 1.

Glandular-leaved Grewia. Shrub 6 feet.

37 G. SERRULA'TA (D. C. prod. 1. p. 510.) leaves ovate-oblong, acuminated, smooth on both surfaces, serrulated, the lower teeth glandular; peduncles axillary, straight, usually 3-flowered, longer than the petioles. ♄. S. Native of Bengal.

Scrrulated-leaved Grewia. Shrub 10 feet.

38 G. LÆVIGA'TA (Vahl. symb. 1. p. 34.) leaves elliptical, acuminated, smooth on both surfaces, serrated at top, quite entire at the base; peduncles long, 3-flowered. ♄. S. Native of the East Indies. Smith, in Rees' cycl. no. 7. G. Damìne, Gært.

Smooth-leaved Grewia. Shrub 6 feet.

39 G. HU'MILIS (Wall. mss. in herb. soc. Lin.) leaves small, oblong, or ovate-oblong, acute or obtuse, rather serrated, wrinkled above, tomentose beneath as well as the branches, 3-nerved at the base, on very short petioles; pedicel apparently 1-flowered, longer than the petioles. ♄. S. Native of the East Indies at the Irawaddi.

Humble Grewia. Shrub 2 feet.

40 G. MO'LLIS (Juss. ann. 4. p. 91.) leaves ovate-lanceolate, serrate-toothed, soft, tomentose beneath; peduncles almost solitary, usually 3-flowered, longer than the petioles. ♄. S. Native of Guinea.

Soft-leaved Grewia. Shrub 6 feet.

41 G. FLAVE'SCENS (Juss. ann. 4. p. 91.) leaves ovate-oblong, acute, unequally serrated, scabrous on both surfaces, with starry hairs; stipulas linear, longer than the petioles; peduncles generally solitary, 3-flowered, length of petioles. ♄. S. Native of the East Indies. Petals yellowish.

Yellowish-petalled Grewia. Shrub 6 feet.

42 G. ACUMINA'TA (Juss. ann. 4. p. 91. t. 48. f. 2.) leaves large, ovate-oblong, abruptly acuminate, crenulated, rounded at the base, smooth; peduncles long, usually solitary, 2-3-flowered. ♄. S. Native of Java. Sepals an inch long, thrice as long as the petals.

Acuminate-leaved Grewia. Shrub 6 feet.

43 G. CARPINIFÒLIA (Juss. ann. 4. p. 91. t. 51. f. 1.) leaves ovate, serrated, cordate at the base, acute or obtuse, roughish beneath; peduncles short, 3-flowered. ♄. S. Native of Guinea. Beauv. fl. d'ow. 1. t. 30. Sepals narrow, equal in length with the stamens, but longer than the petals. Flowers purple.

Var. β, rhamnifòlia (Roth. nov. spec. p. 244.) leaves ovate, scarcely cordate.

Hornbeam-leaved Grewia. Clt. 1823. Shrub 10 feet.

44 G. COMMUTA'TA (D. C. prod. 1. p. 511.) leaves oblong or ovate, acuminated, acute or obtuse, somewhat cordate at the base, unequally serrated, clothed with pale and rufescent pubescence above, tomentose beneath; peduncles axillary, umbellate, 3 times longer than the petioles, upper ones length of leaves. ♄. S. Native of the East Indies. G. carpinifòlia, Roth. nov. spec. 245. but not of Juss. Flowers purple inside.

Changed Grewia. Shrub 6 feet.

45 G. MEGALOCA'RPA (Beauv. fl. d'ow. 2. p. 69. t. 102.) leaves oblong, bluntly acuminated, serrated, smooth; peduncles 1-2-flowered; fruct glabrous, 4-lobed. ♄. S. Native of Guinea. Fruit black and edible, at first bitter, but afterwards becoming sweet. Flowers dark purple.

Large-fruited Grewia. Shrub 10 feet.

46 G. RUGÒSA; leaves large, roundish-oblong, pubescent and very veiny beneath, smoothish and wrinkled, acute or rounded at the apex, coarsely and unequally toothed, 3-nerved at the base. ♄. S. Native of the East Indies. G. oblìqua, Roxb. hort. beng. p. 92.

Wrinkled-leaved Grewia. Shrub.

47 G. OBLI'QUA (Juss. ann. 4. p. 92.) leaves lanceolate, oblique, toothed, scabrous on both surfaces from stellate hairs; stipulas linear, equal in length with the petioles; peduncles solitary, 3-flowered. ♄. S. Native of the East Indies. Flowers purple inside.

Oblique-leaved Grewia. Shrub 6 feet.

48 G. OCCIDENTA'LIS (Lin. spec. ed. 1. p. 964.) leaves roundish-ovate, obtuse, toothed, smooth; peduncles solitary, 1-flowered. ♄. G. Native of the Cape of Good Hope. Seba, thes. 1. t. 26. f. 3. Delaum. herb. amat. t. 95. Curt. bot. mag. t. 422. Leaves small, like those of elm. Sepals equal in length to the petals, a little longer than the stamens. Flowers purple.

Western Grewia. Fl. July, Sept. Clt. 1690. Shrub 10 ft.

§ 4. *Petals oblong. Leaves 5-7-nerved.*

49 G. POPULIFÒLIA (Vahl. symb. 1. p. 33.) leaves small, orbicular, unequally and bluntly crenate-toothed, smooth above, pubescent beneath; peduncles long, solitary, 1-flowered. ♄. G. Native of Egypt and Arabia. Chadàra tènax, Forsk. descr. 105, G. Chadàra, Lam. dict. 3. p. 44. Leaves hanging down like those of *Pópulus trémula*.

Poplar-leaved Grewia. Shrub.

50 G. BETULÆFÒLIA (Juss. ann. 4. p. 92. t. 50. f. 1.) leaves small, cordate, serrate, somewhat villous; peduncles long, solitary, 1-flowered. ♄. S. Native of Senegal and other parts of Guinea. Flowers purple. This is probably only a variety of *G. populifòlia*.

Birch-leaved Grewia. Shrub 6 feet.

51 G. ROTUNDIFÒLIA (Juss. ann. 4. p. 92. t. 50. f. 3.) leaves small, round, crenulated, rather white from down; peduncles usually 2-3 together, 2-5-flowered, longer than the petioles. ♄. S. Native on the Coromandel coast. Leaves like those of *Bétula pùmila*, almost sessile. G. orbiculàta, Roth. nov. spec. 247. Flowers purple.

Round-leaved Grewia. Shrub 4 feet.

52 G. PU'MILA (Hamilt. mss. in D. Don, prod. fl. nep. p. 227.) leaves roundish, 5-nerved, serrated, and are villous as well as the branches; peduncles axillary, solitary, twin, or tern, 3-flowered. ♄. G. Native of Nipaul at a village called Bassaria. G. nàna, Wall. mss. in herb. soc. Lin. Flowers small, purplish.

Dwarf Grewia. Fl. Mar. Shrub 1 foot.

53 G. ASIA'TICA (Lin. mant. 122.) leaves cordate, roundish, acute, unequally serrate, smooth above and hoary beneath, on short petioles; peduncles 2-3 together, 2-3-flowered, twice or thrice the length of the petioles. ♄. S. Native of the Coromandel coast and the Mauritius. Sonn. voy. 2. t. 138. Leaves like those of *Tília argéntea*. Flowers small. Berries small, red, and acid.

Asiatic Grewia. Fl. Jul. Aug. Clt. 1792. Shrub 12 feet.

54 G. SCLEROPHY'LLA (Roxb. hort. beng. p. 92.) leaves large, roundish, obtuse, wrinkled, unequally toothed, smooth above and villous beneath; peduncles axillary, 2-flowered, rather longer than the petioles. ♄. S. Native of Saharimpoor. Leaves usually rounded at the apex, but sometimes with a point, 3-5-nerved at the base. Flowers rather large.

Hard-leaved Grewia. Tree 20 feet.

55 G. SUBINÆQUA'LIS (D. C. prod. 1. p. 511.) leaves orbicular, oblique at the base, with 5-7 palmate nerves, acuminated at the apex, serrate, pubescent; peduncles 2-3 together, 2-3-flowered, longer than the petioles. ♄. S. Native of the East Indies. G. arbòrea, Roth. nov. spec. 247. but not of Forsk.

Almost-equal-leaved Grewia. Tree 15 feet.

56 G. INÆQUA'LIS (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 657.) leaves usually 5-nerved at the base, ovate-oblong, acuminated, somewhat cordate at the base, unequally and obtusely serrated, covered with stellate pubescence above, but with white tomentum beneath; peduncles 2-4, axillary, 2-6-flowered, umbellate, with the pedicels bracteate at the base; petals oblong, shorter than the calyx. ♄. S. Native of Java.

Unequal-leaved Grewia. Shrub 6 to 10 feet.

57 G. ARBÒREA (Roxb. hort. beng. 92.) leaves ovate, subcordate, obtusely serrated, covered with stellate pubescence on both surfaces; peduncles aggregate, elongated, axillary, umbellately-panicled. ♄. S. Native of the East Indies. Leaves 5-nerved at the base.

Tree Grewia. Tree 20 feet.

58 G. VILLÒSA (Roth. nov. spec. 248.) leaves roundish-ovate, with a short acumen, somewhat cordate at the base, doubly serrate, beset with starry hairs above, and with starry greyish down beneath, rufous on both surfaces; peduncles crowded together, 1-flowered, shorter than the petioles. ♄. S. Native of the East Indies. Resembles *G. subinæquàlis*.

Villous Grewia. Fl. July, Sept. Clt. 1816. Shrub 6 feet.

59 G. ORBICULA'RIS (Lamb. herb.) leaves roundish-ovate, hoary on both surfaces, rather serrulated; peduncles axillary, solitary, 3-flowered. ♄. S. Native of the East Indies.

Orbicular-leaved Grewia. Shrub 10 feet.

60 G. ABUTILIFÒLIA (Juss. ann. 4. p. 92.) leaves broad-cordate, sinuately-angular at the apex, unequally-toothed, scabrous above, somewhat tomentose beneath; peduncles 2-3 together, each bearing 3 flowers, much shorter than the petioles. ♄. S. Native of Java. G. arbutifòlia, Pers. no. 31. Resembles *G. áspera*.

Mulberry-leaved Grewia. Shrub 12 feet.

61 G. A'SPERA (Roth. nov. spec. 245.) leaves ovate-roundish, acuminated, blunt at the base, unequally serrated, rough on both surfaces from starry hairs; pedicels in threes, 1-flowered, shorter than the petioles. ♄. S. Native of the East Indies. Flowers purple? G. abutifòlia, Wall. in herb. Lin. soc. but not of Juss.

Rough-leaved Grewia. Shrub 8 feet.

62 G. TILIÆFÒLIA (Vahl. symb. 1. p. 35.) leaves roundish, cordate, smooth, bluntly serrate; peduncles 2-3 together, each bearing 4 flowers, shorter than the petioles. ♄. S. Native of the East Indies and Ceylon. Microcos lateriflòra, Lin. spec. 734. G. arbòrea, Roxb. ex Willd. nov. act. nat. cur. 1813. p. 205.

Lime-tree-leaved Grewia. Clt. 1812. Tree 12 feet.

63 G. SA'PIDA (Roxb. hort. beng. p. 42.) leaves oval, 5-

nerved, obtuse at both ends, coarsely toothed, smoothish; peduncles 3 together, each bearing 3 flowers, 4-times longer than the petioles. ♄. S. Native of Bengal. Fruit eatable.

Good-tasted Grewia. Shrub 6 feet.

64 G. orbicula'ta (Rottl. ex Willd. in nov. spec. act. nat. cur. 1813. p. 205.) leaves roundish-cordate, scabrous, downy beneath, ciliary-serrated; peduncles umbellate, shorter than the petioles. ♄. S. Native of the East Indies. G. villòsa, Willd. l. c. and Smith in Rees' cycl. vol. 17. no. 13.

Orbiculate-leaved Grewia. Shrub 6 feet.

65 G.? therebinthina'cea (D. C. cat. hort. monsp. p. 114.) leaves 5-nerved, cordate, acuminated, toothed, rarely 3-lobed, clothed with soft villi; petioles compressed; flowers racemose; pedicels aggregate. ♄. S. Native of? Branchlets opposite the leaves in flower-bearing branches. Leaves when bruised smelling of *Pelargònium*. Fruit unknown. This plant is sometimes to be found in gardens under the name of *Heliocárpus*, and it is probably a species of that genus with a 4-celled ovary.

Turpentine-scented Grewia. Clt. 1820. Shrub 6 feet.

66 G. erioca'rpa (Juss. ann. 4. p. 93.) leaves ovate, 5-nerved, bluntly serrate, tomentose beneath; peduncles 1-2 together, usually 3-flowered; petals very narrow, not glandular; torus not elongated. ♄. S. Native of Java.

Woolly-fruited Grewia. Shrub.

67 G. dispe'rma (Rottl. ex Spreng. syst. 2. p. 579.) leaves oblong-lanceolate, tapering to both ends, serrate, triple-nerved; peduncles solitary, 3-flowered; petals very short. ♄. S. Native of the East Indies.

Two-seeded Grewia. Shrub 6 feet.

† *Species not sufficiently known.*

68 G. veluti'na (Vahl. symb. 1. p. 35.) leaves oval, very soft on both surfaces, hoary beneath, bluntly serrate, oblique at the base; peduncles 2-3 together, very short, each bearing 3 flowers. ♄. G. Native of Arabia. Chadàra velutìna, Forsk. descr. 106. Flowers smaller than those of *G. Asiática*.

Velvety-leaved Grewia. Shrub.

69 G. obtusifòlia (Willd. enum. 566.) leaves oblong-elliptic, blunt at both ends, hairy, acutely and unequally toothed. ♄. S. Native of the Cape of Good Hope. Flowers purple?

Obtuse-leaved Grewia. Shrub 6 feet.

70 G. Africa'na (Mill. dict. no. 2.) leaves ovate-lanceolate, serrate. ♄. S. Native of Senegal.

African Grewia. Shrub 6 feet.

71 G. echinula'ta (Del. in Guilliaud. voy. à Meroé ex Bull. scien. nat. June, 1827. p. 256.) leaves somewhat orbicular, cordate; peduncles extra-axillary; fruit umbellate, globose, depressed, hispid, warted, containing 4, 3-seeded nuts. ♄. G. Native of the north of Africa at Meroe.

Echinated-fruited Grewia. Shrub.

† The names of species extracted from Roxburgh's Hortus Calcutensis, p. 42 and 92. but these are probably identical with some of those described above, viz. *G. polýgama, pedicellàta, lanceæfòlia*, Roxb.

Cult. All the species of *Grèwia* thrive well in a mixture of loam and peat, and cuttings will root in sand, under a bell-glass; those of the stove species in heat.

X. MI'CROCOS (from μικρος, *micros*, small, κοκκος, *koccos*, a berry). Burm. thes. zeyl. p. 159. Lin. gen. 267. Gært. fruct. t. 57.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 5 sepals. Petals 5, emarginate, without any scale or gland on the inside at the base as in *Grèwia*. Stamens numerous, inserted on the top of the torus, free; anthers roundish. Style 1, crowned by a bluntish stigma. Drupe roundish, containing a nut of 3 cells, each filled with a solitary kernel. Albumen none. Shrubs with the habit of *Grèwia*, but the inflorescence is terminal and panicled, not axillary as in that genus. It also differs particularly in the involucral-bracteas; there are generally 3 flowers together; these are surrounded by 3 trifid bracteas, within which are found 3 smaller linear ones, as well as cut ones at the bottom of the branches of the panicle.

1 M. panicula'ta (Lin. spec. 733.) leaves ovate-oblong, acuminated, 3-nerved, smooth, slightly serrated; panicle terminal, villous, with 2 or 3 flowers together within a 7-leaved involucrum; stipulas and bracteas usually bifid or trifid. ♄. S. Native of the East Indies. Grèwia mícrocos, Lin. syst. ed. 12. vol. 2. p. 602. Gréwia ulmifòlia, Roxb. hort. beng. p. 42. Flowers reddish.

Paniculate-flowered Microcos. Clt. 1799. Sh. 6 to 10 ft.

2 M. tomentòsa (Smith, in Rees' cycl. Mal. mis. 1. no. 1. p. 12.) leaves elliptical-oblong, obtuse, with a short point, obsoletely serrated, chiefly towards the apex, 3-nerved, downy; panicle terminal, clothed with rusty down as well as the branches and petioles, with 2-3 flowers together within a 7-leaved linear involucel; bracteas trifid; stipulas usually bifid. ♄. S. Native of the Prince of Wales Island. Grèwia paniculàta, Roxb. hort. beng. p. 92. Flowers reddish.

Tomentose Microcos. Clt. 1816. Shrub 6 feet.

3 M. sca'bra (Smith, in Rees' cycl. vol. 23.) leaves oblong, obliquely cordate at the base, rough beneath but smooth above, with 5 radiating hispid ribs; panicle ample, terminal, with 2 or 3 flowers within an involucrum, whose leaves are often palmate, as well as the bracteas. ♄. S. Native of Amboyna.

Scabrous Microcos. Shrub 6 feet.

4 M. Stauntonia'na; leaves oblong, broadest at the top, smooth above except the nerves, pubescent beneath, entire, acuminated, 3-nerved at the base; panicle terminal, pubescent, with 3 flowers usually within an involucre, whose leaves are simple, bifid, or trifid, as well as the bracteas. ♄. G. Native of China. (v. s. herb. Lamb.)

Staunton's Microcos. Shrub.

5 M. begoniæfòlia; leaves broad, ovate-oblong, entire, acuminated, smooth above except the nerves, but rough and rusty beneath, 4-5-nerved at the base and obliquely cordate; branches rough from stellate hairs; panicle terminal; flowers in clusters within an involucre; pedicels 2-3-flowered. ♄. S. Native of the East Indies. Grèwia begoniæfòlia, Roxb. hort. beng. p. 92.

Begonia-leaved Microcos. Shrub 10 feet.

6 M. gla'bra (Jack. in mal. misc. vol. 1. pt. 1. Hook. bot. misc. pt. 3. p. 282.) leaves 3-nerved, serrated, smooth; young branches tomentose; panicle terminal, with 3 flowers together within an involucrum. ♄. S. Native of the island of Carnicobar. There are frequently flowers in the axils of the upper leaves in this species.

Smooth-leaved Microcos. Shrub 6 feet.

7 M. involucra'ta; leaves ovate-oblong, acuminated, serrulated, unequally cordate at the base, rough from stellate hairs above, but with stellate tomentum beneath, 5-nerved at the base; panicles axillary and terminal; flowers involucrated. ♄. S. Native of Java. Grèwia involucràta, Blum. bijdr. ex Schlecht. Linnæa. 1. p. 658.

Involucred-flowered Microcos. Shrub.

Cult. The species of *Mícrocos* should be propagated and cultivated in the same manner as that recommended for the species of *Grèwia*.

XI. VINCE'NTIA (in honour of John Vincent, an eminent

advocate in the Mauritius, a great cultivator and patron of natural history, particularly botany). Bojer. mss. Hook. bot. misc. pt. 3. p. 293. t. 62.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 5 reflexed, deciduous sepals. Corolla of 5 bifid petals, each furnished with a scale at the base. Torus pentagonal. Stamens numerous, free, inserted in the stipe-formed torus. Style permanent, crowned by a 4-lobed stigma. Capsule globose, indehiscent, containing 4, 5-celled, 5-seeded nuts, or only 1-celled, 1-seeded from abortion. Seeds horizontal, pear-shaped, compressed. Albumen wanting. A tree with the appearance of *U'lmus campéstris*, having alternate, stalked, oval, oblong, deeply serrated, acuminated leaves, adult ones more cordate, waved, smooth, and shining, 3-nerved at the base, pale beneath. Peduncles short, axillary, solitary or twin, 3-flowered, the 3 flowers are inclosed within a bractea before expansion, hairy. Petals yellow.

1 V. triflòra (Bojer. mss. Hook. l. c.). ♄. S. Native of Madagascar.

Three-flowered Vincentia. Tree 30 feet.

Cult. To be propagated and cultivated in the same manner as that recommended for *Grèwia*, which see.

XII. COLU'MBIA (in honour of the celebrated Christopher Columbus, discoverer of America in 1493; his descendants are called Colon in Spain at this day; hence the genus was originally called *Colòna* by Cavanilles, but afterwards altered by Persoon to *Colúmbia.*) Pers. ench. 2. p. 66. D. C. prod. 1. p. 512.—Colòna, Cav. icon. 4. p. 47. t. 370.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 5 deciduous sepals, which are coloured on the inside. Petals 5, furnished each with a scale at the base. Torus pentagonal, stipe-formed. Stamens numerous, free. Style twice as long as the stamens. Fruit globose, 4-celled, with 4 double wings, each carpel having 2 wings and 2 seeds.—Trees resembling the elm, with serrated, alternate leaves, and terminal and axillary racemes of red flowers, forming a panicle, the partial peduncles are furnished with 3 trifid bracteas and 3-flowers each.

1 C. serratifòlia (D. C. prod. 1. p. 512.) leaves ovate-lanceolate, serrate, 3-nerved and oblique at the base, glaucous beneath; flowers in terminal and axillary bracteate racemes. ♄. S. Native of the Philippine islands. C. Americàna, Pers. ench. 2. p. 66. Colòna serratifòlia, Cav. icon. 4. p. 47. t. 370.

Serrate-leaved Columbia. Tree 20 feet.

2 C. Java'nica (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 658.) leaves cordate, acuminate, somewhat serrulated, 5-nerved at the base, scabrous above, but clothed with starry tomentum beneath, as well as the terminal divaricating panicle; capsule villous, with the wings dilated on the outside. ♄. S. Native of Java. Flowers red? An elegant tree, with the habit of *Theobròma*, with the younger leaves sometimes lobed.

Java Columbia. Tree 50 feet.

3 C. Cele'bica (Blum. ex Spreng. syst. app. p. 205.) leaves oblique at the base, oblong, acuminated, serrate, 3-nerved, scabrous above, but covered with starry down beneath, as well as the panicled, terminal racemes; wings of capsule rounded. ♄. S. Native of the Island of Celebes.

Celebes Columbia. Tree 30 feet.

Cult. The species of *Colúmbia* will thrive well in a mixture of sand and loam, and half-ripened cuttings will root freely in sand under a hand-glass, in heat.

XIII. TI'LIA (an obscure name, the etymology of which is entirely unknown; in Dutch and Swedish it is called *Linden*, in Anglo-Saxon *Lind.*, in English *Lime-tree*). Lin. gen. no. 660. D. C. prod. 512.

Lin. syst. *Polyándria, Monogýnia.* Calyx 5-parted, deciduous. Petals 5, each furnished with a scale at the base on the inside, or wanting the scale. Stamens numerous; filaments free or somewhat disposed into many bundles. Ovary globose, villous, crowned by the deciduous style, 5-celled; cells 1-2-seeded, but many of the cells often prove abortive. Cotyledons sinuately toothed.—Handsome trees, with spreading alternate branches; alternate, stalked, heart-shaped, acute, serrated, deciduous leaves, hairy at the origin of their veins; panicled, yellowish, fragrant flowers, which are continually haunted by bees, with an oblong, entire bractea, united to the common stalk. Capsules with or without angles. Qualities mucilaginous. Inner bark tough and fibrous. Wood smooth, light, delicately white. The sap instipated affords a quantity of sugar.

§ 1. *Petals without scales. All European species.—T. Europæ'a, Lin. spec. 733.*

1 T. microphy'lla (Vent. diss. p. 4. t. 1. f. 1.) leaves cordate, roundish, acuminated, sharply serrated, smooth above, glaucous and bearded beneath in the axils of the veins, as well as with hairy blotches; fruit rather globose, hardly ribbed, very thin and brittle. ♄. H. Native of Europe in sub-mountainous woods. In England frequent in Essex and Sussex. T. Europæ'a var. γ, Lin. spec. 733. T. ulmifòlia, Scop. carn. no. 642. T. sylvéstris, Desf. cat. hort. par. p. 152. T. parvifòlia, Ehrh. ex fl. helv. 1. p. 317. Engl. bot. t. 1705. T. cordàta, Mill. dict. Flowers small, fragrant, of a greenish-yellow colour in compound umbels.

Small-leaved Lime-tree. Fl. July, Aug. Britain. Tree 50 ft.

2 T. Europæ'a (Lin. spec. 733.) leaves cordate, acuminated, serrated, smooth, except a tuft of hair at the origin of the veins beneath, twice the length of the petioles; cymes many-flowered; fruit coriaceous, downy. ♄. H. Native of the north of Europe. In Britain in woods and hedges, or upon grassy declivities. Smith, engl. bot. t. 610. T. intermèdia, Hayne and Svenk. bot. t. 40. T. Europæ'a boreàlis, Wahl. ups. 181. Oed. fl. dan. t. 553. Flowers delightfully fragrant. Petals obovate, of a pale-lemon colour. This tree is cultivated all over England, as well as in some parts of Scotland. The French, growing tired of the horse-chesnut, as Du Hamel reports, adopted this tree for ornamental plantations in the time of Louis XIV. It generally composes the avenues about the residences of the French as well as the English gentry of that date, and Fenelon, in conformity to this, decorates with flowering lime-trees his enchanted isle of Calypso. The inner bark of this, and perhaps some other species, macerated in water, makes the Russia garden-mats, called *Bass* or *Bast-mats.* Mr. P. Lindegaard obtained excellent bass for tying plants, by placing the smooth lateral branches of the tree in water in April and towards midsummer; the branches were taken up when the bark loosened perfectly from the alburnum. It was then peeled off, and washed in water to make the glutinous matter separate, and hung up to dry. This method of making bass will be found of great importance to gardeners resident in the country at a distance from a town, where the lime-tree abounds. Bees collect much honey from the flowers. The smooth, light, delicately white, and uniform wood is used for some domestic purposes, and by the carver, turner, and musical-instrument maker; it served Gibbons for his inimitable carvings of flowers, dead game, &c. so often seen in old English houses, the duke of Devonshire's at Chatsworth, choir of St. Paul's, &c. It forms an excellent charcoal for gunpowder. An ancient lime-tree of great magnitude, which grew where the ancestors of Linnæus had long resided, is said to have given them their family name, *Linn* being the Swedish for a lime-tree (Smith.) The famous *kowno* honey is made exclusively from the blossoms of this tree. Near Kowno in

Lithuania there are large forests chiefly of this tree. The honey produced in these forests sells at more than double the price of any other, and is used exclusively in medicine, and for mixing in liqueurs.

European Lime-tree. Fl. July. Britain. Tree 60 feet.

3 T. RU'BRA (D. C. cat. hort. monsp. p. 150.) leaves cordate, unequal at the base, hairy beneath, as well as the petioles, with a tuft of hair at the origin of each vein; fruit globose, even. ♄. H. Native of Tauria, and probably of Greece. In England in Stoken Church woods, and at Malmsbury. T. triflòra, Puer. in Horn. cat. 2. p. 493. T. Corinthìaca, Bosc. dict. agr. 13. p. 139. T. corallìna, Ait. hort. kew. ed. 1. vol. 2. p. 229. T. Europæ'a, b. rùbra, Sibth. oxon. 166. T. Europæ'a γ, Smith, fl. br. 571. T. Europæ'a, Mill. dict. ed. 8. no. 2. Branches red. Flowers fragrant. Petals yellowish. This is a good tree to plant in avenues for effect as well as timber.

Red-twigged Lime-tree. Fl. June, July. Britain. Tree 66 ft.

4 T. PLATYPHY'LLA (Scop. carn. no. 641.) leaves cordate, roundish, acuminated, sharply serrated, downy beneath; origin of their veins woolly; branches hairy; umbels 3-flowered; fruit woody, downy, turbinate, with 5 prominent angles. ♄. H. Native of Europe in mountain woods. In England in woods and hedges, particularly in Surrey about Dorking and Streatham. Vent. diss. p. 6. t. 1. f. 2. T. cordifòlia, Bess. gal. 1. p. 343. T. Europæ'a, Desf. cat. 152. Bull. fr. t. 175. p. 18. T. grandifòlia, Ehrh. beitr. 5. p. 158. arb. 8. Smith, engl. fl. 3. Flowers very fragrant. Petals yellowish. *T. platyphýlla* is the wild lime-tree of Switzerland and the south of Europe, as *T. Europæ'a* is in the north. Mr. E. Forster remarks that *T. grandifòlia* occurs in very old plantations in England, as frequently as the *T. Europæ'a*, but not in modern ones. There are very large trees of it at Penshurst, and some at Waltham Abbey, the plantation of which is of very ancient date. Mrs. Beecroft brought a specimen from Blair of Athol, where are several trees near the house. Some famous old trees of this species in the Church-yard of Sedlitz, in Bohemia, are reported to have miraculously borne hooded leaves ever since the monks of the neighbouring convent were all hanged upon them.

Broad-leaved Lime-tree. Fl. June, July. Britain. Tree 60 ft.

§ 2. *Petals furnished each with a scale on the inside at the base.—Mostly American species.*

5 T. GLA'BRA (Vent. diss. p. 9. t. 2.) leaves profoundly cordate, abruptly acuminate, sharply serrated, somewhat coriaceous, smooth; petals truncate and crenate at the apex, equal in length to the style; fruit ovate, somewhat ribbed. ♄. H. Native of North America in the woods of Canada, and the northern United States. T. Americàna, Lin. spec. 733. Wat. dend. brit. t. 134. S. Caroliniàna, Wangh. amer. p. 56. T. Canadénsis, Michx. fl. bor. amer. 1. p. 306. Flowers yellowish and fragrant. This tree is known in North America by the name of *Lime* or *Line-tree*, *Basswood*, and *Spoonwood*. The wood is useful, and the tree is ornamental.

Smooth or Black Lime-tree. Fl. July, Aug. Clt. 1752. Tree 50 feet.

6 T. LAXIFLÒRA (Mich. fl. bor. amer. 1. p. 306.) leaves cordate, gradually acuminated, serrated, membranaceous, smooth; panicles loose; petals emarginate, shorter than the style; fruit globose. ♄. H. Native of North America from Maryland to Georgia, near the sea-coast. A very distinct species, though generally confounded with *T. glàbra*. Flowers yellowish-white, sweet-scented.

Loose-flowered Lime-tree. Fl. May, Jul. Clt. 1820. Tr. 50 ft.

7 T. PUBE'SCENS (Ait. hort. kew. ed. 1. vol. 2. p. 219.) leaves truncate at the base, somewhat cordate and oblique, denticulately serrated, pubescent beneath; petals emarginate, shorter than the style; fruit globose, even. ♄. H. Native of North America from Virginia to Georgia, in close copses, and on the banks of rivers. Vent. diss. p. 10. t. 3. Duh. ed. nov. t. 51. Michx. fl. arb. amer. 3. p. 318. T. Caroliniàna, Mill. dict. no. 4. T. Americàna, Walt. fl. carol. p. 153. Wats. dend. brit. 135. The leaves of this tree are much smaller than in the rest of the American species. Flowers yellowish, and very fragrant, crowded.

Var. β, *leptophýlla* (Vent. diss. p. 11.) leaves very thin, with a few fine serratures. T. Mississipénsis, Desf. hort. par. This will probably prove a distinct species.

Pubescent-leaved Lime-tree. Fl. July, Aug. Clt. 1726. Tree 40 feet.

8 T. HETEROPHY'LLA (Vent. diss. p. 16. t. 5.) leaves ovate, downy beneath, sometimes cordate at the base, sometimes obliquely or equally truncate; fruit globose, with 5 ribs. ♄. H. Native of North America on the banks of the Ohio and Missìssippi. T. álba, Michx. fil. arb. amer. 3. p. 315. t. 2. Perhaps also of Hort. kew. A very handsome and desirable ornamental tree. Flowers yellowish, fragrant. There is a species cultivated in Mexico which is probably identical with this.

Various-leaved or White American Lime-tree. Fl. June, July. Clt. 1811. Tree 50 feet.

9 T. A'LBA (Waldst. et Kit. pl. hung. 1. p. 3. t. 3.) leaves cordate, somewhat acuminated, and rather unequal at the base, serrated, clothed with white down beneath, but smooth above, 4 times longer than the petioles; fruit ovate, with 5 obscure ribs. ♄. H. Native of Hungary. Wats. dend. brit. t. 71. T. argéntea, Desf. hort. par. and D. C. cat. hort. monsp. p. 150. T. rotundifòlia, Vent. diss. p. 13. t. 4. Duham. ed. nov. t. 52. T. tomentòsa, Mœnch. weiss. 136. Flowers yellowish, and very fragrant.

White European or Silvery Lime-tree. Fl. June, Aug. Clt. 1767. Tree 50 feet.

10 T. PETIOLA'RIS (D. C. prod. 1. p. 514.) leaves cordate, acuminated, twice the length of the petioles, serrated, smooth above, but white beneath from close pressed down. ♄. H. Native? cultivated in the gardens of Odessa. Flowers yellowish.

Petiolar-leaved Lime-tree. Fl. June, July. Tree 50 feet.

Cult. All the species are desirable for avenues and parks; intermixed they will insure a longer succession of blossoms, and an agreeable variety, than any of them alone. The species will grow in almost any kind of soil; they are easily increased by layers, which should be layed in the autumn, but if seeds can be procured this will be unnecessary, as trees raised from seed are far preferable to those struck from layers. In order to obtain proper shoots for laying, a tree is cut down quite close to the ground, from the roots of which a great number of shoots are produced the following year; these will be strong enough to lay down the following autumn, especially if the smallest of them are cut off close early in the summer.

XIV. BROWNLO'WIA (in honour of the late Lady Brownlow, daughter of Sir Abraham Hume, a great admirer of botany.) Roxb. cor. 3. p. 61. t. 265.

LIN. SYST. *Polyándria, Monogýnia.* Calyx 5-parted. Petals 5. Nectaries 5, linear around the style. Style and stigma simple. Stamens numerous, united at the base, inserted round the apex of a turbinate receptacle. Capsule of 1-5, 2-valved, 1-2-seeded carpels. A tree 15 feet in circumference, with large cordate, acute, 7-nerved, smooth leaves.

1 B. ELA'TA (Roxb. cor. l. c.) ♄. S. Native of the East Indies. Panicle terminal, conical, spreading. Flowers yellow.

Tall Brownlowia. Clt. 1823. Tree 100 feet.

Cult. This is a tree of great beauty. It will thrive well in a mixture of loam and peat; and cuttings will root in sand under a hand-glass, in heat.

XV. DIPLOPHRA'CTUM (from *διπλοος, diploos*, double, and *φραγμος, phragmos*, a dissepiment; in allusion to the cells of the fruit being divided by transverse dissepiments). Desf. mem. mus. 5. p. 34. t. 1. Kunth, malv. p. 15. nov. gen. amer. 5. p. 334. in a note. D. C. prod. 1. p. 514.

LIN. SYST. *Polyándria, Monogýnia.* Calyx of 5 sepals (f. 94. *a.*). Petals 5 (f. 94. *b.*), each furnished with a scale on the inside at the base (f. 94. *c.*). Stamens numerous, free (f. 94. *d.*). Style crowned by 5 aggregate stigmas (f. 94. *g.*). Capsules globose, indehiscent, 5-winged (f. 94. *e.*), 10-celled (f. 94. *f.*), cells divided by transverse dissepiments into 1-seeded divisions. Seeds arillate, fixed to the sides of the cells. Embryo fleshy, placed at the base of the albumen.—A tree, with oak-like leaves.

1 D. AURICULA'TUM (Desf. l. c.) ♄. S. Native of Java. Leaves sessile, oblong-lanceolate, wrinkled, downy beneath, serrated towards the top, obliquely auricled at the base. Stipulas 2 to each leaf, the 1 is of 2-rounded lobes, with a bristle-like appendage rising between these lobes (f. 94. *h.*), the other is of 1 round lobe on one side of a bristle-like appendage (f. 94. *d.*). Flowers rather larger than those of the *Lime-tree*, yellowish or white, solitary, axillary, and terminal, pedicellate.

FIG. 94.

Auricled-leaved Diplophractum. Tree 20 feet.

Cult. This tree will thrive well in a mixture of loam and peat; and cuttings will root in sand or mould under a hand-glass, in heat.

XVI. MICROSTE'MMA (from *μικρος, micros*, small, and *στεμμα, stemma*, a crown; in allusion to the petals being smaller than the sepals.) Lab. aust. cal. p. 58. t. 57.

LIN. SYST. *Monadélphia, Polyándria.* Calyx of 5-6 sepals, permanent. Petals 10-12, shorter than the sepals. Stamens 30 or more; filaments connected at the base. Anthers kidney-shaped, 2-celled. Capsule ovate, 10-12-celled, 10-12 valved. Style simple, crowned by a 5-6-cleft stigma. Valves of capsule with a dissepiment in the middle of each. Seeds solitary at the top of the valves. Albumen fleshy.—A shrub, with terminal clusters of flowers and fascicled exstipulate leaves.

1 M. SALICIFÒLIUM (Lab. l. c.) leaves oblong, tapering to both ends, almost entire; stipulas wanting; peduncles crowded, terminal. ♄. G. Native of New Caledonia. Diplophráctum salicifòlium, Spreng. syst. app. p. 205.

Willow-leaved Microstemma. Tree 16 feet.

Cult. This tree will thrive well in a mixture of peat and loam; and ripened cuttings will root in sand under a hand-glass.

XVII. MUNTI'NGIA (in honour of Abraham Munting, once professor of botany in the university of Groningen, died in 1682, author of several botanical works.) Lin. gen. no. 651. D. C. prod. 1. p. 514. Gært. fruct. 1. t. 59.

LIN. SYST. *Polyándria, Monogýnia.* Calyx 5-7-parted, deciduous. Petals 5-7. Stamens numerous, unconnected. Ovary sessile, globose, surrounded with many hairs at the base, crowned by a sessile, permanent, rayed stigma. Berry 5-celled, many-seeded. Seeds small, imbedded in pulp. Embryo small.—Trees, allied to *Apeìba*, with oblique, alternate, serrated leaves, and large axillary flowers, rising in twos or threes above the axils of the leaves. Pedicels bracteate at the base.

1 M. CALABU'RA (Lin. spec. 728. Jacq. amer. t. 107.) leaves sessile, oblique, and semi-cordate at the base, lanceolate, villous beneath, as well as the branches; pedicels in pairs, or sometimes in fours, axillary, 1-flowered; sepals acuminated. ♄. S. Native of Jamaica on calcareous subalpine hills.—Jacq. amer. pict. p. 81. t. 158.—Sloan. jam. 2. p. 80. t. 194. f. 1. Calabùra álba, Pluk. mant. t. 152. f. 4. Flowers handsome, white, an inch in diameter, resembling those of the bramble. Fruit about the size of a cherry, of a dark-purple colour when ripe. Leaves 4 or 5 inches long, and three quarters broad. *Calabura* is the name of the tree in South America.

Calabura Muntingia. Fl. June, July. Clt. 1690. Tree 12 to 25 feet.

2 M. GLA'BRA (Spreng. syst. 2. p. 592.) leaves obliquely ovate-oblong, smooth; branches compressed, smooth; pedicels axillary, 1-flowered, in pairs; sepals very blunt. ♄. S. Native of Brazil. Flowers white.

Smooth Muntingia. Tree 30 feet.

Cult. These trees thrive well in a light loamy soil; and cuttings will root freely in sand under a hand-glass, in heat. They are handsome trees, and worth cultivating.

XVIII. APEI'BA (a name given to *Apeìba Tiboúrbou* by the natives of Brazil.) Margr. bras. p. 124. Aubl. guian. 1. p. 538. D. C. prod. 1. p. 514.—Aublètia, Schreb. gen. no. 889.—Oxytándrum, Neck. elem. no. 1005.

LIN. SYST. *Polyándria, Monogýnia.* Calyx 5, rarely 4-parted. Petals 5, rarely 4, unguiculate, rather smaller than the calyx. Stamens numerous, with short filaments and long anthers, each ending in 2 leafy lobules. Style dilated at the apex into a funnel-shaped, toothed stigma. Capsule spherical, depressed, coriaceous, rough from stiff hairs or rigid bristles, 8-24 celled. Seeds minute, many in each cell, fixed to the central fleshy receptacle.—Trees or shrubs, clothed with starry down. Leaves broad, entire. Flowers large, golden-yellow or greenish. Peduncles opposite the leaves, branched, many-flowered. The wood of all the species is white and very light. The bark is fibrous and tough, and fit for making cordage.

1 A. TIBOU'RBOU (Aubl. guian. 1. p. 538. t. 213.) leaves cordate, ovate-oblong, serrated, hairy beneath; calyx 5-parted; fruit 10-celled, densely clothed with bristles. ♄. S. Native of Guiana and Cayenne on hills, also of Tobago and the province of Caraccas. Rich. act. soc. hist. nat. par. p. 110. H. B. et Kunth, nov. gen. amer. 5. p. 347.—Apeìba, Margr. bras. t. 124. Sloànea, Lœfl. itin. 311. A. hirsùta, Lam. dict. 1. p. 208. Aublètia Tibúrbu, Swartz. Petals dark-yellow. The tree is called *Tibourbou* by the inhabitants of Guiana.

Tibourbou Apeiba. Fl. Aug. Oct. Clt. 1756. Tree 10 feet.

2 A. PETOU'MO (Aubl. guian. 1. p. 543. t. 215.) leaves ovate-oblong, somewhat cordate at the base, entire, hoary beneath; calyx 4-5-parted; fruit densely clothed with bristles, 18 or 20-celled. ♄. S. Native of Guiana in the woods of Sinemaria. Rich. act. hist. soc. nat. par. 110. A. híspida, Gært. fr. 2. p. 121. Aublètia Petoúmo, Willd. spec. 2. p. 1156. Corolla yellow. The tree is called *Petoumo* by the Caribbees.

Petoumo Apeiba. Aug. Oct. Clt. 1817. Tree 40 feet.

3 A. ULMIFÒLIA (H. B. et Kunth. nov. gen. amer. 5. p. 347.) leaves elliptical-oblong, somewhat acuminated, rounded at the base, sharply toothed, downy above, but clothed with very fine cobwebbed rusty tomentum beneath. ♄. S. Native of South America on the banks of the river Orinoco. Corolla yellow. Resembles *A. Petoúmo.*

Elm-leaved Apeiba. Tree 20 to 30 feet.

4 A. A'SPERA (Aubl. guian. 1. p. 545. t. 216.) leaves ovate-oblong, somewhat cordate, quite entire, smooth; calyx 4-5-parted; fruct 8-10-celled, muricated with short conical pu-

bescent tubercles. ♄. S. Native of Guiana and Cayenne, where it is called *Petoumo*. Lam. ill. t. 470. f. 3. Gært. fruct. 2. p. 188. t. 121. Aublètia áspera, Willd. spec. 2. p. 1156. Corolla yellow.

Rough-fruited Apeiba. Fl. May, Aug. Clt. 1792. Tree 30 to 40 feet.

5 A. echina'ta (Gært. fr. 2. p. 189. t. 121.) leaves? fruit muricated, with long, pyramidal, and very smooth tubercles, 8-10-celled. ♄. S. Native of South America.

Echinated-fruited Apeiba. Tree.

6 A. læ'vis; leaves ovate-oblong, entire, acuminated, smooth, on long petioles; peduncles axillary, opposite the leaves, and terminal, constituting a terminal, many-flowered corymbose panicle; petals and sepals 4. ♄. S. Native of Guiana. Flowers apparently red. (v. s. herb. Lamb.)

Smoothed-leaved Apeiba. Shrub 12 feet.

7 A. gla'bra (Aubl. guian. 1. p. 541. t. 214.) leaves ovate-oblong, acuminated, quite entire, smooth; calyx 5-parted; fruit scabrous, 8-10-celled. ♄. S. Native of Cayenne and Guiana where the inhabitants call it *Ivouyra*. They use pieces of the wood rounded and pointed to produce fire, whence the Creoles call it *Bois de méche*. Aublètia læ'vis, Swartz. prod. 83. Willd. spec. 2. p. 1156. Petals blunt, greenish.

Smooth-leaved Apeiba. Fl. May, July. Clt. 1817. Tree 10 to 15 feet.

8 A. di'scolor (Spreng. neu. entd. 2. p. 166. under *Aublètia*) leaves ovate-oblong, quite entire, hairy beneath, 2-coloured; anthers bristly at the apex; fruit covered with bristles.

Two-coloured-leaved Apeiba. Tree 20 feet.

Cult. *Apeìba* is a genus of trees with fine broad leaves and largish usually yellow flowers. The species will thrive well in a mixture of loam and peat. The best way of bringing them into flower in this country is by cutting a ring round the bark of a large branch; by this means the growth is stopped. The cuttings must be taken off when well ripened, and they should be planted in sand under a hand-glass, in heat. The glass they are planted under should be tilted occasionally, so as to give a little air to the cuttings, otherwise they are apt to damp off.

XIX. SLOA'NEA (in honour of Sir Hans Sloane, once President of the Royal Society, founder of the British Museum, and Chelsea Botanical Garden, author of a history of Jamaica, died in 1753). Plum. gen. t. 15. D. C. prod. 1. p. 515.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 4-7 lanceolate-linear sepals, which are velvety on the outside and coloured on the inside, sometimes they are connected at the base and sometimes almost to the middle. Petals wanting. Stamens numerous, almost destitute of filaments, but with very long anthers, which are terminated by a small point. Ovary 1, crowned by a filiform stigma. Capsules coriaceous, woody, roundish, 4-5-celled, 4-5-valved, echinated from crowded somewhat woody bristles; cells 1-3-seeded. Seeds covered with fleshy aril. Trees natives of South America, with large alternate leaves, and each flower furnished with 1 bractea. This genus should perhaps be divided into as many genera as there are sections.

Sect. I. Sloa'nea (see genus). Plum. gen. t. 15. D. C. prod. 1. p. 515. Calyx 6-7-cleft. Style long, simple. Capsule 4-valved, covered with straight or inflexed bristles. Seeds enwrapped in fleshy aril.

1 S. denta'ta (Lin. spec. 730.) leaves ovate, acute, bluntly toothed; stipulas cordate-triangular, serrated. ♄. S. Native of South America. Castànea Sloànea, Mill. dict. S. grandiflòra, Smith, in Rees' cycl. no. 2. S. Plumièrii, Aubl. guian. 1. p. 536. Flowers large.

Toothed-leaved Sloanea. Fl. Aug. Nov. Clt. 1752. Tree 50 feet.

2 S. ni'tida; leaves broad-lanceolate, acute, shining, entire; stipulas deciduous; peduncles pubescent, terminal, usually 3 or 4 together, 1-flowered, furnished with 2 opposite bracteas in the middle; capsule thickly beset with straight, purple bristles; calyx 4-cleft. ♄. S. Native of Guiana. Peduncles sometimes 2-flowered, rising from the bracteas. Leaves very long and coriaceous. (v. s. herb. Lamb.)

Shiny-leaved Sloanea. Tree 50 feet.

3 S. Plumie'ri; leaves cordate at the base, sinuately toothed; stipulas serrated. ♄. S. Native of St. Domingo. Plum. icon. ed Burm. 240. t. 244. f. 1. Flowers large.

Plumier's Sloanea. Tree 50 feet.

Sect. II. Gynóstoma (from *γυνη, gyne*, a female, and *στομα, stoma*, a mouth; in allusion to the stigma being perforated). D. C. prod. 1. p. 515. Calyx 5-parted, with equal lobes. Torus thickened. Anthers hairy on the outside. Style awl-shaped. Stigma perforated, scarcely toothletted. Capsule 4-valved, covered with variously inflexed bristles; valves opening from the base to the apex.

4 S. Massòni (Swartz, fl. ind. occid. 2. p. 938.) leaves cordate, elliptical, obtuse, entire, or toothed; stipulas linear, serrated. ♄. S. Native of the West India Islands. Leaves more than a foot long. Racemes axillary, nodding towards the ends of the branches. Flowers smaller than those of the preceding species.

Masson's Sloanea. Tree 50 feet.

Sect. III. Myriochæ'ta (from *μυριος, myrios*, an indefinite number, and *χαιτη, chaite*, the hair of the head; in allusion to the capsule being covered with innumerable stiff hairs). D. C. prod. 1. p. 515. Calyx 5-parted, with 1 of the lobes smaller than the rest. Torus villous. Style short. Stigmas 4-5, simple. Capsules 4-5-celled, 4-5-valved, covered with crowded stiff bristles.

5 S. Sinemarie'nsis (Aubl. guian. 1. p. 534. t. 212.) leaves roundish-ovate, entire; stipulas long, acuminated, deciduous. ♄. S. Native of Guiana and the West India Islands, particularly St. Christopher. Lam. ill. t. 469. S. Aublètii, Swartz, fl. ind. occid. p. 490. Wood compact and red. Leaves a foot long. Racemes axillary, each peduncle with a single flower, shorter than the petioles. Flowers small. This tree is probably a species of *Ablània*.

Sinemaria Sloanea. Fl. July, Aug. Clt. 1820. Tree 50 ft.

Sect. IV. Oxya'ndra (from *οξυς, oxus*, sharp or pointed, and *ανηρ ανδρος, aner andros*, a male, alluding to the sharp-pointed anthers). D. C. prod. 1. p. 515. Calyx 5-parted; lobes linear-lanceolate, acuminated. Torus small. Style filiform, long, simple. Capsule, judging from the ovary, is probably destitute of bristles. This is probably a distinct genus.

6 S. corymbiflòra (D. C. prod. 1. p. 516.) leaves ovate, acute, entire; stipulas deciduous; peduncles axillary, branched, corymbose at the apex, many-flowered. ♄. S. Native of French Guiana.

Corymb-flowered Sloanea. Tree 30 feet.

Sect. V.? Foveola'ria (from *fovea*, a pit-fall; alluding to the receptacle being honey-combed or pierced). D. C. prod. 1. p. 516. but not of Ruiz and Pav. fl. per. Calyx 4-parted; lobes ovate-lanceolate, bluntish. Torus distinctly foveolate. Stamens with longish hairy filaments, and elongated, downy, hardly acute anthers. Ovary ovate, villous. Style villous at the base. Stigmas 3. This is perhaps a distinct genus.

7 S. Berteria'na (Chois. mss. D. C. prod. 1. p. 516.) leaves ovate, tapering to both ends; petioles tumid at the base and top; racemes few-flowered, rather shorter than the petioles. ♄. S. Native of St. Domingo. Rheèdia lateriflòra, Bert. in litt. Flowers small.

Bertero's Sloanea. Tree 40 feet.

Cult. A genus of fine trees with large leaves. They thrive best in a mixture of loam and peat, and ripened cuttings will root in sand, under a hand-glass, in heat.

XX. ESENBE'CKIA (in honour of Nees Von Esenbeck, Professor of Botany at Bonn on the Rhine, author of numerous botanical memoirs).

Lin. syst. *Polyándria, Monogýnia.* Calyx 1-leaved, turbinate before flowering, at length saucer-formed, girded by a 3-parted deciduous involucel. Petals 5. Stamens numerous, free; anthers twin. Style 1, crowned by a capitate, 5-angled stigma. Capsule woody, 5-angled, 5-valved; valves with a dissepiment in the middle of each, and covered on the outside with stiff bristles. Seeds 3-6 in each cell, adhering to the dissepiment. Albumen fleshy. Embryo straight. Cotyledons leafy. A tall tree 120 feet high, with alternate, oval, retuse quite entire leaves, and lateral many-flowered peduncles.

1 E. alti'ssima (Blum. l. c.). ♄. S. Native of Java. Thespèsia altíssima, Spreng. syst. app. p. 257.

Tallest Esenbeckia. Tree 120 feet.

Cult. This tree should be propagated and cultivated in the same manner as that recommended for *Sloànea*.

XXI. ABLA'NIA (*A. Guianénsis* is named *Goulougou-ablani* by the Caribbees in Guiana). Aubl. guian. 1. p. 585. t. 234. D. C. prod. 1. p. 516. Trichocárpus, Schreb. gen. no. 923.

Lin. syst. *Polyándria, Digýnia.* Calyx 4-5-parted (probably valvate in the bud). Petals wanting. Stamens numerous, with unconnected filaments and roundish anthers. Ovary ovate. Styles 2, bifid. Capsules 4-valved, 1-celled; valves covered on the outside with stiff bristles. Seeds numerous, covered with aril, fixed to the free placenta. A genus not sufficiently known, but is allied to *Sloànea* and *Bixa*.

1 A. Guiane'nsis (Aubl. guian. 1. p. 585. t. 234.) leaves oblong, waved; flowers corymbose. ♄. S. Native of Guiana in woods. Lam. ill. t. 479. A. laurifòlia, Pers. ench. 2. p. 81. Trichocárpus laurifòlius, Willd. spec. 2. p. 1224. Flowers corymbose, axillary.

Guiana Ablania. Tree 50 feet.

2 A. digita'ta (Spreng. syst. append. p. 210.) leaves digitate, smooth, shining above; leaflets oblong, serrulate; flowers corymbose. ♄. S. Native of Brazil at Rio Grande.

Digitate-leaved Ablania. Tree 40 feet.

Cult. These fine trees will thrive well in a mixture of loam and peat; and ripened cuttings will root in sand, under a hand-glass, in heat.

XXII. GYROSTE'MON (from γυρος, *gyros*, a circle, στημων, *stemon*, a stamen; in allusion to the stamens being twisted round each other in a circular manner). Desf. mem. mus. 6. p. 16. and 8. p. 115. D. C. prod. 1. p. 516.

Lin. syst. *Dioècia, Polyándria.* Flowers dioecious. Calyx spreading, 6-7-lobed. Petals wanting. Stamens in the male flowers numerous, twisted about each other; filaments wanting; anthers 4-lobed, 2-celled, seated on a naked receptacle. Ovaries in the female flowers 20-40, disposed in a whorl around the central axis, each bearing 1 style. Carpels capsular, membranous, 2-valved, 1-seeded. Seeds incurved, transversely striated, adhering to the upper part of the free central axis of the fruit. Embryo incurved, placed at the base of a horny albumen; cotyledons linear, parallel. Smooth, branching shrubs from New Holland. Probably more nearly allied to *Malvàceæ* or *Euphorbiàceæ*.

1 G. ramulòsum (Desf. mem. mus. 6. p. 17. t. 6.) leaves linear, almost sessile. ♄. G. Native of New Holland on the sterile islands. Male flowers pale-yellow. This shrub resembles a species of *E'phedra* when dry. Flowers solitary, axillary.

Branched Gyrostemon. Clt. 1820. Shrub 1 to 2 ft.

2 G. cotinifòlium (Desf. mem. mus. 8. p. 116. t. 10.) leaves ovate, roundish, stalked. ♄. G. Native of New Holland at a place called *Baye des chiens marins*. Flowers in racemes.

Cotinus-leaved Gyrostemon. Shrub 6 feet.

Cult. These shrubs will thrive well in a mixture of loam, peat and sand; and ripened cuttings will root in sand, under a hand-glass.

XXIII. CHRISTIA'NA (in memory of Christian Smith or Schmidt, M. D., a young Norwegian botanist of great promise, who went out with Captain Tuckey in his unfortunate expedition to explore the Congo river, on the south-western coast of Africa, where he died, as well as most of the officers and crews). R. Br. congo. p. 9. D. C. prod. 1. p. 516.

Lin. syst. *Polyándria, Monogýnia.* Calyx 3-lobed. Petals 5. Stamens indefinite. Capsules 5, capsular, 1-seeded, connected at the base. This genus is hardly known. It is allied to *Ventenàtia*.

1 C. Africa'na (D. C. prod. 1. p. 516.). ♄. S. Native of Africa at the river Congo, where it was detected by the unfortunate Christian Smith.

African Christiana. Shrub.

Cult. If ever this shrub should be introduced into Europe, we would recommend its being grown in a mixture of loam, peat and sand; and ripened cuttings will probably root in sand, under a hand-glass, in heat.

XXIV. LUHE'A (in honour of Charles Van der Luhe, a German botanist, who has wrote on the plants of the Cape of Good Hope). Willd. act. soc. nat. scrut. berol. 3. p. 409. t. 5. Luhèa et Alègria, D. C. prod. 1. p. 517.

Lin. syst. *Polyadélphia, Polyándria.* Involucel short, 6-9-12-parted. Calyx 5-parted. Petals 5, with an adnate gland at the claw on the inner side. Stamens numerous; filaments awl-shaped, pilose at the base, and are joined at the bottom into 5 bundles. Stamen scales, or nectaries 5, pencilled or fringed; anthers roundish, 2-celled, at length versatile. Style thick, gradually dilated from the base to the apex. Stigma 5-lobed, perforated, papillose. Capsules 5-angled, 5-celled, 5-valved, with a dissepiment in the middle of each valve, few or many-seeded. Seeds disposed in 2 rows on the margins of the dissepiments, winged at the apex. Albumen fleshy. Cotyledons leafy. This is a fine genus of trees, allied on the one side to *Grèwia* and on the other to *Apeìba*. Leaves alternate, distich, on short footstalks with prominent nerves beneath. Flowers sometimes solitary, terminal, but usually dichotomously branched; cymes axillary and terminal, frequently panicled and racemose. Bracteas under the forks. Pili stellate. Calyx valvate, and petals twisted in æstivation. Corolla white, rarely red.

1 L. speciòsa (Willd. l. c. and spec. 3. p. 1434.) leaves ovate, blunt, unequally toothed, smooth above and hoary beneath, 3-nerved; racemes terminal, simple, few-flowered. ♄. S. Native of Brazil. Flowers white.

Shewy Luhea. Tree 30 feet.

2 L. densiflòra (St. Hil. fl. bras. 1. p. 294.) leaves broad-obovate, short-acuminate, quite entire at the base, pale-rufescent beneath; flowers disposed as if they were in a crowded

panicle, each flower on a short, thick pedicel; outer calyx 9-parted, with linear-lanceolate segments; petals oblong, somewhat rhomboidal; stamen scales fringed at the apex. ♄. S. Native of Brazil. Petals silky at the bottom, but smooth, denticulated, and curled at the top.

Dense-flowered Luhea. Fl. Jan. Tree 10 to 20 feet?

3 L. grandiflòra (Mart. fl. bras. 1. p. 99. t. 59.) leaves broad-ovate, somewhat unequal-sided, acute, unequally serrated, pubescent above and white tomentose beneath; flowers paniculately cymose; pedicels long, bracteate, and are as well as the calyxes covered with brown olive tomentum; segments of outer calyx cordate, acute; petals rhomboidal; stamen scales free, entire, ciliately jagged at the apex. ♄. S. Native of Brazil in the province of Minas Geraes in mountain woods. Petals dilated at the base, bearded at the claws, ending in a lanceolate-spatulate white limb. Involucel 8-parted, (Mart.)

Great-flowered Luhea. Tree 20 feet.

4 L. paniculàta (Mart. fl. bras. 1. p. 100. t. 62.) leaves broad-ovate, bluntish or acutish, cordate at the base; somewhat unequal-sided, of a rufous-white colour beneath, unequally serrated, floral ones smallest; cymes at the tops of the branches disposed in a large leafy panicle, each flower on a short pedicel; outer calyx 9-parted with lanceolate segments; petals rhomboidal; stamen scales multifid even to the base, bearded. ♄. S. Native of Brazil in the province of Minas Geraes. Petals with short fleshy claws and an obovate, subemarginate, rose-coloured or white limb, pubescent at the base. The inhabitants of Brazil use the bark of this tree to tan leather under the name of *Acoeta cavalhos*.

Panicled-flowered Luhea. Fl. Mar. April. Tree 10 to 20 ft.

5 L. divaricàta (Mart. fl. bras. 1. p. 101.) leaves oblong or obovate, unequal-sided, with a short acumen, unequally serrate, but quite entire at the base, smooth above but hoary beneath; flowers dichotomously panicled; peduncles divaricate, cymose; pedicels short, thick; outer calyx 6-parted, with linear, acute segments; petals obovate; stamen scales dissected even to the middle. ♄. S. Native of Brazil in the province of St. Paul. Corolla rose-coloured; petals obovately orbicular, broadish at the claws and covered with long, dense hairs, the rest smooth, yellow at the base.

Divaricate-peduncled Luhea. Tree 30 feet.

6 L. villòsa (Mart. fl. bras. 1. p. 102.) leaves broad-ovate, acutish, denticulated, equal-sided; flowers panicled; fruit villous. ♄. S. Native of Brazil in the province of Bahia.

Villous Luhea. Tree 20 feet.

7 L. cándicans (Mart. fl. bras. 1. p. 102.) leaves ovate-oblong, denticulately serrated, white beneath from tomentum; flowers subsolitary. ♄. S. Native of Brazil in the province of Bahia. Flowers white.

White-leaved Luhea. Tree 20 feet.

8 L. cándida (Mart. fl. bras. 1. p. 102.) leaves ovate-serrated, on short petioles, white beneath; involucel 10-12-parted; stamens a little joined at the base; stamen scales fringed, divided even to the base. ♄. S. Native of Mexico. Alègria cándida, Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 517. A shewy tree with white flowers about the size of those of a single rose.

White-flowered Luhea. Tree 30 feet.

9 L. uniflòra (St. Hil. fl. bras. 1. p. 290.) leaves ovate, acute, entire at the base, pale-rufescent beneath; flowers solitary on short thick pedicels; outer calyx 9-parted; segments linear-lanceolate; petals oblong, linear; stamen scales capillaceous. ♄. S. Native of Brazil in the province of Rio Janeiro. Petals white, hairy and ciliated at the base, the rest smooth. This species appears to approach *L. cándicans*.

One-flowered Luhea. Fl. Dec. Tree 15 feet.

10 L. rufescens (St. Hil. fl. bras. 1. p. 293. t. 293. A.) leaves elliptic or obovate, short-acuminate, subcordate at the base, rufescent beneath; flowers loosely cymose, each flower on a long pedicel; outer calyx 9-parted, with linear lanceolate segments; petals oblong, obovate; stamen scales fringed at the apex. ♄. S. Native of Brazil in the province of Minas Geraes. Petals white, curled, silky-pubescent above the base, the rest smooth.

Rufescent Luhea. Fl. April. Tree 20 feet.

11 L. laxiflòra (St. Hil. fl. bras. 1. p. 293.) leaves elliptical, short-acuminate, quite entire at the base, pale-rufescent beneath; flowers disposed as it were in few-flowered lax racemes, each flower on a long pedicel; outer calyx 9-parted, with lanceolate, acuminated segments; petals oblong-ovate; stamen scales fringed at the top. ♄. S. Native of Brazil in the provinces of Minas Geraes and Minas Novas. Petals white, pubescent and entire at the base, but smooth, denticulated, and curled at the apex.

Loose-flowered Luhea. Fl. May. Shrub 10 feet.

Cult. *Luhèa* is a genus of fine broad-leaved trees with shewy white or red flowers. They will thrive well in a mixture of loam and peat; and cuttings not too ripe will root in sand under a hand-glass, in heat. All the species are worth cultivating.

XXV. MO'LLIA (in honour of L. B. de Moll, Counsellor of State to the King of Bavaria, a patron of natural history). Mart. fl. bras. 1. p. 96. Schlechtendàlia, Spreng. syst. app. p. 295.

Lin. syst. *Polyadélphia, Polyándria.* Calyx of 5 sepals. Petals 5. Stamens divided into many bundles, disposed in many series, outer series divided into 5 bundles, inner one indeterminately joined. Style simple. Capsule 2-celled, 2-valved to the middle, without a central column. Seeds awl-shaped, numerous, disposed in 2 series in each cell. A middle-sized tree with alternate simple, stalked, stipulate leaves, and axillary aggregate stalked flowers.

1 M. speciòsa (Mart. fl. bras. 1. p. 97. t. 60.) leaves ovate, repandly-toothed at the apex, smooth, covered with small scales beneath; flowers axillary, subcorymbose. ♄. S. Native of Brazil near the bar of the Rio Negro. Petals white, a little shorter than the calyx, finely serrulated at the tip.

Shewy Mollia. Tree 10 to 20 feet.

Cult. This tree should be propagated and cultivated in the same manner as that recommended for *Luhèa*.

XXVI. VA'TICA (from Vaticanus, god of the prophets, which is derived from *vates*, divine. This tree is said to be employed by the people of China in some religious ceremonies). Lin. mant. 2. p. 152. D. C. prod. 1. p. 517.

Lin. syst. *Polyándria, Monogýnia.* Calyx 5-cleft; lobes acute, probably valvate in the bud. Petals 5, hoary on the outside, obovate-oblong, twisted in the bud. Anthers 15, sessile, ovate, 4-celled, 3 in front of each petal. Ovary 5-angled. Style 1, crowned by a 3-lobed stigma. Capsule 3-celled? cells 1-seeded? Smith. This genus is not sufficiently known.

1 V. Chinénsis (Lin. mant. 2. p. 152.). ♄. G. Native of China. Smith, icon. ined. t. 36. Lam. ill. t. 397. A shrub with angular branches, alternate cordate-oblong blunt quite entire leaves and panicles of flowers. The 2 outer cells of anthers terminated each in a spine.

Chinese Vatica. Tree 40 feet.

Cult. A mixture of loam and sand will suit this tree, and ripened cuttings will root in sand, under a hand-glass.

XXVII. E'SPERA (perhaps from εσπερα, *espera*, the evening; application not evident). Willd. act. soc. nat. cur. berol. 3. p. 449. D. C. prod. 1. p. 517.

Lin. syst. *Polyándria, Monogýnia.* Calyx 4-parted, spreading. Petals 6, permanent, 3 times as long as the calyx. Stamens numerous, with capillary filaments and roundish anthers. Style 1. Stigma 1. Capsule oblong, 4-6-winged, 4-6-celled; cells 1-seeded. Seeds roundish, hairy. Allied to *Humìria* and *Sloànea* according to Jussieu.

1 E. cordifòlia (Willd. l. c.). ♄. S. Native of? A shrub with alternate, stalked, cordate, quite entire leaves and terminal panicles of flowers.

Heart-leaved Espera. Shrub 5 feet.

Cult. This shrub will thrive well in a mixture of turfy loam and peat; and cuttings will root in sand under a hand-glass, in heat.

XXVIII. BE'RRYA (in honour of Dr. Berry, a friend of Roxburgh's, who first introduced this tree into the botanic garden at Calcutta). Roxb. cor. 3. p. 59. t. 264. D. C. prod. 1. p. 516.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 5 sepals, which are connected before expansion, but afterwards separating irregularly, downy on the outside but coloured within, soon falling off. Petals 5, oblong. Stamens numerous; filaments unconnected (or joined at the base); anthers small, 2-celled. Ovary 1, sessile, 3-winged. Style 1. Stigma trigonal, capitate. Capsule roundish, 3-celled, 3-valved, 6-winged, each valve bearing 2 horizontal wings on the back, with a dissepiment in the middle of each valve within. Seeds 2 in each cell, large, ovate-globose, covered with stiff hairs. A tree with broad, cordate, entire leaves, and spreading terminal panicles of small whitish-yellow flowers.

1 B. amomi'lla (Roxb. cor. l. c.). ♄. S. Native of Ceylon. Branches round, smooth. Leaves alternate, without stipulas, stalked, ovate, acuminate, entire, smooth, 7-nerved at the base. *Amomilla* is the Cingalese name of the tree.

Amomilla Berrya. Clt. 1810. Tree 36 feet.

Cult. This tree will succeed well in a mixture of turfy loam and peat; and cuttings will root readily if planted in sand or mould under a hand-glass, in heat.

XXIX. EUTHE'MIS (from *ευθημων, euthemon,* neat or pretty; in allusion to the elegance and neatness of the shrubs). Jack. in mal. misc. 1. Wall in Roxb. fl. ind. 2. p. 303.

Lin. syst. *Pentándria, Monogýnia.* Calyx inferior, of 5-sepals. Petals 5. Stamens 5, hypogynous. Anthers adnate, bursting at the apex, with 2 pores. Style filiform. Stigma simple. Berry 5-seeded. Seeds disposed round the axis, enclosed in a fibrous aril, albuminous, oblong, angular. Embryo inverse, cylindrical, almost as long as the seed, with a superior radicle.—Small shrubs, with simple, serrated, alternate, stipulate leaves, and racemes of flowers. This genus agrees with *Tiliàceæ* in the stipulate leaves and entire petals, but with *Elæocárpeæ* in the anthers bursting by 2 pores at the apex.

1 E. leucoca'rpa (Jack, l. c.) leaves lanceolate, beautifully spiny-serrated; racemes branched at the base; stipulas lanceolate, ciliated, soon falling off; fruit globose, white. ♄. S. Native of the forests of Singapore. This is a shrub of uncommon elegance and beauty. Corolla white, tinged with purple. Anthers longer than the filaments, ending in a long point, which is a little twisted.

White-fruited Euthemis. Shrub 4 to 5 feet.

2 E. mi'nor (Jack, l. c.) leaves narrow-lanceolate, slightly serrulated; stipulas linear, ciliated; racemes undivided; berry red, angular, acuminated. ♄. S. Gathered along with the preceding. Corolla white. Anthers yellow, ending in a long acumen.

Smaller Euthemis. Shrub 2 feet.

3 E.? eleganti'ssima (Wall. in Roxb. fl. ind. vol. 2. p. 305.) leaves elliptic-lanceolate, tapering to both ends, finely acuminated, sharply and minutely serrulated, the nerves reticulated, and uniting into 2 or more submarginal arches. ♄. S. Native of the forests of Singapore. Stipulas sublaciniate, and deeply divided into filiform long teeth. Flowers not seen.

Very-elegant-leaved Euthemis. Shrub 2 to 3 feet.

Cult. This is a genus of elegant shrubs, none of which have yet been introduced to the gardens. A mixture of sand and loam will probably suit the species, and perhaps ripened cuttings will root in sand under a hand-glass, in heat.

XXX. XEROPE'TALUM (from *ξηρος, xeros,* dry, and *πεταλον, petalon,* a petal; petals permanent.) Raf. Delil. in Guilliaud, voy. meroe. ex bull. scien. nat. June, 1827. p. 256.

Lin. syst. *Polyándria, Monogýnia.* Calyx 5-cleft. Petals 5, nerved, obovate, emarginate, rather oblique, and are as well as the calyx and stamens permanent. Stamens about 20, 5 of these are sterile. Capsule 3-valved, 3-celled. This is a very doubtful genus.

1 X. quinquese'tum (Raf. Delile, l. c.) ♄? G. Native of the north of Africa at Meroe. Flowers in panicled racemes, disposed in 2-4-radiated umbels.

Five-bristled Xeropetalum. Shrub?

Cult. This plant will probably succeed well in a mixture of turfy loam and sand; and cuttings will perhaps root in sand under a hand-glass.

Order XXXV. ELÆOCA'RPEÆ (plants agreeing with *Elæocárpus* in important characters.) Juss. am. mus. 11. p. 223. D. C. prod. 1. p. 519.

Calyx of 4-5 sepals, naked on the outside. Sepals valvate in the bud. Petals 4-5, hypogynous, alternating with the sepals, fringed or lobed at the top (f. 95. *b.*). Receptacle glandular, somewhat exserted. Stamens 15-20 (f. 95. *a.*); filaments short, unconnected; anthers elongated, filiform, tetragonal, 2-celled; cells opening at the top by an oblong pore. Ovary (f. 95. *c. d.*), many-celled. Style 1 (f. 95. *d.*). Seeds 2 or many in each cell. Albumen fleshy. Embryo erect, with flat leafy cotyledons.—Shrubs or trees, with alternate, simple, stipulate leaves. This order is very nearly allied to *Tiliàceæ,* but is distinguished from it by the lobed petals, and the anthers opening by 2 pores at the apex.

Synopsis of the Genera.

1 Elæoca'rpus. Sepals 5. Petals 5, jagged at the apex (f. 95. *b.*). Anthers ending in bristles. Drupe containing 1-nucleus, which is furrowed and wrinkled, 5-celled (f. 95. *b.*), or from abortion only 1-celled.

2 Acera'tium. Sepals 5. Petals 5, fringed at the apex, with broad ciliated claws. Anthers puberulous, destitute of the terminal bristles. Fruit unknown.

3 Di'cera. Sepals 4-5. Petals 4-5, 3-lobed at the apex. Anthers 20-30, linear, each ending in 2 bristles. Capsule 2-celled? cells many-seeded.

4 Frie'sia. Calyx 4-parted. Petals 4, 3-lobed at the apex. Anthers 12, cordate, oblong, acuminated, bursting at the top. Berry dry, rather stipitate, indehiscent, 2-4-furrowed, 2-4-celled; cells 2-seeded.

5 Acrono'dia. Flowers dioecious. Male flowers. Calyx of

4 sepals. Petals 4, linear, erose at the apex. Anthers 8-12, linear, puberulous, destitute of terminal bristles. Female flowers unknown.

6 VA'LLEA. Sepals 5. Petals 5, trifid, with 5 scales under the claws, which adhere to the petals, and with a ring of glands around the torus. Anthers 30-40, mutic, bursting at the top. Capsule 3-4-valved, muricated, 4-5-celled; cells 2-seeded.

7 TRICUSPIDA'RIA. Calyx 5-toothed. Petals 5, tricuspidate, with a ring of glands around the 10-angled torus. Anthers 15, mutic, opening at the apex. Capsule 3-valved, 3-celled, with a dissepiment in the middle of each valve. Seeds few.

8? DECA'DIA. Calyx 3-parted. Petals 10, obovate, serrated. Stamens 10, seated on the base of the petals; anthers roundish. Drupe containing a 5-celled nut.

I. ELÆOCA'RPUS (from ελαια, *elaia*, an olive, and καρπος, *karpos*, a fruit; the fruit is round, containing a nut furnished with rugosities, which has been compared to an olive.) Lin. gen. 665. D. C. prod. 1. p. 519.

LIN. SYST. *Polyándria*, *Monogýnia*. Calyx 5-sepalled. Petals 5, jagged at the apex (f. 95. *b*.). Anthers ending in bristles. Drupe containing a rugged-furrowed, 5-celled nut, (f. 96. *f*.) or only 1-celled from abortion. Trees with white, but not durable wood. Flowers small, usually fragrant; the fruit is eatable, and the hard rugose stones are manufactured into necklaces set in gold.

FIG. 95.

1 E. SERRA'TUS (Lin. spec. 734.) leaves with glands in the axils of the veins beneath, elliptic-oblong, serrated, acuminated; racemes axillary or lateral, drooping; fruit globose; nut wrinkled and furrowed. ♄. S. Native of the East Indies. —Burm. zeyl. 39. t. 40. Ganìtrus sphæ'rica, Gært. fr. 2. p. 271. t. 139. f. 6. Flowers white, but purplish before opening, sweet-scented.

Serrated-leaved Elæocarpus. Fl. March to Oct. Clt. 1774. Tree 50 feet.

2 E. GANI'TRUS (Roxb. hort. beng. p. 42.) leaves elliptic-lanceolate, repand-toothed, acuminated, younger ones pubescent; racemes simple, lateral. ♄. S. Native of the East Indies. Ganítrus, Rumph. amb. 3. p. 162. t. 101. Flowers white, sweet-scented.

Ganiter Elæocarpus. Tree 40 feet.

3 E. PE'RIM-KA'RA (D. C. prod. 1. p. 519.) leaves ovate-lanceolate, serrated; flowers racemose; fruit ovate; nut even. ♄. S. Native of Malabar.—Rheed. mal. 4. p. 51. t. 24. Racemes terminal. Flowers white, sweet-scented. This tree is called *Perim-kara* by the inhabitants of Malabar. Fruit eatable.

Perim-kara Elæocarpus. Tree 40 feet.

4 E. CYA'NEUS (Sims, bot. mag, t. 1737.) leaves oblong-lanceolate, serrated, netted with veins; racemes axillary, close-flowered; fruit somewhat globose; nut almost even. ♄. G. Native of New Holland. Flowers white. Drupe blue. E. reticulàtus, Smith in Rees' cycl. ex Ker. bot. reg. t. 657. E. cyàneus, Lois. herb. amat. t. 237.

Blue-fruited Elæocarpus. Fl. June, Aug. Clt. 1803. Tree 15 feet.

5 E. OBOVA'TUS; leaves obovate-oblong, tapering to the base, obtuse at the apex, entire or serrated towards the apex; racemes numerous, crowded-flowered. ♄. S. Native of New Holland. Flowers white, smaller than those of *E. cyàneus*.

Obovate-leaved Elæocarpus. Shrub.

6 E. STRI'CTUS (Lamb. herb.) leaves oblong-lanceolate, coriaceous, tapering to the base, serrated, silky beneath; racemes simple, axillary. ♄. S. Native of New Zealand. Flowers crowded, white.

Straight Elæocarpus. Tree 15 feet.

7 E. MONO'CERAS (Cav. icon. 6. p. 1. t. 501.) leaves lanceolate, cuneated at the base, serrated at the top; racemes axillary. ♄. S. Native of the island of Luzon, and at the town of Bannos. Ovary 2-celled? Anthers furnished with 1 bristle at the apex. Flowers of a rusty-red colour.

One-horned-anthered Elæocarpus. Tree 20 feet.

8 E. RUGÒSUS (Roxb. hort. beng. p. 42.) leaves large, elliptic or obovately-oblong, acuminated, abrupt at the base, repandly-serrated; anthers ending in 1 bristle each; petals 2-lobed, jagged; racemes simple, axillary. ♄. S. Native of Chittagong. Flowers large, white. Anthers with beardless valves.

Wrinkled-leaved Elæocarpus. Tree 20 feet.

9 E. INTEGRIFÒLIUS (Lam. dict. 2. p. 604.) leaves obovate-oblong, obtuse, quite entire; racemes axillary, longer than the leaves; flowers 4-cleft. ♄. S. Native of the Mauritius. Flowers white. Anthers beardless.

Entire-leaved Elæocarpus. Tree 20 feet.

10 E. OBLÒNGUS (Smith in Rees' cycl. no. 2.) leaves ovate-oblong, acute, quite entire; drupe ovate-oblong, 1-seeded. ♄. S. Native of the Moluccas. Ganìtrum oblóngum, Rumph. amb. 3. p. 163. t. 102. Gært. fruct. 1. p. 202. t. 43. Racemes axillary. Flowers white. Fruit eatable.

Oblong-leaved Elæocarpus. Tree 40 feet.

11 E. INTEGE'RRIMUS (Lour. coch. 1. p. 412.) leaves lanceolate, quite entire; flowers axillary, crowded. ♄. G. Native of Cochin-china. Flowers sweet-scented, of a golden-colour. Drupe black, somewhat ovate. This plant is cultivated in China for the sweetness and beauty of its flowers.

Very-entire-leaved Elæocarpus. Tree 20 feet.

12 E. SYLVE'STRIS (Poir. suppl. 294.) leaves ovate-lanceolate, serrated; spikes almost terminal; glands of receptacle 2-lobed; drupe 1-seeded. ♄. G. Native of Cochin-china in woods. Adenòdus sylvéstris, Lour. coch. 294. Branches spreading. Flowers white, varying to red.

Wild Elæocarpus. Tree 20 feet.

13 E. NI'TIDUS (Mal. misc. 1. no. 2. p. 41.) leaves ovate-lanceolate, serrated; racemes axillary, shorter than the leaves; stamens 15; nut 5-celled, 4 of which are for the most part abortive. ♄. S. Native of Pulo-Pinang. Flowers white.

Shining-leaved Elæocarpus. Tree 20 feet.

14 E. ELLI'PTICUS (Smith in Rees' cycl. no. 3.) leaves smooth, glandless; calyxes acute; ovary globose, with 5 little scales at the base. ♄. S. Native of? Lin. mant. 2. p. 401. in a note. Flowers white?

Elliptic-leaved Elæocarpus. Tree.

15 E. LANCEOLA'TUS (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 659 and 660.) leaves lanceolate, bluntish and remotely serrated at the top; racemes axillary, longer than the leaves, nodding; pedicels longer than the petioles; drupe oval; nut wrinkled, and covered with recurved prickles. ♄. S. Native of Java. Flowers white.

Lanceolate-leaved Elæocarpus. Tree 20 feet.

16 E. OBTU'SUS (Blum. l. c.) leaves obovate-oblong, bluntish, mucronately-serrated above the base; racemes axillary, and are as well as the petals silky; pedicels longer than the petioles. ♄. S. Native of Java. Flowers white. Like *E. monóceras*.

Obtuse-leaved Elæocarpus. Tree 20 feet.

17 E. macrophy'llus (Blum. l. c.) leaves oval-oblong, obtuse, rounded at the base; repandly serrated; stipulas semi-orbicular, leafy; racemes axillary, shorter than the leaves; fruit oval, smooth. ♄. S. Native of Java. Flowers white.

Long-leaved Elæocarpus. Tree 80 feet.

18 E. gla'ber (Blum. l. c.) leaves ovate or oval-oblong, obtuse, rounded at the base, mucronately serrated; racemes axillary, nodding, exceeding the leaves in length; petals fringed. ♄. S. Native of Java. Flowers white.

Smooth Elæocarpus. Tree 20 feet.

19 E. resinòsus (Blum. l. c.) leaves oval-oblong, acuminated, bluntish at the base, obsoletely serrated, with glands at the origin of the veins beneath; racemes axillary, shorter than the leaves; petals fringed, villous on the inside. ♄. S. Native of Java. Flowers white.

Resinous Elæocarpus. Tree 50 feet.

20 E. angustifòlius (Blum. l. c.) leaves oblong-lanceolate, acuminated at both ends, serrulated above the base; racemes axillary, shorter than the leaves; fruit globose; nut wrinkled, somewhat furrowed. ♄. S. Native of Java. Flowers white.

Narrow-leaved Elæocarpus. Tree.

21 E. floribu'ndus (Blum. l. c.) leaves elliptic-oblong, acuminated at the apex, acute at the base, bluntly-serrated, coriaceous, very smooth; racemes axillary, nodding, equal in length to the leaves; petals fringed. ♄. S. Native of Java.

Bundle-flowered Elæocarpus. Tree.

22 E. longifòlius (Blum. l. c.) leaves oblong, acuminate, acute at the base, repandly mucronulate; racemes shorter than the leaves, covered with silky down; petals fringed. ♄. S. Native of Java. Flowers white.

Long-leaved Elæocarpus. Tree.

23 E. stipula'ris (Blum. l. c.) leaves elliptic-oblong. acuminated, with the veins on the under surface pubescent; stipulas ovate, deeply serrated; racemes axillary, velvety-tomentose, equal in length to the leaves; fruit oval. ♄. S. Native of Java. Flowers white.

Large-stipuled Elæocarpus. Tree 60 feet.

24 E. tomentòsus (Blum. l. c.) leaves ovate, acuminate, roundish at the base, with bristle-like teeth, velvety-tomentose beneath, as well as branches; racemes axillary, elongated. ♄. S. Native of Java. Flowers white.

Downy Elæocarpus. Tree.

25 E. pube'scens (Roxb. hort. beng. p. 42.) leaves opposite, oblong, pubescent, membranous, rather cordate at the base; branches villous as well as the young leaves; racemes compound; sepals awl-shaped. ♄. S. Native of the East Indies. Ovary villous, mucronate with the style. Flowers white, rather large.

Pubescent Elæocarpus. Tree.

† *Species only known by name from Roxburgh's Hortus Bengalensis, p. 42 and 92, but some of these are probably identical with some of those described above.*

26 E. aristàtus, Roxb. Silhet. 27 E. serrulàtus, Roxb. Tinnevilly. 28 E. robústus, Roxb. Silhet. 29 E. lùcidus, Roxb. Chittagong. 30 E. lanceæfòlius, Roxb. Silhet. 31 E. tuberculàtus, Roxb. Chittagong. 32 E. pilòsus, Roxb. Mascal Island.

Cult. *Elæocárpus* is a very curious and ornamental genus of trees. They will thrive well in a mixture of loam and peat; and ripe cuttings will root in sand under a hand-glass; those of the stove species in heat. Seeds of some of the species will ripen, if pains be taken to fertilize the stigmas when they are in full bloom. The green-house species are well adapted for a conservatory.

II. ACERA'TIUM (from α, priv. and κερας, *keras*, a horn; because the stamens are destitute of the terminal bristles, which are so conspicuous in the preceding and following genus). D. C. prod. 1. p. 519.

Lin. syst. *Dodecándria, Monogýnia.* Calyx of 5 sepals. Petals 5, jagged at the apex, with broad ciliated claws. Anthers downy, destitute of terminal bristles. Style 1. Fruit unknown.

1 A. oppositifòlium (D. C. prod. 1. p. 519.). ♄. S. Native of Amboyna. Leaves opposite, elliptic-oblong, rather pubescent on the nerves, furnished with a few mucronated teeth. Peduncles terminal, 3-flowered. Flowers white?

Opposite-leaved Aceratium. Clt. 1818. Tree.

Cult. This tree will thrive well in a mixture of loam and peat, and ripe cuttings will root in sand under a hand-glass, in heat.

III. DI'CERA (from δις, *dis*, double, and κερας, *keras*, a horn; in allusion to the anthers being terminated by 2 bristles). Forst. gen. t. 40. D. C. prod. 1. p. 520.

Lin. syst. *Dodecándria, Monogýnia.* Calyx of 4 or 5 sepals. Petals 4-5, 3-lobed at the top. Anthers 12-20, linear, each terminated by 2 bristles. Capsules (in *D. dentàta*, which is the type of the genus,) 2-celled; cells many-seeded. Shrubs with laurel-like leaves.

1 D. denta'ta (Forst. gen. p. 80.) leaves alternate, oblong, serrate-toothed at the top; racemes axillary; flowers monogynous; capsules of 2, many-seeded cells. ♄. G. Native of New Zealand. Elæocárpus dentàtus, Vahl. symb. 3. p. 67. Eriostèmon, Col. hort. rip. t. 30. Filaments of stamens hairy. Flowers white. A rambling shrub.

Toothed-leaved Dicera. Fl. July. Clt. 1818. Shrub 10 ft.

2 D.? serra'ta (Forst. gen. p. 80.) leaves opposite, ovate, doubly serrated; racemes compound; flowers tetragynous; berry of 4, 2-seeded cells. ♄. G. Native of New Zealand. Elæocárpus Dícera, Vahl. symb. 3. p. 67. Flowers white? Perhaps a distinct genus or a species of *Frièsia*.

Serrated-leaved Dicera. Shrub 10 feet.

3 D. craspe'dum (Gmel. syst. D. C. prod. 1. p. 520.) leaves oblong, crenated, ending in a reflexed point; spike subterminal, crowded; flowers monogynous; berry of one many-seeded cell. ♄. S. Native of Cochin-china in woods. Craspédum tectòrium, Lour. coch. 336. Elæocárpus tectòrium, Poir. suppl. 2. p. 104. Perhaps a distinct genus. Flowers greenish-yellow. The wood is used for building houses in Cochin-china, and the leaves for roofing them.

Fringed-flowered Dicera. Tree 50 feet.

Cult. The species of *Dícera* thrive well in a mixture of loam and peat; and ripe cuttings will root in sand under a hand-glass.

IV. FRIE'SIA (in honour of Elias Fries, M. D. Professor of Botany in the university of Lund; an acute philosophical and cryptogamic botanist). D. C. prod. 1. p. 520.

Lin. syst. *Dodecándria, Monogýnia.* Calyx 4-parted. Petals 4, 3-lobed at the apex. Anthers 12, cordate-oblong, acuminate, dehiscent at the apex. Berry dry, somewhat stipitate, indehiscent, 2-4-furrowed, 2-4-celled; cells 2-seeded.

1 F. peduncula'ris (D. C. prod. 1. p. 520.). ♄. G. Native at Cape Van Diemen. Leaves opposite, lanceolate, serrated; pedicels axillary, spreading, 1-flowered, somewhat nodding. Elæocárpus pedunculàris, Lab. nov. holl. 2. p. 15. t. 155. Flowers white.

Peduncled-flowered Friesia. Clt. 1818. Shrub 3 to 6 feet.

Cult. This shrub will thrive well in a mixture of turfy loam and peat; and ripe cuttings will root in sand under a hand-glass.

V. ACRONO'DIA (from *ακρος, akros*, the summit, and *νωδος, nodos*, toothless; alluding to the anthers being without bristles at the summit). Blum. bijdr. ex Schlecht. Linnæa. 1. p. 660.

Lin. syst. *Diœ'cia, Octándria.* Male flowers; sepals and petals 4, the last small and linear, erose at the apex. Anthers 8-12, linear, puberulous, destitute of terminal bristles. Female flowers unknown.

1 A. puncta'ta (Blum. l. c.). ♄. S. Native of Java. A tree with scattered, lanceolate, serrated leaves, which are full of dots beneath and axillary simple racemes of flowers.

Dotted-leaved Acronodia. Tree 30 feet.

Cult. A mixture of loam and peat will suit this tree well, and ripened cuttings will root in sand under a hand-glass, in a moist heat.

VI. VA'LLEA (in honour of Robert Valle of Rouen, who has given a commentary on the works of Pliny). Mut. in Lin. suppl. 266. D. C. prod. 1. p. 520.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 5 sepals. Petals 5, trifid. Glands of receptacle forming a ring around the ovary. Scales 5, adnate under the claws of the petals. Stamens 30-40; anthers mutic, bursting at the top. Style furrowed. Capsules 4-5-valved, 4-5-celled; valves muricated, spreading; cells 2-seeded. Small trees with kidney-shaped stipulas, and alternate, cordate, stalked, entire leaves.

1 V. stipula'ris (Mut. in Lin. fil. suppl. 266.) branches, pedicels and petioles smooth; leaves cordate, blunt, bearded at the origin of the veins beneath, as well as at their base; stipulas on short stalks. ♄. S. Native of South America at Santa Fe de Bogota. H. B. and Kunth, nov. gen. amer. 5. p. 350. t. 489. Flowers pale-red.

Stipular Vallea. Tree 14 feet.

2 V. cordifòlia (Ruiz et Pav. syst. fl. per. 132.) branches, pedicels, and petioles hairy; leaves cordate, acute, hairy beneath, especially at the base; stipulas on short stalks. ♄. S. Native of Peru in groves. Flowers white.

Heart-leaved Vallea. Tree 18 feet.

3 V. pube'scens (H. B. et Kunth, nov. gen. amer. 5. p. 350.) branches, pedicels, and petioles clothed with rusty down; leaves cordate, blunt, covered with rusty pubescence beneath; stipulas sessile. ♄. S. Native of South America near Santa Fe de Bogota. Flowers white.

Pubescent Vallea. Tree 20 feet.

Cult. The species of *Vállea* will thrive well in a mixture of loam and peat; and ripe cuttings will root in sand under a hand-glass, in a moderate heat.

VII. TRICUSPIDA'RIA (from *tres*, three, and *cuspis*, a point; in allusion to the petals being divided into 3 points at the apex). Ruiz et Pav. syst. fl. per. p. 112. prod. t. 36. D. C. prod. 1. p. 520.—Tricúspis, Pers. ench. 2. p. 9.

Lin. syst. *Polyándria, Monogýnia.* Calyx 5-toothed. Petals 5, tricuspidate at the apex. Glands of receptacle annular, 10-sided. Anthers 15, mutic, bursting at the apex. Capsules 3-celled, 3-valved; valves septiferous. Seeds few.

1 T. depe'ndens (Ruiz et Pav. l. c.). ♄. G. Native of Chili in groves and inundated places. Leaves opposite, oblong-ovate, serrated. Pedicels axillary, solitary. Flowers white?

Depending Tricuspidaria. Tree 20 feet.

Cult. See *Vállea* for cultivation and propagation.

VIII. DECA'DIA (from *δεκα, deca*, ten; the corolla is of 10 petals, which distinguishes it from all the other genera of this order). Lour. coch. 1. p. 385. D. C. prod. 1. p. 520.

Lin. syst. *Polyándria, Monogýnia.* Calyx 3-parted, permanent. Petals 10, somewhat ovate, a little serrated. Stamens 30, standing upon the base of the petals. Anthers roundish. Style filiform. Drupe containing a 5-celled nut. Perhaps the stamens are inserted in the calyx, if so this genus is probably referable to *Rosàceæ*.

1 D. aluminòsa (Lour. p. 315.). ♄. G. Native of Cochinchina and the Molucca Islands in woods.—Rumph. amb. 2. t. 100. Leaves alternate, lanceolate, serrated, smooth. Racemes almost simple. Flowers white. The bark and leaves of this tree are used by native dyers to heighten and fix colours.

Alum Decadia. Tree 20 feet.

Cult. This tree will thrive in a mixture of loam and peat; and ripe cuttings will root in sand under a hand-glass.

Order XXXVI. CHLENA'CEÆ (from *χλαινα, chlaina*, a cloak. The flowers of most of the plants belonging to this order are furnished with an involucrum). Pet. Th. hist. veg. afr. austr. p. 49. D. C. prod. 1. p. 521.

Involucre 1 (f. 96. *b.*) to 2-flowered, permanent, various in form and consistence (f. 96. *f.*). Calyx of 3 small sepals (f. 96. *a.*). Petals 5 (f. 96. *b.*) to 6, hypogynous, broadest at the base, sometimes they are connected at the very bottom. Stamens usually numerous (f. 96. *c.*), but sometimes there are even as few as 10; filaments connected at the base into a tube, or adnate to the tube of the petals; anthers roundish. 2-celled, adnate or free. Ovary 1 (f. 96. *g.*), 3-celled. Style 1, filiform, crowned by a triple stigma (f. 96. *d.*). Capsule 3-celled or only 1-celled from abortion. Seeds solitary or numerous in each cell, fixed to the central axis, inverted. Albumen fleshy (ex Juss.) corneous (ex Pet. Th.). Embryo central, green. Cotyledons leafy, waved. Little trees and shrubs, natives of Madagascar, with alternate, feather-nerved, entire leaves; deciduous stipulas; and racemose and panicled flowers. This order is allied to *Malvàceæ*, according to Petit Thouars, in the flowers being furnished with an involucre, as well as in the stamens being monadelphous, but according to the opinion of Jussieu it is more nearly allied to *Ebenàceæ* and *Simplocíneæ*, on account of the petals being connected at the base, as well as in the seeds being albuminous.

Synopsis of the genera.

1 Sarcolæ'na. Involucrum fleshy, urceolate, 5-toothed, with a calyx within it. Petals 5, conniving into a tube, with the stamens inserted in its base. Capsule baccate, 3-celled, cells 2-seeded, furnished with prurient villi on the inside.

2 Leptolæ'na. Involucrum rather fleshy, cylindrical, small. Sepals 3, longer than the involucrum. Petals 5, conniving into a tube. Stamens 10. Ovary 3-celled; cells 2-seeded, but the capsule is 1-celled, 1-seeded from abortion.

3 Schizolæ'na. Involucrum 2-flowered, not fleshy, fringed (f. 96. *f.*). Sepals 3 (f. 96. *a.*). Petals 5 (f. 96. *b.*). Stamens numerous (f. 96. *c.*). Capsule 3-celled; cells many-seeded.

4 Rhodolæ'na. Involucrum of 2 bracteas, which are pressed

to the calyx. Sepals 3, concave, fleshy. Petals 6, urceolate. Stamens numerous, connected at the base. Ovary 3-celled, many-seeded.

† *A genus allied to Chlenàceæ.*

5 Hugònia. Involucrum none. Calyx 5-parted. Petals 5, unguiculate. Stamens 10, monadelphous at the base. Styles 5, distinct. Drupe containing 5, 1-seeded carpels adhering together.

I. SARCOLÆ'NA (from σαρξ σαρκος, *sarx sarcos*, flesh, and χλαινα, *chlaina*, a cloak; alluding to the fleshy involucre). Pet. Thour. l. c. p. 37.

Lin. syst. *Monadélphia, Polyándria.* Involucre fleshy, pitcher-shaped, 5-toothed, and covered with rusty down. Calyx within the involucre. Petals 5, conniving into a tube at the base. Stamens numerous, inserted in the base of the tube. Anthers terminal. Ovary 3-celled; cells 2-seeded. Capsule within the large baccate involucrum, which is furnished with stinging hairs inside. Albumen thin. Shrubs with decumbent branches; younger leaves plaited; adult ones waved, appearing as if they were 5-nerved. Flowers white.

1 S. grandiflòra (P. Th. l. c. p. 40. t. 9.) panicle few-flowered; leaves acute, clothed with rusty down beneath; involucre depressed, scabrous from hairs. ♄. S. Native of Madagascar. Flowers large.

Great-flowered Sarcolæna. Shrub 10 feet.

2 S. multiflòra (P. Th. l. c. p. 40. t. 10.) panicle crowded; leaves acute, rather pilose on the nerves beneath; involucre rough from hairs, 3-lobed. ♄. S. Native of Madagascar.

Many-flowered Sarcolæna. Shrub 10 feet.

3 S. erio'phora (P. Th. l. c. p. 40.) panicle few-flowered, axillary; leaves blunt, free from longitudinal plaits; involucre very hairy. ♄. S. Native of Madagascar.

Wool-bearing Sarcolæna. Shrub 10 feet.

Cult. Sarcolæ'na is a genus of elegant shrubs; the species will thrive well in a mixture of sand, loam, and peat; and cuttings will probably root in sand under a hand-glass, in heat.

II. LEPTOLÆ'NA (from λεπτος, *leptos*, slender, and χλαινα, *chlaina*, a cloak; in allusion to the narrow fleshy involucre). P. Th. hist. veg. afr. austr. p. 41. D. C. prod. 1. p. 521.

Lin. syst. *Monadélphia, Decándria.* Involucre small, rather fleshy, cylindrical. Sepals 3. longer than the involucre. Petals 5, connected into a tube. Stamens 10. Anthers fixed by the back. Ovary 3-celled; cells 2-seeded. Capsule girded by the scabrous involucre, 1-celled, 1-seeded from abortion. An elegant tree, with smooth, waved leaves, and corymbose flowers.

1 L. multiflòra (P. Th. l. c. p. 41. t. 11,). ♄. S. Native of Madagascar at Foulepointe. Flowers white.

Many-flowered Leptolæna. Tree 20 feet.

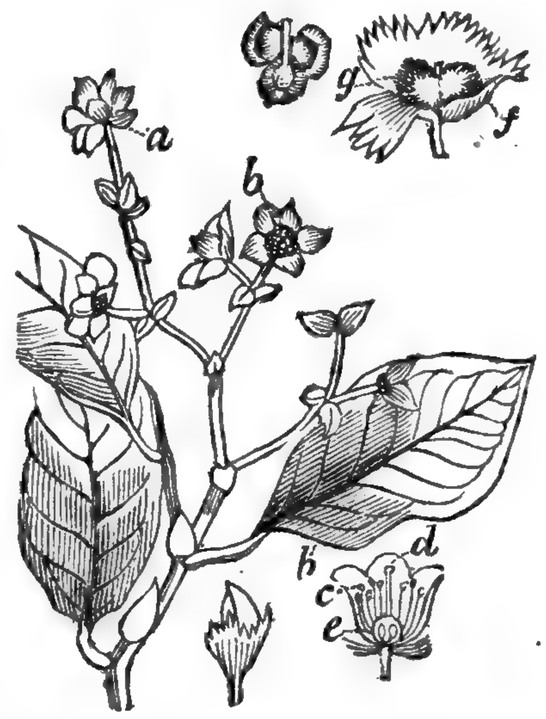
Cult. See *Sarcolæ'na* for cultivation and propagation.

III. SCHIZOLÆ'NA (from σχιζω, *schizo*, to cut, and χλαινα, *chlaina*, a cloak; alluding to the cut involucre (f. 96. *g*.). P. Th. hist. veg. afr. austr. p. 43. gen. nov. no. 55. D. C. prod. 1. p. 521.

Lin. syst. *Monadélphia, Polyándria.* Involucre 2-flowered (f. 96. *b*.), fringed, not fleshy, at length expanded, jagged (f. 96. *f*.), clammy, conniving. Sepals 3 (f. 96. *a*.). Petals 5 (f. 96. *b*.). Stamens numerous, with slender filaments (f. 96. *e*.) and adnate anthers. Capsule enclosed within the involucre (f. 96. *g*.), 3-celled; cells many-seeded. Elegant little trees, with ovate smooth leaves, and panicles or racemes of flowers.

1 S. ròsea (P. Th. l. c. p. 43. t. 12.) panicles terminal; involucre very large, irregularly cleft. ♄. S. Native of Madagascar. Flowers red (f. 96.).

FIG. 96.



Rose-coloured-flowered Schizolæna. Tree 20 feet.

2 S. elonga'ta (Pet. Th. l. c. p. 44.) panicles terminal; involucre 5-lobed, a little longer than the capsule. ♄. S. Native of Madagascar. Flowers white.

Elongated-involucred Schizolæna. Tree 20 feet.

3 S. cauliflòra (P. Th. l. c. p. 44.) flowers racemose; racemes rising from the trunk or larger branches. ♄. S. Native of Madagascar.

Stem-flowered Schizolæna. Tree 20 feet.

Cult. Schizolæ'na is a genus of elegant little trees. The species will thrive well in a mixture of loam, sand, and peat; and cuttings will root in sand, under a hand-glass, in heat.

IV. RHODOLÆ'NA (from ῥοδος, *rhodos*, a rose, and χλαινα, *chlaina*, a cloak; flowers are red). Pet. Th. hist. veg. afr. austr. p. 47. gen. nov. no. 56. D. C. prod. 1. p. 522.

Lin. syst. *Monadélphia, Polyándria.* Involucre constantly of 2 bracteas, which are pressed to the calyx. Sepals 3, concave, fleshy, clammy. Petals 6, large, urceolate, spirally twisted in the bud. Stamens numerous, shorter than the petals, joined at the base into a short urceolus; anthers quadrangular, inserted by the back. Ovary 3-celled, many-seeded. A climbing shrub with oval, acute leaves, which are pointed by the middle nerve being drawn out; 2-flowered, naked, axillary peduncles, and large scarlet flowers.

1 R. altívola (P. Th. l. c. p. 48. t. 13.). ♄. ◠. S. Native of Madagascar. Fruit unknown.

Soaring Rhodolæna. Shrub climbing.

Cult. This is a beautiful climbing shrub with large scarlet flowers, well adapted for covering rafters in stoves. It will thrive well in a mixture of loam and peat; and cuttings will root in sand under a hand-glass, in heat.

† *A genus allied to Chlenàceæ.*

V. HUGO'NIA (in honour of John Hugon, an English botanist, who published a dissertation on the systems of botany in 1771). Lin. gen. no. 831. Gært. fruct. 1. p. 281. t. 58. D. C. prod. 1. p. 522.

Lin. syst. *Monadélphia, Decándria.* Calyx naked, permanent, 5-parted, or of 5 unequal sepals, which are connected at the base, imbricate in the bud. Petals 5, unguiculate, alternating with the sepals, twisted in æstivation. Stamens 10, joined into an urceolus at the base at first, but afterwards becoming free and filiform; anthers ovate, twin. Ovary roundish. Styles 5, distinct. Drupe fleshy, enclosing (5 ex Cav. 10 ex Gært.) 1-seeded carpels, adhering together, with a pendulous seed in each cell. Embryo inverted in the axis of a fleshy albumen, with a short superior radicle and flat leafy cotyledons. Shrubs with alternate leaves, but they are usually crowded and opposite near the flower; 2 awl-shaped stipulas and 1-flowered axillary peduncles, sometimes some of which are changed into hooked spines. This genus is allied to *Malvàceæ* or *Byttneriàceæ*, but the calyx is not valvate but imbricate.

1 H. My'stax (Lin. spec. 944.) leaves oval, smooth, very

entire; spines hooked, almost opposite. ♄. S. Native of Ceylon and Malabar.—Rheed. mal. 2. p. 29. t. 19. Flowers yellow. Fruit yellowish or red.

Bearded Hugonia. Fl. June, Sept. Clt. 1818. Sh. 10 ft.

2 H. SERRA'TA (Lam. dict. 3. p. 149.) leaves oval-oblong, serrated, adult ones smooth; spines almost opposite, hooked. ♄. S. Native of the Mauritius. H. Mýstax, Cav. diss. 3. p. 177. t. 73. f. 1. exclusive of the synonymes. Flowers yellowish.

Serrate-leaved Hugonia. Fl. Ju. Oct. Clt. 1820. Sh. 10 ft.

3 H. TOMENTÒSA (Cav. diss. 3. p. 178. t. 23. f. 2.) leaves oblong, serrated, downy on both surfaces; spines wanting. ♄. S. Native of the Mauritius. Lam. dict. 3. p. 150. Flowers yellowish or white.

Downy-leaved Hugonia. Shrub 10 feet.

Cult. The species of *Hugònia* will thrive well in a mixture of loam, sand and peat; and ripened cuttings will root freely in sand under a hand-glass, in heat.

ORDER XXXVII. TERNSTRŒMIA'CEÆ (plants agreeing with *Ternstræ'mia* in important characters.) D. C. mem. soc. h. nat. gen. vol. 1. prod. 1. p. 523.—Ternstræ'mia, Mirb. bull. philom. 1813. p. 381.

Calyx of 3-5, unequal, concave (f. 97. *a.*), coriaceous, obtuse, permanent, imbricate sepals (f. 99. *a.*), usually furnished with 2 bracteoles at the base. Petals usually 5 (f. 97. *d.* f. 99. *b.*), rarely more or fewer, inserted on the disk, sometimes free (f. 97. *d.*), sometimes connected at the base (f. 99. *b.*). Stamens numerous, hypogynous (f. 99. *d.* f. 98. *c.* &c.), somewhat adnate to the petals at the base, free, or connate, rarely disposed in bundles (f. 99. *d.*); filaments short, awl-shaped; anthers erect, 2-4-celled, adnate or versatile. Ovary ovate (f. 98. *d.* f. 99. *c.*). Styles 2-7, free, or more or less joined together (f. 99. *f.*). Fruit ovate-globose, radiately divided on the inside into as many cells as there are styles or stigmas (f. 97. *g.* f. 98. *e.* f. 99. *c.*), sometimes dry-baccate (f. 97. *g.* f. 98. *d. e.*), indehiscent, sometimes capsular, dehiscent (f. 99. *c.*). Seeds few or numerous, fixed to the central placenta (f. 97. *g.* f. 98. *e.*), sometimes arched (f. 97. *h.*), sometimes roundish or compressed. Albumen fleshy or wanting. Embryo arched or straight, slender, terete, with oblong cotyledons, and an inconspicuous plumule, with a long radicle, which is turned towards the hylum. The order is composed of trees and shrubs, with alternate, exstipulate, coriaceous, feather-nerved, undivided leaves, and axillary and terminal peduncles, bearing handsome, white, yellow, red, purple, and variegated flowers. *Camèllia* and the cuts we have given will convey a very good idea of the beauty of the genera. The tea is well known to be one of the most useful plants in the world for its stimulating influence in decoction upon the nerves, which is attributed by Cullen to the presence of a narcotic principle. The seeds of *Camèllia oleìfera*, and some others, yield a fine oil. Noronha states that the fruit of a *Sauraúja*, found in Java, is subacid, in flavour resembling the Tomato, and that it is eaten by the Javanese under the name of *Koleho*.

Synopsis of the Genera.

TRIBE I.

TERNSTRŒMIE'Æ. *Calyx with 2 bracteas at the base. Petals connected together at the base, opposite the sepals. Anthers adnate. Style crowned by a simple stigma. Albumen fleshy.*

1 TERNSTRŒ'MIA. Sepals and petals 5. Stamens numerous, in a double series. Anthers oblong, smooth. Berry dry, 2-5-celled, at length 3-5-valved; cells 3-4-seeded. Seeds wingless.

TRIBE II.

EURYE'Æ. *Calyx furnished with 2 bracteas at the base, of 5 sepals or 5 lobes. Corolla 5-parted, opposite the sepals. Anthers adnate. Style crowned by 3-5 distinct stigmas.*

2 ANNESLE'A. Calyx 5-lobed. Corolla contracted at the throat, 5-cleft. Stamens numerous, disposed in a double series. Anthers linear, smooth, ending in a long point. Berry dry, 3-celled; cells 1-3-seeded. Style crowned by 3 awl-shaped stigmas.

3 GEE'RIA. Flowers dioecious. Calyx of 5-sepals. Corolla 5-parted. Stamens numerous, adnate to the base of the corolla. Styles 3-5, connected at the base, crowned by as many acute stigmas. Berry 5-celled, many-seeded.

4 EU'RYA. Flowers polygamous. Sepals and petals 5, both concrete at the base. Stamens 12-15. Anthers smooth, tetragonal. Style 3-5-cleft. Capsule 3-5-celled, many-seeded.

TRIBE III.

FREZIE'REÆ. *Calyx furnished with 2 bracteas at the base. Petals free, alternating with the sepals. Anthers adnate. Style crowned by 2-5 distinct stigmas. Seeds wingless. Albumen fleshy. Embryo rather curved.*

5 CLEYE'RA. Sepals and petals 5. Anthers hispid from retrograde bristles. Style filiform, crowned by 2-3 stigmas. Berry 2-3-celled; cells 2-3-seeded.

6 FREZIE'RA. Sepals and petals 5. Anthers smooth, subcordate. Style 3-5-cleft at the apex. Fruit dry, 3-5-celled.

7 LETTSÒMIA. Sepals 7. Petals 5-6, inner petals narrowest. Style short, crowned by 3-5 stigmas. Berry 3-5-celled.

TRIBE IV.

SAURAU'JEÆ. *Calyx deeply 5-parted, furnished with 2-3 bracteas. Petals alternating with the sepals, more or less connected together at the base. Stamens numerous, adhering to the base of the corolla. Anthers incumbent, inserted by the back, not adnate. Styles 3-5, distinct from the ovary. Seeds wingless. Albumen fleshy.*

8 SAURAU'JA. Petals 5, joined together to the middle. Styles 3-5. Capsule 3-5-celled, 3-5-valved; cells many-seeded. Anthers bursting by 2 pores at the apex.

9 APATE'LIA. Petals 5, joined together at the base. Stamens numerous, disposed in 5 bundles. Anthers bursting by 2 pores at the top. Styles 5. Capsule 5-celled, 5-valved, many-seeded.

TRIBE V.

LAPLA'CEÆ. *Calyx bractless, of 3-5 sepals, sometimes 5-parted. Petals usually 5, distinct. Stamens numerous, free, or connected at the base. Anthers adnate or versatile. Styles equal in number to the cells of the ovary, joined in 1, crowned by*

many-stigmas. Fruit 3-5-celled. Albumen fleshy or wanting. Seeds compressed or winged, rarely cochleate.

10 COCHLOSPE'RMUM. Calyx of 5 unequal sepals (f. 97. *a.*). Petals 5, emarginate at the apex (f. 97. *d.*). Filaments free. Anthers acuminated, 4-sided, opening by one pore. Style simple. Capsule globose, 3-5-celled. Seeds numerous, cochleate, woolly (f. 97. *h. g.*). Albumen fleshy.

11 LAPLA'CEA. Calyx of 4-5 sepals. Petals 5-9, equal. Stamens in 3 series, adnate to the base of the petals. Anthers kidney-shaped, 2-celled. Capsule 5-7-celled, 5-7-valved, woody; cells 3-seeded. Seeds winged, hanging from the central axis.

12 BONNE'TIA. Calyx 5-parted. Petals 5. Anthers 2-celled. Style trifid at the apex. Capsule 3-celled, 3-valved; valves bent in at the edges so much as to constitute dissepiments. Seeds linear, winged at both ends.

13 MAHU'REA. Calyx 5-sepalled. Petals 5. Anthers adnate. Style crowned by a 3-5-lobed stigma. Capsule 3-celled, 3-valved; valves bent in so much at the margins as to constitute dissepiments. Seeds minute, compressed, winged at both ends.

14 MARI'LA. Calyx of 4, rarely of 5 sepals. Petals 4-5. Stamens numerous, joined at the base; anthers adnate. Style crowned by a capitate 3-4-lobed stigma. Capsule 3-4-valved, 3-4-celled, with the margins of the valves bent inwards so as to form dissepiments, which are fixed to the central placenta. Seeds numerous, girded by a yellow fringe.

15 VENTENA'TIA. Calyx 3-sepalled (f. 98. *a.*), deciduous. Petals 11-12 (f. 98. *b.*). Anthers adnate, 2-celled (f. 98. *c.*). Capsule 5-celled (f. 98. *e.*); cells many-seeded.

16 CARAI'PA. Calyx 5-parted. Petals 5, inferior. Anthers fixed by the back. Style crowned by a 3-lobed stigma. Capsule 3-celled, 3-valved. Seeds sub-solitary, compressed, inserted in the large, trigonal, 3-winged, central placenta.

17 KIELMIE'RA. Calyx 5-parted, unequal. Petals 5. Anthers oblong, 2-celled, fixed by the back. Style crowned by 3 stigmas. Capsule 3-celled, 3-valved; valves bent in at the margins so much as to constitute dissepiments. Seeds girded by a membranous margin, extended at both ends.

18 ARCHITÆ'A. Calyx 5-parted. Petals 5. Stamens connate into 5 bundles at the base. Anthers 2-celled. Style simple. Capsule 5-celled, incompletely 5-valved. Seeds linear, rather winged.

19 GODÒYA. Calyx of many deciduous sepals. Petals 5. Stamens numerous, disposed in many rows, or collected into 5 bundles. Anthers long, biporose. Style simple. Capsule 3-5-valved, 3-5-celled, with the edges of the valves bent inwards, forming the dissepiments, many-seeded; seeds winged.

TRIBE VI.

GORDONIE'Æ. *Sepals 5, free, or joined together at the base. Petals usually connected at the base. Stamens numerous, monadelphous at the base. Anthers ovate, oscillatory. Styles 5, distinct or connected. Carpels 5, capsular, few or many-seeded, sometimes distinct, sometimes connected into a single fruit, with a dissepiment in the middle. Albumen wanting. Embryo straight, with an oblong radicle, and leafy cotyledons, which are wrinkled and plaited lengthwise, with an inconspicuous plumule.*

20 MALACHODE'NDRON. Calyx 5-cleft, furnished with 2 bracteas. Petals 5, crenulated. Ovary 5-furrowed. Styles 5, free. Stigmas capitate. Carpels 5, capsular, connected, 1-2-seeded.

21 STUA'RTIA. Sepals 5, connected almost to the middle, bibracteate. Petals 5. Style crowned by a 5-lobed stigma. Capsule woody, 5-celled, 5-valved; cells 1-2-seeded. Seeds wingless.

22 GORDÒNIA. Sepals 5, coriaceous (f. 99. *a.*). Petals 5, adhering to the tube of the stamens, and connected together at the base (f. 99. *d.*). Style crowned by 5 stigmas (f. 99. *f.*). Capsule 5-celled, 5-valved (f. 99. *c.*); cells 2-5-seeded. Seeds ending in a leafy wing.

23 BLU'MEA. Calyx 5-parted, unequal. Petals 5, obovate, free. Anthers almost sessile, disposed in a ring around the style, which is 5-cleft at the apex. Capsule 5-celled; cells many-seeded.

24 SCHÌMA. Calyx 5-cleft. Petals 5, connected together at the base, and adnate to the urceolus of the stamens, unequal, one of them is cucullate. Style crowned by a 3-lobed stigma. Capsule globose, 5-celled; valves with a dissepiment in the middle; cells 1-2-seeded. Seeds ending in a wing.

25 POLY'SPORA. Calyx girded by some deciduous accessary bracteas. Sepals and petals 5. Stamens monadelphous at the base. Style crowded by 5 stigmas. Capsule conical, 5-celled, 5-valved. Seeds numerous, imbricate, ending in a wing.

TRIBE VII.

CAMELLIE'Æ. *Sepals 5-9. Petals 5-7-9, usually cohering at the base. Stamens numerous, monadelphous, or polyadelphous at the base. Anthers versatile, 2-celled. Styles 3-5, connected at the base. Fruit 3-celled, 3-valved, few-seeded; valves with a dissepiment in the middle, or bent in at the margins so much as to form dissepiments. Albumen wanting.*

26 CAME'LLIA. Calyx girded by some accessary bracteas or sepals. Stamens polyadelphous, or monadelphous at the base. Valves of capsule bearing a dissepiment in the middle of each; central axis triquetrous.

27 THE'A. Calyx 5-parted. Petals 5-9, in 2-3 series. Stamens adhering to the base of the petals. Style 3-cleft. Capsule 3-lobed, 3-seeded; dissepiments formed from the inflexed margins of the valves.

Tribe I.

TERNSTRŒMIE'Æ (plants agreeing with *Ternstræ'mia* in important characters.) D. C. prod. 1. p. 523.

Calyx with 2 bracteas at the base. Sepals connected together at the base, and opposite the petals. Anthers adnate. Style 1. Stigma simple. Albumen fleshy.

I. TERNSTRŒ'MIA (Ternstrœm, a Swedish naturalist and traveller in China, who died at Palicandre in 1745.) Lin. fil. suppl. 39. D. C. prod. 1. p. 523.—Tonàbea, Juss. Toanàbeo, Aubl. guian. 1. p. 569.

LIN. SYST. *Polyándria, Monogýnia.* Calyx of 5 unequal sepals, furnished with 2 bracteas at the base. Petals 5, connected at the base into a monopetalous corolla. Stamens inde-

finite, inserted in the receptacle, and adhering to the base of the corolla. Anthers oblong, smooth, fixed by the base, commonly bursting lengthwise on the inside. Style simple. Stigma simple. Fruit coriaceous or fleshy, crowned by the permanent style, 2-5-celled; cells 3-4-seeded in *T. Brasiliénsis*, opening irregularly in 3-5-valves, with the valves seminiferous. Seeds oblong. Pedicels axillary, solitary, 1-flowered, furnished with a scale at the base, and with 2 bracteas just under the flower. Hilum situated at the top of the seed. Albumen fleshy. Embryo curved, with a long cylindrical radicle, and linear-entire cotyledons, pointing towards the umbilicus.—Trees or shrubs, with scattered coriaceous, entire or serrated leaves, with the petioles jointed at the base. Flowers axillary, solitary.—Species almost all American.

1 T. bre'vipes (D. C. prod. 1. p. 523.) leaves quite entire, obovate, somewhat emarginate; pedicels axillary, hardly longer than the flower. ♄. S. Native of South America. Flowers small, red. Coll. hort. rip. t. 38.

Short-peduncled Ternstrœmia. Fl. July, Aug. Clt. 1818. Sh.

2 T. peduncula'ris (D. C. l. c. and prod. 1. p. 523.) leaves quite entire, ovate-oblong, obtuse; pedicels lateral, thrice as long as the flower. ♄. S. Native of the West Indies. T. meridionàlis, Swartz, obs. 207. Flowers small, white.

Pedunculated-flowered Ternstrœmia. Fl. July, Aug. Clt. 1818. Tree.

3 T. linea'ta (D. C. l. c. and prod. 1. p. 523.) leaves quite entire, oblong, rather acute; pedicels lateral, drooping, scarcely longer than the flower. ♄. S. Native of Mexico. T. meridionàlis, Moc. et Sesse, fl. mex. icon. ined. Flowers white.

Lined-petalled Ternstrœmia. Shrub 6 feet.

4 T. sylva'tica (Cham. et Schlecht. Linnæa. 4. p. 221.) branches smooth; leaves lanceolate, obtusely acuminated; bracteas ovate, acute, under the calyx; petals not lined; anthers apiculate. ♄. S. Native of Mexico. Flowers white.

Wood Ternstrœmia. Shrub.

5 T. elli'ptica (Swartz, prod. p. 81.) leaves quite entire, elliptical, acute; pedicels lateral, twice as long as the petioles. ♄. S. Native of the West Indies. Flowers white.

Elliptic-leaved Ternstrœmia. Shrub.

6 T. Brasilie'nsis (St. Hil. fl. bras. 1. p. 298. t. 59.) leaves lanceolate or obovate-lanceolate, obtuse, or with a very short acumen, serrulated; leaflets of calyx roundish, denticulated; seeds spotted with red. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers white. Petals shorter than the calyx, with erose margins. Fruit 2-5-celled.

Var. mìnor (St. Hil, l. c.) leaves much smaller; flowers smaller; segments of corolla smaller. In the province of St. Paul.

Brasilian Ternstrœmia. Fl. March. Tree 15 feet.

7 T. carnòsa (St. Hil. fl. bras. 1. p. 299.) leaves obovate, or obovate-lanceolate, nearly entire, rather scabrous above; leaflets of calyx unequal, roundish, quite entire; seeds smooth, white. ♄. S. Native of Brazil in the province of Minas Geraes. This species comes near to *T. meridionàlis* of Mutis. Fruit 2-celled.

Fleshy-leaved Ternstrœmia. Shrub 10 feet.

8 T. meridiona'lis (Mutis, Swartz, prod. p. 81.) leaves obovate, lanceolate, entire, shiny on both surfaces; leaflets of calyx unequal, denticulated; fruit 2-celled. ♄. S. Native of South America. Flowers white.

Meridional Ternstrœmia. Shrub 10 feet.

9 T. puncta'ta (Swartz, prod. p. 81.) leaves entire, oblong, somewhat emarginate, denticulated, dotted on the margin; pedicels axillary, much longer than the petioles. ♄. S. Native of Guiana in woods. Taonàbo punctàta, Aubl. guian. 1. p. 571. t. 228. Flowers yellowish. Fruit 5-6-celled.

Dotted-leaved Ternstrœmia. Fl. Ju. Aug. Clt. 1820. Tree 20 ft.

10 T. clusiæfòlia (H. B. et Kunth, nov. gen. amer. 5. p. 207. t. 463. f. 1.) leaves oblong, obtuse, quite entire, covered with small black dots beneath; pedicels axillary, a little longer than the petioles. ♄. S. Native of South America on the mountains about Popayan. Flowers white.

Clusia-leaved Ternstrœmia. Tree 30 feet.

11 T. denta'ta (Swartz, prod. 81. but not of Mirb.) leaves serrate-toothed, oval-oblong, or oboval, acuminate; pedicels axillary and lateral, a little longer than the petioles; outer leaflets of calyx ovate-lanceolate, acute. ♄. S. Native of Guiana in woods. Toanàbo dentàta, Aubl. guian. 1. p. 569. t. 227. Flowers yellowish.

Toothed-leaved Ternstrœmia. Tree 28 feet.

12 T. salicifòlia (D. C. mem. l. c. and prod. 1. p. 524.) leaves serrulated, oblong, acuminated, almost veinless; pedicels 2-3, axillary, a little shorter than the petioles. ♄. S. Native of Guadaloupe in woods. Flowers yellowish.

Willow-leaved Ternstrœmia. Tree 20 feet.

13 T. venòsa (Spreng. new. entd. 1. p. 162.) leaves serrulately oblong, veiny; pedicels aggregate, axillary, a little shorter than the petioles. ♄. S. Native of Brazil. Flowers white.

Veiny-leaved Ternstrœmia. Fl. June, Aug. Clt. 1824. Shrub 6 feet.

14 T. ? quinquepartìta (Ruiz, et Pav. syst. 180.) leaves obsoletely-serrulated, obovate; corolla 5-parted. ♄. S. Native of cold parts of the Andes of Peru in woods. Stamens disposed in 5 bundles. This is perhaps a distinct genus.

Five-parted-flowered Ternstrœmia. Tree 20 feet.

15 T. ? globiflòra (Ruiz et Pav. syst. 180.) leaves quite entire, oblong; corolla globose, 5-toothed. ♄. S. Native of cold parts of the Andes of Peru in woods. Stamens disposed in 5 bundles. Flowers white. This species, with the preceding, will probably form a distinct genus.

Globe-flowered Ternstrœmia. Tree 12 feet.

16 T. rubiginòsa (Jack, mal. misc. 1. no. 2. p. 39.) leaves ovate, spiny-serrated, hoary beneath; stamens monadelphous; flowers lateral and axillary, in bundles; peduncles and calyxes covered with glandular hairs; fruit 3-celled. ♄. S. Native of Sumatra. Cleyèra rubiginòsa, Spreng. syst. 3. p. 596.

Rusty Ternstrœmia. Tree 16 feet.

17 T. pentape'tala (Jack, mal. misc. 1. no. 2. p. 40.) leaves obovately-lanceolate, spiny-toothletted, smooth; flowers lateral, in bundles; peduncles smooth; fruit 3-celled. ♄. S. Native of Pulo-Pinang. Cleyèra pentapétala, Spreng. syst. 3. p. 596.

Five-petalled Ternstrœmia. Tree 20 feet.

18 T. ? corymbòsa (Smith in Rees' cycl. 35.) leaves opposite, elliptic, acuminated, entire; panicles terminal, forked, corymbose, many-flowered; calyx bractless. ♄. S. Native of Guiana. Flowers white.

Corymbose-flowered Ternstrœmia. Tree.

Cult. All the species of this genus will thrive well in a mixture of loam and peat; and ripened cuttings will root in sand under a hand-glass, in heat.

Tribe II.

EURYE'Æ (plants agreeing with *Eurya* in the corolla being monapetalous, and the style being cleft at the apex). Calyx furnished with 2 bracteas at the base, of 5 sepals or 5 lobes. Corolla 5-parted. Anthers adnate. Styles crowned by 3-5 distinct stigmas.

II. ANNESLE'A (in honour of George Annesley, Lord Mountnorris, F. R. and L. S., who collected many plants on his travels in the north of Africa and the south of Europe, while Viscount Valentia.) Wall. pl. rar. asiat. 1. p. 5. t. 5.

Lin. syst. *Polyándria, Monogýnia.* Calyx bibracteolate at the base, profoundly divided into 5 nearly equal lobes, imbricate in æstivation. Corolla monopetalous, 5-cleft, contracted at the throat, with the segments opposite the calycine lobes. Stamens numerous, distinct, erect, inclosed, disposed in a double series on the receptacle. Anthers linear, smooth, adnate, ending in a long point. Style 1, cylindrical, crowned by 3 awl-shaped stigmas. Berry dry, globose, crowned by the calycine lobes, 3-celled; cells 1-3-seeded. Seeds red, hanging from the top of the central placenta, arillate. Embryo replicate, cylindrical, inverted.—A tree with exstipulate, entire, scattered leaves, and axillary, fragrant, ventricose, yellowish-white flowers on long peduncles. This genus approaches *Cleyèra*, from which it differs in the linear, smooth anthers, while in *Cleyèra* they are hispid.

1 A. fra`grans (Wall. l. c.) ♄. S. Native of the East Indies in woods near Moalmeyn, in Martabania. Leaves oblong-lanceolate, obtuse, shining above, pale beneath. Peduncles long, axillary.

Fragrant Anneslea. Fl. Jan. Tree 30 feet.

Cult. A mixture of turfy loam and peat will suit this tree, and ripened cuttings will root in sand under a hand-glass, in heat.

III. GEE`RIA (Geer, the name of some botanist known to Blume?) Blum. bijdr. ex Schlecht. Linnæa. 1. p. 660.

Lin. syst. *Diœ´cia, Polyándria.* Flowers dioecious. Calyx of 5 sepals, furnished with 2 bracteas at the base. Corolla 5-parted, with rounded segments. Male flowers with numerous stamens, adhering to the base of the corolla, and with a sterile ovary. Female flowers with a globose ovary, and 3-5 styles, which are connected at the base, crowned by as many acute stigmas. Berry 5-celled, many-seeded. Seeds in 2 series, fixed to the top of the central axis. Albumen somewhat cartilaginous. Cotyledons flat-convex. This genus comes near to *Eùrya*, but differs in the flowers being dioecious, not polygamous.—Trees or shrubs, with alternate, serrated, exstipulate leaves, and axillary 1-flowered peduncles.

1 G. serra`ta (Blum. l. c.) ultimate branches tomentose; leaves lanceolate, acuminated, puberulous beneath; flowers crowded, axillary; female ones pentagynous. ♄. S. Native of Java.

Var. β, sericea (Blum. l. c. p. 661.) ultimate branches silky; leaves puberulous on the nerves beneath. ♄. S. Native of Java.

Serrated-leaved Geeria. Tree.

2 G. angustifòlia (Blum. l. c.) leaves narrow-lanceolate, acuminated, serrated, silky beneath, as well as the ultimate branchlets; female flowers tri-pentagynous. ♄. S. Native of Java.

Narrow-leaved Geeria. Tree.

3 G. gla`bra (Blum. l. c.) branches smooth; leaves oblong-lanceolate, acuminated, smooth; flowers crowded, axillary. ♄. S. Native of Java.

Smooth Geeria. Tree.

4 G. obova`ta (Blum. l. c.) branches smooth; leaves obovate, entire at the base, retuse, and obtusely serrated at the apex, smooth; flowers few, axillary. ♄. S. Native of Java.

Obovate-leaved Geeria. Tree.

Cult. The species will thrive in a mixture of loam and peat, and ripened cuttings will root in sand under a hand-glass, in a moist heat.

IV. EU`RYA (from *ευρυς, eurys*, large; flowers large.) Thunb. fl. jap. p. 11. Browne, pl. chin. diss. p. 7. D. C. prod. 1. p. 525.

Lin. syst. *Polygàmia, Monœ`cia.* Flowers polygamous. Calyx 5-parted. Petals 5, roundish, somewhat connected at the base. Stamens 12-15, in one series. Anthers smooth, tetragonal. Style 3-5-cleft at the apex. Berry 3-celled, many-seeded. Seeds reticulated.—Asiatic evergreen shrubs, with axillary pedicels and white flowers.

1 E. Japo´nica (Thunb. jap. p. 191. t. 25.) branches smooth; leaves elliptical, acute; flowers axillary. ♄. G. Native of Japan near Nagasaki. Flowers white.

Japan Eurya. Shrub 4 feet.

2 E. Chine´nsis (Brown. l. c. with a figure.) ultimate branches pubescent; leaves oval-cuneated; flowers axillary. ♄. G. Native of China in the province of Kiang-si and Quangtong, in fields and on hills. Lodd. bot. cab. t. 1213. Flowers white.

Chinese Eurya. Fl. Feb. Clt. 1818. Shrub 2 feet.

3 E. multiflòra (D. C. l. c. and prod. 1. p. 525.) branches hairy; leaves elliptical-oblong, acuminate; flowers axillary, disposed along the branches in fascicles, usually beneath the leaves. ♄. G. Native of Nipaul. Flowers white.

Many-flowered Eurya. Clt. 1823. Shrub 4 feet.

4 E. acumina`ta (D. C. l. c. and prod. 1. p. 525.) branchlets villous; leaves elliptical-oblong, acuminate; flowers few, axillary. ♄. G. Native of Nipaul. Flowers white?

Acuminate-leaved Eurya. Shrub 3 feet.

Cult. All the species of *Eùrya* will thrive in a mixture of loam, peat, and sand; and cuttings will root in sand or mould under a hand-glass, in a moderate heat.

Tribe III.

FREZIE`REÆ (plants agreeing with *Frezièria* in the petals being distinct, and in the style being cleft at the apex). D. C. prod. 1. p. 525. Calyx furnished with 2 bracteas at the base. Petals unconnected, alternating with the sepals. Anthers adnate. Style 1. Stigmas 2-5, distinct. Seeds wingless, with fleshy albumen and a somewhat curved embryo.

V. CLEYE`RA (Andrew Cleyer, M. D. a Dutch physician, once resident in Batavia). Thunb. fl. jap. p. 12. D. C. prod. 1. p. 525.

Lin. syst. *Polyándria, Monogýnia.* Calyx 5-sepalled. Petals 5, unconnected. Stamens adhering to the base of the petals. Anthers hispid from retrograde bristles. Style filiform. Stigmas 2-3. Berry dry, 2-3-celled. Shrubs with the habit of *Ternstræ`mia*. All natives of Asia.

1 C. Japo´nica (Thunb. fl. jap. p. 224.) leaves oblong-lanceolate, veinless, serrulated at the apex. ♄. G. Native of Japan near Nagasaki. Kæmpf. amœn. 5. p. 774. icon. Ternstræ`mia Japónica, Thunb. in Lin. soc. trans. 2. p. 335. Flowers white or yellowish.

Japan Cleyera. Clt. 1820. Tree 20 feet.

2 C. ochna`cea (D. C. mem. soc. his. nat. gen. vol. 1. p. 524.) leaves oval-oblong, acute at both extremities, entire, veiny above; peduncles 1-flowered, axillary, solitary or in fours, twice as long as petioles. ♄. G. Native of Japan. Sakàki, Kæmpf. amœn. 777. Banks, icon. Kæmpf. t. 33. Flowers yellow.

Ochnaceous Cleyera. Tree 20 feet.

3 C. ochnoìdes (Wall. mss. in herb. Lin. soc.) leaves coriaceous, oblong, tapering to both ends, smooth, entire, obtuse or acuminate; pedicels solitary or numerous, rising from a short peduncle, drooping. ♄. S. Native of the East Indies. In the specimen we can see no trace of bracteas, and the calyx is 5-lobed, not of 5 sepals. It is therefore probably a distinct genus. Frezièra ochnoìdes, Wall. l. c.

Ochna-like Cleyera. Shrub.

4 C. lu`shia; leaves obovate or elliptical, quite entire, almost veinless, and are as well as branches smooth; peduncles 1-flowered, axillary, solitary, or in fours, smooth, straight, twice as long as petioles. ♄. G. Native of Upper Nipaul at Sirinagur, where it is called *Lushi-swa*. C. ochnàcea.

Var. β Wallichiàna (D. C. prod. 1. p. 524.) Ternstrœ'mia Lùshia, Hamilt. mss. in D.Don, prod. 1. p. 225. Flowers yellow?

Lushia Cleyera. Fl. June. Tree 20 feet.

Cult. The species of *Cleyèra* will thrive well in a mixture of loam, sand, and peat; and ripe cuttings will root in sand under a hand-glass, in heat.

VI. FREZIE'RA (this genus is dedicated by Swartz to A. F. Frezier, a French engineer and traveller in Chili and the South Sea, who published his travels in 1716). Swartz fl. ind. occid. 2. p. 971. D. C. prod. 1. p. 524.—Eròteum, Swartz. prod. p. 85.

Lin. syst. *Polyándria, Monogýnia.* Calyx 5-sepalled. Petals 5, broadest at the base. Filaments free. Anthers smooth, somewhat cordate. Style 3 or 5-cleft at the apex. Berry dry, 3-5-celled; cells many-seeded. American trees, with the habit of *Laùrus.* Pedicels axillary.

1 F. thæoìdes (Swartz, fl. ind. occid. p. 972.) leaves ovate-lanceolate, serrulate-toothed, smooth on both surfaces; pedicels solitary, 1-flowered. ♄. S. Native of the mountains of Jamaica. Eròteum thæoìdes, Swartz. prod. p. 85. Flowers white; anthers yellow.

Tea-like Freziera. Clt. 1818. Tree 40 feet.

2 F. undula'ta (Swartz. fl. ind. occid. p. 974.) leaves elliptical-lanceolate, acuminate, serrated, smooth; flowers axillary, crowded. ♄. S. Native of the Caribbee Islands. Eròteum undulàtum, Swartz, prod. 85. Flowers white.

Waved-leaved Freziera. Tree 50 feet.

3 F. nervòsa (H. et B. pl. equin. 1. p. 31. t. 9.) leaves lanceolate, toothed, smooth above, pubescent beneath; pedicels many, in fascicles. ♄. S. Native of South America in cold parts of the province of Pasto. Flowers white.

Nerved-leaved Freziera. Tree 40 feet.

4 F. serícea (H. B. pl. equin. 1. p. 29. t. 8.) leaves elliptic-lanceolate, acuminated, serrulate, silvery beneath; flowers 2 or 3 together, axillary, sessile. ♄. S. Native of South America between Quito and Popayan. Flowers white.

Silky-leaved Freziera. Tree 40 feet.

5 F. chrysophy'lla (H. B. pl. equin. 1. p. 27. t. 7.) leaves lanceolate-oblong, smooth above, villous beneath from golden silky down; pedicels axillary, few, short. ♄. S. Native of South America about Popayan. Flowers white.

Golden-leaved Freziera. Tree 30 feet.

6 F. cane'scens (H. B. pl. equin. 1. p. 25. t. 6. nov. gen. amer. 5. p. 211. t. 463. f. 2.) leaves elliptic-oblong, serrulated, hoary from down beneath; pedicels 1-2, axillary. ♄. S. Native of the Andes of Peru. Flowers white.

Hoary-leaved Freziera. Tree 30 feet.

7 F. reticula'ta (H. B. pl. equin. 1. p. 23. t 5.) leaves ovate-lanceolate, serrated, downy beneath; pedicels 3-5 together, axillary, fascicled. ♄. S. Native of the Andes of Peru near Almaguer, Flowers white.

Reticulate-leaved Freziera. Tree 40 feet.

Cult. These trees will thrive well in a mixture of sand, loam, and peat; and cuttings will root in sand under a hand-glass, in heat.

VII. LETTSO'MIA (in honour of John Cockley Lettsom, M. D. F.R.S. an English naturalist, who has given a history of the tea-tree, as well as a work on the means of preserving objects of natural history, in 1772). Ruiz et Pav. prod. fl. per. p. 77. t. 14. D. C. prod. 1. p. 525.

Lin. syst. *Polyándria, Monogýnia.* Calyx 7-sepalled. Petals 5-6, overlapping each other at the bottom, inner ones narrowest. Filaments free. Style very short. Stigmas 3-5. Berry 3-5-celled; cells many-seeded.

1 L. tomentòsa (Ruiz et Pav. syst. 134.) leaves lanceolate, quite entire, clothed with silky down beneath; berry 5-celled. ♄. S. Native of Peru in groves. Flowers white.

Downy Lettsomia. Clt. 1823. Shrub 4 feet.

2 L. lana'ta (Ruiz et Pav. syst. p. 135.) leaves lanceolate, obsoletely serrulated, woolly; berry 3-celled. ♄. S. Native of Peru in groves. Flowers white?

Woolly-leaved Lettsomia. Shrub 4 feet.

Cult. Lettsòmia is a genus of beautiful shrubs. The species will thrive well in a mixture of loam and peat; and ripened cuttings will root in sand under a hand-glass, in heat.

Tribe IV.

SAURA'UJEÆ (plants agreeing with *Sauràuja* in important characters). D. C. prod. 1. p. 525. Calyx furnished with 2-3 bracteas. Petals alternating with the sepals, which are more or less connected at their base into a monopetalous corolla. Stamens numerous, monadelphous at the base, adhering to the lower part of the corolla. Anthers inserted by their back, not adnate, opening by 2 pores at the apex. Styles 3-5, distinct from the ovary, but sometimes connected together at the base. Seeds not sufficiently known.

VIII. SAURAU'JA (from Sauraujo, the name of some Portuguese botanist, known to Willdenow). Willd. nov. act. soc. nat. cur. berol. 3. p. 406. t. 4. D. C. prod. 1. p. 525.

Lin. syst. *Polyándria, Tetra-Pentagýnia.* Calyx 5-parted, Petals 5, connected together to their middle. Styles 3-5, sometimes connected at the base. Berry furrowed, filled with a shining pulp, with as many cells as there are styles, many-seeded; seeds minute, angular. Albumen fleshy. Embryo linear, with short cotyledons and an obtuse, terete radicle. American and Asiatic trees and shrubs with the habit of *Laùrus.* Leaves serrated. Flowers of all white, axillary and lateral.

1 S. exce'lsa (Willd. l. c.) leaves oblong-obovate, acutish, quite entire, scabrous above, hairy beneath at the veins; peduncles long, covered with brown hairs, trichotomously-panicled at the apex. ♄. S. Native of South America on wooded mountains in the province of Caraccas.

Tall Saurauja. Fl.? Clt. 1824. Tree 50 feet.

2 S. villòsa (fl. mex. icon. ined. under the name of *Dàvya*) leaves elliptic, acuminated at both ends, serrated from the middle to the top, villous beneath as well as the branchlets and peduncles. ♄. S. Native of Mexico.

Villous Saurauja. Tree 20 feet.

3 S. panicula'ta (Wall. mss. in herb. soc. Lin.) leaves long, oblong-lanceolate, acuminated, with spinose serratures, clothed with rusty tomentum beneath, with the midrib and petioles beset with bristles; peduncles extra-axillary, panicled at the top, shorter than the leaves. ♄. S. Native of the East Indies.

Panicled-flowered Saurauja. Tree.

4 S. serra'ta (Moc. et Sesse, fl. mex. icon. ined. under *Dàvya.* D. C. prod. 1. p. 526.) leaves elliptic, tapering to the base, acute, serrated, smooth; branches, petioles, and peduncles velvety with rusty down. ♄. S. Native of Mexico.

Serrated-leaved Saurauja. Tree?

5 S. Nipaule'nsis (D. C. mem. soc. gen. 1. p. 421.) leaves lanceolate, acuminated, serrated, smooth above, covered with brown down beneath as well as the branchlets; racemes many-flowered, panicled, on long peduncles. ♄. S. Native of Nipaul at Narainhetty, where it is called *Tonshi.* Ternstrœ'mia racemòsa, D. Don, prod. fl. nep. p. 225. Tónshia polypétala and Dillènia racemòsa, Hamilt. mss. Leaves a span long and 2 or 3 inches in breadth.

Nipaul Saurauja. Fl. Aug. Clt. 1824. Tree 30 feet.

6 S. lanceola'ta (D. C. mem. soc. gen. 1. p. 241.) leaves oblong-lanceolate, acuminate, very minutely serrated, adult ones smooth, younger ones furnished with rufous scales at the nerves;

peduncles axillary, about equal in length with the petioles, umbellate at the apex. ♄. S. Native of Java. Vanalphìmia lanceolàta, Lechen, mss.

Lanceolate-leaved Saurauja. Tree.

7 S. nudiflòra (D. C. mem. soc. gen. 1. p. 241.) leaves obovate, rather acute, somewhat serrated, adult ones smooth on both surfaces; peduncles lateral, 1-flowered, solitary. ♄. S. Native of Java.

Naked-flowered Saurauja. Tree.

8 S. bracteola'ta (D. C. l. c.) leaves oval, tapering to both ends, a little serrated, smooth; peduncles lateral, simple, or branched, and furnished with a few minute bracteas. ♄. S. Native of Java.

Bracteolate-peduncled Saurauja. Tree.

9 S. spadi'cea (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 662.) leaves lanceolate, acuminated, serrulated, smooth above but rusty beneath; umbels axillary, crowded, shorter than the petioles; calyx smooth. ♄. S. Native of Java.

Chesnut-coloured-leaved Saurauja. Tree.

10 S. bracteòsa (D. C. l. c.) leaves oval, cordate at the base, a little serrated; peduncles axillary, trichotomous; bracteas oblong, length of pedicels. ♄. S. Native of Java.

Var. β? punctàta (D. C. prod. 1. p. 526.) leaves more serrated, dotted on the upper surface with down.

Large-bracted Saurauja. Tree.

11 S. tri'stYla (D. C. l. c.) leaves elliptic, acutish at both ends, finely serrated, smooth; petioles and pedicels covered with little scales; pedicels axillary, simple, or trifid, disposed in bundles. ♄. S. Native of the Moluccas.

Three-styled Saurauja. Tree.

12 S. gigante'a (Nor. icon. ined. under the name of *Scàpha*. D. C. prod. 1. p. 526.) leaves oval, cordate at the base, acuminated, serrated, brown-velvety beneath; peduncles axillary, trichotomous, almost without bracteas, one-half shorter than the leaves. ♄. S. Native of Java.

Gigantic Saurauja. Tree 50 feet.

13 S. crenula'ta (D. C. l. c.) leaves obovate, cuneated at the base, somewhat acute at the apex, crenulately serrated; peduncles 1-flowered, aggregated on the old branches. ♄. S. Native of Java. Vanalphìmia Djìnote, Lech. mss.

Crenulate-leaved Saurauja. Tree 20 feet.

14 S.? cauliflòra (Nor. icon. ined. under the name of *Scàpha*,) leaves oblong, acuminate, awnedly serrated, smooth above, but clothed with rusty strigose tomentum beneath; pedicels 1-flowered, collected together in bundles on the trunk; calyx smooth. ♄. S. Native of Java on the banks of the river Sudan. Fruit baccate, therefore this plant may be a distinct genus.

Stem-flowering Saurauja. Tree 20 feet.

15 S. Reinwardtia'na (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 662.) leaves elliptic-oblong, acuminated; obtuse at the base, serrulated, rough on the veins, as well as the branches; peduncles axillary, usually solitary, longer than the petioles, umbellately 3-flowered, bracteate; bracteas oblong, lanceolate, leafy; calyx hairy. ♄. S. Native of Java.

Reinwardt's Saurauja. Tree.

16 S. hirsu'ta (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 661. and 662.) leaves oval, acuminated, unequal at the base and rounded, scabrous above, but covered with hispid hairs beneath, as well as the branches and peduncles; peduncles axillary, umbellately 3-flowered, longer than the petioles; bracteas spatulate; calyx hairy. ♄. S. Native of Java.

Hairy Saurauja. Tree 20 feet.

17 S. pe'ndula (Blum. l. c.) leaves oblong, smooth, broadest above, and tapering to the base, with glandular serratures; peduncles axillary, elongated, nodding, 2-3-cleft, much longer than the petioles; pedicels usually 3-flowered, umbellate; calyx smooth. ♄. S. Native of Java.

Pendulous-flowered Saurauja. Tree.

18 S. cunea'ta (Blum. l. c.) leaves cuneated, acute, serrulated above, smooth; peduncles filiform, axillary, solitary, one-half shorter than the leaves, 3-flowered at the apex, bracteolate; calyx smooth. ♄. S. Native of Java.

Cuneated-leaved Saurauja. Tree.

19 S. micra'ntha (Blum. l. c.) leaves oblong, acuminated, acutish or obtuse at the base, serrulated, strigose on both surfaces, as well as branches and peduncles; racemes crowded, axillary, and lateral bracteolate, shorter than the petioles; calyx smooth. ♄. S. Native of Java.

Small-flowered Saurauja. Tree.

20 S. Noronhia'na (Blum. l. c.) leaves oval, acuminate, obtuse at the base, callosely serrated, covered with strigose scales on both surfaces; peduncles axillary, crowded, 1-flowered, nodding; calyx smooth. ♄. S. Native of Java. Petioles and branches strigosely muricated.

Noronha's Saurauja. Tree.

21 S. Blumea'na (Spreng. syst. app. p. 210.) leaves oval, acuminate, cordate at the base, setaceously serrulated, smooth above, but covered with brown villi beneath; younger ones covered with strigose hairs on both surfaces, as well as the petioles and branches; peduncles axillary, trichotomously cymose, shorter than the petioles, bracteate; bracteas broad-lanceolate; calyx hairy. ♄. S. Native of Java. S. gigantèa, Blume, l. c. but not of Noronha.

Blume's Saurauja. Tree.

Cult. Sauraúja is a beautiful genus of trees, with fine leaves, and rather large white flowers. The species will thrive well in a mixture of loam and peat; and ripened cuttings will root in sand under a hand-glass, in heat.

IX. APATE'LIA (from απατηλος, *apatelos*, false. This genus does not differ from *Sauraúja* unless in the disposition of the stamens, which is not always constant). D. C. mem. soc. gen. vol. 1.—Palàva, Ruiz et Pav. prod. fl. per. p. 88. t. 22. but not of Cav.

Lin. syst. *Polyadélphia, Polyándria*. Calyx 5-parted. Petals 5, somewhat joined together at the base. Stamens numerous, disposed in 5 bundles. Anthers bursting by 2 pores at the apex. Stigmas 5. Capsule 5-celled, 5-valved.—Trees with fine leaves, and axillary peduncles bearing white flowers.

1 A. lanceola'ta (Ruiz et Pav. syst. 181. under the name of *Palàva*,) leaves oval-oblong, acuminated at both ends, serrated, rusty beneath; branches, petioles, and peduncles very hairy. ♄. S. Native of Peru in the mountains about Chincao.

Var. β, pedunculàris (D. C. prod. 1. p. 526.) leaves ovate at the base; peduncles 4 times longer than the petioles. ♄. S. Native of Peru.

Lanceolate-leaved Apatelia. Tree 20 feet.

2 A. tomentòsa (H. B. et Kunth, nov. gen. amer. 7. p. 222. t. 650. under the name of *Palàva*,) leaves obovate-lanceolate, sharply toothletted, rough above, clothed with white down beneath, as well as the branchlets; panicles axillary, bracteated. ♄. S. Native of New Granada in the kingdom of Quito near Popayan. Sauraúja tomentòsa, Spreng. syst. app. p. 211.

Downy Apatelia. Tree 30 feet.

3 A. glabra'ta (Ruiz et Pav. syst. 181. under the name of *Palàva*,) leaves oblong, acute, serrulate, almost smooth on both surfaces; branches, petioles, and peduncles covered with small strigose hairs. ♄. S. Native of Muna among weeds.

Smoothish Apatelia. Shrub 4 to 10 feet.

4 A. biserra'ta (Ruiz et Pav. syst. 181. under the name of *Palàva*,) leaves obovate-oblong, doubly serrated; racemes branched; pedicels 3-flowered. ♄. S. Native of Peru in shady places. Sauraúja biserràta, Spreng. syst. app. p. 211.

Twice-serrated-leaved Apatelia. Shrub 12 feet.

5 A. sca'bra (H. B. et Kunth, nov. gen. amer. under *Palàva*, 7. p. 221. t. 648.) branches, panicles, petioles, and calyx setose; leaves cuneate, oblong, denticulated, scabrous. ♄. S. Native of New Grenada. Panicles axillary. Filaments adhering to the base of the petals, but free from each other.

Scabrous Apatelia. Tree 24 feet.

Cult. See *Sauràuja* for cultivation and propagation.

Tribe V.

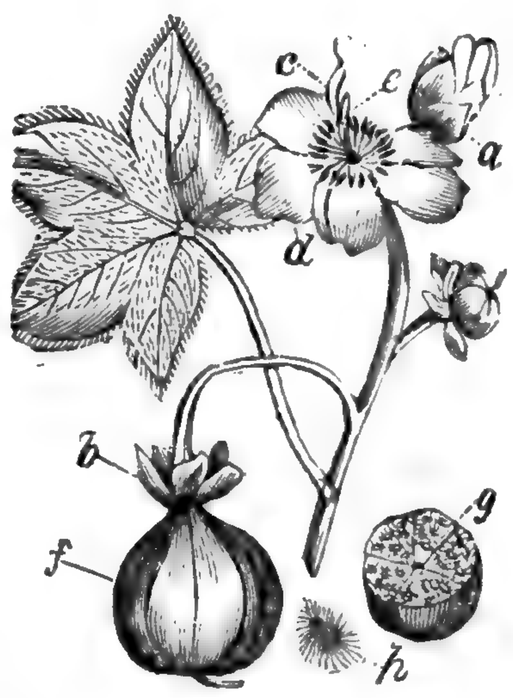
LAPLA'CEÆ (plants agreeing with *Laplàcea* in many important characters). D. C. prod. 1. p. 526.

Calyx bractless, of 3-5 sepals. Petals sometimes exceeding the number of sepals. Stamens numerous, free, or connected at the base; anthers adnate or versatile Styles connected or free. Fruit 3-5-celled. Albumen fleshy or wanting..—The tribe contains elegant trees, with fine leaves, and large shewy flowers.

X. COCHLOSPE'RMUM (from *κοχλω, cochlo*, to twist, and *σπερμα, sperma*, a seed; in allusion to the seeds being rather curved, f. 97. *h*.) Kunth, diss. mal. p. 6. nov. gen. amer. 7. p. 526. D. C. prod. 1. p. 527.

Lin. syst. *Polyándria. Monogýnia.* Calyx of 5, permanent, oval-oblong, blunt, unequal, imbricate sepals (f. 97. *a*.), which at length become reflexed, 2 outer ones smallest (f. 97. *b*.). Petals 5 (f. 97. *d*.), permanent, somewhat ovate, emarginate at the apex, unequal-sided, twisted in the bud. Stamens numerous; filaments filiform, smooth; anthers fixed by the base, linear, 4-sided and 4-celled, opening by a single pore at the apex. Style long, filiform, hooked at the top (f. 97. *c*.). Capsules girded by the permanent calyx, petals, and stamens, ovate-globose, 3-5-celled, 3-5-valved (f. 97. *f*.). Valves bearing incomplete dissepiments in the middle. Seeds numerous, somewhat cochleate or kidney-shaped (f. 97. *h. g*.), covered with wool. Albumen fleshy. Embryo slender, with the radicle at the sharpest end of the seed pointing towards the hylum; cotyledons entire, incumbent.—Trees or shrubs, with alternate, stipulate, lobed leaves, with the petioles jointed at the base. Flowers large, yellow, panicled, with the peduncles articulated at the base.

FIG. 97.



1 C. gossy'pium (D. C. prod. 1. p. 527.) lobes of leaves 5, very entire. ♄. S. Native of the East Indies. Bómbax grandiflòrum, Sonn. voy. ind. 2. p. 235. t. 133. Bómbax gossýpium, Lin. syst. 517. Cav. diss. 5. p. 297. t. 157. Bòmbax Cóngo, Burm. ind. 145. Leaves almost like those of *Gossýpium religiòsum*, tomentose beneath. Flowers large, yellow. (f. 97.).

Cotton-like Cochlospermum. Clt. 1822. Tree 50 feet.

2 C. Orinoce'nse (Mart. fl. bras. 1. p. 83.) lobes of leaves 5-7, digitate, smooth, entire. ♄. S. Native of New Spain. Bómbax Orinocénse, H. B. et Kunth, nov. gen. amer. 5. p. 234. Flowers large, yellow.

Orinoca Cochlospermum. Clt. 1820. Tree 20 feet.

3 C. insi'gne (St. Hil. pl. usu. bras. no. 57.) leaves coriaceous, palmately 5-lobed; lobes conduplicate, coarsely, sharply, and doubly serrated, adult ones smooth. ♄. S. Native of Brazil in the provinces of Minas Novas and Minas Geraes. Flowers large, yellow. Maximiliàna règia, Mart. et Schrank, bot. zeit. regensb. 1819. p. 452. Wittelsbáchia insígnis, Mart. fl. bras. 1. p. 81. t. 55. C. hibiscoìdes, H. B. et Kunth, nov. gen. amer. 7. p. 223. C. serratifòlium, D. C. prod. 1. p. 527. Bómbax hibiscifòlium, Willd. herb. In Brazil this plant is called *Butua do Curvo*, where a decoction of the roots are used against internal pain, especially that which is the result of falls or other accidents; this decoction will cure an abscess although of considerable standing.

Shewy Cochlospermum. Fl. May, Sept. Tree 30 feet.

4 C. vitifòlium (Spreng. syst. app. p. 206.) lobes of leaves crenate-serrated, smooth on both surfaces. ♄. S. Native of New Spain. Bómbax vitifòlium, Willd. enum. p. 720. Wittelsbáchia vitifòlia, Mart. nov. gen. 1. p. 83. Flowers large, yellow.

Vine-leaved Cochlospermum. Clt. 1820. Tree 30 feet.

Cult. *Cochlospérmum* is a genus of magnificent trees. The species thrive well in a mixture of loam and peat. Cuttings should not be too ripe, and they should be taken off at a joint, and if planted in sand they will root freely under a hand-glass, in a moist heat. Plants raised from seeds make finer trees.

XI. LAPLA'CEA (in honour of Marquis La Place, the celebrated French mathematician). H. B. et Kunth, nov. gen. amer. 5. p. 207. t. 461. D. C. prod. 1. p. 527. Hæmochàris, Sal.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 4 or 5 deciduous, rather orbicular, concave, imbricate, unequal sepals. Petals 5-9, free, but unequal-sided, twisted in the bud. Stamens numerous, disposed in 3 rows, adnate to the base of the petals in *L. speciòsa*, but free in the rest; anthers versatile, 2-celled, bursting lengthwise behind. Ovary sessile, 5-7-celled; cells 3-seeded. Styles 5-7, joined into 1 or free. Capsules woody, 5-7-celled, 5-7-valved from the top to the middle; central column thick, bearing the seeds. Seeds oblong, pendulous, ending in a wing. Albumen wanting. Embryo linear, straight, with a short, superior radicle, and ovate, entire cotyledons.—Trees or shrubs; leaves scattered, exstipulate, entire, coriaceous, with the petioles articulated at the base. Flowers axillary, solitary, bractless, with the peduncles jointed at the base.

1 L. speciòsa (H. B. et Kunth, l. c.) leaves oblong, quite entire, coriaceous, smooth; flowers large, axillary, solitary, on peduncles; styles 5, connate; capsule 5-valved, 5-celled. ♄. S. Native of South America between Gonzana and Loxa. Flowers large, white, very shewy. Petals 9.

Shewy Laplacea. Tree 20 feet.

2 L. semiserra'ta (St. Hil. fl. bras. 1. p. 306.) leaves lanceolate, dentately-serrated, glabrous; calyx and corolla silky on the outside; styles free. ♄. S. Native of Brazil in the provinces of Rio Janeiro and Minas Geraes. Hæmochàris semiserràta, Mart. et Zucc. fl. bras. 1. p. 107. t. 66. Wikstrœ'mia fruticòsa, Schrad. in gœtt. anz. 1821. p. 710. Lindlèya, Nees in bot. zeit. 1821. p. 299. Petals 5-8, white, unequal-sided. Styles 5-7, crowned by bifid stigmas. Capsule 5-7-valved from the top to the middle.

Var. β, acuminàta (St. Hil. l. c. p. 301.) leaves lanceolate, acuminated, sharply serrated, very narrow at the base, cuneated, longer than the petioles. Province of St. Paul.

Half-serrated-leaved Laplacea. Fl. year. Tree 30 feet.

3 L. hæmato'xylon; leaves ovate, acuminated, serrated; styles 5, distinct; fruit oblong, somewhat pentagonal; pedicels very thick, short; petals 5. ♄. S. Native of Jamaica. Gordònia hæmatóxylon, Swartz, fl. ind. occ. 2. p. 1199. Flowers white to flesh-coloured.

Red-wooded Laplacea. Tree 16 feet.

4 L. tomentòsa; leaves obovate, unequal-sided, nearly entire, smooth above, but tomentose beneath; flowers terminal, solitary; petals 5. ♄. S. Native of Brazil in the province of St. Paul. Hæmochàris tomentòsa, Mart. fl. bras. 1. p. 106. t. 67. Flowers white. Styles 5, free. Capsule 5-celled.

Tomentose-leaved Laplacea. Fl. Dec. Shrub 10 feet.

Cult. *Laplàcea* is a very shewy genus of small trees. They will thrive well in a mixture of loam and peat; and ripened cuttings will root in sand under a hand-glass, in a moderate heat.

XII. BONNE'TIA (in honour of Charles Bonnet, a French naturalist; he wrote some botanical papers in 1754.) Mart. et Zucc. fl. bras. 1. p. 115. t. 100. but not of Schreb.

Lin. syst. *Polyándria, Monogýnia.* Calyx permanent, 5-parted, imbricate. Petals 5, equal, free, but unequal-sided, twisted in æstivation. Stamens indefinite, smooth, free, filiform, permanent; anthers fixed above the base, 2-celled, each cell opening by a pore at the base. Style trifid at the apex, each lobe terminated by a peculiar kind of stigma. Capsule girded round the base by the permanent calyx and stamens, 3-celled, 3-valved; valves bent in at the edges so much as to constitute dissepiments, central column awl-shaped, placentiferous, each placenta opposite the valves. Seeds numerous, linear. Integument thin, drawn out at both ends.—Elegant middle-sized trees or shrubs. Leaves scattered, exstipulate, coriaceous, entire, 1-nerved, marked with transverse veins, with the petioles articulated at the base. Flowers large, terminal; peduncles 1 or many-flowered, articulated at the base.

1 B. a'nceps (Mart. fl. bras. 1. p. 115. t. 100. B) leaves obovate-oblong, on short petioles, smooth; peduncles axillary, 3-flowered; pedicels involucrated at the base. ♄. S. Native of Brazil in the province of Rio Janeiro in sandy places. Petals white, mixed with rose-colour, smooth.

Two-edged Bonnetia. Fl. Sept. Shrub 2 to 3 feet (St. Hil.) Tree 16 feet (Mart.).

2 B. venulòsa (Mart. fl. bras. 1. p. 115. t. 100. A.) leaves oblong, bluntish, veiny beneath, on short petioles; flowers in racemes; seeds erect. ♄. S. Native of Brazil in the province of Bahia. Flowers white. Leaves tapering to the base.

Veiny-leaved Bonnetia. Tree.

3 B. stri'cta (Nees et Mart. in nov. act. bonn. 12. p. 87. t. 6.) leaves alternate, nearly sessile, obovate, obtuse or acutish, coriaceous, shining; peduncles axillary and terminal, somewhat corymbose at the tops of the branches, 3-flowered. ♄. S. Native of Brazil between Cabo Frio and Lagoa Feia, and the river Parahiba, in marshy places. Kisèria stricta, Mart. in regensb. bot. zeit. Jahrg. p. 298. Calyx with 3 bracteas under the flower.

Straight Bonnetia. Shrub 8 feet.

Cult. See *Laplàcea* for cultivation and propagation.

XIII. MAHU'REA (Mahuri is the name of the tree in Guiana). Aubl. guian. 1. p. 558.

Lin. syst. *Monadélphia, Polyándria.* Sepals 5. Petals 5, equal. Stamens numerous, connected at the base. Anthers adnate, 2-celled, bursting lengthwise. Style 1. Stigma 3-4-lobed. Capsule conical, 3-valved, bent in at the margins. Seeds numerous, linear, winged at both ends, attached to the angles of the central column.—Trees, with alternate leaves. Flowers disposed in racemes, purplish.

1 M. palu'stris (Aubl. guian. 1. p. 558. t. 222.) flowers hardly the diameter of an inch; anthers adnate, minute; leaves oblong-coriaceous. ♄. S. Native of Guiana in marshes. Bonnètia meridionàlis, Swartz. B. palústris, Vahl. Flowers terminal, racemose, purplish. Leaves entire, full of pellucid dots.

Marsh Mahurea. Tree 15 feet.

2 M. speciòsa (Chois. mss. in D. C. prod. 1. p. 558.) flowers yellow, 2 inches in diameter; anthers elongated, tetragonal, furrowed, fixed by the base; leaves oblong-lanceolate; racemes axillary. ♄. S. Native of the island of St. Martha. M. racemòsa, Balbis, mss.

Shewy Mahurea. Tree 12 feet.

Cult. See *Laplàcea* for cultivation and propagation.

XIV. MARI'LA (from *μαριλη, marile,* live embers or sparks; in allusion to the sparkling yellow fringe round the seed, or the transparent dots and lines on the leaves). Swartz, prod. 84. D. C. prod. 1. p. 558.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 4 cross sepals, the 2 outer ones involving the flower. Corolla of 4-5 petals. Stamens very numerous, somewhat connected at the base; anthers adnate, 2-celled, bursting lengthwise. Style 1, short, crowned by a capitate 4-5-lobed stigma. Fruit columnar, crowned by the permanent style, 3-4-celled, 3-4-valved; valves bent inwards at the margins so much as to form dissepiments, with the placentas opposite the valves. Seeds very numerous, girded by a yellow fringed margin. Leaves entire, full of pellucid dots.

1. M. racemòsa (Swartz, prod. p. 88.) leaves opposite, oblong-lanceolate, veined; racemes axillary. ♄. S. Native of the Caribbee islands. Flowers yellow or greenish-white.

Racemose-flowered Marila. Tree 15 feet.

Cult. This tree will thrive well in a mixture of loam, sand, and peat; and half-ripened cuttings will root if planted in a pot of sand, and a hand-glass placed over them, in heat.

XV. VENTENA'TIA (in honour of E. P. Ventenat, a French botanist, author of Choix de Plantes cultivées par Cels, and the Jardin de la Malmaison, in 1803.) P. Beauv. fl. d'ow. et de Ben. 1. t. 17. D. C. prod. 1. p. 527.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 3, concave, (f. 98. *a.*), deciduous sepals. Petals 11-12 (f. 98. *c.*), oblong, tapering to the base, blunt, spreading. Stamens numerous, free; anthers oblong, 2-celled, adnate, bursting lengthwise. Ovary ovate (f. 98. *d.*). Style longer than the stamens. Berry ovate-globose, furrowed longitudinally, 5-celled, cells many-seeded (f. 98. *e.*). Seeds unknown, therefore the place which this plant should occupy in the natural system is uncertain. Calyx imbricate, not valvate, on this account this genus is removed from *Tiliàceæ*.

1 V. glau ca (P. Beauv. l. c.) ♄. S. Native of the western coast of Africa, in the kingdom of Benin. A small tree, with exstipulate, stalked, ovate, acuminate, glaucous, feather-nerved leaves. Flowers scarlet, about the size of those of a species of *Gordònia*.

FIG. 98.

Glaucous-leaved Ventenatia. Shrub 10 feet.

Cult. *Ventenàtia* is a very fine shrub, bearing very ornamental scarlet flowers. It may probably thrive well in a mixture of loam and peat; and cuttings will perhaps root in sand under a hand-glass, in a moist heat.

XVI. CARAI'PA (Caraipe is the name of one of the species in Guiana). Aubl. guian. 1. p. 56. t. 223.

Lin. syst. *Polyándria, Monogýnia.* Calyx inferior, 5-parted. Corolla of 5 unequal-sided petals. Stamens indefinite, free or somewhat connected at the base. Style simple, crowned by a 3-lobed stigma. Capsule 3-celled, 3-valved, bearing the seeds on the large, ligneous, central, trigonal, 3-winged placenta. Seeds subsolitary, compressed. Albumen wanting.—Middle-sized trees, with stalked, opposite, and alternate, simple, exstipulate, coriaceous, entire leaves, and terminal racemes or panicles of white flowers.

1 C. paniculà'ta (Mart. fl. bras. 1. p. 104. t. 64.) leaves opposite, oblong, acute, smooth above; petioles and peduncles rusty-tomentose; flowers panicled; petals tomentose on the outside. ♄. S. Native of Brazil near the bar of the Rio Negro. Petals white. The anthers in all are versatile.

Panicled-flowered Caraipa. Fl. Oct. Tree 23 feet.

2 C. glabra'ta (Mart. fl. bras. 1. p. 105. t. 65.) leaves alternate, oblong, acuminated, tapering to the base, glaucescent beneath; flowers racemose. ♄. S. Native of Brazil in the province of Rio Negro. Corolla white.

Smooth Caraipa. Tree 30 feet.

3 C. densifòlia (Mart. fl. bras. 1. p. 105. t. 65. fruit only,) leaves alternate, ovate, oblong, bluntly cuspidate, rounded at the base, smooth on both surfaces, glaucous beneath; flowers racemose. ♄. S. Native of Brazil in the province of Rio Negro on the banks of the river Solimoes near Ega.

Dense-leaved Caraipa. Tree 20 feet.

4 C. grandiflòra (Mart. fl. bras. 1. p. 106.) leaves alternate, very long, oblong-lanceolate, cuspidate, acutish at the base, shining above, glaucous beneath; flowers racemose. ♄. S. Gathered with the last. Flowers white.

Great-flowered Caraipa. Tree 20 feet.

5 C. parvifòlia (Aubl. guian. 1. p. 561. t. 223. f. 1.) leaves alternate, ovate, acute, tomentose beneath and whitish; flowers racemose; ovary villous. ♄. S. Native of Guiana. This tree is called *Manche-haches* by the Creoles in Guiana, who consider the wood to be the best for making handles to hatchets and axes. Flowers white, small.

Small-leaved Caraipa. Tree 20 feet.

6 C. longifòlia (Aubl. guian. 1. p. 561. t. 223. f. 2.) leaves alternate, ovate-oblong, acute, hoary beneath; flowers racemose; ovary tomentose. ♄. S. Native of Guiana.

Long-leaved Caraipa. Tree 20 feet.

7 C. Richardia'na (Cambess. in mem. mus. 16. p. 414. t. 3.) leaves alternate, oblong, usually with a short and blunt acumen, quite smooth; flowers corymbose, pedicellate; ovary smooth. ♄. S. Native of Guiana. Flowers white and rose-coloured.

Richard's Caraipa. Fl. May. Shrub 6 to 12 feet.

8 C. racemòsa (Rich. herb. Cambess. l. c. p. 415.) leaves alternate, oblong, very blunt, and very smooth; flowers racemose, almost sessile; ovary tomentose. ♄. S. Native of Guiana. Petals tomentose.

Racemose-flowered Caraipa. Tree 20 to 30 feet.

9 C. varia'bilis (Cambess. in mem. mus. 16. p. 416.) leaves alternate, oblong-lanceolate, narrowed at both ends, usually acuminated, smooth; flowers few, panicled or racemose, pedicellate; ovary tomentose. ♄. S. Native of Guiana. Petals clothed on the outside with refuscent tomentum.

Variable Caraipa. Tree 20 feet.

10 C. fasciula'ta (Rich. herb. Cambess. l. c. p. 417.) leaves alternate, elliptic, acuminated, quite smooth; flowers few, panicled, pedicellate; ovary tomentose. ♄. S. Native of Guiana.

Fascicled Caraipa. Tree 20 feet?

11 C. angustifòlia (Aubl. guian. 1. p. 562. t. 224. f. 4.) leaves alternate, long, ovate, acuminated, clothed with white tomentum beneath; flowers racemose; ovary tomentose. ♄. S. Native of Guiana.

Narrow-leaved Caraipa. Tree 20 feet.

12 C. latifòlia (Aubl. guian. 1. p. 561. t. 224. f. 3.) leaves broad, ovate, acuminated, cinereous beneath; flowers racemose; ovary tomentose. ♄. S. Native of Guiana. Leaves alternate.

Broad-leaved Caraipa. Tree 20 feet.

Cult. The species of *Caraìpa* will no doubt thrive well in a mixture of loam and sand; and cuttings with their ends ripened will root in sand under a hand-glass, in heat.

XVII. KIELMEYE'RA (from C. F. D. Kielmeyer, Counsellor of State to the King of Wurtemberg, a patron of botany). Mart. et Zucc. fl. bras. 1. p. 112. St. Hil. fl. bras. 1. p. 303.

Lin. syst. *Polyándria, Monogýnia.* Calyx permanent, bract-less, 5-parted, imbricate, 2 outer leaflets smallest. Petals 5, free, equal, unequal-sided, twisted in the bud. Stamens numerous, free, rarely connected at the base, filiform. Anthers fixed by the back, oblong, 2-celled, bursting lengthwise inwards. Style simple, crowned by 3 free or connate stigmas, and appearing as if the style was trifid. Capsule 3-celled, 3-valved; valves bent in at the margins so much as to constitute dissepiments. Central column awl-shaped, placentiferous, each placenta opposite the valves. Seeds oblong, girded by a membranous margin extended at both ends. Integument thin. Albumen wanting. Embryo straight, flat, with a minute radicle pointing towards the umbilicus, and large kidney-shaped cotyledons.—Trees or shrubs, full of resinous juice. Leaves scattered, exstipulate, usually crowded at the tops of the branches, coriaceous, entire, 1-nerved, and marked with feathered veins; petioles jointed at the base. Flowers large, axillary, and terminal, usually at the tops of the branches among the shorter leaves, or appearing in corymbs, or racemes, rarely in panicles, in consequence of the upper leaves being absent. Peduncles bracteate, articulated at the base.

1 K. speciòsa (St. Hil. fl. bras. 1. p. 304. pl. usu. bras. no. 58.) stem arboreous; leaves oblong, somewhat elliptical, obtuse, puberulous beneath on the nerves; flowers racemose; calycine segments ovate, obtuse, tomentose, nearly equal. ♄. S. Native of Brazil in the province of Minas Geraes, where it is called *Malva do Campo, Folha Santa,* and *Pinhao,* and where a decoction of the leaves is employed to prepare emollient baths. Petals white or flesh-coloured.

Shewy Kielmeyera. Fl. April. Tree 20 feet.

2 K. falca'ta (St. Hil. fl. bras. 1. p. 304.) stem arboreous; leaves oblong-subelliptic, somewhat falcate, puberulous; flowers racemose; calycine segments ovate, acuminated, puberulous, nearly equal. ♄. S. Native of Brazil in the province of St. Paul. Petals flesh-coloured. A small twisted tree.

Falcate-leaved Kielmeyera. Fl. Oct. Tree 15 feet.

3 K. coria'cea (Mart. fl. bras. 1. p. 112. t. 70.) shrubby; leaves spatulate, glaucescent, glabrous; flowers racemose; sepals ovate, acute, tomentose, nearly equal. ♄. S. Native of Brazil in the province of Minas Geraes. A small twisted shrub, abounding in yellow juice. Petals flesh-coloured.

Coriaceous-leaved Kielmeyera. Fl. Aug. Shrub 3 to 4 feet.

4 K. rubriflòra (St. Hil. fl. bras. 1. p. 305.) stem suffruticose, simple; leaves oblong-subelliptic, obtuse; puberulous beneath; flowers corymbose; sepals ovate, puberulous, nearly equal. ♄. S. Native of Brazil in the province of Minas Geraes. Petals obovate-oblong, obliquely truncate at the apex, red.

Red-flowered Kielmeyera. Fl. May. Shrub 1½ foot.

5 K. ròsea (Mart. fl. bras. 1. p. 110. t. 68.) stem shrubby, branched; leaves lanceolate, very smooth, pale beneath; flowers corymbose; sepals ovate-roundish, nearly equal. ♄. S. Native of Brazil in the province of Minas Geraes. Petals obovate, rose-coloured.

Rose-coloured-flowered Kielmeyera. Fl. Feb. Sh. 3 to 4 ft.

6 K. neriifòlia (St. Hil. fl. bras. 1, p. 306.) stem shrubby, simple; leaves long, lanceolate, quite smooth; flowers racemose or panicled; sepals ovate, acute, puberulous, nearly equal. ♄. S. Native of Brazil in the provinces of Minas Geraes and Minas Novas. Petals obovate, rose or flesh-coloured.

Oleander-leaved Kielmeyera. Fl. May. Shrub 2 to 3 feet.

7 K. corymbòsa (Mart. fl. bras. 1. p. 113. t. 72.) stem shrubby, simple; leaves obovate-oblong, very blunt, and quite smooth; flowers panicled; sepals ovate-lanceolate, ciliated, nearly equal. ♄. S. Native of Brazil in the province of Goyaz near Villa Boa. Petals obovate, rather retuse, red.

Var. β, pauciflòra (St. Hil. fl. bras. 1. p. 307.) branches naked above; panicle few-flowered. In the province of Minas Geraes.

Corymbose-flowered Kielmeyera. Fl. July. Shrub 3 to 4 ft.

8 K. HUMIFU'SA (St. Hil. fl. bras. 1. p. 307. t. 63.) stem suffruticose, trailing; leaves ovate-elliptic, densely puberulous beneath; flowers racemose; sepals ovate, puberulous, nearly equal. ♄. S. Native of Brazil in the province of Minas Geraes near Tejuco. Stems numerous from the root, 1 foot high, rather trailing. Petals obovate, rose-coloured, smooth, but rather ciliated on the margin.

Trailing Kielmeyera. Fl. Sept. Shrub ½ to 1 foot.

9 K. TOMENTÒSA (St. Hil. fl. bras. 1. p. 308. t. 61.) shrubby; leaves elliptic, obtuse, tomentose beneath; flowers corymbose; sepals ovate, tomentose, nearly equal. ♄. S. Native of Brazil in the province of Minas Geraes at a place commonly called Bosa. Petals obovate-oblong, white, tomentose beneath.

Tomentose Kielmeyera. Shrub 2 to 4 feet.

10 K. EXCE'LSA (St. Hil. fl. bras. 1. p. 308.) arboreous; leaves oblong-subelliptic, obtuse, quite smooth; flowers racemose; sepals ovate, smooth, nearly equal. ♄. S. Native of Brazil near Rio Janeiro. Petals obovate, smooth, white.

Tall Kielmeyera. Fl. June. Tree 60 feet.

11 K. PETIOLA'RIS (Mart. fl. bras. 1. p. 111. t. 69.) stem arboreous or shrubby; leaves oblong, subelliptic, obtuse, quite smooth; flowers corymbose or racemose; sepals roundish, smooth, unequal. ♄. S. Native of Brazil in the province of Minas Geraes near Villa Rica. Petals obcordate, white.

Petiolar Kielmeyera. Fl. Feb. Shrub 3 to 4 feet.

12 K. VARIA'BILIS (Mart. fl. bras. 1. p. 112. t. 71.) stem shrubby, simple; leaves ovate or obovate, very obtuse, quite smooth; flowers racemose or subsolitary; sepals ovate-roundish, smooth, unequal. ♄. S. Native of Brazil in the province of Minas Geraes. Petals obovate-oblong, white, and smooth.

Variable Kielmeyera. Fl. Feb. Shrub 1 to 2 feet.

Cult. This is a beautiful genus of shrubs, with fine leaves and elegant flowers. The species will thrive well in a mixture of turfy loam and sand; and ripened cuttings will root in sand under a hand-glass, in heat. None of them have yet been introduced to the gardens.

XVIII. ARCHITÆ'A (in honour of Archyta, an ancient philosopher of Tarento). Mart. fl. bras. 1. p. 117.

Lin. syst. *Polyadélphia, Polyándria.* Calyx 5-parted, permanent. Petals 5. Stamens numerous, collected into 5 bundles at the base. Anthers 2-celled, didymous, bursting lengthwise. Style simple, permanent. Capsule 5-celled, incompletely 5-valved, opening at the base, but connate at the apex. Seeds linear, rather winged, inserted in the central pentagonal column.—A shrub, with the habit of *Bonnètia*. Leaves in fascicles, feather-nerved.

1 A. TRIFLÒRA (Mart. fl. bras. 1. p. 117. t. 73.) leaves in fascicles, nearly sessile, obovately-lanceolate, acuminated, acutish; peduncles terminal, 3-flowered. ♄. S. Native of Brazil.

Three-flowered Architæa. Tree 15 feet.

Cult. A mixture of loam and peat will answer this tree well; and cuttings which are ripened at the bottom will root in sand under a hand-glass, in heat.

XIX. GODO'YA (in honour of Emmanuel Godoy, Duke of Arcadia, commonly called Prince of Peace, on account of his having concluded the peace between France and Spain, after the war of the revolution. This genus has been dedicated to him as a protector of botany). Ruiz et Pav. fl. per. prod. p. 101.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 5 or many sepals, imbricate in æstivation. Petals 5, convolute in æstivation. Stamens definite or indefinite, disposed in many series, outer series sterile, free or in 5 bundles, inner series of 10-40 free fertile stamens. Anthers long, opening by 2 pores behind. Style simple, crowned by a 3-5-angled stigma. Capsule 3-5-valved, 3-5-celled; valves bent inwards at the edges, constituting the dissepiments; cells many-seeded. Seeds imbricate, winged.—Trees, with alternate, stalked, entire, or subserrulated, coriaceous leaves, which are finely ribbed, and racemes of yellow flowers.

1 G. GEMINIFLÒRA (Mart. fl. bras. 1. p. 119. t. 74.) leaves oblong, bluntish, obsoletely serrulated; racemes axillary or terminal, compound, elongated; calyx of 10 sepals; stamens about 40. ♄. S. Native of Brazil in the province of Rio Negro.

Twin-flowered Godoya. Clt. 1829. Tree 20 feet.

2 G. SPATULA'TA (Ruiz et Pav. l. c. p. 102.) leaves spatulate, crenated; calyx 5-sepalled; stamens about 40. ♄. S. Native of Peru in groves at Cuchero and Chinchao.

Spatulate-leaved Godoya. Tree 20 feet.

3 G. OBOVA'TA (Ruiz et Pav. l. c.) leaves ovate, elliptical, crenated; calyx 5-sepalled; stamens about 10. ♄. S. Native of Peru at Cuchero. Wood hard.

Obovate-leaved Godoya. Tree 30 feet.

Cult. These are elegant trees, worth cultivating; they will thrive well in a mixture of sandy loam and peat; and ripened cuttings will root freely in sand under a hand-glass, in heat.

Tribe VI.

GORDONIE'Æ (plants agreeing with *Gordònia* in many important characters). D. C. prod. 1. p. 527. Calyx of 5 free or connected sepals (f. 99. *a.*). Stamens numerous, with filiform filaments, which are connected together at the base (f. 99. *d.*), and oscillatory oval anthers. Carpels 5, more or less joined together at the base (f. 99. *c.*). Styles 5, distinct, and connected together at the base, or sometimes almost to the apex (f. 99. *f.*), with an equal number of stigmas (f. 99. *f.*). Carpels capsular, 1-2-seeded, sometimes almost distinct, sometimes closely joined together into 1 capsule (f. 99. *c.*), sometimes with a dissepiment in the middle of each valve. Seeds few. Albumen wanting. Embryo straight, with an oblong radicle, and leafy cotyledons which are plaited lengthwise, and with an inconspicuous plumule. American and Asiatic trees and shrubs with alternate oval or oblong, entire or toothed, feather-nerved exstipulate leaves, which are usually deciduous. The flowers resemble those of *Camèllia* on the one hand and *Cydònia* on the other. This tribe was formerly confused with *Malvàceæ* and *Tiliàceæ*, from their plaited, wrinkled cotyledons, but it is more nearly allied to *Ternstræmiàceæ* on account of the calyx being imbricate, not valvate in æstivation, and in the absence of stipulas.

XX. MALACHODE'NDRON (from μαλαχος, *malachos*, soft, and δενδρον, *dendron*, a tree). Cav. diss. 5. p. 502. f. 2. Juss. gen. 275. D. C. prod. 1. p. 528.

Lin. syst. *Monadélphia, Polyándria.* Calyx 5-cleft, furnished with 2 bracteas at the base. Petals 5, with a crenulate limb. Ovary 5-furrowed. Styles 5, unconnected. Stigmas capitate. Carpels 5, capsular, connected, 1-seeded. Seeds unknown.

1 M. OVA'TUM (Cav. l. c.). ♄. H. Native of the mountains of Virginia, Carolina, and Georgia. Lindl. bot. reg. 1104. Stuártia pentágynia, Lher. stirp. nov. 1. p. 155. t. 74. Smith, exot. bot. t. 101. Leaves ovate, acuminated. Flowers axillary, solitary, almost sessile. Petals waved, cut, of a pale-cream colour. This is an elegant tree.

Ovate-leaved Malachodendron. Fl. Aug. Sept. Clt. 1785. Tree 20 feet.

Cult. This beautiful deciduous shrub, whose large flowers are of a cream-colour, deserves a place in the collection of every admirer of ornamental shrubs. Although it is sufficiently hardy to bear the winters in Britain in the open air, yet the young shoots often get injured in winter, the summer not being long

enough to ripen the wood, or flower it in perfection; it is therefore better to keep it as a greenhouse plant. Peat soil, mixed with a little loam, suits it best; and it is readily encreased by layers, and ripened cuttings will root in sand, under a hand-glass.

XXI. STUA'RTIA (in honour of John Stuart, Marquis of Bute, once a distinguished patron of botany). Cav. diss. 5. p. 393. t. 159. f. 2. D. C. prod. 1. p. 528.

Lin. syst. *Monadélphia, Polyándria.* Calyx permanent, 5-cleft, rarely 5-parted, furnished with 2 bracteas at the base. Petals 5. Ovary roundish. Style 1, filiform, crowned by a capitate 5-lobed stigma. Capsule woody, 5-celled, 5-valved; cells 1-2-seeded. Seeds wingless, ovate, even. A shrub with deciduous leaves.

1 S. Virgi'nica (Cav. l. c.). ♄. H. Native of North America in swamps in the lower counties of Virginia and Carolina. S. malachodéndron, Lin. spec. 982. Lher. stirp. rar. 1. t. 73. Lam. ill. t. 593. S. Marilándica, Andr. bot. rep. t. 397 or 73. Duh. arb. 2. t. 78. Flowers large, white, with purple filaments and blue anthers, usually in pairs. Leaves ovate, acute. Petals entire.

Virginian Stuartia. Fl. July, Sept. Clt. 1742. Sh. 6 to 8 ft.

Cult. This beautiful shrub deserves to be cultivated in every collection of ornamental shrubs. For treatment and cultivation see *Malachodéndron.*

XXII. GORDO'NIA (in honour of Alexander Gordon, a celebrated nurseryman at mile-end near London, who lived in the time of Philip Miller). Ellis in phil. trans. 1770. Cav. diss. 307. D. C. prod. 1. p. 528.

Lin. syst. *Monadélphia, Polyándria.* Calyx of 5 rounded, coriaceous sepals (f. 99. *a.*). Petals 5, somewhat adnate to the urceolus of the stamens (f. 99. *d.*). Style crowned by a peltate 5-lobed stigma (f. 99. *f.*). Capsules 5-celled, 5-valved (f. 99. *c.*); cells 2-4-seeded. Seeds ending in a leafy wing, fixed to the central column, filiform. Trees with the appearance of *Gordònia.*

Sect. I. Lasia'nthus (from λασιος, *lasios*, wool, and ανθος, *anthos*, a flower; calyx covered with silky wool). D. C. prod. 1. p. 528. Petals somewhat connected at the base. Stamens almost disposed in five bundles. Style 1.

1 G. lasia'nthus (Lin. mant. 570.) pedicels axillary, usually shorter than the leaves; leaves oblong-coriaceous, smooth, serrated; calyx silky; capsules conoid, acuminated. ♄. H. Native of North America in cedar swamps near the sea-coast, from Virginia to Florida, where it is called *Loblolly-bay.* Cav. diss. 6. t. 161. Sims, bot. mag. t. 668. Hypéricum lasiánthus, Lin. spec. 1101. Catesb. carol. 1. t. 44.—Pluk. amalth. t. 352. This is a beautiful small evergreen tree with white flowers, about the size of those of a single rose. (f. 99.)

FIG. 99.

Loblolly-bay or *Woolly-flowered* Gordonia. Fl. Aug. Oct. Clt. 1739. Tree 14 feet.

2 G. Chilau'nea (Hamilt. mss. in D. Don, prod. fl. nep. p. 225.) pedicels axillary, elongated, hardly longer than the petioles; leaves elliptical, acute, veiny, quite entire, pubescent beneath; calyx a little ciliated; petals entire. ♄. G. Native of Nipaul at Suembu, where it is called *Chilaune-swa.* G. Wallichii, D. C. prod. 1. p. 528. Leaves 3-4 inches broad. Bud of flower globose, and girded by the short calyx. Flowers white. A small evergreen tree.

Chilaune Gordonia. Fl. May. Tree 14 feet.

3 G. exce'lsa (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 663.) leaves oblong-lanceolate, acuminated at both ends, serrulated; peduncles axillary, solitary, 1-flowered, shorter than the leaves. ♄. S. Native of Java. Schìma excélsa, Reinw. cat. pl. hort. bot. Buitenz. p. 80. In a specimen gathered by Blume on Mount Burangrang in Java, the ovary was constantly 4-celled, and the stigma peltate, 4-lobed.

Tall Gordonia. Tree 30 feet.

Sect. II. Lacathe'a (from λα, *la*, very, and καθημαι, *cathemai*, to sit; application not evident). Salisb. D. C. prod. 1. p. 528. Petals connected at the base. Filaments free. Style 1.

4 G. pube'scens (Pursh, fl. amer. sept. 2. p. 451.) flowers almost sessile; leaves obovate-lanceolate, pubescent beneath, somewhat serrated, membranaceous; petals and sepals rather silky on the outside; capsules spherical. ♄. H. Native of North America in Georgia on the banks of the Alatamaha, near Fort Barrington; also in South Carolina. Lois. herb. amat. t. 236. Lacathèa flórida, Sal. par. lond. t. 56. This is a beautiful tree, whose large white flowers and yellow anthers have a most agreeable appearance.

Var. α, velutìna (D. C. prod. 1. p. 528.) leaves oblong, velvety beneath. G. pubéscens, Lher. stirp. p. 156. Vent. malm. t. 1. Cav. diss. 6. t. 162. Franklìnia Americàna, Marsh. arb. 48.

Var. β, subglàbra (D. C. prod. 1. p. 528.) leaves obovate-oblong, smoothish beneath. G. Franklìni, Lher. stirp. 1. p. 156. Franklìnia Alatámaha, Marsh. arb. 48. Flowers fragrant.

Pubescent Gordonia. Fl. Aug. Sept. Clt. 1774. Tr. 20 ft.

Cult. Gordònia is a genus of elegant trees and shrubs, whose large beautiful white flowers make a very agreeable appearance. For cultivation and treatment see *Malachodéndron.* The *G. excélsa,* being a native of Java, will require to be kept in a stove, and ripened cuttings will root in sand under a hand-glass, in heat.

XXIII. BLU'MEA (in honour of C. L. Blume, M. D. for a long time resident in Java, author of several works on Java plants). Spreng. syst. 5. p. 12. no. 2461.

Lin. syst. *Monadélphia, Polyándria.* Calyx 5-parted, unequal. Petals 5, obovate, fugacious. Anthers almost sessile, disposed in a ring around the style. Style 5-cleft at the apex. Capsule 5-celled; cells many-seeded. Seeds winged?

1 B. Java'nica (Spreng. syst. 3. p. 126.). ♄. S. Native of Java. Reinwárdtia Javánica, Blume. Leaves oblong, serrulated, smooth; peduncles 3-flowered. Flowers large, yellow.

Java Blumea. Tree 30 feet.

Cult. A mixture of loam and peat will suit this tree, and ripened cuttings will root in sand under a hand-glass, in heat.

XXIV. SCHI'MA (probably from σχισμα, *schisma*, a fissure; in allusion to the valves of the capsule only being cleft half-way down). Reinwardt, Blum. bijdr. ex Schlecht. Linnæa. 1. p. 662.

Lin. syst. *Monadélphia, Polyándria.* Calyx 5-cleft, permanent. Petals 5, adnate to the urceolus of the stamens, as well as being connected together at the base, unequal, one of which is cucullate. Style crowned by a peltate, 5-lobed stigma. Capsule globose, 5-celled, half 5-valved; valves woody, with a dissepiment in the middle of each. Central receptacle capitate. Seeds 1-2 in each cell, elongated into a leafy wing at the apex.

This genus comes near to *Gordònia*, but differs in the structure of the calyx and capsule.

1 S. Noro'nhæ (Blum. l. c.) leaves oblong-lanceolate, acuminated, entire; peduncles axillary, solitary, 1-flowered at the extremity of the branches. ♄. S. Native of Java.

Var. β, undulàta; leaves waved. ♄. S. Native of Java.

Noronha's Schima. Tree.

Cult. This tree will thrive well in a mixture of loam and sand, and ripened cuttings taken off at a joint will root freely if planted in sand under a hand-glass, in heat.

XXV. POLY'SPORA (πολυς, *polys*, many, and σπορα, *spora*, a seed; many in capsule). Sweet, hort. brit. p. 61.

Lin. syst. *Monadélphia, Polyándria.* Calyx girded by accessory bracteas. Sepals and petals 5. Stamens numerous, monadelphous at the base. Style crowned by a 4-5-lobed stigma. Capsule conical, 5-celled, 5-valved, many-seeded. Seeds imbricate, ending in a wing. A shrub with smooth, obovate, entire leaves, and axillary, solitary, almost sessile flowers.

1 P. axilla'ris (Sweet, l. c.). ♄. S. Native of Pulo-Pinang. Camèllia axillàris, Roxb. ex Ker. bot. reg. t. 349. Sims, bot. mag. t. 2047. Gordònia anómala, Spreng. syst. 3. p. 126. Leaves obovate-oblong, serrulated, upper ones quite entire. Flowers of a yellowish-white colour, about the size of those of *Camèllia Sasánqua*, solitary, almost sessile, usually axillary. Styles 4, and hardly unconnected at the apex.

Axillary-flowered Polyspora. Fl. Nov. to Mar. Clt. 1816. Shrub 3 feet.

Cult. This shrub will thrive well in a mixture of loam and peat; and cuttings not too much ripened will root in sand, under a hand-glass, in heat, or it may be grafted on the single red *Camèllia Japónica*.

Tribe VII.

CAMELLIE'Æ. D. C. theor. elem. ed. 1. 1813. Feb. as an order. Theàcea, Mirb. bull. phil. Dec. 1813. as an order. Calyx of 5-9 sepals, inner ones largest and concave, deciduous. Petals 5-7-9, alternating with the sepals when the same number, sometimes they are connected at the base. Stamens numerous, filiform, separated into many bundles at the base, but usually monadelphous. Anthers ellipsoid, roundish, versatile. Ovary ovate-roundish, crowned by 3-5 filiform styles, which are connected at the base. Capsule 3-5-celled, 3-5-valved; valves sometimes with dissepiments in the middle, sometimes so much bent in at the margins as to form dissepiments. Seeds large, few, fixed to the margins of the central placenta. Albumen wanting. Embryo with large, thick, oily cotyledons, and as if they were jointed at the base, and an obtuse, short, radicle, pointing to the hilum, and a hardly evident plumule. Smooth evergreen trees or shrubs, inhabitants of the colder parts of Asia, China, Japan, &c. Flowers axillary, very shewy, red, white, or striped.

XXVI. CAME'LLIA (in honour of George Joseph Camellus or Kamel, a Moravian Jesuit and traveller in Asia. He wrote a history of the plants of the isle of Luzon, which is inserted in the 3d vol. of John Ray's Historia Plantarum). Lin. gen. no. 848. D. C. prod. 1. p. 529.

Lin. syst. *Monadélphia, Polyándria.* Calyx imbricate, surrounded by accessory bracteas or sepals. Stamens monadelphous. Anthers elliptical, 2-celled, bursting lengthwise. Capsule furrowed, with a dissepiment in the middle of each valve, separating from the free triquetrous axis when ripe. Cells 1-2-seeded. Elegant evergreen trees or shrubs, with coriaceous, dark-green, shining leaves, and large flowers, resembling the rose, of various hues.

1 C. Japo'nica (Lin. spec. 982.) leaves ovate, acuminate, acutely serrated; flowers axillary, sessile, usually solitary; ovary smooth. ♄. G. Native of Japan and China. Cav. diss. 6. t. 160. Jacq. icon. rar. 3. t. 553. Duh. ed nov. t. 71. Andr. bot. rep. t. 25. Lodd. bot. cab. t. 329. and 455. Lois. herb. amat. t. 43, 44, 45, and 46. Curt. bot. mag. t. 42. This plant, in its native country, grows to a large tree. It is in high esteem among the Japanese and Chinese for the elegance of its large flowers, which exhibit a great variety of colours, but have no scent, and for its evergreen leaves. It is very common everywhere in the groves and gardens, flowering from October to April. It varies with white, red, yellowish, purple flowers, and variegated and blotched with the same colours, from single to semidouble and double. It is the greatest ornament of the greenhouses of Europe in spring, and is now cultivated by nurserymen to a vast extent. The plant was cultivated in England before 1742 by Robert James Lord Petre.

The varieties at present cultivated in England are as follows:

Varieties of Camèllia Japónica which have been introduced from China.

α *álba-plèna.* Double white Camellia. Clt. 1792. The flowers are pure white, from 3 to 4 inches in diameter, the petals being disposed in circles from the circumference to the centre, and lying particularly flat and even one above another. Andr. bot. rep. p. 25. Lodd. bot. cab. 269.

β *fimbriàta.* Fringed white Camellia. Clt. 1816. The flowers are double, white; the petals are fringed. Lodd. bot. cab. 1103.

γ *variegàta.* Double striped Camellia. Clt. 1792. The flowers of a fine dark rose of red-colour, irregularly blotched with white, whilst those which appear in the spring are generally plain red. They are 3 or 4 inches in expansion. The outer petals are about $1\frac{1}{2}$ inch in diameter, roundish cordate, thick and fleshy at the base, and sometimes a little divided at the apex. When the flowers are fully expanded they become recurved. The centre petals are often small, narrow, and upright, confusedly arranged, many of them being disposed in tufts, with small parcels of stamina intermixed. Some flowers are particularly handsome and as double as a rose. Andr. bot. rep. t. 91. Lodd. bot. cab. 329.

δ *rùbro-plèna.* Double red Camellia. Old Red and Greville's Red. Clt. 1794. The flowers are 3 or $3\frac{1}{2}$ inches in diameter. They are of a crimson-red colour, and resemble the flowers of a double *Hibíscus*. The petals are numerous, of an irregular shape, comparatively long and narrow, pointed, and veined. They are curled on the margins, gradually diminishing in size towards the centre. Andr. bot. rep. t. 199. Lodd. bot. cab. 397.

ε *incarnàta.* Lady Hume's Blush Camellia or Buff Camellia. Clt. 1806. The flowers open very regularly 3 or $3\frac{1}{2}$ inches in diameter, of a fine glowing blush-colour, becoming richer as they expand; the outer petals are a good deal recurved, they gradually diminish in size towards the centre, and are pointed. In general they are evenly arranged and laid over each other. Ker. bot. reg. 112. Andr. bot. rep. 660. f. 1. Lodd. bot. cab. 140.

ζ *anemonefl̀ora.* Waratah Camellia or Blush Waratah Camellia or Anemone-flowered Camellia. Clt. 1739. The flowers are remarkably shewy, and resemble a double anemone. They are about 3 or 4 inches in diameter, of a deep-red colour. The outer petals expand quite flat, roundish-cordate, surrounding a great number of smaller ones, regularly disposed and rising upright in the centre, each of them are roundish-cordate, and slightly marked with veins of a deeper colour. Those in the centre of the flower are of a peculiar form, being small and fleshy at the base, and broad and thin towards the point, with

a very minute white tip, they are compactly arranged in rows from the circumference to the centre, which is considerably elevated about the outer petals, and each incurved towards the styles, with their edges turned outwards. Sims, bot. mag. 1654. Lodd. bot. cab. 537.

η crassinérvis. Mr. Kent's Camellia. Clt. 1820. This kind is very like the *Waratah.* The only difference appears to be that in the flowers of this the outer petals are paler and more cupped and the leaves are thinner and rounder. It was formerly known under the name of *Kent Hexangular.* Lodd. bot. cab. 1475.

θ myrtifòlia. Myrtle-leaved Camellia. Clt. 1808. The flowers are large in proportion to the plant, about 3 inches in diameter, and are freely produced. On their first opening they appear to be of a deep rose-colour, but when expanded become paler. The petals are numerous and regularly arranged over each other, forming a peculiar nice compact flower, faintly veined with red. The outer petals are of a roundish form, always darker in colour than the interior ones, an inch broad, at length becoming recurved. The inner petals are much smaller, and pointed, at first they are erect and closely set together, so that the centre of the flower is considerably elevated; they afterwards expand almost flat. Sims, bot. mag. 1670. Lodd. bot. cab. 354.

ι hexangulàris. Hexangular-flowered Camellia. This variety is no less remarkable for the regular disposition of its petals, than for the peculiar elegance of its flowers. This plant is only known by the Chinese drawings in the possession of the Horticultural Society. It has not yet been introduced. The preceding variety usually goes under that name in the gardens.

κ involùta. Lady Long's Camellia. Clt. 1820. It agrees precisely in character with the *myrtle-leaved*, but differs in being more erect and of stronger growth, and in having all the petals involute instead of spreading, but this is not permanent, as the petals are sometimes inflexed. Ker. bot. 633.

λ *variábilis.* Various-flowered Camellia. Clt. 1816. This is remarkable for producing more than 4 different coloured flowers upon the same plant, red, white, and blush varieties of the *pæony-flowered* and the *Pompone.*

μ Pompònia. The Kew Blush Camellia. Clt. 1810. The flowers of this variety are very delicate, and measure, when full expanded, 4 inches in diameter. They consist of 10 or 12 roundish-cordate outer petals, arranged in 2 rows round a great number of smaller ones that rise in the centre, in an erect, irregular mass, the outer petals spread open and become almost flat, they are sometimes entire, but usually indented and undulated. Their colour is pure white, excepting for about a third of their length, nearest the base, which is deeply tinged with red, as well as a small stripe up the centre. Ker. bot. reg. 22. Lodd. bot. cab. 596.

ν pæoniflòra ròsea. Red Pæony-flowered Camellia. Clt. 1810. Andr. bot. rep. 660. Lodd. bot. cab. 238.

ο pæoniflòra pállida. Blush Pæony-flowered Camellia. Clt. 1820.

π pæoniflòra álba. White Pæony-flowered Camellia. Clt. 1810.

These three last varieties are in every respect the same as the *Pompone.* The only difference appears to be in the colour of the flowers. That of the first is of a bright rose or red-colour, marked with darker veins. The second is intermediate in the colour between the last-mentioned and the *Pompone*, being darker than the *Pompone*, yet not so dark as the *Red Pæony-flowered.* The whole of the petals are veined and of a deep blush-colour, excepting the edges, which are nearly white. The third variety is generally cultivated under the name of *White Waratah* or *White Anemone-flowered* and *White Pompone.* The flowers are exactly the same as the *Pompone*, excepting that they are pure white, and have not the blush tinge at the base of the petals.

ρ semidùplex. Semi-double Red Camellia. Clt. 1808. The plant is not easily distinguished from Middlemist's Red Camellia, unless when in flower. The flowers consist of from 6-12 large roundish petals in a single or double series, round the column of stamina, and expanding to $2\frac{1}{2}$ inches in diameter; they are generally concave, and all marked with veins that are darker than the uniform rich rose-colour of the flowers. The stamens rise erect, they are transformed into small, roundish, ligulated petals, slightly divided at the apex, and striped with white in the same manner as Middlemist's Red, but not so large nor are the petals so numerous. It has been impregnated with the pollen of the single white, and some excellent varieties have been raised from the seed by Mr. Press, the gardener to Edward Gray, Esq. at Harringay House, Hornsey. Andr. bot. rep. 559.

ς atrorùbens. Loddiges's Red Camellia. Clt. 1809. The flowers are generally middle-sized, and seldom exceed 3 inches in diameter. They are very striking at a distance, appearing scarlet. The outer petals are of a thick substance, roundish, oblong, with the edges sometimes notched and slightly undulated. The whole are ranged in a double or triple series, and are faintly marked with darker veins. The centre of the flower is filled with small petals, confusedly mixed together, varying a good deal both in size and form, each are incurved and have a white tip, sometimes elongated, ligulate petals rise out from amongst them, intermediate in shape between the outer and inner petals, of a paler colour, arranged in a cluster overtopping the others. The flower is usually neat and shewy. Lodd. bot. cab. 170.

τ Welbánkii. Welbank's White Camellia. Clt. 1820. This variety is called *luteo-albicans* in bot. reg. 708. also *flavéscens* and White Moutan Camellia. The flowers are of a yellowish-white colour, and do not open freely, about $3\frac{1}{2}$ inches in diameter. The petals are not arranged in any sort of order, so that the flower has a confused appearance, the outer ones are of a roundish form, much undulated, and but very little recurved or divided at the extremity. The centre petals are of an irregular shape, sometimes they approach to those of the *Pompone*, but are often twisted and arranged in tufts with several parcels of imperfect stamens intermixed among them. The flower is upon the whole rather delicate, and has been compared to those of *Gardènia flórida.*

υ ròsea. Le Blanc's Red Camellia. Clt. 1821. This, though not so shewy as many other varieties, is nevertheless desirable, from producing its flowers both early and abundantly. The flowers, when expanded, measure about $2\frac{1}{2}$ inches in diameter, of a pale-rose colour approaching that of the Myrtle-leaved. The flower has sometimes the appearance of a small moss rose, but generally the outer petals expand nearly flat, they are roundish-cordate, and sometimes have a faint green stripe down the centre. The whole of the petals are nearly of the same form, being evenly arranged, diminishing gradually in size to the centre, but not so full of petals as some other varieties.

χ *speciòsa.* Rawes's Variegated Waratah. Clt. 1824. The flowers of this variety are extremely handsome, and of a deeper red than either the *atrorùbens* or *Waratah.* They open very regularly, and when expanded are usually 4 inches in diameter. The outer petals 10-12 or more, a little cordate, but generally rounded, a little recurved and faintly veined, disposed in 2 or 3 series, with a few unequal blotches of white appearing on some of them near the edges, above these there is another row of small incurved thick petals, which rise upright, and become

larger the nearer they approach the centre; from these proceed 8 or 10 petals, nearly as large as those at the extremity, and surround another set of small incurved petals, thus having the appearance of two flowers, one formed in the centre of the other; nearly the whole of the petals have a little white stripe at their base, and some will even be variegated; all are tipped with white in the same manner as those of the *Waratah*.

ω *cárnea*. Middlemist's Red Camellia. Clt. 1808. This variety is also known under the name of Rose-coloured Camellia. The flowers are similar in colour to the semi-double red but larger. The outer petals are roundish-cordate, arranged in circles over each other, they are not numerous, although the flowers may be said to be more than semi-double. The centre petals are short, and vary in form, generally they are roundish and a little twisted, as well as marked with dark-coloured veins, and all of them have more or less a small white-coloured stripe down their centre. The stamens are at times perfect, but usually changed into petals, and the whole altogether resemble a full-blown rose. Ker. bot. reg. 22. Andr. bot. rep. 660. f. 1.

α α *imbricàta*. Crimson Shell Camellia. Clt. 1827. This is without doubt the best variety that has been brought from China. The flowers are upwards of $3\frac{1}{2}$ inches in diameter, and very regular in form, the petals being arranged one above another, and gradually diminishing in size towards the centre, exactly in the manner of the Double White. The colour is of a fine crimson-red and remarkably shewy. When the flowers first begin to open they are concave, but as they expand they become quite flat. The outer petals are nearly round. The centre petals are rather pointed and rise upright.

β β *Párksii*. Park's Striped Rose Camellia. Clt. 1824. This differs from the common striped. The flowers open well, and measure 4 inches in diameter. They are of a bright rose-colour, irregularly striped or blotched with white. The outer petals are very large, slightly cordate, occasionally having a fringed edge. Those towards the centre are irregular in their form, partly twisted and disposed in a similar manner to those of the Common Striped, giving the whole flower the same confused appearance, and shewing a few imperfect stamens in the hollows formed by the twists of the petals. It is upon the whole a very handsome variety. It possesses a slight but pleasant scent, which has also been remarked in the Myrtle-leaved.

γ γ *Sabiniàna*. Sabine's White Camellia. Clt. 1824. The flowers are pure white, 3 inches in expansion, and resemble in their form those of the *Pompone*. The outer petals are disposed in 2 series and spread nearly flat, about 20 in number; they are round, and but a very little cordate. Those towards the centre of the flower are small and narrow, confusedly arranged, like the centre petals of Walbank's White, and rise nearly upright, a few of them are small and incurved, with their sides compressed so as almost to have a tubular appearance. In the centre of the flower several small parcels of stamina sometimes appear, but they are not always discernible, unless closely examined.

To these 24 varieties may be added the Semi-double White and Rose-coloured Waratah, which have been ascertained to be different from any of those described above. The first was purchased on the Continent in 1822 by Mr. Palmer. The second was introduced from China by the Horticultural Society in 1824, neither of which has yet produced perfect flowers in the gardens.

N.B. There are numerous other names for varieties known by gardeners, but they appear to be all synonymous with those described above unless they are seedling varieties.

* * *Names of seedling varieties which have been raised in the gardens of Britain.*

1 *Colvíllii* (Sweet, fl. gard. n. s. with a figure). Colvill's Striped Camellia. An elegant hybrid, with the petals regularly disposed, blotched with white on a red ground.

2 *Rósa Sinénsis* (Lodd. bot. cab. 1455.). China Rose Camellia. Flowers red.

3 *Aitóni* (Chandl. cam. 3.). Aiton's Large Single Red.

4 *althæiflóra* (Chandl. cam. 4.). Hollyhock-flowered. Flowers red.

5 *corállina* (Chandl. cam. 5.). Coral-flowered.

6 *insígnis* (Chandl. cam. 6.). Splendid Red.

6 *flórida* (Chandl. cam. 7.). Florid Red.

8 *anemoneflóra-álba* (Chandl. cam. 8.). White Anemone-flowered Camellia.

9 *Chandlèri* (Chandl. cam. 1-2.). Chandler's Striped Waratah.

10 *punctàta*. Gray's spotted. Flowers pink spotted with white.

11 *Rósa múndi*. The Rose of the World. Flowers white and crimson.

12 *Préssii*. Presse's Single Red.

13 *eclípsis*. Presse's Eclipse. White and red.

14 *rúbro-punctàta*. Single Red Spotted. Flowers white spotted with red.

Common or *Japan* Camellia. Fl. Feb. May. Clt. 1739. Tree 20 feet.

2 C. reticula'ta (Lindl. bot. reg. t. 1078. Hook, bot. mag. t. 2784.) leaves oblong, acuminated, serrated, flat, reticulated; flowers axillary, solitary; calyx 5-leaved, coloured; ovary silky. ♄. G. Native of China. A splendid species, distinguished from *C. Japónica* in the strongly reticulated leaves, and in the silky ovarium. The flowers are large and elegant, containing from 17-18 petals, which are loosely arrayed, wavy, and generally entire, they are of a clear bright purple, darker towards the base and paler towards the edges; stamens irregularly monadelphous, in several bundles; ovary 2-4-celled; style 2-4-cleft.

Reticulated-leaved or Captain Rawes's Camellia. Fl. Feb. May. Clt. 1824. Shrub 10 feet.

3 C. maliflòra (Lindl. bot. reg. 1078. in a note) leaves obovate, convex, bluntly serrated; flowers terminal and axillary, usually solitary; branches and petioles pubescent; ovary smooth. ♄. G. Native of China. C. Sasánqua flòre-plèno, Ker. bot. reg. vol. 7. t. 549. Sims, bot. mag. 2080. An elegant species with small semidouble red flowers.

Apple-flowered Camellia. Fl. Jan. May. Clt. 1816. Sh. 8 ft.

4 C. Sasa'nqua (Thunb. fl. jap. p. 273. t. 30.) leaves ovate-oblong, serrated; flowers terminal and axillary solitary; branches and ovary villous. ♄. G. Native of Japan and China. Sasánqua, Kæmpf. amœn. 853. Staunt. icon. chin. 2. p. 466, with a figure. This is a tree of middling size, with much smaller leaves and flowers than *C. Japónica*. The leaves dried in the shade have a sweet smell; a decoction of them is used by the women in Japan to wash their hair with, and they are mixed with tea to give it a grateful odour; indeed they are hardly to be distinguished from the leaves of that plant. The flowers vary from single to semi-double and double, white. This plant is also cultivated to a great extent by nurserymen on account of the fragrance and elegance of its flowers.

Var. α; semidouble white. Ker, bot. reg. t. 12.

Var. β; double white. Ker, bot. reg. t. 1091.

Sasanqua or Lady Bank's Camellia. Fl. Jan. May. Clt. 1811. Tree 10 feet.

5 C. Ki'ssi (Wall. asiat. res. 13. p. 429.) leaves elliptical, serrulated, bluntly acuminate; flowers sessile, generally solitary, axillary, and somewhat terminal, usually 4-petalled, and with 3 distinct, furrowed, woolly styles, which are about equal in length to the stamens. ♄. G. Native of Nipaul at Narainhetty, where it flowers in September, and where it is called

Kengna by the inhabitants. C. Keìna, Hamil. mss. in D. Don, prod. fl. nep. p. 924. This species is very like *C. Sasánqua*. The flowers are white and fragrant. It is called in the Newar language *Kissi* or *Kissi-swa*. The leaves of this shrub have a very strong but transient smell of tea, but their infusion possesses only to a very slight degree its flavour, owing perhaps, as Mr. Gardner justly observes, to the defective manner of gathering and drying them for the trials which he instituted. It has also been ascertained by Mr. Gardner that the Nipaulese extract an oil from the seed of the *Kissi* by pressure, which is much valued by them as a medicine.

Kissi Camellia. Fl. Dec. to May. Clt. 1823. Shrub 7 feet.

6 C. oleífera (Abel. chin. p. 174. with a figure;) leaves elliptic-oblong, acute, serrated, coriaceous, shining; flowers solitary; calyxes silky, deciduous; petals 5-6, 2-lobed. ♄. G. Native of China. Lodd. bot. cab. 1065. This plant resembles the two preceding species. The flowers are very numerous, white, and fragrant. The Chinese extract an oil from the seed by pressure, which is in very general use in the domestic economy of China. The seeds are white, and are as well as those of any other species, reduced to a coarse powder, which is stewed or boiled in bags, and then pressed, when the oil is yielded. Dr. Abel, trav. 176.—Ker, bot. reg. 492.

Oil-bearing Camellia. Fl. Nov. Shrub 6 to 8 feet.

7 C. drupífera (Lour. coch. 2. p. 499.) leaves ovate-oblong, somewhat crenated; flowers terminal in twos or threes, 8-petalled; drupe 4-celled. ♄. G. Native of Cochin-China, where it is also cultivated. The flowers are probably white. The inhabitants of Cochin-china extract an oil from the seed by pressure, which is used by them to anoint their hair, and for various medical purposes; it has a pleasant odour, and does not easily become rancid. It will perhaps prove a distinct genus from *Caméllia*, as well as the following species.

Drupe-bearing Camellia. Tree 10 feet.

8 C. euryoìdes (Lindl. bot. reg. t. 983.) leaves ovate-lanceolate, acuminate, serrated, silky beneath; branches hairy; peduncles lateral, 1-flowered, scaly. ♄. G. Native of China. Lodd. bot. cab. 1493. Thèa euryoìdes, Booth in hort. trans. Flowers white.

Eurya-like Camellia. Fl. May, July. Clt. 1822. Shrub 4 ft.

Cult. All the species of *Caméllia* are universally admired by every collector of plants, on account of their beautiful rose-like flowers, and elegant, dark-green, shining, laurel-like leaves. They are very hardy green-house plants, and are easy of culture, requiring only to be sheltered from severe frost. The best soil for them is an equal quantity of good sandy loam and peat. Messrs. Loddiges find that light loam alone answers as well or better, and in the Comte de Vandes gardens at Bayswater rotten dung is mixed with loam and peat. The pots should be well drained with pieces of potsherds, that they may not get soddened with too much wet, as nothing injures them more than overwatering, particularly when they are not in a growing state. When growing freely, they can scarcely have too much, and they should be watered all over the leaves with a fine rose pot. They are readily increased by cuttings or inarching on the commoner kinds. The cuttings should be taken off at a joint as soon as they are ripened, and planted in sand under a hand-glass, where they will soon strike root; when this is the case, they should be planted singly into small pots, and set in a close frame, and they must afterwards be hardened to the air by degrees. (Sweet.)

The single red *Caméllia Japónica* is propagated by cuttings or layers and seed for stocks, and on these the other kinds are generally inarched or budded. Henderson, ot Wood-hall near Hamilton, puts in cuttings at any time of the year, except when they are making young wood; lets them remain in a vinery for a month or more, and then puts them in a hot-bed, where there is a little bottom heat. A speedy mode of obtaining stocks is by planting stools in a pit devoted to that purpose, and laying them in autumn; the following autumn most of the layers will be rooted, when they may be taken off and potted, and used as stocks the succeeding spring. Inarching or grafting is performed early in the spring, when the plants begin to grow; the chief care requisite is so to place and fix the pot containing the stock, as that it may not be disturbed during the connection of the scion with the parent plant. The graft being clayed over is then covered with moss to prevent its cracking. When independent grafting is used, the mode called side grafting is generally used, and the operation of tongueing is generally omitted. A few seeds are sometimes obtained from the single and semi-double kinds; these require 2 years to come up, but they make the best stocks of any, but the seedlings are usually allowed to come into flower before they are grafted upon, in case some new variety should be produced, but the best cultivators cross-impregnate the blossoms by cutting off the stamens before the anthers burst, and when the stigma is in a perfect state, dusting it with the pollen of the kind intended for the male parent. *C. Sasánqua* seeds most readily, and is often employed as the female parent for raising new varieties. The plants so raised from seed, if well treated, flower in 4 or 5 years, and if nothing new is produced they still make excellent stocks. Henderson of Wood-hall, who is one of the most successful growers of *Camélliας* in Scotland, uses the following compost: equal parts of light-brown mould, river sand and peat earth, and a little rotten leaves, mixed well together; and when the camellias require shifting put some broken coal-char in the bottom of the pots, and some dry moss or *Hýpnum* over it. (Cal. mem. 3. p. 316.)

Camélliας have the best effect, and are grown to most advantage, in a house entirely devoted to them. Such a house should be rather high than otherwise, as the plants never look so well as when 6 or 8 feet high, trained in a conic form, and clothed with branches from the root upwards. The plants should be raised near to the glass by means of a stage, which should be so contrived that as they advance in height it may be lowered in proportion; only the very best crown or patent glass should be used, because it is found that the least inequality of surface or thickness of material, so operates on the sun's rays as to concentrate them, and burn or produce blotches on the leaves.

To grow *Camélliας* in perfection considerable care is requisite. The roots are apt to get matted, so as after a time to render them impervious to water. Hence frequent attention should be paid to see that the water poured on the pots moistens all the earth equally, and does not pass by the sides and leave the middle or principal part dry. When the plants are in a growing state they require to be liberally watered, and to have a greater degree of heat than that which is usually given to green-house plants. If this heat and watering is not given in November and December, the plants will not expand their blossoms freely, neither will vigorous shoots be supplied after the blossoming is over. To form handsome plants they should be trained with single stems to rods, and pruned so as to make them throw out side branches from every part of the stem; to encourage this, the plants should not be set too close together on the stage. In summer the plants should be set out of doors on a stratum of scoria or on pavement, in a sheltered but open situation, or the glass roof may be taken off. Some kinds do very well if planted out in a green-house conservatory. The single and double red *Camélliа* will endure the open air when trained against a south wall, and protected by mats in winter. Henderson, of Wood-hall, gives the following account of his mode of treating *Camélliας*: "The best time for a regular shifting of the *Camélliа* is the month of February and beginning of March. After shifting all those that require it, put them into a peach-house, vinery or pinery, or in

the warmest part of a green-house. They will soon begin to make young wood. From the time they begin to make their young shoots till they have finished their growth give them plenty of water. They may be kept in the vinery or peach-house until they have formed their flower-buds, when a few of them may be removed to a colder place, such as behind the stage of a green-house, for the *Camélliias* are fond of being shaded during strong sunshine. In three or four weeks after, a few more of the *Camélliias* may be brought out of the peach-house, and put into a colder situation. This may be repeated three or four times, which will make as many different successions of flowering. Those that are wanted to come into flower early may remain in the warm house until they are beginning to flower, when they should be taken to a cold place, as the coldest place in the green-house, then give them plenty of light only, and they will open their flowers well, and stand long. A *Camélliia* cannot stand heat when in flower, indeed they seldom open their flowers well when in heat, at all events the flowers soon fall off. Those that are kept all the summer in the vinery will come into flower by the 1st or middle of October, and a pretty large plant, having perhaps 50 or 100 flower-buds, will continue in flower till the month of January. Those plants that are removed early from the vinery will now be in flower, to succeed those that were in flower in October, and have now done flowering. These last should be immediately taken into the heat; they will make their young wood early, and they may remain in heat till they come into flower, which will perhaps be a month earlier next year. By attending to shifting the *Camellia* plants from the warm-house to the cold, a regular succession of flowers may be had from the first of October to the middle of July."

The plants produce better flowers from November to April than in the summer months, although they are sometimes to be had all the year round. *Camélliias* delight to be kept damp all the summer months, and a little shaded from the strong sun. Give them plenty of water all the time they are making their young shoots; they may also get a gentle sprinkling over the leaves once every week during the summer months, except when they are in flower. *Camélliias* will stand a great deal of cold and heat without being much injured, but they will not form many flower-buds without some artificial heat.

XXVII. THE'A (altered from *Tcha*, the Chinese name for tea). Lin. gen. no. 668. D. C. prod. 1. p. 530.

Lin. syst. *Monadélphia, Polyándria.* Calyx of 5 sepals. Petals 5-9, disposed in 2 or 3 rows, cohering at the very base. Stamens almost unconnected to the very base. Anthers roundish. Style trifid at the apex. Capsules 3-berried or 3-seeded; the dissepiments are formed from the edges of the valves being bent inwards. (Gært. fruct t. 95.)—Beautiful evergreen shrubs, with shining laurel-like leaves, and largish, white, axillary, stalked flowers.

1 T. ví'ridis (Lin. spec. 735.) leaves elliptic-oblong, serrated, 3 times longer than broad; flowers of 5-sepals, and 5-7-petals, axillary, solitary, erect; fruit nodding, dehiscent. ♄. F. Native of China and Japan. Letts. mon. t. 1.—Black. herb. t. 351. (but with the flower red.) T. Bohèa stricta, Ait. hort. kew. ed. 2. vol. 3. p. 303. T. Chinénsis, Sims, bot. mag. t. 998. T. Chinénsis, var. α víridis, D. C. prod. 1. p. 530. Camélliia víridis, Link. enum. 2. p. 73. Thèa Cantonénsis, Lour. coch. p. 339. —Lodd. bot. cab. 227.—Woodv. med. bot. suppl. 116. t. 256. Leaves pale-green. Flowers spreading, white, fragrant.

All the different kinds of teas brought to this country from China are the produce of *Thèa víridis*, and the whole differences depend upon soil and climate, and the different ages and periods at which their leaves are gathered, and different modes of drying. Dr. Lettsom observes, that a green-tea planted in the Bohea-tea country will produce Bohea-tea, and on the contrary that a plant brought from the Bohea-tea country planted in the Green-tea country will produce Green-tea. The plant loves to grow in valleys, at the foot of mountains, and upon the banks of rivers, where it enjoys a southern exposure to the sun, though it endures considerable variation of heat and cold, as it flourishes in the northern clime of Pekin, as well as about Canton, and it is observed, that the degree of cold is as severe in winter as some of the southern parts of Europe. However, the best tea grows in a mild temperate climate, the country about Nankin producing better tea than either Pekin or Canton. In Japan the tea is planted round the borders of fields without regard to soil or situation, but as the Chinese export great quantities, they plant whole fields with it. The plants are raised from seeds sown where they are to remain. Three or more are dropped into a hole 4 or 5 inches deep; these come up without any further trouble, and require little culture, except that of removing weeds. The leaves are not collected from the cultivated plants until they are 3 years old, and after growing 7 or 10 years they are cut down, in order that the numerous young shoots that will then rise may afford a greater supply of leaves. The best time to gather the leaves is while they are small, young, and juicy. The first gathering of tea leaves, according to Kæmpfer, commences about the latter end of February, when the leaves are young, and unexpanded. The second collection is made about the beginning of April, and the third in June. The first collection, which only consists of fine tender leaves, is most esteemed, and is called Imperial tea. The second is called Tootsjaa or Chinese tea, because it is infused and drank after the Chinese manner. The last, which is the coarsest and cheapest, is drank by the lower class of people. Besides the three kinds of tea here noticed, it may be observed, that by sorting these the varieties of tea become still further multiplied. The tea-trees that yield often the finest leaves grow on the steep declivities of hills, where it is dangerous, and in some cases impracticable to collect them. The Chinese are said to vanquish this difficulty by a singular contrivance. The large monkies which inhabit these cliffs are irritated, and in revenge they break off the branches and throw them down, so that the leaves are thus obtained. The leaves should be dried as soon as possible after they are gathered. The buildings or drying houses contain from 5 to 10 or 20 small furnaces, about 3 feet high, each having at the top a large flat iron pan. There is also a long low table, covered with mats, on which the leaves are laid and rolled by workmen, who sit round it; the iron pan being heated to a certain degree, a few pounds of fresh gathered leaves are put upon it, the fresh and juicy leaves crak when they touch the pan, and it is the business of the operator to shift them as quick as possible with his bare hands, till they become too hot to be easily endured. At this instant the leaves are taken off with a kind of shovel, like a fan, and thrown on the mats before the rollers, who, taking small quantities at a time, roll them in the palms of their hands in one direction, while others are fanning them that they may cool the more speedily, and retain their curl the longer. This process is repeated two or three times, or oftener, before the tea is put into the stores, in order that all the moisture of the leaves may be thoroughly dissipated, and their curl more completely preserved. On every repetition the pan is less heated, and the operation performed more slowly and cautiously. The tea is then separated into the different kinds, and deposited in the store for domestic use or exportation. The country people cure their tea-leaves in earthen kettles, which answer every necessary purpose at less trouble and expense than the process described above, and they are thus enabled to sell it cheaper. After the tea has been kept for some months, it is taken out of the vessels in which it was stored, and dried again

over a very gentle fire, that it may be deprived of any humidity which remained, or it might have since contracted. That which is brought down to Canton undergoes a second roasting, winnowing, packing, &c. from whence it is sent to Europe.

The Chinese know nothing of Imperial tea, flower of tea, and many other names which in Europe serve to distinguish the goodness and the price of tea; but besides the common tea they distinguish two other kinds, viz. the *Voui* and *Soumlo*, which are reserved for people of the first quality, and those who are sick. We have two principal kinds of tea in Europe, viz. Green tea, which is the common tea of the Chinese; T. Le Compte calls it *Bing-tea*, and says it is gathered in April; Bohea tea, which is the *Voui* or *Vou-tcha* of the Chinese, M. Le Compte makes to differ from the Green tea only by its being gathered a month before it, viz. in March, while in the bud. Others take it for the tea of some particular province, the soil being found to make as much alteration in the properties of tea as the time of gathering. As to the difference of flavour and colour peculiar to these two kinds, Dr. Lettsom thinks that there is reason to suspect that they are produced by art. As to the opinion that green tea owes its verdure to an inflorescence acquired from the plates of copper on which it is supposed to be curled or dried, there is no foundation for the suspicion, as the infusions undergo no change on the affusion of volatile alkali, which would detect the minutest portion of copper by turning the liquors blue. On the whole, Dr. Lettsom thinks it not improbable that some green dye, prepared from vegetable substances, is employed in the colouring of the leaves of the green teas. And Newmann suspects that the brown colour and flavour of the bohea teas are introduced by art. Both convey their own particular colour to water, but to rectified spirits they both impart a fine deep-green. Savory speaks of a sort of red tea or Tartar tea, called *Honan-tcha*, which tinges the water of a pale-red; it is said to be extremely digestive; by means of it the Tartars are said to be able to feed on raw flesh. The drink tea is made in China and the greatest part of the East in the same manner as in Europe. The Japanese are said to prepare their liquor in a somewhat different manner, by pulverizing the leaves, stirring the powder in hot water, and drinking it as we do coffee. The Chinese are always taking tea, especially at meals, sometimes 3, 6, or 10 times a day; it is the chief treat with which they regale their friends.

With regard to the commercial history of tea, it was first introduced into Europe by the Dutch East India Company very early in the 17th century, and a quantity of it was brought over from Holland by Lord Arlington and Lord Ossory about the year 1666, at which time it was sold for 60s. a pound. But it appears, even before this time, drinking of tea even in public coffee-houses in this country was not uncommon, for in 1660 a duty of 8d. per gallon was laid on the liquor made and sold in all coffee-houses. The present consumption of it is immense, both amongst the rich and the poor.

Tea is extolled as the greatest of all medicines, moderately and properly taken; it acts as a gentle astringent and corroborative; it strengthens the stomach and bowels, and is good against nauseas, indigestions, and diarrhœas. It acts as a diaphoretic and diuretic. The immoderate use of it is, however, very prejudicial. It refreshes the spirits in heaviness and sleepiness, and seems to counteract the effects of inebriating liquors. The activity of tea chiefly resides in the fragrant and volatile parts, which stands charged as the cause of those nervous affections that are said to be produced or aggravated by the use of this liquor. From Dr. Smith's experiments it appears that green tea has the effect of destroying the sensibility of the nerves and the irritability of the muscles; and from the experiments of Dr. Lettsom it appears that green tea gives out on distillation an odorous water, which is powerfully narcotic, but in a more recent state, as in China, it is still more powerfully narcotic, therefore the Chinese never use it until it is one year old or more, till its volatile parts are still further dissipated. It would, therefore, appear that what are considered the finer teas, contain more of this narcotic principle than what are considered the coarser kinds, especially the green teas, as the more odorous teas in this country often shew their sedative powers in weakening the nerves of the stomach, and indeed of the whole system. Its effects, however, seem to be very different in different persons, and hence the contradictory accounts that are reported of these effects.

The substitutes for teas used by the Chinese may be mentioned. A species of moss common to the mountains or Shantung, an infusion of ferns of different sorts, and Dr. Abel thinks that the leaves of the common *Camèllia* and oil *Camèllia* may be added, and Kæmpfer asserts that in Japan, a species of *Camèllia*, as well as *Olea fràgrans*, is used to give tea a high flavour. By far the strongest tea Dr. Abel tasted in China was that called *Yutien*, used only on occasions of ceremony. It scarcely coloured the water, and on examination it was found to consist of buds and half-expanded leaves. As more select sorts of tea, the flowers of *Camèllia Sasánqua* appear to be collected; the buds also appear to be gathered in some cases.

Common or *Green* Tea. Fl. Sept. Dec. Clt. 1768. Shrub 3 to 6 feet.

2 T. BOHE'A (Lin. spec. 743.) leaves elliptical-oblong, obtuse, crenated, twice as long as broad; flowers of 5 sepals, and 5 petals, axillary, twin or tern. ♄. G. Native of China and Japan. Blackw. herb. t. 352. Letts. mon. ed. 1. with a figure. Lois. herb. amat. t. 255. Lodd. bot. cab. 226. T. Chinénsis β Bohèa, Sims, bot. t. 998. D. C. prod. 1. p. 530. Leaves dark-green, coriaceous. Flowers spreading, white. This is falsely called Bohea tea, as we find the Bohea teas of the shops, as well as other kinds, both green and black, to be the leaves of the former species.—Kæmpf. amœn. t. 606.

Bohea Tea. Fl. Nov. Feb. Clt. 1780. Shrub 2 to 6 feet.

3 T. COCHINCHINE'NSIS (Lour. coch. 338.) leaves lanceolate; flowers of 3-5-sepals and 5 petals, solitary, terminal; fruit 3-lobed, usually 1-seeded, opening at the apex. ♄. G. Native in the north of Cochin-china, where it is also cultivated. Flowers white. This species is used by the inhabitants of Cochin-china medicinally, especially in hot weather, as a sudorific and refrigerent in decoction.

Cochin-china Tea. Shrub 8 feet.

4 T. OLEÒSA (Lour. coch. 339.) leaves lanceolate; flowers of 6-sepals and 6-petals; peduncles 3-flowered, axillary; fruit indehiscent. ♄. G. Native of China about Canton. Flowers white. An oil is obtained from the seed of this shrub, which the inhabitants of China use both for the table, and to burn in lamps. The fruit is more of a berry than a capsule. It is probably Camèllia oleìfera of Abel.

Oily Tea. Shrub 8 feet.

Cult. For the cultivation and propagation see *Camèllia*. The species only require to be protected from severe frost.

ORDER XXXVIII. OLACI'NEÆ (plants agreeing with *Olax* in important characters). Mirb. bull. philom. 1813. no. 75. p. 377. D. C. prod. 1. p. 531.

Calyx of 1 sepal (f. 100. *a*.), somewhat toothed, at length usually enlarged and baccate (f. 100. *h*.), perhaps it is an involucrum. Petals (sepals?) 4-6, hypogynous, rather coriaceous, valvate in æstivation, sometimes free, sometimes all or some of them connected by pairs (f. 100. *b*.), and therefore appear semibifid (f.

100. *d.*). Appendages hair-formed or filiform, simple (f. 100. *d.*), or bifid, rising from the disk of the petals or near the margins of them (f. 100. *c.*). Stamens 3 (f. 100. *b.*) to 10, hypogynous (f. 100. *b.*) or epipetalous; filaments compressed, awl-shaped; anthers cordate-oblong, erect, 2-celled; ovary free, 1 (f. 100. *i.*) -4-celled; cells 1-seeded. Style 1, filiform (f. 100. *e.*). Fruit somewhat drupaceous, indehiscent, girded by the large fleshy calyx, 1-celled, 1-seeded from abortion (f. 100. *h. i.*). Seed pendulous, umbilicate at the base. Albumen fleshy, large. Embryo small, enclosed in the albumen, egg-shaped, basilar, with the radicle directed towards the umbilicus, and with continuous cotyledons. Smooth trees or shrubs, with simple, stalked, alternate, exstipulate, entire leaves, rarely without, and small axillary flowers. The place which this order should occupy in the natural system is extremely doubtful. If the calyx is to be considered an involucre and the petals a calyx, then *Olacíneæ* must come in the subclass *Monochlamýdeæ*, not far from *Santalàceæ*, but if the corolla and calyx are admitted the order comes into subclass *Calyciflòræ*, not far from *Sapòteæ*, but if the petals are to be considered as distinct or variously joined, *Olacíneæ* must be admitted into subclass *Thalamiflòræ*.

Synopsis of the Genera.

§ 1. *Petals twice the number of the antheriferous stamens.*

1 O'lax. Calyx entire. Petals 6, joined to the middle by pairs. Appendages 6, filiform, bifid. Stamens 3, adnate with each other and with the petals.

2 Sperma'xyrum. Calyx entire (f. 100. *a.*), not enlarging. Petals 5, 4 of which are joined to the middle by pairs, and with the stamens, the middle one free. Appendages filiform, simple (f. 100. *d.*). Stamens 3 (f. 100. *b.*), 2 of which are adnate to the petals, the third free (f. 100. *b.*).

3 Fissi'lia. Calyx entire, enlarged. Petals 5, 4 of which are joined by pairs and with the stamens, the fifth free. Appendages filiform, simple. Stamens 3, 2 of which are adnate to the petals, the third free.

§ 2. *Stamens double the number of the petals.*

4 Heiste'ria. Calyx 5-cleft. Petals 5, distinct. Stamens 10. Style crowned by a trifid stigma.

5 Xime'nia. Calyx 4-cleft. Petals 4, hairy inside, conniving at the base, revolute at the top. Stamens 8.

6 Ge'la. Calyx 4-toothed. Petals 4, linear, smooth. Stamens 8. Stigma bifid.

† *Genera not sufficiently known.*

7 Pseudale'ia. Calyx nearly entire. Petals 3, conniving into a tube. Stamens 6, adnate to the petals. Appendages filiform, bifurcate, on each side of the petals.

8 Pseudaleioìdes. Calyx small, entire. Petals 4, unequal, conniving at the base. Stamens 6, adnate to the petals.

9 Icacìna. Calyx 5-cleft. Petals 5. Stamens 5. Style crowned by a truncate stigma.

§ 1. *Petals double or about double the number of the antheriferous stamens.*

I. O'LAX (so called, as Linnæus informs us, from *oλαξ*, *olax*, a furrow, but how it applies to the plant we are not informed; nor is the difficulty of the question lessened by the name being ranged in Phil. Bot. among those which allude to the medicinal effects of the plants that bear them). Lin. amœn. 1. p. 387. Gært. fruct. 3. p. 119. t. 201. D. C. prod. 1. p. 531.

Lin. syst. *Triándria, Monogýnia.* Calyx small, entire, becoming large and baccate after flowering. Petals 6, joined to the middle by pairs, or 3 semibifid ones, with 6 bifid, filiform appendages, one of which is inserted in the disk of each of the petals. Stamens 3; filaments connected with the petals, and therefore bear an ovate anther between each fissure. Drupe dry, 1-seeded, surrounded by the calyx. Flowers in axillary racemes. Leaves entire, ovate-oblong, 1-nerved, entire.

1 O. Zeyla'nica (Lin. spec. 49.) leaves ovate, pointed, smooth; branches angular, flaccid; stem unarmed. ♄. S. Native of Ceylon. Vahl. symb. 3. p. 7. Flowers white.

Ceylon Olax. Tree 20 feet.

2 O. sca'ndens (Roxb. cor. 2. p. 102.) leaves elliptical, obtuse, pubescent beneath; branches round, climbing; stem armed with strong prickles. ♄. ◡. S. Native of Coromandel. Flowers white, with yellow appendages. Drupe yellow.

Climbing Olax. Fl. year. Clt. 1820. Shrub cl.

3 O. imbrica'ta (Roxb. in fl. ind. 1. p. 169.) climbing; leaves bifarious; ovate-lanceolate or oblong, entire, glossy; racemes axillary, bifariously imbricated before the flowers expand; drupes ovate. ♄. ◡. S. Native of the East Indies at Chittagong. Flowers white, with yellowish appendages.

Imbricated-racemed Olax. Fl. July. Clt. 1820. Shrub climbing.

4 O. obtu'sa (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 663.) shrubby; leaves bifarious, ovate or oval-oblong, very blunt, pubescent beneath as well as the terete branches; spikes axillary, very short, bifariously imbricated before expansion; drupe globose. ♄. ◡. S. Native of Java.

Obtuse-leaved Olax. Shrub climbing.

Cult. The species of *O'lax* will thrive well in a mixture of loam and sand; and cuttings will strike root in sand under a hand-glass, in heat.

II. SPERMA'XYRUM (from *σπερμα*, *sperma*, a seed, *αξυρα*, *axyra*, an anchor. The umbilicle funicle is of the form of an anchor). Lab. nov. holl. 2. p. 84.—Oláx, R. Brown, prod. 1. p. 358.—D. C. prod 1. p. 352.

Lin. syst. *Triándria, Monogýnia.* Calyx small, entire, not enlarging after flowering (f. 100. *h.*). Petals 5, 4 of which are united to the middle by pairs, as well as to the filaments of stamens, both are therefore semibifid, the fifth is unconnected and entire. Appendages or nectaries simple, filiform (f. 100. *d.*). Stamens 3, 2 of which adhere to the joined petals, the third is free (f. 100. *b.*). Ovary 1-celled, containing 3 ovulæ; ovulæ hanging from the apex of the central, filiform column. Drupe dry, 1-seeded (f. 100. *i.*). Leaves in 2 rows, and are arranged along the branches as if they were the leaflets of a pinnate leaf, disposed on their petiole. Flowers small, sometimes polygamous from abortion.

§ 1. *Phyllanthoídeæ* (*Phyllánthus and idea, like; plants with the habit of Phyllánthus*). *D. C. prod.* 1. *p.* 533. *Leaves disposed in 2 rows along the branches. Peduncles* 1*-flowered.*

1 S. phylla'nthi (Lab. nov. holl. 2. t. 233.) leaves oval, retuse. ♄. G. Native of New Holland in Van Lewin's Land. Oláx phyllánthi, R. Br. prod. 1. p. 358. Flowers white?

Phyllanthus-like Spermaxyrum. Shrub 6 feet.

2 S. stri'ctum (D. C. prod. 1. p. 532.) leaves oblong-linear, mucronate. ♄. G. Native of New Holland about Port Jackson. Oláx stricta, R. Brown, prod. 1. p. 358.

Straight Spermaxyrum. Clt. 1820. Shrub 6 feet.

FIG. 100.

§ 2. *Osyroídeæ* (*Osyris and idea, like; plants with the habit of Osýris*). *D. C. prod.* 1. *p.* 532. *Leaves like scales, almost none; flowers almost sessile in the axils of the scales, and appear as if constituting a terminal spike.*

3 S. aphy'llum (D. C. prod. 1. p. 532.) leaves almost wanting; flowers sessile, somewhat spiked. ♄. S. Native of New Holland between the tropics. Oláx aphýlla, R. Br. prod. 1. p. 358. Flowers whitish.

Leafless Spermaxyrum. Sh. 6 feet.

Cult. These shrubs will thrive well in a mixture of loam and peat; and cuttings will root in sand under a hand-glass.

III. FISSI'LIA (from *fissus*, cloven; four of the petals being joined at the base, appear as if they were cloven at the apex). Comm. in Juss. gen. 260. D. C. prod. 1. p. 532.

Lin. syst. *Triándria, Monogýnia*. Calyx entire, enlarging after flowering. Petals 5, 4 of which are connected together by pairs to the middle, and are therefore semibifid, the fifth one free. Appendages or nectaries filiform, simple. Stamens 3, 2 of which are adnate to the connected petals and adhering a considerable way, the third one free; filaments flat; anthers elliptical, oscillatory. Ovary 3-celled, 3-seeded. Drupe dry, 1-seeded, girded by the cup-like calyx.

1 F. psitacco'rum (Lam. dict. and illus. t. 28.). ♄. S. Native of Mauritius. O'lax psitaccòrum, Vahl. enum. 2. p. 33. Branches stiff. Leaves ovate-oblong or lanceolate, nerveless. Racemes axillary, few-flowered. Flowers small, white. Parrots are very fond of the fruit of this tree, whence the specific name.

Parrot Fissilia. Tree 20 feet.

Cult. This tree will thrive in a mixture of loam and peat; and cuttings will root in sand under a hand-glass, in heat.

§ 2. *Stamens double the number of the petals.*

IV. HEISTE'RIA (in honour of Laurence Heister, a celebrated physician and anatomist, once Professor of Botany at Helmstadt; died in 1758). Lin. gen. no. 535. but not of Berg. D. C. prod. 1. p. 532.

Lin. syst. *Decándria, Monogýnia*. Calyx small, 5-cleft, becoming very much enlarged after flowering, and cup-shaped, with a spreading border. Petals 5, distinct. Stamens 10; with flat filaments and roundish anthers. Style short. Stigma trifid. Ovary 3-celled, each containing 1 ovula. Drupe 1-celled, 1-seeded from abortion, the form of an olive, half hid by the permanent calyx; seed pendulous. Integument thin. Albumen very fleshy. Embryo small, situated near the hilum at the top of the seeds, with the radicle pointing towards the hilum. Unarmed trees, with alternate, entire, exstipulate, coriaceous leaves, with the petioles jointed at the base. Flowers small, axillary, with the pedicels jointed at the base.

1 H. cocci'nea (Jacq. amer. 126. t. 81.) leaves lanceolate, rounded at the base, shining; flowers twin or numerous, axillary; calyx when in fruit spreading, with obtuse lobes. ♄. S. Native of Martinique in woods, where it is vulgarly called *Bois perdrix* by the French inhabitants, because birds are very fond of the fruit, and of Brazil at Rio Janeiro. Lam. ill. 354. Smith, in Rees' cycl. 17. no. 1. Flowers small, white. The calyx is dark-purple when the fruit is ripe.

Scarlet-calyxed Heisteria. Fl. Dec. Clt. Tree 15 feet.

2 H. cauliflòra (Smith, in Rees' cycl. no. 2.) leaves oblong, sometimes obovate, tapering to the base; flowers rising from the naked stem and branches; calyx closed when in fruit, deeply-lobed. ♄. S. Native of Dutch Guiana. Flowers small and probably white.

Stem-flowered Heisteria. Tree 60 feet?

3 H. parvifòlia (Smith, in Rees' cycl. no. 3.) leaves ovate, acute, shining; flowers axillary; calyx when in fruit spreading, with deep ovate lobes. ♄. S. Native of Sierra Leone. Branches rather flattened. Recesses of calyx reflexed. Flowers small and probably white. Calyx red.

Small-leaved Heisteria. Tree.

Cult. These trees will thrive well in a mixture of loam, sand, and peat; and cuttings will root in sand under a hand-glass, in heat.

V. XIME'NIA (Francis Ximenes, a Spanish monk, who has published four books on the plants which are used in medicine, and animals of New Spain). Plum. gen. 6. t. 21. D. C. prod. 1. p. 533.

Lin. syst. *Octándria, Monogýnia*. Calyx small, 4-cleft, permanent, not enlarged when in fruit. Petals 4, hairy inside and conniving at the base, revolute above, valvate in æstivation. Stamens 8, with capillary filaments, 4 of which are opposite the petals. Anthers fixed by the base, 2-celled, bursting lengthwise at the sides. Ovary 4-celled, 4-seeded. Stigma trifid. Drupe olive-formed, 1-celled, 1-seeded from abortion. Trees or shrubs, usually armed with spines, with alternate, ovate, or lanceolate exstipulate leaves and male axillary flowers.

1 X. America'na (Lin. spec. 497.) branches spinose, peduncles axillary, many-flowered, umbellate, the lower ones usually changed into spines; leaves oblong, entire. ♄. S. Native of South America. Flowers small, greenish-yellow inside, sweet-scented. The fruit is yellow, about the size of a pigeon's egg, of a somewhat acid sweet taste, and is eaten by the natives.

Var. α, ovàta (D. C. prod. 1. p. 533.) leaves ovate. ♄. S. Native of the West Indies and Brazil. X. multiflòra, Jacq. amer. 106. t. 277. f. 31. Lam. ill. t. 297. f. 1. Fruit yellow, drupaceous. Petals greenish.

Var. β, oblónga (D. C. prod. 1. p. 533.) leaves oblong. ♄. S. Native of Guiana. Heymassòli spinòsa, Aubl. guian. 1. p. 324. t. 125.—Lam. ill. t. 297. f. 2.

American Ximenia. Fl. June, Sept. Clt. 1759. Sh. 15 ft.

2 X. elli'ptica (Forst. prod. no. 162.) branches unarmed; peduncles many-flowered; leaves elliptical-lanceolate. ♄. S. Native of New Caledonia. Flowers small, yellowish?

Elliptical-leaved Ximenia. Tree 15 feet.

3 X. ine'rmis (Lin. spec. 497.) unarmed; pedicels 1-flowered; leaves ovate. ♄. S. Native of Jamaica. Liman. hort. jam. 2. p. 156. Flowers small, greenish-yellow.

Unarmed Ximenia. Clt. 1818. Tree 15 feet.

4 X.? fe'rox (Poir. dict. suppl. no. 3.) peduncles somewhat

umbellate; branches spinose; leaves roundish, coriaceous, almost sessile, pubescent. ♄. S. Native of Hispaniola. Flowers small, yellowish?

Fierce-branched Ximenia. Tree?

Cult. The species of *Ximènia* thrive well in a mixture of loam and peat; and cuttings will root in sand under a hand-glass, in heat.

VI. GE'LA (from γελα, *gela*, the light of the sun, which is from γελεω, *geleo*, to shine; in allusion to the shining leaves). Lour. coch. 1. p. 285.—Sèlas, Spreng. syst. 2. p. 172.

Lin. syst. *Octándria, Monogýnia.* Calyx very short, 4-parted. Petals 4, linear, smooth. Stamens 8. Anthers roundish. Style 1. Stigma bifid. Drupe 1-seeded. A little tree, with ovate, shining, quite entire, opposite leaves, and small yellowish flowers disposed in axillary corymbs.

1 G. lanceola'ta (Lour. cochin. 4. p. 285.). ♄. G. Native of Cochin-china. Sèlas lanceolàtum, Spreng. syst. 2. p. 216. Ximènia lanceolàta. D. C. prod. 1. p. 533.

Lanceolate-leaved Gela. Clt. 1823. Shrub 5 feet.

Cult. A mixture of loam, peat, and sand will suit this shrub well; and cuttings will root in sand under a hand-glass.

† *Genera not sufficiently known, but certainly belonging to the present order.*

VII. PSEUDALE'IA (ψευδο, *pseudo*, false, ελαια, *elaia*, an olive; form of fruit like that of an olive). Pet. Th. gen. mad. no. 51. D. C. prod. 1. p. 533.

Lin. syst. *Hexándria, Monogýnia.* Calyx small, nearly entire. Petals 3, conniving into a tube. Filaments 6, adnate to the petals, hence they appear epipetalous. Capillary threads forked at the apex on each side of the petals. Ovary conical. Style length of corolla. Stigma 3-lobed. Drupe spherical, 1-seeded. Seeds exalbuminous. Embryo with indistinct fleshy cotyledons. From the flowers this shrub appears to be intermediate between *O'lax* and *Heistèria*, but the seed is truly distinct.

1 P. Madagascarie'nsis (D. C. prod. 1. p. 533.) ♄. S. Native of Madagascar. A little branching tree, with alternate smooth leaves, and axillary few-flowered peduncles. O'lax pseudalèia. Willd. in Steud. nom. Flowers white?

Madagascar Pseudaleia. Shrub 10 feet.

Cult. A mixture of loam and sand will suit this tree very well; and cuttings will root in sand, under a hand-glass, in heat.

VIII. PSEUDALEIOI'DES (in reference to its similarity to the foregoing genus). Pet. Th. gen. mad. no. 52. D. C. prod. 1. p. 533.

Lin. syst. *Hexándria, Monogýniá.* Calyx small, entire. Petals 4, unequal, broad and connivent at the base. Stamens 6, with broad filaments, unequally applied to the petals, and appear to be inserted in them. Anthers inserted by their apex. Ovary 1-seeded. Style length of corolla. Stigmas 3, globose. Fruit unknown.

1 P. Thoua'rsii (D. C. prod. 1. p. 533.). ♄. S. Native of Madagascar. A weak shrub with alternate leaves and unilateral few-flowered racemes. O'lax pseudaleioìdes, Willd. in Steud. nom. Flowers small, and probably white.

Du Petit *Thouars's* Pseudaleioides. Shrub 6 feet.

Cult. See *Pseudalèia* for cultivation and propagation.

† *A genus allied to Olacìneæ.*

IX. ICACI'NA (this name refers to the similarity of the plant with that of *Chrysobálanus Icàco*, a name given by the Americans to the fruit of that shrub). Adr. Juss. mem. soc. hist. nat. par. 1823. 1. p. 174. D. C. prod. 1. p. 534.

Lin. syst. *Pentándria, Monogýnia.* Calyx short, 5-cleft, usually permanent. Petals 5, valvate in the bud, alternating with the lobes of the calyx and 3-times larger than them, villous on the inside at the base. Stamens 5, erect, alternating with the petals. Anthers cordate, fixed by their middle, 2-celled; cells opening lengthwise. Style simple, incurved, truncate at the apex. Ovary seated on a glandular disk, 1-celled. Fruit fleshy, containing a large nut. A shrub with simple, alternate, exstipulate, short-stalked, ovate, entire, reticulately-nerved leaves, and small panicles of white flowers.

1 I. Senegale'nsis (Ad. de Juss. l. c. t. 9.). ♄. S. Native all along the coast of Guinea by the sea-side. Chrysobálanus lùtea, Hort. trans. 5. p. 453. This is a spinose shrub, it has much the habit of *Cìtrus limònum*. The fruit is about the size of an Orlean's plum, of a yellow colour, with a flavour much resembling that of noyeau.

Senegal Icacina. Fl. April, May. Shrub 10 feet.

Cult. This shrub would thrive in this country in a mixture of one-quarter loam and three-quarters sand, which should be repeatedly watered with salted water, and ripened cuttings will probably root in sea-sand under a hand-glass, in heat.

Order XXXIX. AURANTIA'CEÆ (plants agreeing with the *Orange* in important characters). Corr. ann. mus. 6. p. 376. Mirb. bull. phil. 1813. p. 379. D. C. prod. 1. p. 535.

Calyx urceolate, campanulate, somewhat adnate to the disk, short, 3-5-toothed (f. 101. *a.*), marcescent. Petals 3-5 (f. 101. *b.*), broadest at the base, sometimes free, sometimes a little connected at the base, inserted on the outside of the disk, imbricate in æstivation by the margins. Stamens equal in number with the petals, or double, or multiple (f. 101. *c.*) that number; filaments flat at the base, sometimes free, sometimes variously connected in many bundles, sometimes truly monadelphous, but always free at the apex, and subulate. Anthers terminal, inserted by the base, erect. Ovary ovate, many-celled (f. 101. *d.*). Style 1, terete, crowned by a thick subdivided stigma. M. Decandolle thus explains the structure of the fruit, the orange; first, of a thick, valveless, indehiscent indusium or coat, which is most likely to be considered a continuous torus; secondly, of several carpels in a whorl, around an imaginary axis, often separable without laceration, membranous, and either containing seeds only, or filled with pulp, lying in innumerable little bags, proceeding from the inner coat of the cells. Seeds situated in the carpels, fixed to their inner angles, numerous or solitary, exalbuminous, usually pendulous, often inclosing many embryos. Seed-cover usually marked with a raphis and cup-shaped chalaza. Embryo straight, with a retracted superior radicle, turned towards the hilum, and large thick cotyledons, which are auricled at the base, and a conspicuous plumule.—This order consists of smooth trees and shrubs of the greatest beauty and utility. The leaves are alternate, articulated above the stem, sometimes compound, with one or many pairs of leaflets, the terminal one always standing on a winged, leafy or dilated petiole, which is furnished with a joint, sometimes simple, with a dilated, jointed petiole, and sometimes reduced to the dilated petiole, the terminal leaflet being abortive. Axillary spines not always present. The

leaves, indusium of fruit, stamens, filaments, petals, and calyx abounding in transparent reservoirs of odoriferous oil, which are the most obvious characters. This oil possesses powerful tonic and stimulating properties. The flowers are fragrant, and the fruit in all cases fleshy, and generally eatable. The well known orange, lemon, lime, and shaddock are the representatives of this order.

Synopsis of the Genera.

1 Atala'ntia. Parts of flower quaternary. Stamens 8, monadelphous, but free at the apex. Anthers terminal. Fruit 4-celled, 4-seeded. Leaves simple.

2 Tripha'sia. Parts of flower ternary. Stamens 6, free, rarely 5 or 8. Anthers rather sagittate. Fruit 3-celled, rarely 2-4. Cells 1-seeded. Leaves simple or ternate.

3 Limònia. Parts of flower quaternary or quinary. Stamens free, 8-10, rarely 4-5. Fruit pulpy, 4-5-celled. Cells 1-seeded. Leaves simple or trifoliate.

4 Scleróstylis. Parts of flower quaternary or quinary. Stamens 8-10. Anthers cordate. Fruit dry, 1-2-celled; cells 1-2-seeded. Leaves simple, trifoliate or pinnate.

5 Coókia. Parts of flower quinary. Stamens 10, free. Anthers roundish or cordate. Fruit baccate, subglobose, 5-celled; cells 1-seeded. Leaves pinnate.

6 Murra'ya. Parts of flower quinary. Stamens 10, free. Anthers roundish. Fruit fleshy, 1-2-celled; cells 1-seeded. Leaves pinnate.

7 Microme'lum. Calyx entire. Petals 5. Stamens 10, free. Anthers roundish, didymous. Fruit dry, 5-celled; cells 1-2-seeded. Leaves pinnate.

8 Aglai'a. Parts of flower quinary. Stamens 5, monadelphous, with the anthers inclosed. Fruit baccate, 1-seeded. Leaves pinnate.

9 Berge'ra. Parts of flower quinary. Stamens 10, free. Anthers roundish. Fruit baccate, usually 1-celled, 1-seeded. Leaves pinnate.

10 Clauce'na. Parts of flower quaternary or quinary. Stamens 8-10; filaments dilated at the base, and conniving. Anthers ovate-roundish. Fruit nearly dry, 1-celled, 1-seeded from abortion. Leaves pinnate.

11 Glyco'smis. Parts of flower quinary. Stamens 10, flat. Anthers elliptical. Fruit fleshy, 1-2-celled; cells 1-seeded. Leaves pinnate.

12 Ferònia. Parts of flower quinary. Stamens 10, free, dilated and villous at the base. Anthers oblong. Fruit baccate, many-celled; cells many-seeded. Leaves pinnate.

13 Æ'gle. Parts of flower ternary or quinary (f. 101. *b.*). Stamens 30-40, free (f. 101. *c.*). Anthers long, linear, mucronate. Fruit baccate, woody, turbinately-globose, many-celled (f. 101. *d.*); cells many-seeded. Leaves trifoliate.

14 Ci'trus. Parts of flower usually quinary. Calyx 3-5-cleft. Petals 5-8. Stamens 20-60; filaments compressed, more or less connected at the base into many bundles. Fruit baccate, 7-12-celled; cells many-seeded, pulpy. Leaves simple, with a flat or winged petiole.

I. ATALA'NTIA (from Atalanta, the daughter of Schæneus, so swift that she promised to marry him who outran her, but was overtaken by Hippomanes by casting three golden apples in her way. The fruit of this tree is of a golden-yellow colour.) Corr. ann. mus. 6. p. 383. D. C. prod. 1. p. 535.

Lin. syst. *Monadélphia, Octándria.* Calyx 4-toothed. Petals 4. Stamens 8, monadelphous at the base, but are unconnected at the apex. Anthers terminal. Pistil villous. Fruit spherical, 4-celled, 4-seeded.—A thorny shrub, with simple leaves.

1 A. monophy'lla (D. C. prod. 1. p. 535.) ♄. S. Native of the East Indies. Limònia monophýlla, Roxb. cor. 1. p. 59. t. 83. Leaves ovate-oblong, emarginate at the apex. Spines small, simple. Racemes axillary. Flowers small, white. Fruit yellow, about the size of a nutmeg, very like a lime, and is called by the Hindoos *wild lime.*

One-leaved Atalantia. Fl. June, Aug. Clt. 1777. Shrub 8 ft.

Cult. Atalántia will succeed well in a mixture of loam and peat, and ripened cuttings planted in sand under a hand-glass will root readily, in heat.

II. TRIPHA'SIA (from τριφασιος, *triphasios*, triple; in allusion to the calyx being 3-toothed, and the 3 petals.) Lour. fl. coch. 1. p. 189. D. C. prod. 1. p. 535.

Lin. syst. *Hexa-Octándria, Monogýnia.* Calyx 3-toothed. Petals 3. Stamens 6, unconnected, rarely 5 or 8; filaments awl-shaped, flat. Anthers somewhat sagittate. Fruit 1-3-celled; cells 1-seeded, filled with mucilage. Embryos many in the seed.—Shrubs, furnished with straight axillary spines, and with simple or trifoliate leaves.

1 T. monophy'lla (D. C. prod. 1. p. 536.) leaves simple, oblong. ♄. S. Native in the island of Timor. Leaves almost sessile, blunt. Racemes small in the axils of the spines, shorter than the leaves. Flowers small, white. Fruit unknown. This shrub has the habit of *Atalántia*, but with the flower of *Triphàsia.* Fruit 5-celled?

One-leaved Triphasia. Shrub 6 feet.

2 T. sarmentòsa (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 663.) arboreous; stem prickly; branches sarmentose, hooked; leaves ternate and simple; leaflets oblong, acuminated, quite entire, stalked; corymbs axillary. ♄. S. Native of Java. Calyx 3-4-toothed. Stamens 8. Fruit egg-shaped, 2-3-celled, 2-3-seeded, full of mucilaginous pulp.

Rambling Triphasia. Tree.

3 T. trifolia'ta (D. C. prod. 1. p. 536.) leaves 3-foliate; leaflets ovate, retuse, emarginate at the top, the lateral ones smallest. ♄. S. Native of the East Indies, Cochin-china, and China. Limònia trifoliàta, Lin. mant. 237. Jacq. icon. rar. t. 463. Andr. bot. rep. t. 143. T. Aurantìola, Lour. p. 153. Leaves on short petioles, trifoliate; leaflets ovate, terminal one usually emarginate. Flowers white, sweet smelling. Stamens 6. Fruit of a red-bay colour, soft, the size of a hazel-nut. The pulp is colourless, very sweet, with a slight taste of turpentine; before it is ripe glutinous, and tasting strong of turpentine. Loureiro says, that the berry is red, and ovate like those of coffee, but only half the size, covered with a thin pellicle, and containing a clammy, sweet, inodorous, eatable pulp, and a single ovate seed.

Trifoliate Triphasia. Fl. May, July. Shrub 5 feet.

Cult. The species of *Triphàsia* will grow well in a mixture of turfy loam and peat; but care must be taken not to sodden them with water during winter. Cuttings not too ripe, but ripened at the base, will root readily in sand under a hand-glass, in heat.

III. LIMO'NIA (*Lymoun* is the Arabic name of the citron.

The species of this genus have the appearance of the citron as well as its acid fruit). Lin. gen. no. 524. D. C. prod. 1. p. 536.

LIN. SYST. *Octo-Decándria, Monogýnia.* Calyx 4-5-parted. Petals 4-5. Stamens unconnected, equal or double the number of petals. Fruit baccate, pulpy, 4-5-celled; cells 1-seeded. This genus includes an heterogeneous mass of species.

* *Leaves simple. The genus to which these plants should be referred is doubtful, owing to the parts of fructification being insufficiently known.*

1 L. LU'CIDA (Forst. prod. no. 191.) leaves simple; peduncles axillary. ♄. S. Native of the island of Mallicolla in the South Seas. Flowers white.

Shining-leaved Limonia. Shrub.

2 L. LAURE'OLA (D. C. prod. 1. p. 536.) leaves simple; flowers terminal, in corymbose heads. ♄. G. Native of Nipaul. Leaves exactly like those of *Dáphne laurèola.* Calyx 5-parted. Petals and stamens 5. Flowers white.

Spunge-*laurel*-leaved Limonia. Shrub.

3 L. RETU'SA (D. Don, prod. fl. nep. p. 224.) leaves elliptical, blunt at the apex, and emarginate, acute at the base; petioles semi-cylindrical; peduncles usually solitary, 1-flowered, one-half shorter than the leaves. ♄. G. Native of Nipaul at Sirinagur. Flowers white?

Retuse-leaved Limonia. Shrub.

** *Leaves trifoliate. Shrubs with the habit of Toddàlia.*

4 L. CITRIFÒLIA (Willd. enum. 448.) leaves simple and trifoliate; leaflets ovate-oblong, acuminated; pedicels axillary, shorter than the petioles. ♄. G. Native of China. Flowers small, white. Berry red.

Citron-leaved Limonia. Fl. year. Clt. 1800? Shrub 5 ft.

5 L.? DIACA'NTHA (D. C. prod. 1. p. 536.) leaves trifoliate; leaflets oval, somewhat emarginate; spines axillary, twin, straight. ♄. S. Native of Pondicherry. Flowers small, white, pentandrous?

Two-spined Limonia. Shrub.

6 L.? HO'RRIDA (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 663.) leaflets 3, ovate-oblong, bluntish, obsoletely crenulated, intermediate one stalked and larger than the rest; spines twin, infra-axillary, divaricate, straight. ♄. S. Native of Java. Perhaps the same as *L. diacántha.*

Horrid Limonia. Shrub.

7 L.? DU'BIA (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 665.) leaflets 3, sessile, oblong, tapering to the base, retuse at the apex, quite entire, lateral ones small; common petiole marginate. ♄. S. Native of Java. Young branches spinose; spines axillary, twin, straight.

Doubtful Limonia. Shrub.

8 L.? MAURITIA'NA (Lam. dict. 3. p. 517.) leaves trifoliate; leaflets oval, somewhat mucronate; panicles axillary; spines none. ♄. S. Native of the Mauritius. Flowers white, quadrifid, octandrous.

Mauritian Limonia. Shrub.

*** *Leaves impari-pinnate, with wingless petioles. Thorns wanting.*

9 L. MADAGASCARIE'NSIS (Lam. dict. 3. p. 517.) leaves pinnate, with 4-5 alternate, lanceolate, toothed leaflets; panicles short, axillary. ♄. S. Native of Madagascar. Flowers white.

Madagascar Limonia. Shrub 6 feet.

10 L. PARVIFLÒRA (Sims, bot. mag. t. 2416.) leaves with 2 pairs of elliptical-lanceolate, quite entire leaflets; corolla campanulate; fruit ovate-spheroid, oblique. ♄. G. Native of China. Flowers white.

Small-flowered Limonia. Fl. year. Clt.? Shrub 6 feet.

11 L. MINU'TA (Forst. prod. no. 190.) leaves pinnate; racemes corymbose, terminal. ♄. S. Native of the Friendly Islands. Flowers white.

Minute Limonia. Shrub.

**** *Leaves impari-pinnate, with winged petioles. Spines axillary. True Limònia.*

12 L. ACIDI'SSIMA (Lin. mant. 380.) leaves with 2 pairs of obovate, somewhat emarginate leaflets; spines solitary; fruit egg-shaped. ♄. S. Native of the East Indies.—Rumph. amb. 2. t. 43. Calyx 5-parted. Petals 5, whitish. Filaments 10. Fruit about the size of a nutmeg, yellowish, but reddish when perfectly ripe. Pulp flesh-coloured, very acid, and is used by the inhabitants of Java instead of soap.

Very-acid-fruited Limonia. Shrub 6 to 10 feet.

13 L. CRENULA'TA (Roxb. cor. 1. t. 86.) leaves pinnate, with 2 or 3 pairs of oblong-elliptical crenulated leaflets; spines solitary; fruit globose. ♄. S. Native on the Coromandel coast. Calyx 4-cleft. Petals 4, white. Stamens 8.—Rheed. mal. 4. t. 14. Fruit about the size of a large pea, when ripe black. It is much used on the coast of Malabar as a medicine. Flowers sweet-scented. Petioles with broad wings.

Crenulate-leaved Limonia. Fl. July. Clt. 1808. Shrub 6 to 10 feet.

14 L. AMBI'GUA (D. C. prod. 1. p. 536.) leaves pinnate; spines in pairs; leaflets roundish-oval. ♄. G. Cultivated in Eastern Florida? L. acidíssima? Nutt. in Sillim. journ. amer. 5. 1822. p. 295. Perhaps a variety of *L. acidíssima* or *L. crenulàta.*

Ambiguous Limonia. Shrub 6 feet.

Cult. The species of *Limònia* will thrive well in a mixture of loam and peat, with the addition of a little rotten dung; ripened cuttings will root in sand under a hand-glass, in a moist heat.

IV. SCLERO'STYLIS (σκληρος, *scleros*, hard, and στυλος, *stylos*, a style; in allusion to the style being thick and hard). Blum. bijdr. ex Schlecht. Linnæa. 1. p. 665.

LIN. SYST. *Octo-Decandria, Monogýnia.* Calyx 4-5-parted. Petals 4-5, connivent or spreading. Stamens free, double the number of the petals; filaments awl-shaped, flat, alternate ones for the most part longest; anthers cordate. Ovary 1-3-celled. Style short, thick, crowned by an obtuse stigma. Berry dry, 1-2-celled, 1-2-seeded. Auricles of cotyledons inconspicuous. Shrubs with simple or impari-pinnate leaves. This genus is nearly allied to *Triphàsia.*

* *Leaves simple.*

1 S. SPINÒSA (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 664.) spinose; leaves oblong, acutish, rounded at the base, obsoletely crenulated; peduncles 1-flowered, solitary or crowded; ovary 3-celled; cells 2-seeded. ♄. S. Native of Java. Limònia spinòsa, Spreng. syst. append. 162.

Spinose Sclerostylis. Shrub.

2 S. LANCEOLA'TA (Blum. l. c.) unarmed; leaves oblong-lanceolate, bluntish at the apex; racemes axillary, short. ♄. S. Native of Java. Glycósmis simplicifòlia, Spreng. Ovary 2-celled; cells 1-seeded.

Lanceolate-leaved Sclerostylis. Shrub.

** *Leaves simple and trifoliate.*

3 S. TRIFOLIA'TA (Blum. l. c.) unarmed; leaves simple or trifoliate, oblong-lanceolate, obtuse; racemes axillary, very short. ♄. S. Native of Java. Glycósmis trifoliàta, Spreng. Ovary 3-celled; cells 1-seeded.

Trifoliate Sclerostylis. Shrub.

* * * *Leaves impari-pinnate.*

4 S. PENTAPHY'LLA (Blum. l. c.) unarmed; leaflets 5, rarely 7, oval-oblong, obtuse; racemes axillary, very short; berry globose. ♄. S. Native of Java. Ovary 3-celled; cells 1-seeded.

Five-leaved Sclerostylis. Shrub.

5 S.? MACROPHY'LLA (Blum. l. c.) unarmed; leaflets usually 5, rarely twin or ternate, ovate-oblong, obtusely acuminated, quite entire; racemes divaricate, axillary, very long, tapering to both ends. ♄. S. Native of Java. Calyx 5-toothed. Ovary 3-celled; cells 1-seeded. Perhaps *Glycósmis pentaphýlla*.

Long-leaved Sclerostylis. Shrub.

Cult. Loam and peat will be a good mixture for these shrubs, with the addition of a little rotten dung, and ripened cuttings will root if planted in a pot of sand placed under a hand-glass, in a moist heat.

V. COO'KIA (in memory of the celebrated circumnavigator, Captain James Cook, R. N., who was killed in the Sandwich Islands in 1779). Sonner. voy. 2. p. 130. t. 131. D. C. prod. 1. p. 537.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-cleft. Petals 5, navicular, villous. Stamens 10, with free linear filaments and roundish anthers. Ovary villous. Fruit baccate, somewhat globose, 5-celled, or 1-2-celled from abortion; cells 1-seeded. Small trees with impari-pinnate leaves; leaflets alternate, unequal at the base or oblique.

1 C. PUNCTA'TA (Retz. obs. 6. p. 29.) leaflets ovate-lanceolate, acuminated, hardly unequal at the base. ♄. G. Native of China and the Moluccas. Jacq. schœnbr. 1. t. 101. Lam. ill. t. 354. Quinària Lánsium, Lour. coch. 272.—Rumph. amb. 1. t. 55. A middle-sized tree bearing eatable fruit about the size of a pigeon's egg, yellow on the outside; pulp white, rather acrid but sweet. Flowers small, white, disposed in racemose panicles. There are 2 other figures of *Lansiums* in Rumph. amb. which are probably varieties of this plant or perhaps distinct species. The fruit is sold in the markets at Canton.

Dotted Wampee-tree. Clt. 1795. Tree 20 feet.

2 C. FALCA'TA (D. C. prod. 1. p. 537.) petals with 4 furrows on the inside; leaflets lanceolate, falcate. ♄. G. Native of Cochin-china. Aulàcea falcàta, Lour. cochin. 273. Branches spreading. Flowers small, white, in terminal racemes.

Sickle-leaved Wampee-tree. Shrub 8 feet.

3 C. CYANOCA'RPA (Blum. ex Schlecht. Linnæa. 1. p. 665.) leaflets oblong, acuminated at both ends, bluntish; corymbs solitary, axillary, and terminal. ♄. S. Native of Java. Glycósmis cyanocárpa, Spreng. syst. app. p. 161. Leaflets 5-7, alternate. Calyx 5-leaved. Petals 5, oval, concave, connivent. Stamens 10, awl-shaped, free, equal, compressed. Anthers cordate. Ovary girded by a tumid disk, 5-celled; cells 1-seeded. Stigma obtuse, sessile. Berry oval, dry, 1-seeded. Cotyledons obvolute.

Blue-fruited Wampee-tree. Tree 20 feet.

4 C. CHLOROSPE'RMA (Blum. l. c. p. 664.) leaflets oblong-lanceolate, obtusely acuminated; racemes compound, terminal, and axillary. ♄. S. Native of Java. Glycósmis chlorospérma, Spreng. Leaflets 5-7, alternate. Calyx 5-leaved. Petals elliptic. Stamens for the most part 9, free, awl-shaped, compressed, unequal. Anthers cordate. Ovary tumid at the base, 5-celled; cells 1-seeded. Style almost wanting, crowned by an obtuse stigma. Berry coriaceous, globose, 1-celled, 1-3-seeded. Cotyledons usually lobed. Perhaps a genus allied to *Glycósmis*.

Green-seeded Wampee-tree. Shrub 6 feet.

Cult. The species of *Coókia* thrive very well in a mixture of loam and peat; ripened cuttings, not deprived of any of their leaves, will root in a pot of sand plunged under a hand-glass, in a moist heat.

VI. MURRA'YA (in honour of John Andrew Murray, a Swedish botanist, once Professor of Medicine and Botany in the university of Gottingen, a pupil of Linnæus, and editor of some of his works, especially an edition of his Systema). Kœn. in Schreb. gen. no. 717. D. C. prod. 1. p. 536.—Marsàna, Sonn. voy. ind. 3. t. 139.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-parted. Corolla campanulate, 5-petalled. Stamens 10, with linear-awl-shaped filaments, and roundish anthers. Fruit baccate, fleshy, 2-celled, but usually 1-celled from abortion; cells 1-seeded. Seed pendulous, with a thick woolly covering. Auricles of cotyledons small (Mirb.). Trees with impari-pinnate leaves, and white, sweet-scented flowers. Fruit eatable.

1 M. EXO'TICA (Lin. mant. 563.) leaflets 7-9. obovate, obtuse; peduncles many-flowered, corymbose; berries roundish, usually 1-seeded. ♄. S. Native of the East Indies. Ker. bot. reg. 434.—Murr. comm. goett. 9. p. 186. t. 1. Lam. ill. t. 352. Chálcas Japonénsis, Lour. coch. 271. Marsàna buxifòlia, Sonn. itin. ind. t. 139.—Rumph. amb. 5. p. 29. t. 18. f. 2. Fruit red. Flowers white, sweet-scented.

Exotic Murraya. Fl. Aug. Sep. Clt. 1771. Shrub 10 ft.

2 M. PANICULA'TA (Jack. mal. misc. 1. no. 2. p. 31.) leaflets ovate, acuminated; flowers terminal and axillary, usually panicled; berries oblong, usually 2-seeded. ♄. S. Native of the East Indies. Hook, exot. fl. t. 79. Chàlcas paniculàta, Lour. cochin. 270.—Rumph. amb. 5. p. 26. t. 17. Flowers white, with the scent of jasmine. Fruit about the size of a small *Cápsicum*, red, with a strong scent like the gooseberry.

Panicled Murraya. Fl. July. Clt. 1823. Tree 20 feet.

3 M. LONGIFÒLIA (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 665.) leaflets 3-5, oblong, acute at the base; racemes terminal. ♄. S. Native of Java. Petals 5, linear, spreading. Anthers ovate. Ovary tumid at the base, 3-celled; cells 3-seeded. Stigma obtuse, sessile.

Long-leaved Murraya. Shrub 10 feet.

Cult. These shrubs will thrive well in a mixture of turfy loam and peat, and ripened cuttings, not deprived of any of their leaves, will root in sand under a hand-glass, in a moist heat.

VII. MICROME'LUM (from μικρος, *micros*, small, and μηλον, *melon*, apple; fruit small). Blum. bijdr. ex Schlecht. Linnæa. 1. p. 665.

Lin. syst. *Decándria, Monogýnia.* Calyx urceolate, entire, permanent. Petals 5, linear, spreading. Stamens 10, free; filaments awl-shaped, alternate ones shortest; anthers roundish, didymous. Ovary 5-celled; cells 2-seeded. Style thick, crowned by an obtuse stigma. Berry dry, with 5 papery, twisted dissepiments inside, lamellate, 1-2-seeded. Cotyledons leafy, twisted. This genus is nearly allied to *Murràya* and *Coókia*. A tree with impari-pinnate leaves and alternate oblique leaflets, and terminal corymbs of flowers.

1 M. PUBE'SCENS (Blum. l. c.) leaflets 7-9, ovate, obtusely acuminated, puberulous beneath as well as the branches and corymbs. ♄. S. Native of Java.

Pubescent Micromelum. Tree 20 feet.

Cult. To be cultivated and propagated in the same manner as that recommended for *Murràya*.

VIII. AGLAI'A (from αγλαια, *aglaia*, one of the Graces, which expresses beauty; given to this genus, which is remarkable for its beauty and the sweet scent of the flowers). Lour. coch. p. 216. D. C. prod. 1. p. 537.

Lin. syst. *Monadélphia, Pentándria.* Calyx 5-parted.

Petals 5. Stamens 5-10, with the filaments as in the *Meliàceæ*, connected into an ovate tube or attached to an urceolate nectary, with enclosed anthers. Stigma broad, sessile. Ovary 1-celled, enclosing 2 ovulæ. Berry 1-seeded (mal. misc. 1. no. 2. p. 33.) Shrubs or trees with impari-pinnate leaves and axillary panicles or racemes of yellow flowers.

1 A. odora'ta (Lour. coch. p. 173.) leaves pinnate, with 5 or 7 glossy leaflets. ♄. G. Native of Cochin-china and China. Opìlia odoràta, Spreng. syst. 1. p. 766. Cumùnium Sinénse, Rumph. amb. 5. p. 28. t. 18. The leaves have a bitter and acrimonious taste. The flowers are small, yellow, and sweet-scented, and are said to be used by the Chinese to scent their teas. Berries small, red, eatable when ripe.

Sweet-scented-flowered Aglaia. Fl. Feb. May. Clt. 1810. Shrub 6 to 10 feet.

2 A. odorati'ssima (Blum. ex Spreng. syst. app. p. 250.) leaflets usually 2 pairs, oblong, bluntish, beneath as well as the panicles clothed with very fine scales; panicles pyramidal. ♄. S. Native of Java. Flowers small, yellow, very sweet-scented.

Very sweet-scented Aglaia. Shrub 10 feet.

3 A. polysta'chia (Wall. in Roxb. fl. ind. 429.) leaflets of few pairs, oblong, lanceolate, acuminated, very smooth, oblique at the base; racemes panicled, axillary; flowers nearly sessile. ♄. S. Native of Silhet in the East Indies. Panicle composed of racemes of small, yellow, sweet-scented flowers.

Many-spiked Aglaia. Tree 40 feet.

4 A. Suli'ngi (Blum. ex Spreng. l. c.) leaflets usually 2 pairs, elliptical-oblong, bluntish, and are as well as the corymbose panicles smooth. ♄. S. Native of Java.

Suling's Aglaia. Tree.

5 A. elli'ptica (Blum. ex Spreng. l. c.) leaflets usually 2 pairs, elliptic-oblong, clothed with rusty down beneath as well as the loose elongated panicles. ♄. S. Native of Java.

Elliptical-leaved Aglaia. Shrub.

6 A. speciòsa (Blum. ex Spreng. l. c.) leaflets usually 4 pairs, oblong-lanceolate, acute, clothed with brown scales beneath as well as the panicles. ♄. S. Native of Java.

Shewy Aglaia. Tree 20 feet.

7 A. deca'ndra (Wall. in Roxb. fl. ind. 2. p. 427.) leaflets usually 6 pairs, oblong, acuminated, pubescent on both surfaces as well as the panicles, which are axillary; flowers decandrous; fruit 5-seeded. ♄. S. Native of Nipaul. Flowers yellow, small, sweet-scented.

Decandrous Aglaia. Tree 50 feet.

8 A. arge'ntea (Blum. ex Spreng. l. c.) leaflets many pairs, cordate, oblong, acuminated, covered with silvery leprosy beneath; panicles elongated, divaricating. ♄. S. Native of Java.

Silvery-leaved Aglaia. Tree 30 feet.

Cult. The species of this genus will thrive well in a mixture of turfy loam and peat, and young cuttings, which are ripened at the base, taken off at a joint, will root in sand under a hand-glass, in heat.

IX. BERGE'RA (in honour of C. J. Berger, once professor of Botany at Kiel). Kœn. in Schreb. gen. no. 718. D. C. prod. 1. p. 537.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-parted. Corolla 5-parted. Stamens 10, with awl-shaped, compressed filaments and roundish anthers. Style somewhat conical. Ovary 2-celled, 2-ovulate. Fruit baccate, usually 1-celled and 1-seeded. Seed appendent with a membranaceous covering. Auricles of cotyledons large (Mirb. l. c.). This genus is perhaps sufficiently distinct from *Murràya*. Trees with impari-pinnate leaves; leaflets alternate, acuminated, pubescent.

1 B. Kœni'gii (Lin. mant. 565.) leaflets serrated. ♄. S. Native of the East Indies. Lodd. bot. cab. t. 1019.—Rumph. amb. 1. p. 149. t. 53. f. 1. Murràya Kœnígii, Spreng. syst. 2. p. 315. Racemes many, forming a corymb at the top of the branches. Flowers small, whitish-yellow. Fruit the size and form of a pigeon's egg, of a yellow colour. The pulp is easily separated when ripe, and gives out a kind of white juice before it is ripe when cut or broken, which blackens the skin as the outer covering of walnuts does in Europe, but when ripe it is grateful to the palate, and is much sought after by the inhabitants. The taste resembles that of white currants. The wood is hard and durable, and is used to make many implements of husbandry.

Kœnig's Bergera. Fl. April, July. Clt. 1820. Tree 40 ft.

2 B. integrifòlia (Roxb. ex Lamb. herb. D. C. prod. 1. p. 537.) leaflets quite entire. ♄. S. Native of the East Indies. Panicle subcorymbose, terminal. Flowers whitish.

Entire-leaved Bergera. Fl. Jun. Jul. Clt. 1823. Tree.

Cult. The species of *Bergèra* will thrive well in a mixture of turfy loam and peat; and young cuttings, ripened at the bottom, taken off at a joint, will root in sand under a hand-glass, in heat.

X. CLAUCE'NA (meaning unknown). Burm. ind. p. 89. D. C. syst. 1. p. 538.

Lin. syst. *Octo-Decándria, Monogýnia.* Calyx 4-5-toothed. Petals 4-5, oval, concave, spreading. Stamens 8-10, with awl-shaped filaments, which are excavated, dilated, and conniving at their base, and ovate or roundish anthers. Ovary 4-celled; cells 1-2-seeded. Style short, cylindrical. Stigma obtuse. Fruit almost dry, 1-celled, 1-seeded from abortion. Seed appendent, with a membranaceous covering. Auricles of cotyledons large, retuse. Trees with impari-pinnate leaves, and stalked pubescent leaflets. Flowers very small, disposed in lax panicles.

1 C. excava'ta (Burm. ind. t. 29.) leaflets 13 or 15, ovate, acuminate, unequal-sided; petioles and terminal panicles puberulous. ♄. S. Native of Java. Murràya Burmánni, Spreng. syst. 3. p. 315. C. Javénsis, Ræusch. Flowers white, octandrous.

Excavated-filamented Claucena. Tree 20 feet.

2 C. pentaphy'lla (D. C. prod. 1. p. 538.) leaflets 5 or 7. ♄. S. Native of the East Indies. Limònia pentaphýlla, Lamb. herb. but not of Roxb. Flowers white.

Five-leaved Claucena. Fl. Ju. Aug. Clt. 1800. Tr. 20 ft.

Cult. These trees should be propagated and cultivated in the same manner as recommended for *Bergèra*.

XI. GLYCO'SMIS (from γλυκυς, *glycus*, sweet, and οσμη, *osme*, smell; in allusion to the sweet-scented flowers). Cor. ann. mus. 6. p. 384. D. C. prod. 1. p. 538.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-parted. Petals 5. Stamens 10, with flat, awl-shaped filaments and elliptical anthers. Style short, cylindrical. Ovary 5-celled; cells 1-seeded. Fruit fleshy, 1-2-celled; seed pendulous, with a membranaceous covering. Auricles of cotyledons very short (Mirb.). Trees with impari-pinnate smooth leaves. Panicles axillary and terminal.

1 G. arbòrea (D. C. prod. 1. p. 538.) leaflets 5-7, oblong-linear, alternate, toothletted. ♄. S. Native of Coromandel and the Mauritius, in woods. Limònia arbòrea, Roxb. cor. 1. t. 85. Flowers small, white, sweet-scented. Fruit reddish, and are eaten by birds. The whole plant, when drying in the shade, diffuses a pleasant permanent scent as well as the following.

Tree Glycosmis. Fl. May, Aug. Clt. 1796. Tree 20 feet.

2 G. pentaphy'lla (D. C. prod. 1. p. 538.) leaflets 5, ovate, quite entire. ♄. S. Native of Coromandel. Limònia pentaphýlla, Retz. obs. 5. p. 24? Roxb. cor. 1. t. 84. Flowers

small, white, very fragrant. Fruit red, about the size of a small cherry, and which are eaten by birds.

Five-leaved Glycosmis. Fl. Ju. Jul. Clt. 1790. Sh. 6 ft.

Cult. These trees will succeed well in a mixture of turfy loam and peat, with the addition of a little rotten dung. Ripened cuttings will root in sand under a hand-glass, in heat.

XII. FERO'NIA (Feronia, the goddess of the forests). Cor. in Lin. soc. trans. 5. p. 224. D. C. prod. 1. p. 538.

Lin. syst. *Decándria*, *Monogýnia*. Flowers usually polygamous. Calyx flat, 5-toothed. Petals 5, oblong, spreading. Stamens 10, rarely 11, with filaments which are villous, dilated, and connected at their bases, and oblong, erect, tetragonal anthers. Ovary seated on an elevated disk, crowned by an elliptic-globose sessile stigma. Berry baccate, 5-celled; cells many-seeded; seeds imbedded in spongy pulp. Trees and shrubs with impari-pinnate leaves and racemose flowers.

1 F. elepha'ntum (Corr. l. c. Roxb. cor. 2. t. 141.) leaflets 5-7, obovate, sessile, crenulated, shining; common petiole with a narrow, smooth margin. ♄. S. Native of Coromandel, in woods on the mountains. Spines simple. Leaves smooth. Panicle small, axillary, or terminal. Flowers white with reddish anthers. Fruit large, about the size of an apple with a greyish rind; the pulpy part is universally eaten on the coast of Coromandel. The wood is white, hard, and durable. There is a transparent liquor which exudes from the stem when cut or broken, which is useful for mixing with painters' colours.

Elephant Apple. Clt. 1804. Tree 30 feet.

2 F. pellu'cida (Roth. nov. spec. p. 384.) leaves full of pellucid dots; common petiole round, pubescent. ♄. S. Native of the East Indies. Flowers white. Fruit eatable.

Pellucid-dotted-leaved Elephant Apple. Tree 20 feet.

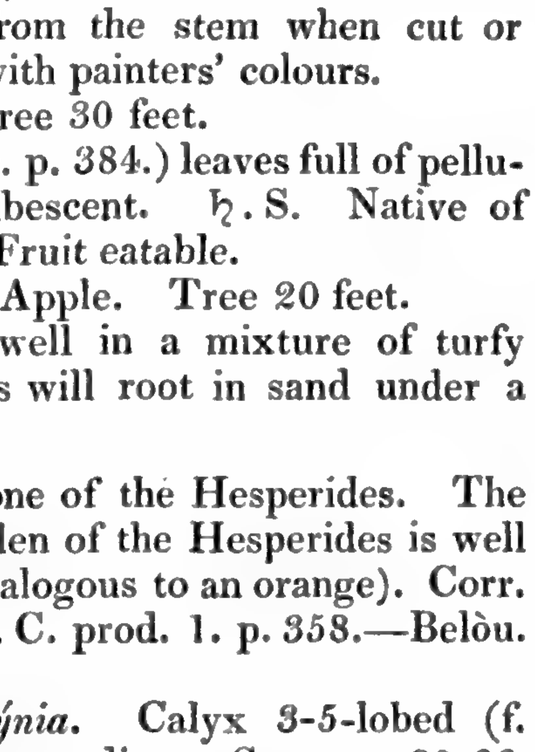
Cult. These trees will thrive well in a mixture of turfy loam and peat; and ripened cuttings will root in sand under a hand-glass, in heat.

XIII. Æ'GLE (Αιγλη, *Ægle*, one of the Hesperides. The fable of the golden apple in the garden of the Hesperides is well known. The fruit of this tree is analogous to an orange). Corr. in Lin. soc. trans. 5. p. 222. D. C. prod. 1. p. 358.—Belòu. Adans. fam. 2. p. 408.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx 3-5-lobed (f. 101. *a*.). Petals 3-5 (f. 101. *b*.), spreading. Stamens 30-36, unconnected, with long, linear, mucronate anthers (f. 101. *c*.) Stigma almost sessile. Fruit baccate, at length woody, turbinately globose, many-celled (f. 101. *d*.); cells many-seeded. Seeds imbedded in fleshy mucous pulp. Auricles of cotyledons very short (Mirb.). Shrubs with simple and double spines and trifoliate leaves; leaflets toothletted.

1 Æ. Ma'rmelos (Corr. l. c. Roxb. corom. 2. t. 143.) middle leaflet stalked; fruit 15-celled. ♄. S. Native of the mountainous parts of Coromandel and elsewhere in the East Indies. Cratæ'va Marmèlos, Lin. spec. 637. The fruit is much larger than that of *Feronia elephántum*, and is very delicious to the taste; and exquisitely fragrant. It is not only nutritious, but possesses an aperient quality which is particularly serviceable in habitual costiveness; it contains a large quantity of exceedingly tenacious transparent gluten, which may be drawn out, when fresh, into fine threads 2 or 3 yards in length. From the rind the Dutch in Ceylon prepare a perfume. The flowers are disposed in axillary and terminal panicles; they are white, and very fragrant.

FIG. 101.



Marmelos Bengal Quince. Clt. 1759. Shrub 10 ft.

2 Æ. sepia'ria (D. C. prod. 1. p. 538.) leaflets obovate-oblong, obtuse, sessile; lateral ones smallest; fruct 7-celled. ♄. S. Native of Japan. Citrus trifoliàta, Lin. spec. 1101.—Ssi. Kæmpf. amœn. 801. t. 802. Flowers axillary, solitary, white. Pulp of fruit glutinous, ungrateful to the taste, but possessing a laxative aperient quality. This shrub forms strong hedges in Japan, from its long, stiff, sharp thorns.

Hedge Bengal Quince. Shrub 8 feet.

Cult. These shrubs thrive best in a rich loamy soil; ripe cuttings, not deprived of any of their leaves, will root in sand under a hand-glass, in heat.

XIV. CI'TRUS (it is supposed that this genus has derived its name from the town of Citron in Judea, but it is very doubtful.) Lin. gen. no. 1218. D. C. prod. 1. p. 539.

Lin. syst. *Polyadélphia*, *Polyándria*, or *Polyándria*. *Monogýnia*. Calyx urceolate, 3-5-cleft. Petals 5-8. Stamens 20-60, with compressed filaments, which are more or less connected together at the base into many bundles, or free. Anthers oblong. Style cylindrical, crowned by a hemispherical stigma. Fruit baccate, 7-12-celled; cells many-seeded, full of pulp, spermaderm, membranous. Auricles of cotyledons very short. Evergreens, trees, or shrubs, with axillary spines and simple leaves, with their petioles usually winged. Flowers white and exquisitely fragrant but heavy. Fruit with a yellow rind, and soft, usually delicious pulp. This genus contains the orange, lemon, lime, and shaddock. *Citrus* is the most striking of fruit-bearing trees, and must have attracted the notice of aboriginal man long before other fruits of less beauty but of more nutriment or flavour. The golden apples of the heathens and the forbidden fruit of the Jews are supposed to allude to this genus, though it is remarkable that we have no authentic records of any species of *Citrus* having been known; certainly none were cultivated by the Romans.

Dr. Sickler, who spent 6 years in Italy, and paid great attention to the kinds and culture of the *Citrus* tribe, published at Weimer in 1815, a quarto volume called *Vollkommene Orangerie-Gartner*, in which he describes 74 sorts. He arranges the whole into 2 classes, and these classes into divisions and subdivisions, without regard to their botanical distinctions or species, as follows:

Lemons.	Cedrates or Citrons		4 sorts.
	Lemons.	Round Lemons	6 do.
		Pear-shaped do.	11 do.
		Cylindrical do.	4 do.
		Gourd-shaped do.	2 do.
		Wax do.	5 do.
		Lumies	8 do.
	Cedrate Lemons or Citronates		6 do.
	Limes		4 do.
Oranges.	Bitter Oranges		6 do.
	Sour Oranges		6 do.
	Sweet Oranges		12 do.

A short delineation of Dr. Sickler's treatise by Dr. Nochden will be found in Hort. trans. vol. 3. append., which is perhaps of more use for the Italian names of the varieties than for any other information it contains.

In the districts towards the sea-coast in the south and south-west of Italy, especially about Sorento and Amalfii, you meet not only with groves of Orange and Lemon trees, but almost with forests.

1 C. Me'dica (Risso, ann. mus. 20. p. 199. t. 2. f. 2.) branches spiny; petioles naked; leaves oblong, obtuse; flowers with 35-40

stamens, often without a style; fruit oblong, wrinkled, with a thick rind, and acid pulp. ♄. G. Native of Asia, but has been cultivated from time immemorial in middle and south Europe, and now cultivated almost throughout the world.—Ferr. hesper. t. 59, 60-63. C. Mèdica Cèdra, Gall. citr. p. 87. var. 1, 2-5-7. —Rumph. amb. 2. t. 25 and 26. f. 2. Blackw. herb. t. 361. Young branches violet-coloured. Rind wrinkled, adhering to the pulp, possessing a sweet odour. Petals purplish on the outside. Pedicels axillary, solitary, 1-flowered. The specific name *Mèdica* is said to be derived from Media, where it is said to have originally come from. This was the opinion of the Romans. The tree was cultivated in Italy before Virgil and Pliny. The wood was formerly used in making furniture by the Romans, as the Acasia is at this day. The fruit is often half a foot in length, ovate, with a protuberance at the tip; usually 9-celled; the pulp is white, and commonly acid; the rind yellow, thick, hardish, odoriferous, irregular; it is esculent, both raw and preserved. Properly there are two rinds; the outer thin, with innumerable miliary glands, full of the most fragrant oil; the inner thick, white, and fungous; the partitions consist of two very thin diaphanous, membranaceous plates, connected at the axis, and inserted into the rind at the perephery; the cells are filled with a bladdery pulp. In each cell are a few seeds, commonly 1 or 2, sometimes 3 or 4.

Risso gives the following description of this species:

Branches spiny. Pedicels bear about 10-flowers, disposed in a corymb, the greater part of them sterile. The calyx is 5-toothed, covered on the outside with protuberances, and streaked with a few reddish nerves. The flowers are large, purple without and white within, usually of 5 petals, which are oval-oblong, with 40 or 50 stamens, with flat unequal filaments, and yellow anthers. Pistil permanent, caducous, or wanting. The fruit is large and oblong, covered with protuberances, which are red when young, but of fine yellow colour when ripe; the rind is spongy and thick, with a sweet odour, adhering closely to the pulp, which is sparing and acid. Seeds oblong, with a reddish pellicle. It is called *Cedrat* (Fr.), *Cedrot* (Ital.), *Sedrou* (Nice), *Citron* (Eng.), *Cedreiro* (Brazil).

The fruit of the *Citron* is seldom eaten raw, but is generally preserved and made into confections, which being kept till winter and spring, when there is a scarcity to furnish out the desert, is the more valuable; but unless the season be warm, and the trees well managed, the fruit rarely ripens in England. The finest fruit that ever was produced in England, was in the garden of his Grace the late Duke of Argyle, at Whitten, where the trees were trained against a south wall, through which there were flues for warming the air in winter, and glass covers to put over them when the weather began to be cold. Thus the fruit was as large as it is in Italy or Spain.

The *Citron* is a native of the warm regions of Asia. Being introduced into Europe from Media, it had the name of *Malus Medica*. It seems to have come into Italy after the age of Virgil and Pliny, but before that of Palladius (Lin.), who appears first to have cultivated it with any success there (Virg. 136. qu. ed.) According to Haller, the Median apple described by Theophrastus is certainly a sort of orange (Bibl. bot. 32.), which fruit, according to Athenæus, first travelled into Greece from Persia (Evelyn), and in time became known to the Greeks, and about the same time it began also to be cultivated in Judea. If the Median apple be the orange, the *tristes succi* of Virgil, and the *acres medullæ* of Palladius, it must have been much corrected by culture; the latter author, Theophrastus, and Pliny, all speak of it as not eatable, though they celebrate its medicinal qualities far above its desert.

It has been conjectured by many commentators, from the circumstance of Jews at the present day carrying *Citrons* to the Feast of the Tabernacles, that it was the fruit ("Hadar") spoken of in the 23d chap. 4th ver. of the Book of Leviticus. In old Samaritan coins *Citrons* may be observed attached to the palm on one side. Josephus mentions a custom of great antiquity. Thus on one occasion, when Alexander the king and the high priest stood at the altar, the people revolted, and threw at him the *Citrons* they bore in their hands. It is, however, probable, that no particular fruit was alluded to, and it was not until the days of Solomon that *Citrons* became known.

There are 3 varieties of the *Citron* enumerated by Risso in ann. du. mus. 20. p. 199 and 200. which are as follows:

1 *Large Citron* (Engl.), *Gros Sedrou* (Nice), *Cedrat a gros fruit* (Fr.), *Cedrone* (Ital.). *Citrus Médica frúctu máximo* (Risso). Fruit large, wrinkled, copper-coloured, with a very thick rind and acid pulp. Volc. p. 119. Gal. p. 98. no. 2. The principal difference which separates this variety from the species is the great size of its fruit. The leaves are oval-oblong and thick, of a glaucous green-colour. The flowers are large, white, and numerous; the stamens are much longer than the pistil. The fruit is large, with a thick rind, adhering closely to the pulp, which is a little acid.

2 *Monstrous Citron* (Engl.), *Cedro monstruoso* (Ital.), *Sedrou* (Nice), *Cedrat monstrueux* (Fr.), *Citrus Médica tuberòsa* (Risso). Fruit monstrous, mucronated, yellow, with acid pulp. Ferr. hesp. 357. Volc. p. 162. Gal. p. 100. no. 5. From the tubercles and teats, which ordinarily cover the fruit, the name is derived. The leaves are large, usually curled, and of a dark-green colour, placed on short petioles. The flowers are disposed in a corymb. The fruit is roundish oval, of a dark-yellow colour, usually terminating in a short point at the apex; the rind is thick, and is covered with large tubercles, which even penetrate to the middle of the pulp, which is acid, and does not contain any seeds.

3 *Florence Citron* (Engl.), *Cedratello di Firenze* (Ital.), *Cedrat de Florence* (Fr), *Citrus Médica Florentìna* (Risso). Fruit small, ovate, acuminated, very sweet-scented, with a thick yellow rind and acid pulp. Volc. p. 133. Desf. p. 138. Gal. p. 103. no. 7. This variety is a very pretty tree. The branches are spiny and green. The leaves are oval-oblong, toothed, and pointed, of a glaucous-green colour. The flowers are disposed in a tuft at the summits of the branches. The calyx is 5-toothed. The corolla is composed of 5 or 8 petals, which are tinted with violet on the outside. Stamens from 30 to 36, with twisted filaments, which are as long as the pistil. The fruit is ovate, gradually tapering to the apex into a point; the rind is thick, of a clear yellow colour, with a sweet scent, and covered with a few tubercles; the pulp is divided into 8-cells, and is truly acid.

The Portuguese had many of the most curious sorts of *Lemons* and *Citrons*, brought from the Indies formerly, which seemed to thrive almost as well there as in their native soil, and yet they have not been increased. There are a few trees still remaining in some neglected gardens near Lisbon, almost unnoticed by the inhabitants (Martyn). The *Lemon* was first cultivated in Britain in the botanic garden at Oxford in 1648. (Hort. kew).

The useful parts of the *Lemon* and *Citron* are the juice and the outward rind of the fruit, and the volatile oil of the outer rind. The juice of *Lemons* is analogous to that of the Orange, from which it only differs in containing more citric acid, and less syrup. The quantity of the former is indeed so great that the acid has been named from the fruit, *acid of Lemons*, and is always prepared from it. The simple expressed juice will not keep on account of the syrup, extractive mucilage, and water, which cause it to ferment. The yellow peel is an elegant aromatic, and is frequently employed in stomachic tinctures and infusions; and yields by expression or distillation with water an essential oil, which is much used in perfumery. Fresh Lemon-

juice is truly specific in the prevention and cure of scurvy; that is, its effects are certain, and cannot be explained, for the crystalized acid, and even the rob or inspissated syrup, do not produce the same salutary effects. It is given freely mixed with water and sugar, and in a short time the symptoms disappear. The juice is also a powerful and agreeable antiseptic. Its powers are much increased, according to Dr. Wright, by saturating it with muriate of soda. This mixture he recommends as possessing very great efficacy in dissentery, remittent fevers, the belly-ache, putrid sore-throat, and as being perfectly specific in diabetes and lienteria. Citric-acid is often used with great success for allaying vomiting; with this intention it is mixed with carbonate of potass, from which it expels the carbonic acid with effervescence. This mixture should be drank as soon as it is made, or the carbonic acid gas, on which its anti-emetic power chiefly depends, may be extricated in the stomach itself, by first swallowing the carbonate of potass dissolved in water, and drinking immediately afterwards the acid properly sweetened. The doses are about a scruple of the carbonate dissolved in 8 or 10 drachms of water, and an ounce of Lemon-juice, or an equivalent quantity of Citric-acid. Lemon-juice, as well as Lime-juice, is also an ingredient in many pleasant refrigerent drinks, which are of very great use in allaying febrile heat and thirst. Of these the most generally useful is Lemonade, or diluted Lemon, or Lime-juice sweetened. (Duncan, edinb. disp. p. 309.)

Median Apple or Citron. Fl. May, July. Clt. 1648. Tree 8 to 15 feet.

2 C. Limétta (Risso, ann. mus. 20. p. 195. t. 2. f. 1.) petioles subalate; leaves ovate-roundish, serrated; flowers with 30 stamens; fruit globose, with a blunt nipple-like protuberance at the apex, a firm rind, and sweet pulp. ♄. G. Native of Asia, but cultivated in Italy. C. Médica Limon, Gal. citr. no. 10, 25-38. Ferr. hesp. t. 230. 395. 233. 321. Corolla white on both sides. This is commonly called *Sweet Lime or Lemon*, *Bergamotte*, *Limeta*, *Peretta*, *Lima dolce*, *Lime douce*, *Limo dúlcis*, *Limétta Bergamótta*. A rather tall tree, with diverging branches. The corolla is of a fine white colour, and composed of 5 oblong petals, which are rounded at the apex, covered with small pores full of essential aromatic oil.

There are also 7 varieties of this enumerated by Risso, which are as follows:

1 *Small-fruited Sweet Lime* (Engl.). *Lemettier petit fruit. Petit Lime douce* (Fr.), *Lima dolce piccola* (Ital.), *Limeta picouna* (Nice), *Citrus Limétta fructu pumilo* (Risso). Fruit small, somewhat depressed, crowned, of a yellow-greenish colour, with a very smooth rind and sweet pulp. This variety is cultivated in the gardens. It differs from the species to which it is analogous, in the tree being lower in stature, and in the leaves being more toothletted on the edges.

2 *Lemon-formed Sweet Lime* (Engl.) *Limettier limoniforme* (Fr.), *Limoun douce* (Nice), *Lima dolce* (Ital.), *Citrus Limétta limoniforme* (Risso). Fruit roundish-oblong, copper-coloured, with a very sweet pulp. Ferr. l. 3. cx. p. 227. t. 230. Volc. p. 159 and 160. This fine and rare variety has been confounded with the common *Sweet Lime*. From which it differs not only in the flowers and leaves, but in the form of the fruit, as well as in its juice and seeds. It is a much larger tree than the preceding variety. The calyx is reddish, and the corolla is of a beautiful white, bearing from 30 to 45 unequal stamens. The fruit is oblong-roundish, terminated by 2 protuberances, with a long navel-like protuberance, and the rind is of a dark yellowish-saffron colour. The rind is insipid. The pulp has a taste as sweet as sugar, and is very agreeable. The seeds are oblong, pointed at one end, but blunt at the other. The tree is very rare in the gardens.

3 *Starry Sour Orange* (Engl.), *Limettier a fruit étoilé. Mella Rose* (Fr.), *Melarosa* (Ital.), *Melarosa* (Nice), *Citrus Limétta fructu, stellato* (Risso). Fruit subrotund, depressed, striated, crowned, containing acid pulp. Ferr. hesp. p. 393. t. 395. Volc. p. 190, 191. Gal. p. 141. no. 38. This tree is of ordinary size. The calyx is short. The corolla is small and white, with 30 unequal stamens, which sometimes change into lanceolate petals. The fruit is round, of a yellow colour, crowned by a small, blunt, nipple-like protuberance; the rind is thin, adhering closely to the pulp. The seeds are oval and striped.

4 *Bergamote Lime* (Engl.), *Lemettier Bergamote*, *Bergamote* (Fr.), *Bergamota* (Nice), *Bergamoto* (Ital.), *Citrus Limétta Bergàmium* (Risso). Leaves ovate, acute, toothed; fruit golden, quite smooth, with an acid and bitter pulp. Volc. p. 155 and 156. Desf. p. 138. Gal. p. 118. no. 25. The branches are spiny. The leaves are large, on long petioles. The flowers are white, and have a particular scent, composed of 4 or 5 petals, with about 26 stamens. The fruit is large and spherical, of the form of a pear, terminated by a small nipple-like protuberance; the rind is thin, of a golden-yellow colour, enclosing an acid and equally bitter pulp. The seeds are oblong.

5 *Pear Lemon* (Engl.), *Limettier Perette* (Fr.), *Peretta* (Ital.), *Pereta* (Nice), *Citrus Limétta Perétta* (Risso). Fruit ovate, ribbed lengthwise, very sweet-scented, with an acid pulp. Ferr. hesp. p. 231. t. 233. This variety is easily distinguished by the fruit being in the form of a pear. The branches are straight, and furnished with spines. The leaves are oval and rounded, and finely toothletted, on long stalks. The flowers are purplish on the outside, containing about 35 stamens. The fruit is of a fine yellow colour, and is traversed longitudinally with stripes, which are not very apparent, and terminated by a small, sharp, nipple-like protuberance, of an agreeable odour; the rind is thick, and the pulp is acid.

6 *Adam Apple* (Engl.), *Limettier pomme d'Adam*, *Pomme d'Adam* (Fr.), *Pomo d'Adamo* (Ital.), *Citrus Limétta pomum Adami* (Risso, l. c.) Leaves ovate-oblong, curled; petioles winged; fruit very large, round, of a greenish-colour, with a sweet pulp. Ferr. hesp. p. 317. t. 321. Volc. p. 181, 182. Desf. p. 138. Gal. p. 138. This variety will form a distinct species at some future day. The branches are furnished with very small spines, and are traversed longitudinally with white stripes. The leaves are oval-oblong, waved at the margins, of a dark-green colour, with broad winged petioles. The flowers are white, and contain about 40 stamens. Fruit with a thick rind and sweet but equally bitter and acid pulp. The varieties of this kind are called *Lumies*.

7 *Rose Sweet Lime* (Engl.), *Limettier Pomme rose* (Fr.), *Mello rosa* (Ital.), *Poum roso* (Nice), *Citrus Limétta pomum rosæ* (Risso). Fruit roundish-oblong, usually pear-shaped, rough, of a pale-copper colour, very sweet-scented, with an acid pulp. Ferr. hesp. 231. t. 233. The branches of this variety are brittle and spiny. The leaves are oval, toothletted, on long petioles, of a dark-green colour. The flowers are few in number, white, of 5 oblong petals, and about 30 stamens. The fruit is roundish-oblong, but often pear-shaped, of a saffron-yellow colour; the rind is thick, hard, and of a very agreeable smell; the pulp is divided into 10 cells, which contain acid juice. The seeds are less numerous than in the other varieties.

8 *Limeira embiguda* of Brazil. The fruit is large and globular, and terminated by a large protuberance. The rind is thin and the flesh very sweet. They cultivate at Bahia a second variety of this orange under the name of *Limeira de Persia*; it has a very large fruit, and is also terminated by a point; the inside of the rind is bitter, and outside smooth. The pulp is very sweet.

Sweet *Lime* and Lumy Fl. May, July. Clt. 1648. Tree 8 to 15 feet.

3 C. Java'nicum (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 667.) petioles winged; leaves oval, very blunt, unequally crenulated; flowers with 22 stamens; fruit oblong, with an obtuse point, with a thick rind and bitter pulp. ♄. S. Native of Java. Allied to *C. Limétta*.

Java Lemon. Tree 20 feet.

4 C. Limònum (Risso, ann. mus. 20. p. 201.) petioles somewhat winged; leaves oval-oblong, crenulated; flowers with 25-35 stamens, but usually without styles; fruit oblong, with a very thin rind, and very acid pulp. ♄. G. Native of Asia, but cultivated in the south of Europe, and most parts of the world within the tropics. Cìtrus Médica Limon, Gal. cit. 105. exclusive of the varieties under no. 2.—Ferr. hesp. t. 247, 211, 253, 223, 229, 293, 255, 265, 105, 225, 207, 243, 219, 301, 307, 215. C. Lìmon, Lin. Mill. Petals purplish on the outside. Branches violet. Racemes axillary. Fruit ovate, with a yellow rind, adhering to the pulp. It is commonly called *Citron* (Ital.), *Limone* (Fr.).

The most remarkable varieties in the English gardens are,

1 Common Lemon. 2 Pear-shaped Lemon. Fruit small, with very little juice. 3 Imperial Lemon. The fruit of this variety is sometimes imported from Italy, but not from Spain or Portugal. 4 Furrowed Lemon. 5 Childing Lemon. 6 Double-flowered Lemon. 7 Broad-leaved Lemon. 8 Chinese Lemon. 9 Rough-fruited Lemon. 10 Smooth-leaved Lemon. 11 Gold and Silver-striped Lemon. 12 Upright Lemon. 13 Warted-fruited Lemon. 14 St. Helena Lemon. Browne mentions this variety as having been introduced into Jamaica, and much cultivated there, on account of its large fruit, which frequently yields about a pint of juice. 15 Fingered Lemon. In China and other parts of the East, they have a remarkable variety of *Lemon* or *Citron*, which has a solid fruit, without any cells or pulp, and divided above the middle into 5 or more long round parts, a little crooked, and having the appearance of the human hand, with the fingers a little bent, whence the Chinese call it *Phat thu*, or Fingered Lemon.

Risso gives the following description of the species: The stem is straight, and much branched, hairy and spiny, covered with a clear grey bark; the branchlets are violet. The leaves are petioled, oblong, acuminated, and toothed, of a yellowish-green colour, beset with small transparent points. The petioles are long, with a leafy border, which is lengthened out even to the base. The calyx is permanent and quinquefid, of a violet colour, seated upon a long pedicel. The corolla is of 5 petals, which are of a reddish-purple on the outside, but white on the inside, with a heavy penetrating odour. The stamens are unconnected, long, and about 36 in number, with yellow anthers. The pistil is reddish. The fruit is small, egg-shaped, of a saffron-yellow colour, terminated by a nipple-like protuberance; the rind is thin, but compact, adhering closely to the pulp, which is divided into 10 cells, containing very acid juice. The seeds are oblong and yellowish.

* *Fruit egg-shaped, terminated by a small blunt nipple-like point.*

1 *Thin-rinded Lemon* (Engl.), *Limonier a écorce fine* (Fr.), *Limone lustrato* (Ital.), *Limoun scorso fino* (Nice), *Cìtrus Limònum cortice tenui* (Risso, l. c.) Fruit ovate, very smooth, with a thin rind and very acid pulp. Tour. inst. p. 321. Gal. p. 111. no. 9. The difference which separates this variety from the species is its being less branched, and these destitute of spines, and in the leaves being more oval, toothed, larger towards the summit, and diminishing gradually towards the base, as well as in the flowers being more numerous, and the petals being larger. Fruit roundish, egg-shaped, very smooth and shiny, of a beautiful greenish-yellow colour; the rind is very thin and sweet-scented; the pulp is very considerable, full of an agreeable acid juice. Seeds small, but often wanting.

2 *Naples* or *Common Lime* (Engl.), *Limonier de Calabre* (Fr.), *Limoncello di Napoli* (Ital.), *Limouncello* (Nice). Lìma, Macf. in Hook, bot. misc. pt. 3. p. 300. Flowers very white; fruit small, globose, with a thin sweet-scented rind and acid pulp. Ferr. hesp. p. 209. t. 211. Volc. p. 144. Gal. p. 120. no. 16. This is a beautiful variety, with spiny elongated branches, younger branches of a greenish-red. Leaves oval-roundish, on short petioles. Flowers of 5 or 6 oblong, pointed petals, with about 25 stamens. Fruit small, round, of a pale-yellow colour, with a thin but firm aromatic rind and acid pulp, usually without seeds.

3 *Streaked Lemon* (Engl.), *Limonier canellè* (Fr.), *Limone incanellato* (Ital.), *Limoun raiat* (Nice), *Cìtrus Limònum striàtum* (Risso). Fruit ovate, channelled, with a thick rind and acid pulp. Ferr. hesp. p. 245. t. 247. Volc. no. 9. In spite of the opinions of many authors that the varieties of *Limes* do not retain their characters for any length of time, this variety, according to Risso, has retained its character since the time of Ferrari without any change, in spite of the difference of climate and soil to which it has been transplanted. Tree branched; branches brittle, beset with small points. Leaves oval-roundish, toothletted, of a pale-green colour. Flowers solitary, composed of 4 petals. Fruit striped lengthwise, and terminated by a small nipple-like process, with the rind rather thick; the pulp is divided into 9 or 10 cells, full of an acid juice. Seeds not very numerous.

4 *Sbardonius's Lemon* or *Round Lime* (Engl.), *Limonier de Sbardonius* (Fr.), *Limone Sbardonio* (Ital.), *Limoun rount* (Nice), *Cìtrus Limònum Sbardònii* (Risso). Leaves oblong, acute, wrinkled; fruit ovate-roundish, wrinkled, with an acid pulp. Ferr. hesp. p. 251. t. 253. This variety is named in honour of the director of the botanic garden at Rome by the celebrated Ferrari. Principal branches grey. Leaves oblong, thin, toothed, pointed, of a dark-green colour, on rough petioles. Flowers of 4 large petals and 4 small ones, white inside, but reddish on the outside, with about 50 stamens. Fruit roundish-oval, rough, of a fine clear yellow colour, and furnished with tubercles towards the peduncle, and terminated by a nipple-like protuberance, which is crowned by the usually permanent style; the rind is rather thick; the pulp is divided into 10 or 12 cells, full of an acid juice. Seeds roundish-oval.

5 *Incomparable Lemon* (Engl.), *Limonier incomparable* (Fr.), *Limone incomparabile* (Ital.), *Limoun gros* (Nice), *Cìtrus Limònum incomparàbile* (Risso). Fruit large, roundish-ovate, with a thin, very smooth rind and acid pulp. Ferr. hesp. p. 221. t. 223. In spite of the distinctive characters which Ferrari had given to this variety, the name has fallen into oblivion. Branches reddish. Leaves oblong, pointed, large, on long petioles. Flowers usually 2 to 4 upon the same pedicel, with a rough calyx, small petals, and about 30 very long stamens. Fruit roundish-oval, very large, of a clear yellow colour, terminated by a small, blunt, nipple-like protuberance; the rind is rather thick; the pulp is very considerable, divided into 10 cells, full of an acid juice. Seeds oblong.

6 *Small-fruited Lime* (Engl.), *Limonier a petit fruit* (Fr.), *Limone picollo* (Ital.), *Limoun gallo* (Nice), *Cìtrus Limònum fructu pusillo* (Risso). Ferr. hesp. p. 209. t. 211. The name that has been given to this variety is sufficient to distinguish it from all others. Branches a little spiny. Leaves small, oblong, pointed, on long petioles. Flowers usually scattered, with small petals, which are purplish on the outside, but white on the inside. Fruit round, very small, of a greenish-yellow colour; the rind is rather thick; the pulp is divided into 9 cells, full of rather acid pulp.

7 *Caly Lime* (Engl.), *Limonier Caly* (Fr.), *Limone cerceli* (Ital.), *Limoun Cali* (Nice), *Cìtrus Limònum Caly* (Risso). This

variety resembles the preceding, and the *Calabrian Lime*, but is easily distinguished from both by its greater size, and the branches only being furnished with a few very short spines, by the leaves being oval, on twisted petioles, yellowish, by the flowers being of 5 petals, reddish on the outside, and by the fruit being larger, perfectly round, and very smooth, of a beautiful yellow colour, terminated by a small nipple-like protuberance, with a thin rind, and the pulp is divided into 9 cells, which are full of an acid juice. Seeds egg-shaped. This variety is also distinguished from the *Pusilla-pila* of Ferr. hesp. t. 201. by the spines being shorter, the leaves more pointed, the fruit larger, with a thinner rind, and from the *Barbadorus* of Ferr. hesp. t. 259. by the leaves being shorter, the branches more spiny, and the fruit smaller.

8 *Sweet Lemon* (Engl.), *Limonier a fruit doux* (Fr.), *Limone a frutto dolce* (Ital.), *Limoun san Bartolomea* (Nice), *Limueiro doce* (Braz.), *Cìtrus Limònum pulpa dulci* (Risso). Ferr. hesp. p. 227. t. 229. Fruit ovate-oblong, with an incurved point and sweet pulp. This variety is not to be confounded with the *Lemon-shaped Sweet Lime*, nor with the *Lemon-shaped Orange*. It presents a different appearance to both. Leaves oblong, pointed, rather deeply toothletted towards the summit, but entire towards the petiole, which is very long. Flowers of a beautiful white colour, slightly tinged with red on the outside, very odoriferous. Fruit oval-oblong, smooth, terminated by a long nipple-like point, which is sometimes curved; the rind is very thin, of a beautiful yellow colour; the pulp is divided into 8 cells, full of a sweet juice. Seeds oblong.

9 *Poncine Lemon* (Engl.), *Limone Ponzino* (Ital.), *Limonier Poncine* (Fr.), *Limoun Pounsino* (Nice), *Cìtrus Limònum Pouzìnum* (Risso). Fruit large, globose, with an incurved point and acid pulp, without seeds. The Poncine is cultivated in some gardens in the south of Europe, and makes a very fine vigorous tree, full of spurs. Leaves oval-oblong, pointed, on short petioles. Flowers usually collected together at the summit of the branches. Fruit very large, terminated by a small, curved, nipple-like protuberance, of a beautiful yellow colour, at maturity, traversed lengthwise by lines, which are a little elevated, which renders it somewhat rugged; the rind is very thick; the pulp is divided into 11 cells, full of an acid juice, without seeds. This variety is only cultivated for curiosity.

10 *Rosoli Lemon* (Engl.), *Limonier Rosolin* (Fr.), *Limone Rosolino* (Ital.), *Limoun san Gerorme* (Nice), *Cìtrus Limònum Rosolìnum* (Risso). Ferr. hesp. p. 251. t. 255. Leaves large, elongated, thick, slightly toothletted, on long winged petioles. Flowers collected together in bunches. Fruit very large, round, a little oblong, traversed lengthwise by warted stripes, of a deep-yellow colour, mixed with green, terminated by a nipple-like point, which is usually curved, with a very thick tender rind, of an insipid taste, adhering firmly to the pulp, which is very inconsiderable, considering the size of the fruit, full of feeble acid juice.

11 *Small Cedrate Lemon* (Engl.), *Limonier petit Cedrat* (Fr.), *Limone Cedrino* (Ital.), *Limoun Sedrin* (Nice), *Limueiro Francez* (Braz.), *Cìtrus Limònum Citràtum pumilum* (Risso). Fruit ovate, smooth, shining, with a pulp containing little acid. Tree small. Leaves small, green on one side, but yellowish on the other. Flowers ordinarily grow in pairs, violet on the outside, with a 4-cleft calyx, and the stamens are usually shorter than the pistil. Fruit egg-shaped, covered with sunk points, of a shining-yellow colour, terminated by a small, blunt, nipple-like protuberance, containing a faint tasted, rather acid pulp.

12 *Bignette Lime* (Engl.), *Limonier Bignette* (Fr.), *Limone Bignetta* (Ital.), *Bignetta comuna* (Nice), *Cìtrus Limònum Bignétta* (Risso). Fruit ovate, smooth, of a greenish-yellow colour, blunt at the apex, with an acid pulp. There is a variety of this sort, which is used in sauces, and to make lemonade, in Brazil under the name of *limueiro azedo*. The fruit is very small, and resembles a *citron* in form; the rind is smooth and green.

13 *Large-fruited Bignette Lemon* (Engl.), *Bignette a gros fruit* (Fr.), *Bignetta grossa* (Ital.), *Bignetta* (Nice), *Cìtrus Limònum Bignétta fructu maximo* (Risso). Fruit large, ovate, shining, pale-yellow, with acid pulp. This tree is also known under the name of *Bignette*, but it should not be confounded with the preceding variety; it is a much more majestic tree. The leaves are more developed, roundish-oval, toothletted, of a beautiful shining green, mixed or spotted with yellow, traversed by large nerves beneath; the flowers are larger, and slightly tinged with purple, with the stamens united at the base by twos or threes, for the most part sterile; the fruit is egg-shaped, smooth, and shining, without any nipple-like process, of a pale greenish-yellow colour, two or three times larger than the common *Bignette*, and less abundant in juice. The culture of this tree is almost abandoned, on account of the fruit which seldom comes to maturity.

14 *Cedrate Lemon* (Engl.), *Limonier Cedrin* (Fr.), *Limone Cedrino* (Ital.), *Limoun Sedrou* (Nice), *Cìtrus Limònum Citràtum* (Risso). Fruit round, smooth, with a long acute point. Ferr. hesp. p. 266. t. 263. The characters which separate this from all the other varieties are its long pale-green leaves, which are deeply toothletted, and traversed by small, hardly apparent nerves, and the large flowers composed of 3 or 4 petals, which are coloured with red on the outside, and are borne on long slender peduncles, as well as in the fruit being large, of a very shining greenish-yellow colour, terminated by a very long nipple-like point, with a thick rind and slightly acid pulp, without seeds.

* * *Fruit oblong, terminated by a large nipple-like point,*

15 *Wax Lemon* (Engl.). *Limonier Ceriesc* (Fr.). *Limone seriesco* (Ital.). *Limoun seriesc* (Nice). *Cìtrus Limònum ceriéscum* (Risso). Fruit ovate-oblong with a thick rind and grateful acid pulp. Tourn. inst. p. 621. Volc. p. 163. and 164. Desf. tab. de l'eco. de bot. p. 138. Gall. p. 110. no. 8. Of all the varieties this is the most generally cultivated, next to the common *Bignette*, on account of the abundance of fruit which it produces every year. It is a vigorous tree, with large oblong-pointed leaves; the flowers are situated on long peduncles; the calyx is coloured like the petals. The fruit is variable in form, but generally oval-oblong, terminated by a point, with a thicker rind than that of the common *Bignette*, containing abundance of acid juice.

16 *Gaeta Lemon* (Engl.). *Limònier de Gaete* (Fr.). *Limone di Gaeta* (Ital.). *Limoun Gaetan* (Nice). *Cìtrus Limònum Gaietànum* (Risso). Fruit oval, oblong, with a thick, eatable, wrinkled rind. Ferr. hesp. p. 233. t. 105. This tree, which bears beautiful fruit, differs essentially from all the other varieties. The leaves resemble those of the *Laurel of Apollo*, oblong, finely toothletted, acuminated. The branches are furnished with spines. The flowers are large and situated along the branches, composed of 9 linear, reflexed petals, sweet-scented, and of a purplish colour, with about 42 stamens, which are longer than the pistil. The fruit is long, oval-oblong, terminated by a large, blunt, nipple-like protuberance, with a thick sweet rind, and the pulp divided into 10 cells, full of an acid juice, and containing a very few small seeds.

17 *Imperial Lemon* (Engl.). *Limonier Imperial* (Fr.). *Limone Imperiàle* (Ital.). *Limoun gros* (Nice). *Cìtrus Limònum Imperiàle* (Risso.). Fruit roundish-oblong, wrinkled, with a thick rind and rather acid pulp. Ferr. hesp. p. 221. t. 225.

The branches of this tree are thick and are furnished with spines. The leaves are large, oval-oblong, pointed or blunt, on short petioles. The flowers are composed of from 6-9 reflexed petals, with about 40 unequal stamens, which are usually about the length of the pistil. The fruit is oblong-roundish, terminated by a long navel-like protuberance, with a very thick, wrinkled, clear yellow rind; the pulp is divided into 10 cells, full of an acid juice, containing a few seeds.

18 *Long-fruited Lime* (Engl.). *Limonier a fruit allongé* (Fr.). *Limone lungo* (Ital.). *Limoun nazellou* (Nice). *Cìtrus Limònum elongàtum* (Risso). Fruit elongated, yellow, with a curved point and acid pulp. This is a beautiful variety, and is easily distinguished from the others by its tall straight branches, and by its large elliptical leaves, which are of a gay green colour, placed on thin petioles, which are a little twisted at the base. The flowers are composed of 5 purplish petals, with about 30 stamens. The fru t is long, usually terminated by a short curved point, with a thick, spongy, beautiful yellow rind, of an insipid taste; the pulp is divided into 10 cells, full of acid juice, without any seeds.

19 *Amalfi Lemon* (Engl.). *Limonier d'Amalfi* (Fr.). *Limone d'Amalfi* (Ital.). *Limoun long* (Nice). *Cìtrus Limònum Amalphitànum* (Risso). Fruit oblong, warted, with an elongated point and acid pulp. Ferr. hesp. 203. t. 207. This variety bears the name of the country where it has apparently been cultivated for the first time. It differs from the other varieties, in the fruit being longer and warted. The leaves are round, of a green mixed with yellow. The flowers are composed of 5, usually unequal petals, which are slightly tinged with purple, with about 40 stamens, bearing very long anthers. The fruit is long, straight, and rugged, terminated by a long, nipple-like point, with a rather thick dark-yellow rind; the pulp is divided into 10 cells, full of a rather acid pulp, containing oblong seeds, which are pointed at one end.

20 *Balotin Lemon* (Engl.). *Limonier Balotin* (Fr.). *Limone Balotino* (Ital.). *Limoun Baloutin* (Nice). *Cìtrus Limònum Balotinum* (Risso). Fruit oblong, with a thick, even, or rugged rind, containing a rather acid pulp. Desf. tab. de l'ecol. de bot. p. 188. This variety cannot be confounded with any other in this series. The tree has a prickly appearance, with long branches. The leaves are oval-oblong, straight, serrated, and standing upon long yellow petioles. The flowers are 6-petalled, with the teeth of the calyx sharp. The fruit is roundish-oblong, lengthened towards the peduncle, and is terminated by a nipple-like point, with a rather thickish yellow rind which has an insipid taste; the pulp is divided into 13 unequal cells, full of a sourish juice, without any seeds.

21 *Clustered Lime* (Engl.). *Limonier a fruit en grappe* (Fr.). *Limone racemoso* (Ital.). *Limoun à bouquet* (Nice). *Citrus Limònum racemòsum* (Risso). Fruit rounded, oblong, with a curved point, with rather acid pulp. Ferr. hesp. p. 239. t. 243. The leaves are oval-oblong, pointed. The flowers are collected in corymbs, the corolla is long, and composed of 5 petals. The fruit in great number on each peduncle, oblong-rounded, terminated by a nipple-like point which is usually curved, with a thick, shining, clear yellow rind; the pulp is full of sourish juice, containing a few oblong seeds. The variety is cultivated to a great extent in the south of Europe, on account of its bearing abundance of fruit all the year round.

22 *Laura Lemon* (Engl.). *Limonier Laure* (Fr.). *Cìtrus Limònum Làuræ* (Risso). Fruit large, oblong, wrinkled, with a thick rind and acid juice. Ferr. hesp. 217. t. 219. The name given by Ferrari to this variety has been retained. The tree has a fine appearance; the branches are furnished with some spines. The leaves are very long, thin, of a fine green colour, upon very long petioles. The flowers are very large. The fruit is oblong, rounded, very large, smooth or furnished with a few protuberances, terminated by a small point, with an agreeable scent; the rind is very thick and compact, of a dark yellow colour, with a very agreeable taste, the pulp is whitish, divided into 11 cells, full of an acid juice, containing a few elongated seeds.

23 *Citron Lemon* (Engl.). *Limonier cedrat* (Fr.). *Limone cedrato* (Ital.). *Limoun sedrou* (Nice). *Cìtrus Limònum citràtum* (Risso). Ferr. hesp. p. 299. t. 301. Gal. p. 115. no. 12. The branches of this tree are covered with a smooth grey bark. The leaves are oval-oblong, pointed, on long petioles. The flowers are usually solitary. The fruit is very large, oblong, rounded, of a pale-yellow colour, traversed by warted nerves, which renders it very rugged, with a very thick firm rind and a very small quantity of pulp, which is divided into many cells, full of an acid juice, without seeds.

24 *Two-teated Lemon* (Engl.). *Limonier a fruit a deux mamelons* (Fr.). *Limone bicapezuollato* (Ital.). *Limoun pouncut* (Nice). *Cìtrus Limònum fructu bipapillato* (Risso). Fruit ovate-oblong, greenish-yellow, with two nipple-like points. Ferr. hesp. p. 233. t. 215. This variety is easily distinguished by the form of its fruit. The branches are furnished with some points. The leaves are oval-oblong, pointed, of a greenish-yellow colour. The rind of the fruit is very thin, and the pulp has a very agreeable acid taste.

The following names occur in the English nurseries:—1 The Common Lime. 2 Broad-leaved. 3 Chinese. 4 Weeping. 5 West India.

The quality of *limes* and *lemons* are only to be judged by the quantity and acidity of their juice; the juice of the *lime* is preferred in tropical countries to that of the *lemon*, as being more wholesome and agreeable; mixed with water and sugar it is called lemonade. Its medical qualities are the same as those of the *lemon*, see p. 588 and 589. Lime-trees usually grow from 10 to 12 feet high, branching much from the base, and generally furnished with spines, therefore they are usually planted for fences as well as for their fruit in warm climates.

Lemon and Lime. Fl. May, July. Clt. 1648. Tr. 8 to 20 ft.

5 C. Paradìsi (Macfadyen, in Hook. bot. misc. pt. 3. p. 304.) leaves oval, rounded, crenulate, smooth; petioles winged; stamens 25; fruit large, subacid. ♄. G. Native? *Lomonier pomme* (Fr.). *Limone cedrato* (Ital.). *Limoun senso aigre* (Nice). *Cìtrus Limònum Paradìsi* (Risso). Fruit ovate-oblong, with a very thick and very smooth rind, and hardly any pulp, but what there is, is rather acid. The flowers are large, composed of 4-7 unequal petals. The fruit pear-shaped, of a greenish-yellow colour, with a good-tasted very thick tender rind. In Jamaica there are two varieties of this species, the *Barbadoes grape-fruit* and the *Forbidden-fruit*; the first possesses most of the sweet principle.

Paradise Orange or Forbidden-fruit. Fl. May, July. Clt.? Tree 30 feet.

6 C. Aura'ntium (Risso, ann. mus. 20. p. 181. t. 1. f. 1, 2.) petioles almost naked; leaves ovate-oblong, acuminate, with blunt point flower with 20-22 stamens; fruit globose with a thin rind and sweet pulp. ♄. G. Native of Asia, but cultivated in the south of Europe as well as in all the warmer regions of the world. Cìtrus Aurántium Sinénse, Gall. citr. 149.—Ferr. hesp. t. 427. 399. 401. and 385. Trunk naked at the bottom, but the branches form a tuft at the top. Petals white. Fruit of a golden colour. Commonly called Sweet Orange. The specific name is derived from *aurus*, gold, colour of fruit. As a desert fruit the *orange* is well known. The varieties most esteemed are the China, Portugal, and Maltese. The fruit is also used in confectionary, both ripe and when green and not larger than a pea, it forms various liquors and conserves, either alone or with sugars, wines, or spirits. In cooking it is used to perfume

a number of dishes. It is used to form various perfumes and pomades, and the flowers distilled produce orange-water, used in cooking, medicine, and as a perfume, but the chief use of the sweet orange is for the dessert.

There are 19 varieties of the orange enumerated by Risso.

1 *Common Orange*. Stem erect, branched, spiny; leaves ovate, oblong, and acute, slightly crenulated on the margins, smooth, and of a dark-green colour, on long petioles. Peduncles axillary, solitary, smooth, each bearing from 2-6-flowers. calyx pale-green, 5-cleft. Petals 5, oval-oblong, terminated by a point, of a beautiful white colour, furnished with green glands. Stamens from 20-22, unequal, with the filaments united at their bases by fours. The fruit is round, smooth, of a beautiful golden colour, with a rather thick rind, and the pulp is divided into 9 or 11 cells, full of a sweet yellow juice. Seeds roundish. This tree bears exquisite fruit, which resists the cold, but it is at the same time but little cultivated in the south of Europe, on account of its not bearing well until it is about 25 or 30 years old, as well as because the fruit is apt in windy weather to come against the spines of the branches, which injures them, and therefore renders them unfit to resist a long voyage.

2 *Majorca Orange* (Engl.). *Oranger de Majorque* (Fr.). *Arancio di Majorca* (Ital.). *Pourtegalie Majourkin* (Nice). *Citrus Aurántium Baleáricum* (Risso). Fruit globose, shining, with a thick rind and sweet pulp. Gall. p. 153. no. 30. The branches are furnished with spines at their base. The leaves are less than in the preceding tree, thicker, and more shining. The peduncles are very long, from 3-6-flowered; they have a pleasant sweet smell. The fruit is globose, smooth, deeply coloured, and arrives very soon at maturity. It will keep a longer time than any of the other varieties; the pulp is very sweet, and usually without seeds. This tree is not much cultivated, on account of its not being very productive.

3 *China Orange* (Engl.). *Oranger de la Chine* (Fr.). *Arancio fino* (Ital). *Pourtegalie de Malta* (Nice). *Citrus Aurántium Sinénse* (Risso). Ferr. hesp. p. 425. t. 427. Comel. hesp. no. 8. Volc. p. 185 and 186. This is a very majestic tree. The leaves are oval-oblong, sometimes roundish, a little waved at the margins, of a pale-green colour, upon long petioles. The flowers are usually disposed in corymbs, these are situated upon the tops of the branches. The fruit is round, depressed, firm, weighty, of considerable diameter; the rind is very thin, adhering closely to the pulp, which is very sweet. The seeds are oblong, with a curved point. This tree is much cultivated at Nice. The fruit is not so sensible to cold as the other varieties.

4 *Nice Orange* (Engl.). *Oranger de Nice, Oranger a fruit doux* (Fr.). *Arancio dolce* (Ital.). *Pourtegalie noustral* (Nice). *Citrus Aurántium Nicæ'nse* (Risso, l. c. pl. 1. f. 1.). Volc. p. 187 and 188. Desf. tab. de l'ecol. de bot. p. 138. This orange, from the abundance of its fruit, forms a very lucrative production for the inhabitants of Nice. The leaves are oval-oblong, tapering gradually to a point, of a beautiful shining green, bearing in their axils a great quantity of bunches of sweet-scented flowers towards the months of March and April. The fruit is round, usually depressed at both extremities, firm, of a beautiful yellow colour, with a thin rind; the pulp is divided into 10 or 12 cells, full of sweet and pleasant juice, and oblong seeds. This tree is generally cultivated.

5 *Genoa Orange* (Engl.). *Oranger de Genes* (Fr.). *Arancio di Genova* (Ital.). *Pourtegalie de Genova* (Nice). *Citrus Aurántium Genuénse* (Risso). This tree is very large. The leaves are small, oval-oblong, pointed, of a fine dark green. The flowers are disposed in bunches, and are composed sometimes of only 3 petals. The fruit is round, but sometimes oblong, commonly marked with a little ridge, which extends even to the middle of the rind, which is rather thick, and of a beautiful yellow colour; the pulp is divided into 10 cells, full of a sweet juice. The seeds are yellowish.

6 *Thick-rinded Orange* (Engl.). *Oranger a fruit de la grosse ecorce, Oranger a ecorce du fruit epaisse* (Fr.). *Arancio a frutto di corteccia spessa* (Ital.). *Pourtegalie bouffat* (Nice). *Citrus Aurántium cortecrasso* (Risso). Fruit large, round, with a thick rind and sweetish pulp. The leaves of this variety are always of a beautiful green, usually collected in tufts at the tops of the branches. The flowers are very large. The fruit is very large, round, of a deep-yellow colour, with a very thick granulated spongy rind, adhering closely to the pulp, which is divided into 10 cells, some of these contain a few small seeds; the juice is sweet and more watery than in the preceding varieties, which is the cause of the fruit not being easily preserved any length of time. This tree bears fruit well as an espalier, but is very little cultivated about Nice.

7 *Teat-fruited Orange* (Engl.). *Oranger a fruit mameloné* (Fr.). *Arancio scabroso* (Ital.). *Pourtegalie gibous* (Nice). *Citrus Aurántium gibbòsum* (Risso). Fruit round, with a sweetish insipid pulp. The tree is large, and very branchy. The leaves are usually curled. The fruit is round, of a reddish-yellow colour, covered with large protuberances, and its juice is never so sweet as the other varieties.

8 *Small-fruited Orange* (Engl.). *Oranger a petit fruit* (Fr.). *Arancio picciol frutto* (Ital.). *Pourtegalie gallo* (Nice). *Citrus Aurántium microcárpon* (Risso). Many gardeners are of opinion that this variety was the first that was introduced to the south of Europe, but particularly about Nice. It differs from all the other varieties in the leaves being smaller, situated upon petioles, which are a little winged at the base. The flowers are collected into bundles at the tops of the branches, each containing about 26 stamens. The fruit is always very small, and of a pale-yellow colour, full of a sweetish juice.

9 *Double-flowered Orange* (Engl.). *Oranger a fleur double* (Fr.). *Arancio a fior doppio* (Ital.). *Pourtegalie a flou doublo* (Nice). *Citrus Aurántium dùplex* (Risso). Fruit somewhat globose, usually fetiferous, with a sweet pulp. Volc. p. 201 and 202. Calv. no. 9. Gal. p. 159. no. 35. The leaves are large. The flowers are composed of from 6-10 petals. The pistil is usually divided into two parts at the top, each bearing a yellow stigma. The fruit is very different from the other varieties, as the pulp is formed of a double unequal range of cells, all of which are full of sweet juice. This tree is very little cultivated.

10 *Malta Orange* (Engl.). *Oranger a fruit rouge* (Fr.) *Arancio sanguigno* (Ital.). *Pourtegalie rouge* (Nice). *Citrus Aurántium Hierochúnticum* (Risso). Fruit globose with a thin rind and blood-coloured pulp. Till. 21. t. 16. Calv. no. 7. Ferr. hesp. p. 429. Gal. p. 156. no. 32. The fruit is of a golden colour, but becoming as red as blood at maturity; the pulp is divided into 9 cells, full of very sweet juice and small seeds.

11 *Compressed-fruited Orange* (Engl.). *Oranger a fruit deprime* (Fr.). *Arancio a frutto compresso* (Ital.). *Pourtegalie galleto* (Nice). *Citrus Aurántium fructu depresso* (Risso). Fruit round, depressed, with a sweet pulp. The fruit of this variety is not much esteemed in commerce, on account of the depression at the extremities. The trees are very large. The leaves are long oval. The flowers are collected into corymbs. The fruit is large and round, of a lively colour, with a smooth thick rind; the pulp is divided into 10 or 12 cells, which contain but a small quantity of sweet juice but a great number of seeds. This tree is not much cultivated.

12 *Ribbed-fruited Orange* (Engl.). *Oranger a fruit a côte* (Fr.). *Arancio a frutto costato* (Ital.). *Pourtegalie regat* (Nice). *Citrus Aurántium, fructu costato* (Risso). Fruit ribbed, crowned by a point, with a sweetish pulp. The fruit is of a middle size,

with a thin rind of a dark-yellow colour; the pulp is divided into 11 cells, full of an agreeable juice and a few small seeds. The flowers are smaller than in the other varieties. This tree is rather rare.

13 *Smallest-fruited Orange* (Engl.). *Oranger a fruit nain* (Fr.). *Arancio nano* (Ital.). *Pourtegalie Chinet* (Nice). *Cìtrus Aurántium fructu minutíssimo* (Risso). Fruit very small; leaves lanceolate, acute, subalate; pulp of fruit sweet. Ferr. hesp. p. 429. Volc. t. 2. p. 206, 207. Gal. p. 157. no. 32. This beautiful variety differs from all the other kinds, in its leaves being lanceolate, of a beautiful green, upon long subalate petioles. The flowers are small. The fruit is very small, about the size of those of the *Bigaradier Chinois;* the rind is smooth, of a pale-yellow colour; the pulp is divided into 7 cells, full of an agreeable acid juice.

14 *Holly-leaved Orange* (Engl.). *Oranger a feuille d'yeuse* (Fr.). *Arancio a foglia crispàta* (Ital). *Pourtegalie crispat* (Nice). *Cìtrus Aurántium illicifòlium* (Risso). Petioles awl-shaped; leaves roundish, curled, toothed; fruit somewhat ovate, very smooth, with a very sweet pulp. The appearance of this variety is very singular. The leaves are round, waved, curled, of a fine shining-green colour, yellowish beneath, with large, strong nerves, like those of the *China Holly.* The flowers are collected into isolated corymbs. The fruit is round, a little oblong, terminated by a small, nipple-like point at the summit, hollow in the middle; the rind is thickish, of a pale-orange colour; the pulp is divided into 10 cells, full of a very sweet pulp, usually without seeds. This variety is very rare in the environs of Nice.

15 *Eared-fruited Orange* (Engl.). *Oranger a fruit doré et Oranger dore* (Fr.). *Arancio dorato* (Ital.). *Pourtegalie daurat* (Nice). *Cìtrus Aurántium fructu aurato* (Risso, l. c. pl. 1. f. 2.) fruit ovate, eared, with a sweet pulp. This rare and beautiful variety is furnished with some spines; the young shoots are reddish. The leaves are oval, long, of a fine shining-green above, but yellowish beneath. The calyx is tinged with purple. The corolla is whitish-yellow with about 30 stamens. The fruit is oval-round, of a golden-yellow colour, terminated by a small nipple-like point, with a very smooth rind; the pulp is divided into 12 cells, full of an agreeable juice. Seeds few or wanting.

16 *Ray-fruited Orange* (Engl.). *Oranger a fruit rayé et Oranger a fruit blanc* (Fr.). *Ariancio bianco* (Ital.). *Pourtegalie blanc* (Nice). *Cìtrus Aurántium fructu variegato* (Risso). leaves ovate-oblong, sinuated, variegated with yellow; fruit globose, striped with yellow and green, with a somewhat sweet pulp. Ferr. hesp. p. 397. t. 399. Volc. p. 195. t. 196. The leaves have very long petioles. The flowers are composed of 5 long, blunt petals, with about 24 or 28 stamens. The fruit is globose, sometimes a little depressed, of a golden-yellow colour, traversed lengthwise with bands of green, which disappear at maturity; the rind is rather thick; the pulp is of a pale-yellow, of an agreeable sweet taste. This tree does not bear much cold.

17 *Changeable-fruited Orange* (Engl.). *Oranger a fruit changeant et Culotte de chien* (Fr.). *Calzoni di cane* (Ital.). *Braio de can* (Nice). *Cìtrus Aurántium fructu variábili* (Risso). Leaves narrow, spotted; fruit oblong, green, striped, with a sweet and bitter pulp. Ferr. hesp. p. 397. t. 401. Tourn. R. H. p. 620. This is a very majestic tree. Petioles long. The flowers are collected in bunches with small petals, and about 24 short stamens. The fruit is oblong, pear-shaped, yellow, striped with bands of a reddish colour; the rind is thick and bitter; the pulp is sweetish. The seeds are striped.

18 *Lime-shaped Orange* (Engl.). *Oranger Limetiforme et Oranger a fruit Limette* (Fr.). *Arancio frutto Limeta* (Ital.). *Pourtegalie Limetta* (Nice). *Cìtrus Aurántium limetiforme* (Risso). Fruit oblong, sinuated, pointed, with a reddish sweet pulp. This is the tenderest of all the *oranges* we have mentioned. The tree is rather high. The leaves are of a yellowish-green. The fruit is globular, of a pale-yellow, longitudinally traversed by many sinuses from the base, and terminated by a small obtuse point. The rind is thin and the pulp is divided into 8 cells full of sweet juice. It is rare, and the fruit seldom comes to maturity.

19 *Lemon-formed Orange* (Engl.). *Oranger limoniforme* (Fr.). *Limone aranciato* (Ital.). *Limoun Pourtegalie* (Nice). *Cìtrus Aurántium limoniforme* (Risso). Fruit roundish-oblong, with a sweet pulp. Ferr. l. 3. p. 384. t. 385. Gal. p. 117. no. 14. The form of the fruit of this tree is that of a *lemon,* but the colour and taste of the fruit are those of an *orange.* The branches are hairy and spiny. The leaves are oval and finely denticulated, on short petioles. The flowers are usually in pairs; the calyx is red and the corolla is very long and pointed, with 26-30 free stamens. The fruit is roundish-oblong, terminated by a short obtuse point, of a yellowish-green colour. The pulp is sweet, without seeds.

In Brazil the following varieties of the *orange* are cultivated. Some of them are probably identical with some of those described above.

1 *Larangeira seleta.* This variety is obtained by grafting. Its rind is thin and smooth. The pulp is very delicious and sweet. This is probably the *Navel-orange* of Bahia, which is large and round, and terminated by a small protuberance, hence its name. It is considered one of the best oranges in that country.

2 *Larangeira da China.* This variety is very common all over Brazil. It is perhaps the common *China orange.*

3 *Larangeira Tangerina pequena.* The rind is very thin and smooth. The fruit is small. The pulp is reddish and of a very agreeable taste.

4 *Larangeira Tangerina grande.* In every respect the same as the preceding, but the fruit is much larger.

5 *Larangeira seca.* The fruit is sweet but it is not juicy.

6 *Larangeira embeguda.* The rind is incomplete and shining, it divides into 9 divisions at the top. The taste is very agreeable. It is common at Bahia, but it is also much spread over the rest of Brazil.

The following names of *oranges* occur in the London nurseries; many of them may be the same as those described above. 1 Common Orange. 2 Bloody-fruited. 3 Broad-leaved. 4 Large Bergamot. 5 Small Bergamot. 6 Cluster-fruited. 7 Curled-leaved. 8 Fine-leaved. 9 Laurel-leaved. 10 Lisbon. 11 Maltese. 12 Bloody Maltese. 13 Monstrous. 14 Narrow-leaved. 15 Spike-flowered. 16 Striped leaved, of various sorts. 17 Striped Willow-leaved. 18 Sweet-skinned. 19 Sweet China. 20 Tangiorana. 21 Thick-leaved. 22 Weeping. 23 Willow-leaved, &c.

Sweet *Orange.* Fl. May, July. Clt. 1595. Tree 10 to 30 ft.

7 C. vulgàris (Risso in ann. mus. 20. p. 190.) petioles winged; leaves elliptical, acuminate, crenulated; flowers with 20 stamens; fruit globose, with a thin, scabrous, or smooth rind, and a bitter acrid pulp. ♄. G. Native of Asia, but now cultivated in the south of Europe, America, and Africa. C. Aurántium I'ndicum. Gall. citr. 122. C. Bigaràdia, Duh. ed. nov. 7. p. 99. Ferr. hesp. t. 409. 589. 391. 430. 433. C. Sinénsis, Pers. ench. 2. p. 74. C. Aurántium, Ker. bot. reg. 346. C. Cálot, Lag. gen. et spec. 17. Petal white. Risso gives the following description of the species. Stem erect; branches spiny. The petioles have a wing in the form of a heart. The flowers are of 5 white petals on short pedicels. Stamens from 30 to 34, unequal, with flat filaments. Fruit round, rarely tubercled, of a dark-orange colour. The rind is sweet-scented. The pulp is divided into 12 or 14 cells, containing a bitter acid juice.

The seeds are oblong, of a yellow colour. *Seville* or *Bitter Orange* (Engl.). *Bigaradier sauvage* (Fr.). *Citrone, Sour sylvatico* (Ital.). *Citroun sauvage* (Nice). Ferr. 377. Volc. 186. Gal. 121.

The juice of the Seville *orange* is used in medicine in febrile and inflammatory disorders, but that of the other sorts possesses the same qualities in a lesser degree. It is chiefly used for making marmalade, and a variety of other agreeable confections. The acid of *oranges*, Dr. Cullen observes, unites with the bile, takes off its bitterness, and may be useful in obviating disorders arising from its acidity. The qualities of the Seville *orange* are exactly the same as that of the *lemon* and *lime*. Orange-water is obtained from the flowers by distillation.

1 *Common Seville Orange* (Engl.). *Oranger bigarade* (Fr.). *Arancio citrone* (Ital.). *Limoun San Vincent* (Nice). *Cìtrus vulgàris* (Risso). A tall tree with greyish bark, with the branchlets furnished with deciduous points at the base of the petioles. The leaves are oval-oblong, finely denticulated. The flowers are always disposed in terminal corymbs. The calyx is whitish and deeply 5-lobed. Petals 5, oblong. Stamens 30. The fruit is roundish-oblong, terminated by a large obtuse point, of a dark-yellow colour, with a few little protuberances. The rind is thick, adhering to the pulp, which is divided into 8 cells, full of an acid bitter juice, and does not contain any seeds. This tree bears flowers and fruit all the year round.

2 *Horned Seville Orange* (Engl.). *Bigaradier cornu* (Fr.). *Citrone cornuto* (Ital.). *Sitroun daude* (Nice). *Cìtrus vulgàris corniculàta* (Risso). Fruit roundish, with a thick, wrinkled rind, mucronate. Ferr. p. 407. t. 409. This is a tall tree. The leaves are large, elliptical, of a dark-green colour. The flowers are usually disposed in pairs. The fruit is large, of a reddish-yellow colour, full of small tubercles, the pulp is divided into 10 or 14 cells, full of an acid bitter pulp, containing angular seeds. This variety is very generally cultivated in the south of Europe for its flowers, which are used in the composition called *eau-de-Bigarade*, as well as for its fruit, which is used to season meat.

3 *Bouquette Bigarade* or *Bouquette Seville Orange* (Engl.). *Bigaradier bouquetier* (Fr.). *Citrone a foglia rizza* (Ital). *Bouquetie* (Nice). *Cìtrus vulgàris folio crispo* (Risso). Leaves curled; fruit small, roundish, scabrous, containing an acid, rather bitter pulp. Ferr. p. 387. t. 389. Volc. p. 178 and 179. Gal. p. 131. no. 20. This is a small tree. It is thickly covered with leaves, which are oval-roundish, curled, and denticulated, on round almost wingless petioles. The flowers are axillary, 5 or 7 together, usually of 6 petals. The fruit is of a reddish-yellow colour, with a tubercled or wrinkled thick rind, scented like the lily of the valley, containing a very bitter acid pulp.

4 *Many-flowered Seville Orange* or *Bigarade* (Engl.). *Bigaradier riche dépouille* (Fr.). *Citrone a molti fiori* (Ital.). *Grand bouquetie* (Nice). *Cìtrus vulgàris multiflòra* (Risso). Many-flowered; fruit globose, very smooth, containing an acid and bitter pulp. Desf. tab. de l'ecol. de bot. p. 138. This differs much from the preceding, not only in its larger size; but also in the disposition of the leaves, as well as in the great number of flowers which cover the plant all the year round. The tree emits short branches. The leaves are elliptic and denticulated, of a fine green colour; the wings of the petioles are broad and heart-shaped. The flowers are in tufts at the extremity of the branches; the corolla is white, usually of 5 petals, which are oval-oblong and recurved. The stamens are about 36 in number. The fruit is round, very large, of a dark reddish-yellow colour, with a very smooth rind; the pulp does not adhere to the rind, and is divided into 10 cells.

5 *Double-flowering Seville Orange* or *Bigarade* (Engl.). *Bigaradier a fleur double* (Fr.). *Citrone fiore doppio* (Ital.). *Bigarado flou doublo* (Nice). *Cìtrus vulgàris florifer* (Risso). Flowers double; fruit globose or oblong, usually fetiferous, containing bitter pulp. Ferr. p. 187. t. 391. Volc. 201 and 202. Gal. p. 129. no. 18. This tree resembles the horned Seville orange. The leaves are very smooth, and the wings of the petiole are rather narrow. The calyx is 8-cleft. The petals are 8-14, oblong. The fruit is middle-sized, varying in form, usually double, that is to say, containing one within the other. The flowers are used as a perfume.

6 *Spanish Seville Orange* or *Bigarade* (Engl.). *Bigaradier d'Espagne* (Fr.). *Citrone di Spagna* (Ital.). *Sitroun d'Espagna* (Nice). *Cìtrus vulgàris Hispánica* (Risso). Leaves ovate-oblong, revolute, sinuated; fruit large, round, wrinkled, with a sweet pulp. This tree is distinguished alone by its aspect. The branches and branchlets are very short. The leaves are oval, curled, and sinuated, of a clear green colour; the wings of the petioles are broad and heart-shaped. The flowers are large, and have a scent resembling that of jasmine, of 5 elliptic petals. The fruit is large, round, and wrinkled or tubercled, of a pale reddish-yellow colour, with a thick rind which does not adhere firmly to the pulp, which is divided into 10 cells, full of a sweet bitterish pulp, and oblong seeds.

7 *Wrinkled Seville Orange* (Engl.). *Bigaradier rugueux* (Fr.). *Citrone scabroso* (Ital.). *Serioulou dous* (Nice). *Cìtrus vulgàris rugòsa* (Risso). Fruit small, mucronate, wrinkled, containing a sweet and bitter pulp. The branches are straight and the leaves are elliptic and undulated, of a dark shining-green, on long, winged, heart-shaped petioles. The flowers are in twos or threes, white, usually of 5 oblong petals. The fruit is round, of a pale-orange colour, with a thick wrinkled rind, furnished with protuberances at the summit, containing a sweet pulp, but it is rather bitterish. The seeds are pale-yellow.

8 *Sweet-fruited Seville Orange* or *Bigarade* (Engl.). *Bigaradier a fruit doux* (Fr.). *Citrone frutto dolce* (Ital.). *Sitroun dous* (Nice). *Cìtrus vulgàris pulpâ dulci* (Risso). Fruit globose, smooth, with a thick rind, containing a sweet pulp. The leaves of this tree are pale-green, oval-oblong, standing upon long, winged petioles, and often furnished with spines at the base. The flowers are large, disposed in corymbs, of 5 petals and very sweet-scented. The seeds are round on this and the preceding variety.

9 *Smooth-fruited Bigarade* (Engl.). *Bigarade a fruit lisse* (Fr.). *Citrone liscio* (Ital.). *Serioutou unit* (Nice). *Cìtrus vulgàris glabérrimus* (Risso). Fruit round, smooth, with a thin rind and bitter sweet pulp. This tree is not so much branched as the other varieties; the leaves are oval-lanceolate, of a pale-green colour, standing on long, winged, heart-shaped petioles. The flowers are disposed singly, but sometimes in pairs on the summits of the branches. The calyx is 4-5-cleft, and the corolla is of 5 reflexed petals. The fruit is always solitary, of a pale-yellow colour, and the pulp is divided into 9 cells. The seeds are striated.

10 *Chinese Bitter Orange* or *Bigarade* (Engl.). *Bigaradier Chinois* (Fr.). *Chinotto* (Ital.). *Chinet* (Nice). *Cìtrus vulgàris Chinénsis* (Risso). Fruit small, spherical, containing a somewhat acrid, bitter pulp. Ferr. t. 430. 433. Tourn. p. 620. Desf. tab. de l'ecol. de bot. p. 138. Gal. p. 132. no. 21. The branches of this shrub are small and scabrous, covered with small lanceolate leaves, standing on short wingless petioles. The flowers are disposed in a kind of thyrse along the peduncles. The fruit is concave at the summit, of a reddish-yellow colour; the rind is rather thick, and the pulp adheres but slightly to the rind.

11 *Myrtle-leaved Orange* (Engl.). *Bigaradier Chinois a feuille de myrte* or *Chinois nain* (Fr.). *Nanino da China* (Ital.). *Chinet picoun* (Nice). *Cìtrus vulgàris myrtifòlia* (Risso). Fruit small, with an acid and bitter pulp. Ferr. p. 430. Gal. p. 134. no. 22. This variety never grows to a tree, but always remains a small shrub. The leaves are small, lanceolate, and

pointed, of a fine green colour, resembling those of the broad-leaved myrtle. The flowers are small and white, disposed in racemes along the branches, there are usually a great number on the same peduncle. The fruit is of the colour and form of the preceding, but rather smaller.

12 *Large-fruited Bigarade* or *Seville Orange* (Engl.). *Bigaradier a gros fruit* (Fr.). *Citrone frutto grosso* (Ital.). *Gros sitroun dous* (Nice). *Cìtrus vulgàris fructu maximo* (Risso). Fruit large, round, wrinkled, depressed, with a spongy rind, and rather sweet pulp. The leaves are very long, reclined, shining, undulated, of a dark-green, on long, winged petioles. The flowers are large and white, sweet-scented, disposed along the branches. The calyx is green, of 5 lobes. The corolla is composed of 4-6 petals. The stamens about 26 in number. The stigma is trigonal. The fruit is very large, of a reddish-yellow colour, with a very thick spongy rind, and the pulp is divided into 9 cells.

Common Seville or Bitter Orange. Fl. May, July. Clt. 1595. Tree 20 to 30 feet.

8 C. decuma'na (Lin. spec. 1100.) branches prickly; leaves oval, obtuse or emarginate, pubescent beneath: petioles with broad, cordate wings; fruit large, with a thick rind, and red or white pulp; stamens 30. ♄. S. Native of China and Japan, but now cultivated in South America. Pampel-moes, Rumph. amb. 2. t. 24. f. 2. The shaddock is called *Arancio Massino* by the Italians, and *Oranger Pampelmouse* by the French. The fruit is very large and round, about the size of a large cannon-ball, about 10 or 14 pounds weight; rind even, of a greenish-yellow colour; thick, fungous, and bitter; pulp white or red: juice sweet or acid. It was first brought from China to the West Indies by Captain Shaddock, from whom it has derived its name. The shaddock is certainly the least useful of the species, and is cultivated chiefly for show. Where several sorts of *oranges* are presented at the dessert it makes a striking addition to the variety. The fruit is of a subacid sweetness, excellent for quenching thirst, and from the thickness of its rind, will keep longer at sea than the fruit of any other species of *Cìtrus*. The Italians, according to Dr. Sickler, have one variety, the French, according to the *Nouveau Cours*, &c. have four kinds. In the English nurseries the names of four occur, viz. 1 The Common Shaddock. 2 The Rough-fruited. 3 The Largest-fruited. 4 The West Indian. In Jamaica there are 2 varieties, 1 malifórmis; fruit globose, with white pulp; 2 pyrifórmis, fruit pear-shaped, with red pulp.

Large-fruited Orange or Shaddock. Fl. May, July. Clt. 1722. Tree 18 feet.

† *Species not sufficiently known.*

9 C. hy'strix (D. C. cat. hort. monsp. p. 97.) petioles with broad wings; leaves ovate, hardly larger than the petioles; branches very spiny. ♄. S. Native of the East Indies. Lèmoferus, Rumph. amb. 2. t. 28? Flowers and fruit unknown.

Porcupine Orange. Clt.? Tree 10 feet.

10 C. spinosi'ssima (Meyer. esseq. 247.) petioles winged; leaves oval, crenated, bluntish at both extremities. ♄. S. Native of Guiana and Brazil in sandy woods. Flowers white, twin. Fruit yellow, about the size of a walnut. This appears to be the common wild lime of America, and perhaps only a variety of *Cìtrus Limétta*.

Very-spinose Lime. Fl. May, Jul. Clt.? Tree 15 feet.

11 C. Japo'nica (Thunb. fl. jap. 292.) petioles winged; leaves acute; stem angular; flowers axillary, solitary, or twin; fruit 9-celled. ♄. G. Native of Japan. Thunb. icon. jap. t. 15. Fruit the colour and form of an orange, but small, about the size of a cherry, containing a sweet eatable pulp.

Japan Orange. Fl. May, July. Clt.? Shrub 2 feet.

12 C. fu'sca (Lour. coch. 467.) petioles with heart-shaped wings; leaves ovate-lanceolate; branches spinose; fruit 9-celled, globose, rough. ♄. G. Native of China, Cochin-china, and the Moluccas.—Rumph. amb. 2. t. 33. Fruit of a greenish-brown colour, containing an acid ungrateful pulp.

Brown-fruited Citron. Fl. May, July. Clt.? Tree 15 feet.

13 C. nóbilis (Lour. coch. 466.) petioles rather linear, straight; branches ascending, unarmed; fruit depressed, 9-celled, with a thick rind. ♄. G. Native of Cochin-china and China. Ker, bot. reg. 211. Andr. bot. rep. 608. Fruit reddish, both without and within, containing sweet juice, and eatable sweet rind. This is distinguished from the common orange by its curious form, and by the pulp adhering so loosely to the rind, as to be separable from it by the slightest effort, and leaving in many places a considerable opening between them. It is the most delicate of its tribe, whence its name by the Chinese, *Mandarine* or *Noble Orange*.

Noble or Mandarine Orange. Fl. May, July. Clt. 1805. Tree 15 feet.

14 C. margari'ta (Lour. coch. 467.) petioles linear; leaves lanceolate; branches ascending, spiny; fruit oblong, 5-celled, covered with a thin smooth rind. ♄. G. Native of China about Canton. Fruit reddish-yellow, 8 lines long, containing a sweet pulp.

Pearl Lemon. Fl. May, July. Clt.? Tree 12 feet.

15 C. Madure'nsis (Lour. coch. 570.) petioles linear; leaves broad-lanceolate; branches diffuse, unarmed, angular; fruit globose, smooth, 8-celled. ♄. G. Native of China, Cochin-china, and Madura.—Rumph. amb. 2. t. 31. Fruit greenish-yellow, containing a bitter pulp, which is eaten when prepared with sugar, but never raw.

Madura Orange. Fl. May, July. Clt.? Shrub 8 feet.

16 C. angula'ta (Willd. spec. 3. p. 1426.) petioles naked; leaves ovate, acute; fruit angular. ♄. G. Native of Amboyna.—Rumph. amb. 2. t. 32.

Angular-fruited Citron. Fl. May, July. Clt.? Tree.

17 C. buxifòlia (Poir. dict. 5. p. 681.) petioles linear, very short; leaves ovate, retuse; flowers racemose. ♄. G. Native of China. Perhaps this plant is allied to *Cìtrus vulgáris var. myrtifòlia* of Risso, and therefore ought perhaps to be placed under that head.

Box-leaved Orange. Fl. May, July. Shrub 3 feet.

18 C. articula'ta (Willd. herb. ex Spreng. syst. 3. p. 334.) petioles leafy, obovate, large, articulated; leaves oblong; peduncles many-flowered. ♄. S. Native of Guinea.

Jointed-petioled Orange. Tree 20 feet.

19 C. Chile'nsis (Molin. chili. ex Spreng. syst. 3. p. 335.) leaves ovate-lanceolate, nearly sessile, shining; fruit nearly globose. ♄. G. Native of Chili.

Chili Orange. Tree 15 feet.

Cult. All the species of *Cìtrus* may be propagated by seeds, cuttings, layers, by grafting, and budding. The object of raising plants from seed is stock for grafting or budding, or for new varieties. To attempt raising new varieties from seed in Britain would be too tedious, as the plants raised from seed in Italy do not shew for fruit for 7 or 8 years. *Citrons* or *Seville Oranges* Miller considers the best to raise for stocks, as they are of more robust and quicker growth. These should be raised on a hot-bed, and in the course of 6 weeks they will be fit to plant separately into pots, and placed again into the hot-bed, shading them for some time, but afterwards allowing plenty of air in order to harden them. In August of next year they will be sufficiently strong for budding; after the operation has been performed, they should be placed under a hand-glass. In the course of a month it will be observable whether the buds have taken, then untie them, and let them remain in the green-house all winter. In spring cut off the heads of the stocks 3 inches above the buds, again place them in a moderate hot-bed, and by the end of July they

will have made shoots 2 feet long, then harden them before the cold sets in by exposing them to the air by degrees. In Italy the plants are budded at from 2 to 5 feet high on the stem, according to the intention of the trees; a bud is commonly inserted on each side of the stock. The Maltese make a sloping section and bud on one side only, which is a much better method than the Italian, as the sloping section becomes covered with bark, which the horizontal ones never do, but a dead stump or rotten hole may be observed during the whole period of their existence.

Grafting is occasionally resorted to in Italy, and is that most generally adopted in the nurseries at Paris. The stocks when of 2 years growth, and not much thicker than a scion, are cut off and grafted in the whip manner. This manner, as well as approach grafting, is frequently practised in England, as well as another manner of grafting, by taking a slice out of the stock without taking off the head, tying the scion as neatly and firmly as possible, without tongueing it, and claying it over. Mr. John Nairn places his stocks in a hot-bed for a fortnight, in order to rise the sap, that the bark may easily separate from the wood; the stocks are then cut off about 2 inches above the surface, and a longitudinal incision made with a sharp knife as in budding, separating the bark from the wood on each side. Let the scion, whether in fruit or flower, be cut thin, in a sloping direction, and thrust between the bark and the wood; it should then be carefully tied with woollen yarn and clayed, then place a glass of proper size over each, pressing it firmly into the mould to prevent the damp from dropping on the scion. These stocks should then be placed on a brisk hot-bed of dung, and in about 6 weeks the glasses may be taken off, and the clay and binding removed, but it will be necessary to tie a little damp moss on in lieu of the clay, and keep the glasses on in the heat of the day, removing them at night, when in about 3 weeks they will be fit to put into the greenhouse, where they will be a great ornament, being either in flower or fruit. He prefers the *Mandarine Orange* for this trial, as the fruit is more firmly fixed than in any other sort.

Mr. Henderson of Woodhall near Hamilton, a superior cultivator of the *Citrus* tribe, considers cuttings as the quickest mode of getting plants. The cuttings should be from 9 to 18 inches long, taking the lower leaves off to the extent of 5 inches, then cut them right across, make a small incision in an angular direction at the bottom of the cutting, then plant in a pot of sand 5 inches deep, sorting them according to their size, then give them a good watering overhead to settle the sand about them; he lets them stand a day or two in the shade, then plunges the pots to the brim in a hot-bed, and shades them well until they have struck root. After they are rooted they should be planted separately into pots in a proper compost, place them again in a hot-bed, and shade them for some weeks, then gradually expose them to the air. Cuttings with wood of 2 years old he finds strike as freely as young wood. They may be put in at any time of the year except when the plants are making young shoots. They generally strike in about 6 weeks with a hand-glass over them, in a gentle heat. The *Citron* strikes easiest, and makes much better stocks for grafting than any other kind.

By layers. This method is practised both on the continent and in England. In laying, the plants may either be laid down on their sides and laid as stools, or pots may be raised and supported under the branches to be propagated from. Shoots of 1 or 2 years growth may be then cut or ringed, and bent into the pot, or drawn through the hole at the bottom, and treated in the usual manner, taking care to supply water with the greatest regularity. Shoots layered in March will be fit to separate in September. In general the *Citron* tribe, like most other fruit trees, do not succeed so well from cuttings or layers as they do by grafting or budding on seedling stocks.

Compost. At Genoa and Florence they are grown in a strong yellow clay, richly manured; this is considered by Italian gardeners to be best suited to the *Orange* tribe. The French use equal parts of clayey loam, rotten vegetable matter, and half-rotten dung. In the succeeding year they add a portion of decomposed horse-dung, equal to the half of its bulk, turned over 2 or 3 times, and many other ingredients, as pigeons' dung and sheep's dung.

Mr. James Mean (Hort. trans. 2. p. 295.) makes his compound as follows: Well rotted cow-dung, 2 or 3 years old, one-fourth, well prepared rotten leaves, 2 or 3 years old, one-half, mellow loam one-fourth, with a small quantity of sand or road-grit added to the compost, which ought not to be sifted too fine.

Henderson (Cal. hort. mem. 3. p. 302.) takes one part of light brown mould from a piece of ground that has not been cropped or manured for many years, one part of peat earth, two parts of river sand or pit sand, and one part of rotted hot-bed dung, with one part of rotted leaves of trees; mixes them all well together, so as to form a compost of uniform quality.

R. Ayres (Hort. trans. 4. p. 310.) uses ten parts of strong turfy loam, seven of pigeons'-dung, seven of good rotten horse-dung, and 10 of old vegetable mould, mixed and prepared a twelvemonth before using.

Temperature. The standard temperature for the *Citrus* tribe is 48°, but in the growing season they require at least 10 degrees higher to force them to produce luxuriant shoots, but the air of the house should never be allowed to fall under 40°. Although the *Orange* will endure a severe degree of cold for a few hours without injury, yet, as Mean has observed, the leaves once injured, the trees will require 3 years to recover their appearance. Ayres never suffers his Orangery to be heated above 50° by fire, until the end of February, when the trees show blossom; it is increased to 55°, but never allowed to exceed 60° by sun heat, the excess of which he checks by the admission of air till the early part of June, when he begins to force the trees by keeping the heat in the house up as near as possible to 75°. For, he says, that neither *Citrons*, *Oranges*, *Lemons*, or *Limes*, can be grown fine and good without less heat (Hort. trans. 4. p. 311.). The *Orange*, Humboldt observes (De Distrib. Plant. 158.), which requires an average temperature of 64° degrees, will bear a very great degree of cold, if continued only for a short time. Dr. Sicklers says, "it is remarkable how much cold and snow the common *Lemons* and *Oranges* will bear at Rome, provided they are planted in a sheltered situation, not much exposed to the sun. He saw at Monte Pincio 3 standard trees in the open ground heavily covered with snow for more than a week. The green leaves, but still more the golden fruit, looked singular and beautiful amidst the snow. Neither fruit nor leaves had suffered, being in a sheltered place, while those that were exposed to the sun turned black and died, rendering the whole tree at once sickly. This proves that it is more the sudden transition of heat to cold or cold to heat, than the degree of either which destroys vegetation, as it appears that the snow had been thawed gradually from off these trees, and more by the temperature of the atmosphere than by the direct rays of the sun. *Oranges* will stand the climate of Devonshire and Cornwall, and perhaps the south of Ireland, in the open air in sheltered situations. All the species endure the open air at Nice, Genoa, and Naples; but at Florence and Milan, and often at Rome, they require protection during winter by placing the trees in conservatories, or under sheds. But the finest orange orchards are in the vicinity of Genoa.

Air. Orange trees require a large share of air when the weather is favourable; the prevention of damp is as essential to the perfection of the plants as the exclusion of cold. Where these trees are kept in old-fashioned opaque-roofed green-

houses, these cautions as to air and damp deserve particular attention. Ayres says, the more air orange trees have during the blossoming season, the more certain they will be of setting the fruit.

Light is very essential to the growth of orange trees. Whoever intends to grow the *orange* in perfection, should adopt houses, if not with glass on all sides, at least with glass fronts and roofs. When the plants are placed in the naked ground as standards, glass on all sides is highly desirable, for otherwise their leaves and shoots will all be turned to the south, but not so with those in tubs and boxes, as they can be turned at pleasure.

Water. Orange trees, like other evergreens which delight in a strong soil, are not naturally fond of water; but in this country those grown in boxes are often much injured for want of a due supply, for the earth becoming indurated, and the roots matted, the water wets only the surface, and escapes by the sides of the boxes, so that while the mass of the earth is dry the surface is moist.

Mean. When he thinks from the appearance of a plant that the water does not penetrate the earth, he uses a sharp iron rod to penetrate to the bottom of the earth, and to form a channel for the water, too little or too much of which is equally injurious to orange trees.

Knight (Hort. trans. 2. p. 129.) watered an orange tree with very strong liquid manure, and found it to grow with equal comparative vigour to the mulberry.

Ayres (Hort. trans. 5. p. 310.), after the fruit is set, waters with water, in which at the rate of 3 barrows of fresh cow-dung, 2 barrows of fresh sheep's-dung, and 2 pecks of quick-lime, have been added to every hogshead; when used, the water is about the consistence of cream.

The French (Nouveau cours. art. oranger,) water once after shifting with a very strong lessine; they also mulch with recent cow and horse-dung, renewing these once a month or oftener during summer, that there may be always abundance of soluble matter for the water to convey to the roots.

Growing the trees. All the kinds may be either grown as dwarfs in moderate sized pots or boxes; as standards, with stems from 3 to 8 feet high, in large boxes or tubs; as standards planted in the naked ground, and either dwarf or standard espaliers, planted or trained against a trellis, under glass.

The three first modes are best adapted for ornament; standards combine both elegance and utility; in a house properly constructed they will produce handsome heads and abundant crops. Espaliers is a much more certain way of having large crops, as every part of the plant above ground can thus be brought near the glass. Though orange trees thrive exceedingly well in large pots and boxes, yet to have them produce the finest crop of fruit, they should be planted in the ground like peach trees, and trained like them, or as standard cherry trees in a conservatory. The latter has by far the best effect, especially when the stems of the trees are 7 or 8 feet high, and the heads well formed; but the largest fruit is produced when the trees are planted against a trellis of a narrow house, and treated like peach trees. Henderson, of Woodhall, grows very large fruit in this way. All the *Citrus* tribe when first potted or put in boxes, require to be placed in heat, watered overhead occasionally, in order to make them throw out fresh shoots and roots.

Pots, boxes, and tubs, should be of a size proportionable to the plants, as too much or too little room for the roots will injure the plants. Large boxes or tubs should be so constructed as to be easily taken to pieces, so as to examine the roots, or to shift into larger boxes. The largest boxes in use in Holland and France are 4 feet square, which serve for trees with stems 6 or 8 feet high, with heads of 6 feet diameter, and above a century old.

Choice of plants. For moderate sized trees to be grown in green-houses, such as are in this country or the Parisian nurseries are preferable. But for large handsome trees, those from Genoa, Nice, or Malta are preferable, for those which are raised from seed in England will not grow so large in their stems under 18 or 20 years, as those are when brought over. But the best way to procure trees from Italy is to send an order through a British merchant, who has a correspondent at Genoa or Nice, for named sorts, according to the Nice or Genoa names, which will be found in their proper order in the enumeration of varieties which we have given, as the plants purchased in London at the Italian warehouses are without names, the greater number of which will be found to be the *Shaddock* and *Citron*, as the Italian gardeners find these sorts make stronger roots and more shewy trees, and therefore send the less number of the less luxuriant, but more useful varieties.

Pruning. The object of pruning is to keep the head proportionate to the capacity of the box containing the roots. At Versailles, M. Pethon, who has been head gardener for 40 years, every 6 or 8 years gives an elaborate pruning, shortening the shoots to within an inch of the old wood, and the tree, thus almost deprived of its leaves does not produce blossoms during the 2 next years, it furnishes, however, strong shoots, which are trained to the form of a bushy well furnished head. Pruning orange trees in England does not differ from that given to other green-house plants, and the consequence is handsome bushes or trees, with the blossoms and fruit on the surface of the foliage. But when orange trees are cultivated for the sake of their fruit, the branches ought to be kept thin, so as to admit of sun and air. The blossoms of most of the *Citrus* kind are produced in the form of terminating peduncles, on the wood of the current year, and hence the object of the pruner ought to be to encourage the production of young wood in every part of the tree.

Ayres cuts away the least promising branches in February, to make room for younger and more productive wood, and shortens very strong branches, to keep the tree in shape. After the fruit is set, it ought to be thinned, seldom leaving more than one on a peduncle.

In France they thin the flowers, which by that means they are enabled to use for distillation. The thinned fruit is used in confectionary. The thinning of the fruit, however, will depend upon the state of the trees; those at Bromley-hill in Kent never require any thinning, where the trees are very fine, and loaded with peculiarly large fruit.

Insects and diseases. The coccus and red-spider are the chief insects injurious to the *Citron* tribe; both to be removed by water applied with a brush or sponge. Mean (Hort. trans. 2. p. 296.) early in March, when he top-dresses his plants, applies a copious washing with the engine; then shuts up the house close for three or four hours, which produces a strong heat, as high as 70°, which effects the destruction of the red-spider, while the stems and leaves are wiped with a wet sponge, to remove other insects and dirt.

Gathering the fruit. At Rienes in France, where the fruit of the *Orange* is reared for sale, it is gathered every year, generally in May. If not gathered then it will hang on the tree for 2 or 3 years longer; but when the young fruit is green and swelling, the old ripe fruit becomes somewhat shrivelled, and almost void of juice. But as the new fruit begins to arrive at maturity, the juice begins to return to the old fruit, so that both old and new crops are in perfection the following May. In this way at Genoa the fruit is sometimes allowed to remain on 3 years, and being then gathered, has a peculiar sub-acid sweetness and flavour, and is sold at a higher price. The *Lemon* ripens irregularly, and drops off when ripe. It is therefore gathered all the year through. In conservatories the orange tree generally requires

15 months to ripen its fruit, and hence both green and ripe fruit are together on the tree. In gathering for the table in this country, the fruit should be carefully cut off with a few leaves attached, and thus garnished sent to the dessert. By allowing the fruit to remain, the trees will at all times have green and yellow fruit, which, with the shewy leaves and fragrant white blossoms, form in spring a charming ornament.

ORDER XL. HYPERICI'NEÆ. D. C. theor. elem. ed. 1. p. 214. fl. fr. 4. p. 860. Chois. prod. hyp. 32. D. C. prod. 1. p. 541.—Hypérica, Juss. gen. p. 254.

Calyx 4-5-parted or 4-5-sepalled, permanent, usually unequal, the 2 outer ones small, the 3 inner ones largest, usually dotted and glandularly-toothed. Petals 4-5 (f. 103. *c.*), hypogynous, alternating with the lobes of the calyx, twisted in the bud, commonly yellow and veined, sometimes full of black dots. Stamens numerous, usually indefinite, collected together at the base into small bundles (f. 102. *e.*), very rarely free, or monadelphous, with long filaments and yellow, minute, oscillatory anthers. Ovary 1, free. Styles numerous (f. 102. *a.* f. 103. *j.*), but sometimes joined into one. Stigmas simple, rarely capitate. Capsules many-valved (f. 103. *i.* f. 102. *a.*), many-celled; cells equalling the styles in number. Central placenta entire or many-parted, fixed to the inflexed margins of the valves. Seeds numerous, commonly terete, rarely flat. Integument double, both membranous. Embryo straight, with an inferior radicle, destitute of albumen. Herbs, shrubs, subshrubs and trees, beset with glands, and abounding in a yellow resinous juice, which is usually purgative or anthelmutic, and so very analogous to gamboge, that the juice of *Vismia Guianénsis* and several other species have received the name of American gamboge. Most of the *Hypericíneæ* are bitter and slightly astringent, whence they have been used as febrifuges. Leaves exstipulate, opposite, very rarely alternate, crenated, sessile, or on very short petioles, full of pellucid and black dots, seldom without, feather-nerved. Flowers terminal or axillary, stalked or sessile, leafy or nakedly-panicled, but usually bracteate. This order may be easily distinguished from the preceding orders in abounding in resinous juice. It differs from *Aurantiàceæ* in having opposite, simple leaves, and from *Guttífereæ* in the anthers being oscillatory, not adnate.

Synopsis of the genera.

Tribe I.

VISMIE'Æ. *Fruit baccate* (f. 102. *a.*). *Seeds terete. Flowers in leaflets, racemose or corymbose, distinct, terminal panicles. Shrubs with stalked leaves.*

1 VI'SMIA. Berry membranous. Styles 5 (f. 102. *a.*), crowned by 5 peltate stigmas. Stamens disposed in 5 bundles (f. 102. *e.*), each bundle alternating with a gland. Calyx 5-parted. Petals 5, usually villous within.

Tribe II.

HYPERI'CEÆ. *Fruit capsular. Seeds terete. Flowers terminal and axillary, corymbose. Shrubs and herbs usually with sessile leaves.*

2 ANDROSÆ'MUM. Capsule baccate, 1-celled. Calyx 5-parted. Petals 5. Styles 3. Stamens numerous, monadelphous at the base (D. C.) disposed in 3 sets (Smith).

3 HYPE'RICUM. Capsule membranous. Styles 3-5, variable in number. Stamens indefinite, rarely definite, disposed in 3-5 bundles at the base, rarely free. Petals 5. Sepals 5, unequal, more or less connected at the base.

4 ELO'DEA. Capsule partly 3-celled, many-seeded. Styles 3. Calyx 5-parted. Petals 5, with nectariferous claws. Stamens 9-15, growing in 3 parcels.

5 SARO'THRA. Capsule 3-valved, 1-celled, margins of the valves bearing the seeds. Stamens 5.6, free. Calyx 5-parted. Petals 5, narrow.

6 LANCRE'TIA. Calyx of 4-5 equal sepals. Petals 4-5. Stamens 10, free, 5 of which are opposite the petals and shorter. Styles 4-5.

7 A'SCYRUM. Calyx of 4 sepals, 2 outer ones small, 2 inner ones large. Petals 4. Stamens numerous, hardly connected at the base. Styles 1-3.

Tribe III.

EUCRYPHIE'A. *Fruit capsular* (f. 103. *i.*). *Seeds flat, winged. Styles* 3-12 (f. 103. *j.*). *Shrubs and trees with stalked leaves. Flowers axillary, solitary, or disposed in terminal cymes or panicles.*

8 CARPODÓNTOS. Sepals and petals 4. Styles 5-8. Capsule woody, with filiform placentas and boat-shaped cells. Ovary villous. Stamens numerous.

9 EUCRY'PHIA. Sepals and petals 5 (f. 103. *c.*). Styles 12 (f. 103. *j.*). Stamens numerous, rather connected at the base. Carpels boat-shaped, hanging by funicles (f. 103. *e.*).

10 ELIE'A. Sepals and petals 5. Stamens numerous, disposed in 3 bundles. Styles 3. Capsule 3-celled, 3-valved. Seeds 2 in each cell, fixed above the base of the central trigonal receptacle.

11 CRATO'XYLUM. Calyx 5-parted. Petals 5. Stamens numerous, collected into 3 bundles. Styles and stigmas 3. Capsule 3-celled, 3-valved, with a dissepiment in the middle of each valve.

12 HARO'NGA. Sepals and petals 5. Stamens 15, collected into 5 bundles. Fruit baccate, 5-celled; cells 2-3-seeded. Styles and stigmas 5.

Tribe I.

VISMIE'Æ (Chois. prod. hyp. 33.) Fruit a berry. Flowers in distinct, leafless, racemose or corymbose terminal panicles. Shrubs or trees with opposite, usually stalked leaves.

I. VI'SMIA (in honour of M. de Visme, a Lisbon merchant), Vand. in Rœm. script. hisp. p. 138. t. 7. f. 4. Chois. prod. hyp. 34. D. C. prod. 1. p. 542.

LIN. SYST. *Polyadélphia, Polyándria.* Calyx 5-parted. Petals 5, usually villous on the inside. Berry membranaceous. Styles 5 (f. 102. *a.*). Stigmas peltate. Stamens numerous, disposed into 5 bundles (f. 102. *e.*), opposite the petals, alternating with 5 glands or scales. Anthers small, roundish, 2-celled, bursting lengthwise. Seeds with a double covering.—Shrubs and trees, with quadrangular, opposite branches. Leaves entire, usually covered with rufescent down, and generally full of glandular and pellucid dots. Flowers disposed in terminal, branched panicles or cymes. Buds ovate or oblong. Flowers of all yellow or greenish. A resinous yellow juice flows from all parts of the plant when cut or broken, resembling gamboge.

1 V. GLA'BRA (Ruiz et Pav. syst. fl. per. p. 183.) branches

compressed; leaves elliptical-lanceolate, smooth; petioles short, compressed; buds globose; sepals obtuse, smooth; panicle loose. ♄. S. Native of Peru.

Smooth Wax-tree. Shrub 15 feet.

2 V. SESSILIFÒLIA (Pers. ench. 2. p. 86.) stem angular; leaves elliptical-lanceolate, acute, cordate at the base; petioles very short and thick; buds globose; calyx ovate-oblong; panicle multifid. ♄. S. Native of Guiana. Hypéricum sessilifòlium, Aubl. guian. 2. p. 787. t. 312. f. 2. The resinous juice which flows from all parts of the plant when broke or cut, is purgative in doses of 7 or 8 grains.

Sessile-leaved Wax-tree. Shrub 6 feet.

3 V. RETICULA'TA (Chois. prod. hyp. p. 34.) branches rufescent; leaves elliptical-oblong, very long, somewhat obtuse, rather cordate at the base, netted, rufescent; petioles very short; buds ovate-globose; calyx obtuse, villous on the outside. ♄. S. Native of Guiana. Hypéricum reticulàtum, Poir. dict. suppl. 3. p. 694.

Netted-leaved Wax-tree. Shrub 6 feet.

4 V. MACROPHY'LLA (H. B. et Kunth, nov. gen. amer. 4. p. 184.) branches smooth; leaves elliptical-oblong, acuminated, cordate, hairy beneath; petioles 8-lines long; calyxes clothed with rusty down. ♄. S. Native of South America on the banks of the river Cassiquiares.

Long-leaved Wax-tree. Tree 20 feet.

5 V. GUIANE'NSIS (Pers. ench. 2. p. 86.) stem quadrangular; leaves ovate-lanceolate or oblong, acuminate, dilated at the base, rufescent beneath, smooth; petioles short; calyxes ovate, obtuse, tomentose, with ciliated margins; flowers corymbose; stamens numerous; berry ovate. ♄. S. Native of Guiana, Cayenne, and Brazil. Hypéricum Guianénse, Aubl. guian. 2. p. 784. t. 311. The whole plant abounds in a thick, viscid, saffron-coloured juice. Leaf-bud rusty tomentose. Androphorus woolly.

Var. β, glabràta (D. C. prod. 1. p. 542.) the whole plant is less rufescent, but whiter; leaves more acuminated; buds more globose. Perhaps this may be a distinct species. Hypéricum baccíferum, Marcgr. bras. 96. f. 1. Moc. et Sesse, fl. mex. icon. ined. ♄. S. Native of Mexico and Surinam. This is also abundant in yellow viscid juice.

Guiana Wax-tree. Fl. July, Oct. Clt. 1824. Shrub 8 ft.

6 V. LONGIFÒLIA (St. Hil. fl. bras. 1. p. 326.) leaves usually oblong and acuminated, smoothish above, puberulous beneath, as well as furnished with black dots, with the nerves rusty beneath and pubescent; calyx tomentose; stamens 20-30; androphorus smooth; styles smooth. ♄. S. Native of Brazil in the province of Minas Geraes near Villa Rica. V. laccífera, Mart. Leaf-bud rusty-tomentose. Petals whitish-green.

Long-leaved Wax-tree. Fl. Jan. Shrub 5 feet.

7 V. RUFE'SCENS (Pers. ench. 2. p. 86.) branches quadrangular; leaves oblong-lanceolate, with a very long acumen, tapering to the base, rather hairy beneath, smooth above; petioles short, channelled; calyx acute, smooth. ♄. S. Native of Guiana. Chois. prod. hyp. p. 35. t. 1. (f. 102.)

FIG. 102.

Rufescent Wax-tree. Shrub 12 feet.

8 V. MICRA'NTHA (Mart. trav. St. Hil. fl. bras. 1. p. 327.) leaves usually lanceolate, acuminated, smooth above, rusty puberulous beneath, and with black dots; calyx smoothish; stamens about 15; styles pilose. ♄. S. Native of Brazil in the province of Minas Geraes. Leaf-buds rusty. Petals greenish.

Small-flowered Wax-tree. Fl. Jan. March. Shrub 6 to 8 feet.

9 V. DEALBA'TA (H. B. et Kunth, nov. gen. amer. 4. p. 184. t. 454.) branches quadrangular, clothed with a whitish down; leaves ovate, acuminated, rounded and cordate at the base, clothed beneath with white down; petiole 7 or 8 lines long, furrowed; calyx clothed with rusty down; ovary somewhat globose-ovate. ♄. S. Native of South America on the banks of the rivers Niger and Cassiquiares.

Whitened-leaved Wax-tree. Shrub 6 feet.

10 V. MAGNOLIÆFÒLIA (Nees ex Schlecht. Linnæa. 3. p. 118.) calyx opaque, vittate; petals somewhat 5-striped; bundles of stamens containing about 30; styles long; leaves ovate, rather cuneated at the base, full of pellucid dots, canescent. ♄. S. Native of Brazil. This species differs from *V. dealbàta* in the leaves being cuneated at the base, not rounded and cordate.

Magnolia-leaved Wax-tree. Shrub 6 feet.

11 V. FERRUGI'NEA (H. B. et Kunth, nov. gen. amer. 4. p. 183.) branches quadrangular, and are as well as calyxes clothed with rusty down; leaves elliptical-oblong, acuminated, rather shining above, clothed with very fine golden down beneath; petioles 6 or 8 lines long, channelled; ovary oblong. ♄. S. Native of South America on the banks of the river Orinoco.

Rusty Wax-tree. Shrub 12 feet.

12 V. LAURIFO'RMIS (Chois. prod. hyp. p. 35.) leaves ovate, acute, smooth, concave; corolla length of calyx; bundles of stamens like hair-pencils; styles filiform. ♃ ? S. Native of New Granada. Hypéricum lauriförme, Lam. dict. 4. p. 152.

Laurel-shaped-leaved Wax-tree. Pl. 2 feet.

13 V. BRASILIE'NSIS (Chois. prod. hyp. p. 35. t. 2.) stem terete; branches somewhat compressed at the apex; leaves ovate-lanceolate, acute, short-acuminated, rufescent beneath, smooth above; petioles channelled; flowers corymbose; berry globose. ♄. S. Native of Brazil.

Brazilian Wax-tree. Fl. July, Oct. Clt. 1824. Shrub 8 ft.

14 V. DECI'PIENS (Cham. et Schlecht. Linnæa. 3. p. 116.) calyx opaque, vittate; petals with 9 stripes; bundles of stamens containing about 30, a little longer than the calyx; styles long; leaves elliptic-lanceolate or ovate, full of pellucid dots, clothed with fine tomentum, at length canescent. ♄. S. Native of Brazil. This species differs from *V. Brasiliénsis* in the styles being long.

Var. α, laurifòlia (Cham. et Schlecht. l. c.) leaves elliptic-lanceolate, tapering to both ends, with a bluntish acumen, older leaves not canescent. ♄. S. Sýmplocos pentágyna, Spreng. syst. 3. p. 340.

Var. β, pyrifòlia (Cham. et Schlecht. l. c.) leaves ovate, or elliptical, rounded at the base, with a short, blunt, oblique acumen at the apex.

Deceiving Wax-tree. Shrub 4 feet.

15 V. PARVIFLÒRA (Cham. et Schlecht. Linnæa. 3. p. 119.) calyx 3-nerved, with a few pellucid dots; bundles of stamens triandrous, shorter than the calyx; styles long; leaves elliptical, full of black dots, and with a few hairs. ♄. S. Native of Brazil.

Small-flowered Wax-tree. Shrub 6 feet.

16 V. CAYENNE'NSIS (Pers. ench. 2. p. 86.) stem terete; leaves ovate-lanceolate, acuminated, with black dots above; petioles channelled; calyx obtuse; buds globose; panicles few-flowered. ♄. S. Native of Cayenne. Hypéricum Cayennénse, Lin. amœn. 8. p. 321. Petals white.

Cayenne Wax-tree. Shrub 10 feet.

17 V. ACUMINA'TA (Pers. ench. 2. p. 86.) leaves hispid beneath, hardly dotted, acuminated at the apex; buds small, ovate;

calyx somewhat hairy; berry globose; branches compressed. ♄ .S. Native of Guiana. Hypéricum acuminàtum, Lam. dict. 4. p. 150.

Var. β, caparòsa (D. C. prod. 1. p. 543.) branches tetragonal; leaves much more hispid on both surfaces. V. caparòsa, H. B. et Kunth, nov. gen. amer. 4. p. 182.

Acuminated-leaved Wax-tree. Tree 25 feet.

18 V. Guinee'nsis (Chois. prod. hyp. p. 36.) stem round; branches divaricating; leaves ovate-lanceolate, acute, soft, and dotted beneath; petioles thin; panicles spreading; calyx ovate-lanceolate; corolla smooth. ♄ . S. Native of Guinea in low lands, near Freetown, Sierra Leone. Hypéricum Guineénse, Lin. amœn. 8. p. 32. t. 8. f. 1.

Guinea Wax-tree. Fl. Feb. April. Shrub 4 feet.

19 V. latifòlia (Chois. prod. hyp. p. 36.) arborescent; leaves ovate-oblong, acuminated, somewhat cordate, full of black dots, and covered beneath with short rufescent down, green above; petioles short, thick; calyx irregularly vittate; bundles of stamens containing about 15; styles short, thick. ♄ . S. Native of Guiana. Hypéricum latifòlium, Aubl. guian. 2. p. 787. t. 312. f. 1. Petals dotted.

Broad-leaved Wax-tree. Shrub 6 feet.

† *Species little known, or doubtful whether they belong to this genus.*

20 V. tomentòsa (Ruiz et Pav. syst. fl. per. 183.) leaves ovate, acute, downy beneath; racemes terminal. ♄ . S. Native of Peru.

Tomentose-leaved Wax-tree. Shrub.

21 V.? petiola'ta (Chois. prod. hyp. p. 36.) flowers trigynous; leaves ovate, downy beneath; stem tetragonal, compressed. ♄ . S. Native of Brazil. Hypéricum petiolàtum, Lin. spec. 1102.

Stalked-leaved Wax-tree. Shrub 6 feet,

22 V.? arbore'scens (Chois. prod. hyp. p. 36.) flowers trigynous; leaves elliptical, a little acuminated; racemes branched; calyxes and corollas smooth; fruit capsular. ♄ . S. Native of the East Indies. Hypéricum arboréscens, Vahl. symb. 2. p. 86.

Arborescent Wax-tree. Shrub 10 feet.

Cult. The species of *Vismia* will thrive well in a mixture of loam and peat, and young cuttings will root in sand under a hand-glass, in heat.

Tribe II.

HYPERI'CEÆ (plants agreeing with *Hypéricum* in important characters). Chois. prod. hyp. 37. Fruit a capsule. Flowers terminal or axillary, usually corymbose.—Herbs or subshrubs, usually with sessile leaves.

II. ANDROSÆ'MUM (from *ανερ ανδρος, aner andros,* a man, and *αιμα, aima,* blood; the fresh capsules crushed between the fingers bring out a blood-coloured juice.) All. pedm. no. 1440. Chois. prod. hyp. 37. D. C. prod. 1. p. 543.

Lin. syst. *Polyadélphia, Polyándria.* Capsule baccate, usually 1-celled. Calyx 5-parted, with unequal lobes. Petals 5. Styles 3. Stamens numerous, disposed in 3 sets (Smith).—A suffruticose plant, with sessile leaves, and terminal, stalked flowers.

1 A. officina'le (All. pedm. no. 1440.) ♄ . H. Native of the north of Europe, Caucasus, and Greece, in humid places. In Britain in moist woods, Hampstead, Highgate, Norwood, near Berkhamstead, and in Ashridge woods, Norfolk, Worcestershire, Oxfordshire, and Cornwall. In Scotland, as in the woods of Inverary, and at Loch Ransa. Hypéricum Androsæ'mum, Lin. spec. Smith, engl. bot. 1225.—Blackw. t. 94. Stem 2-edged. Flowers yellow. Fruit an ovate capsule, assuming the appearance of a berry; at first yellowish-green, then red or brownish-purple, and lastly almost black when ripe. The juice expressed from the leaves is claret-coloured. The leaves were formerly applied to fresh wounds, and hence the French name it *la toute saìne,* and the English *tutsan.* It is also called *park-leaves,* from its frequently being found in parks. In Italian, Spanish, and Portuguese, it is *androsemo;* in German *konrad-skraut* or *standenartige johanniskraut;* in Dutch *groobladig hypéricum,* or *mansbloed.* The leaves when bruised have an aromatic scent.

Officinal or Common Tutsan. Fl. July. Sept. Britain. Shrub 3 feet.

Cult. This plant will grow well under shrubs or trees. It is easily increased by dividing the plants at the root early in spring, or by seeds.

III. HYPE'RICUM (according to Linnæus this name is said to be derived from *υπερ, uper,* under, and *εικων, eicon,* an image; that is to say, the superior part of the flower represents a figure). Lin. gen. no. 902. Juss. gen. p. 255. Chois. prod. hyp. p. 37. D. C. prod. 1. p. 545.

Lin. syst. *Polyadélphia, Polyándria.* Capsule membranaceous. Stamens numerous, free or joined at the base into 3 or 5 bundles. Petals 5. Sepals 5, more or less connected at the base, unequal, rarely equal. Styles 3-5, rarely connate in one, permanent. Capsule 1 or many-celled, many-seeded, 3-5-valved. Integument of seed double. Albumen none. Embryo with the radicle situated at the umbilicus, and with semi-cylindrical cotyledons.—Herbs or under-shrubs. Leaves opposite, sessile or sub-sessile, usually full of pellucid and black dots on their edges, lodging an essential oil. Flowers variously disposed, solitary, tern, cymose, corymbose panicled, rarely umbellate, usually yellow.

Sect. I. Ascyre'ia (from *α* priv. and *σκυρος,* hard; that is to say, plants soft to the touch). Chois. prod. hyp. p. 38. Sepals connected at the base and unequal. Stamens numerous. Styles 3-5. Flowers commonly terminal, large, few, sub-corymbose.

* *Styles commonly 3.*

1 H. ela'tum (Ait. hort. kew, ed. 2. vol. 3. p. 104.) younger stems reddish; leaves ovate-oblong, acute, dilated at the base, somewhat emarginate, with the margins somewhat revolute; flowers corymbose; peduncles bibracteate; sepals ovate-oblong. ♄ . S. Native of North America. Juss. ann. du. mus. 3. p. 162. t. 17. Wats. dend. brit. t. 85.

Tall St. John's-wort. Fl. July, Aug. Clt. 1762. Shrub 5 ft.

2 H. frondòsum (Mich. fl. bor. amer. 2. p. 81.) branches 2-edged; leaves ovate-elongated, blunt at the apex, narrowed at the base; flowers large, usually solitary; calyx equalling or exceeding the petals in length; styles united together. ♃. H. Native of North America on shady rocks in Kentucky and Tennessee.

Frondose St. John's-wort. Fl. July, Aug. Clt. 1806. Pl. 5 ft.

3 H. sessiliflòrum (Willd. herb. ex Spreng. syst. 3. p. 346.) branches round; leaves stem-clasping, cordate-oblong, without nerves, dotted; corymb terminal; flowers nearly sessile; sepals oblong, acute, leafy, much longer than the corolla; styles joined. ♃. H. Native of North America.

Sessile-flowered St. John's-wort. Pl. 3 feet.

4 H. amœ'num (Pursh. fl. amer. sept. 2. p. 375.) branches 2-edged; leaves oblong-elliptical, bluntish at the apex, but tapering to the base, with curled revolute margins; flowers terminal, usually solitary; sepals ovate, acuminated, never equal in length with the corolla; styles connected together. ♃. H. Native of South Carolina and Georgia. Flowers large, bright yellow, with red ovaries.

Pleasing St. John's-wort. Fl. July, Aug. Clt. 1812. Pl. 2 ft.

5 H. GRANDIFLÒRUM (Chois. prod. hyp. p. 38. t. 3.) stem round, reddish; leaves ovate-oblong, cordate, somewhat stem-clasping, acute at the apex, netted with pellucid veins; flowers corymbose; peduncles bibracteate; calyx acutish, reflexed upon the peduncle after flowering, much shorter than the corolla. ♄. G. Native of Teneriffe. H. Canariénse, Willd. not of Lin.

Great-flowered St. John's-wort. Fl. July, Aug. Shrub 3 ft.

6 H. HIRCI'NUM (Lin. spec. 1103.) branches winged; leaves somewhat emarginate at the base, dilated, sessile, acute at the apex, ovate-lanceolate, with glandular margins; peduncles bibracteate; stamens exceeding the corolla in length; seeds 2, appendiculated. ♄. H. Native of the regions of the Mediterranean. Schkuhr. handb. 3. t. 213. f. 3. Wats. dend. brit. t. 86. This plant when bruised has a very disagreeable smell.

Var. β, obtusifòlium (D. C. prod. 1. p. 544.) leaves blunter. ♄. H. Native of Corsica on humid rocks in the mountains.

Var. γ, mìnus (Wats. dend. brit. t. 87.) plant much smaller.

Goat-scented St. John's-wort. Fl. July, Sept. Clt. 1640. Shrub 2 to 4 feet.

7 H. INODÒRUM (Willd. spec. 3. p. 1449.) stem suffruticose, round; branches somewhat winged; leaves ovate, very blunt; calyx lanceolate, acute; peduncles sometimes bibracteate; stamens equal in length with the corolla. ♄. H. Native of Greece and the Levant. Herb scentless.

Scentless St. John's-wort. Shrub 3 feet.

8 H. FOLIÒSUM (Ait. hort. kew, ed. 1. vol. 3. p. 104.) branches winged; leaves sessile, oval-oblong, rather acute, finely perforated; calyx lanceolate, caducous. ♄. G. Native of the Azores.

Leafy St. John's-wort. Fl. Aug Clt. 1778. Shrub 2 feet.

9 H. FLORIBU'NDUM (Ait. hort. kew, ed. 1. vol. 3. p. 104.) stem round; leaves sessile, lanceolate, numerous, without dots; peduncles dilated and somewhat compressed towards the apex; calyx obtuse; corolla and stamens marcescent. ♄. G. Native of the Canary Islands. H. frutéscens, &c. Comm. hort. amst. p. 137. t. 68. Sepals ciliated.

Bundle-flowered St. John's-wort. Fl. Aug. Clt. 1779. Shrub 3 feet.

10 H. MILLE'PORUM (Willd. herb. ex Spreng. syst. 3. p. 343.) branches round; leaves on short petioles, lanceolate, tapering to both ends, nerved, full of pellucid dots, fringed with glandular teeth; sepals lanceolate, fringed with glandular teeth; flowers corymbose. ♄. G. Native of Teneriffe.

Thousand-pored-leaved St. John's-wort. Shrub 2 feet.

11 H. OLY'MPICUM (Lin. spec. 1102.) stem round; leaves elliptical-lanceolate, rather acute, full of pellucid dots; calyx ovate, acute; peduncles bibracteate; corolla and stamens marcescent. ♄. G. Native of mount Olympus and of China. Smith, exot. bot. 2. p. 71. t. 96. Sims, bot. mag. t. 1867. Leaves glaucous, sessile.

Olympian St. John's-wort. Fl. July, Sept. Clt. 1706. Shrub 1 to 2 feet.

12 H. CANARIE'NSE (Lin. syst. 575.) stem obsoletely quadrangular; branches compressed; leaves ovate-lanceolate, acute; calyx ovate, obtuse; styles 3-4, diverging. ♄. G. Native of the Canary Islands. Lodd. bot. cab. 953.

Var. β, triphýllum (D. C. prod. 1. p. 544.) leaves tern.

Var. γ, salicifòlium (D. C. prod. 1. p. 544.) leaves linear-lanceolate, longer.

Canary-Island St. John's-wort. Fl. July, Sept. Clt. 1699. Shrub 2 feet.

* * *Styles commonly 5.*

13 H. CHINE'NSE (Lin. amœn. 8. p. 323.) stem round; leaves elliptical, obtuse, with a few black dots; peduncles bibracteate; calyx oblong, obtuse, beset with black dots; styles connected together. ♄. G. Native of the East Indies, and of the Cape of Good Hope? H. monógynum, Mill. illust. 151. f. 2. H. aúreum, Lour.

Chinese St. John's-wort. Fl. March, Sept. Clt. 1753. Shrub 3 feet.

14 H. MONO'GYNUM (Lin. spec. 1102. Blum. bijdr. ex Schlecht. Linnæa. 1. p. 667.) stem terete, shrubby; leaves oblong-oval, recurved at the base, somewhat auricled, without dots; peduncles sub-corymbose, leafy, bibracteate; bracteas nearly opposite; sepals lanceolate, acutish; styles 5, coadunate, equal in length to the stamens and corolla. ♄. G. Native of Japan and China. Curt. bot. mag. 334. Flowers yellow.

One-styled St. John's-wort. Shrub 3 feet.

15 H. CORDIFÒLIUM (Chois. mss. D. C. prod. 1. p. 545.) stem round; leaves elliptical, acute, coriaceous, smooth, somewhat stem-clasping, without dots; flower-bearing branches crowded, leafy below; bracteas ovate-cordate, acute; sepals ovate, mucronate, without dots; petals oblong, unequal-sided, obliquely mucronulate; stamens short; styles unconnected, scarcely longer than the corolla. ♄. G. Native of Nipaul at Thankot, and at Narain-hetty. H. bracteàtum and Lungùsum, Hamilt. mss. in D. Don, prod. p. 217. It is called *Lungusu* and *Ricanava* in the Nawar language.

Heart-leaved St. John's-wort. Fl. April, Oct. Clt. 1825. Shrub 2 feet.

16 H.? ALTERNIFÒLIUM (Vahl. symb. 2. p. 85. t. 42.) branches round; leaves alternate, lanceolate; peduncles tribracteate; styles reflexed.—Native of the East Indies.

Alternate-leaved St. John's-wort. Shrub?

17 H. PYRAMIDA'TUM (Ait. hort. kew, ed. 1. vol. 3. p. 103.) stem winged; leaves stem-clasping, oblong-lanceolate, acute, with revolute margins; peduncles short, thick; sepals rather acute; styles 5-7, short, thick, connected together at the base. ♃. H. Native of North America in Canada? Vent. malm. t. 118. H. amplexicaûle, Lam. dict. 4. p. 14.

Pyramidal-flowered St. John's-wort. Fl. July, Aug. Clt. 1764. Pl. 4 feet.

18 H. ROSTRA'TUM (Rafin. fl. lud. p. 87.) stem frutescent, 2-edged; leaves sessile, ovate, acute at both ends, with revolute, dotted margins; corymbs axillary and terminal; calyx bibracteate; ovaries beaked; styles 5. ♃. H. Native of North America in Louisiana.

Beaked-ovaried St. John's-wort. Fl. July, Aug. Pl. 2 feet.

19 H. A'SCYRON (Lin. spec. 1102.) stem tetragonal, simple; leaves stem-clasping, lanceolate, acute, full of pellucid dots; flowers few; sepals blunt; styles connected together at the base. ♃. H. Native of Siberia.—Gmel. fl. sib. 4. p. 178. t. 69. Flowers very large.

Soft St. John's-wort. Fl. July, Sept. Clt. 1774. Pl. 3 feet.

20 H. ASCYROI'DES (Willd. spec. 3. p. 1443.) stem simple, winged at the base, and tetragonal towards the top; leaves oblong-lanceolate, acute; sepals oblong-lanceolate; styles free, length of the stamens. ♃. H. Native of North America in Canada and the western parts of New York. H. macrocárpum, Mich. fl. bor. amer. 2. p. 82. Flowers very large.

Ascyron-like St. John's-wort. Fl. July, Aug. Clt. 1812. Pl. 3 feet.

21 H. LANCEOLA'TUM (Lam. dict. 4. p. 145.) stem round; leaves lanceolate, with black dotted margins, acutish at the apex; flowers solitary; sepals blunt; styles connected together. ♄. G. Native of the Island of Bourbon and Caffre Land. Chois. prod. hyp. p. 41. exclusive of the synonyme of Jacq.

Lanceolate-leaved St. John's-wort. Shrub 3 feet.

22 H. ANGUSTIFÒLIUM (Lam. dict. 4. p. 145.) stem round; leaves linear-lanceolate, approximate, with revolute margins,

without dots; flowers large, solitary; sepals acutish; styles connected together. ♄. S. Native of the Island of Bourbon.

Narrow-leaved St. John's-wort. Shrub 3 feet.

23 H. PA'TULUM (Thunb. jap. p. 295. t. 17.) stem round, purplish; leaves ovate-lanceolate, acute, tapering to the base, with revolute margins, without dots; flowers corymbose; styles recurved at the apex, scarcely longer than the stamens; peduncles bibracteate; sepals suborbicular, very obtuse. ♄. H. Native of Japan and Nipaul.

Var. β, attenuàtum (D. C. prod. 1. p. 545.) all parts of the shrub are shorter, slenderer, and more crowded.

Spreading St. John's-wort. Fl. June, Aug. Clt. 1823. Shrub 6 feet.

24 H. JAVA'NICUM (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 667.) stem terete, shrubby; leaves membranous, ovate-lanceolate, bluntish, tapering a little to the base, with reflexed margins, glaucous beneath, full of fine pellucid dots; flowers corymbose; pedicels bibracteate; bracteas linear-awl-shaped; sepals lanceolate, acuminated; styles exceeding the stamens, but shorter than the corolla. ♄. S. Native of Java. Allied to *H. pàtulum*. Flowers yellow.

Java St. John's-wort. Shrub.

25 H. CORIA'CEUM (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 667.) stem terete, shrubby; branches fastigiate; leaves coriaceous, crowded, ovate-lanceolate, obtuse, glaucous beneath, full of pellucid dots; peduncles tern, 1-3-flowered, bracteate in the middle; bracteas lanceolate; sepals oval, obtuse or acute; styles 5, exceeding the stamens, but equal with the corolla. ♄. S. Native of Java. Allied to *H. Javánicum*.

Coriaceous-leaved St. John's-wort. Shrub 6 feet.

26 H. CE'RNUUM (Roxb. hort. beng. p. 59. D. Don, prod. fl. nep. p. 218.) branches round; leaves elliptical-oblong, mucronulate, glaucous; peduncles solitary or in threes; sepals elliptical, acute; petals unequal-sided, oblong, obtuse; styles and stamens very long. ♄. G. Native of Sirinagur, where it is called *Peoalee*. Branches purplish, suffused, with glaucous pollen. Flowers very large.

Drooping St. John's-wort. Shrub 3 feet.

27 H. KALMIA'NUM (Lam. dict. 4. p. 148.) branches tetragonal; leaves linear-lanceolate; flowers 3-7, in a terminal corymb; sepals lanceolate, bluntish. ♄. H. Native of North America in Pennsylvania and Virginia.

Kalm's St. John's-wort. Fl. June, July. Clt. 1759. Shrub 2 to 4 feet.

28 H. VENÒSUM (Lam. dict. 4. p. 146.) stem tetragonal, reddish, simple; leaves ovate-oblong, stem-clasping, bluntish; flowers large, terminal; peduncles bracteate; sepals ovate-roundish; styles exceeding the stamens in length. ♄. G. Native? Perhaps this plant is sufficiently distinct from *H. calycìnum*.

Veiny St. John's-wort. Shrub 1 foot?

29 H. TRIFLÒRUM (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 667.) stem terete, shrubby; leaves membranous, ovate-oblong, bluntish, full of pellucid dots, younger ones somewhat stem-clasping at the base; peduncles usually tern, 1-flowered, terminal, with 2 lanceolate bracteas in the middle; sepals oval-oblong, acute; styles 5, exceeding the stamens, but shorter than the corolla. ♄. S. Native of Java. Allied to *H. Leschenaúltii*.

Var. β, angustàtum (Blum. l. c.) leaves and sepals oblong-lanceolate.

Three-flowered St. John's-wort. Shrub.

30 H. LESCHENAU'LTII (Chois. mss. D. C. prod. 1. p. 545.) stem round, suffruticose: leaves oblong-elliptical, obtuse, full of pellucid dots; sepals ovate-lanceolate, acute; stamens very short; styles exceeding the stamens in length, but shorter than the corolla. ♄. S. Native of Java. Very like *H. oblongifòlium*.

Leschenault's St. John's-wort. Shrub 2 feet.

31 H. URA'LUM (Hamilt. mss. in D. Don, prod. nep. p. 218.) branches compressed, 2-edged; leaves elliptical, mucronulate, smooth, shining; flowers terminal, somewhat corymbose; sepals oval, very blunt; petals orbicular; styles shorter than the stamens. ♄. H. Native of Nipaul at Narainhetty. Called *Urala Swa* in the Nawar language. Sims, bot. mag. t. 2375.

Urala St. John's-wort. Fl. July, Sept. Clt. 1823. Shrub 2 ft.

32 H. OBLONGIFÒLIUM (Chois. prod. hyp. p. 42. t. 4.) stem round; branches compressed; leaves elliptical-lanceolate, crowded, with the margins a little revolute, full of fine pellucid dots; sepals oblong, bluntish; styles exceeding the stamens in length. ♄. G. Native of the East Indies and Nipaul.

Oblong-leaved St. John's-wort. Fl. July, Sept. Clt. 1823. Shrub 2 feet.

33 H. CALYCI'NUM (Lin. mant. 106.) stem tetragonal, dwarf; leaves ovate, coriaceous, broad, full of pellucid dots; flowers large, terminal, solitary; sepals large, obovate, spreading; capsule nodding. ♄. H. Native of the Levant and on Mount Olympus, &c. In Ireland 3 miles from Cork, on the way to Bandon. Wood above Largs, on the western coast of Scotland. Curt. bot. mag. t. 146. Smith, engl. bot. t. 2017. Jacq. fragn. 10. t. 6. f. 4. Root creeping. This plant is a great ornament to shrubberies and parks, and excellent as a shelter for game.

Var. β, acutifòlium (D. C. prod. 1. p. 546.) the leaves at the base of the branches are more acute.

Large-calyxed St. John's-wort or Tutsan. Fl. June, Sept. Ireland. Shrub 1 foot.

34 H. BALEA'RICUM (Lin. spec. 1101.) stem quadrangular, warted; leaves ovate, obtuse, rather stem-clasping. ♄. F. Native of the island of Majorca. Curt. bot. mag. t. 137. Leaves small, glaucous.

Majorca St. John's-wort. Fl. March, Sept. Clt. 1714. Shrub 1 to 2 feet.

SECT. II. TRIDE'SMOS (from *τρεις, treis*, three, and *δεσμε, desme*, a bundle; in allusion to the stamens being disposed into 3 bundles). Chois. mss. D. C. prod. 1. p. 546. Calyx of 5 equal, entire sepals. Stamens connected together in 3 bundles, each bundle having the appearance of a hair-pencil. Styles 3. —An undershrub, with axillary, long stalked flowers. Perhaps a species of *Elòdea* or *Elièa*.

35 H. BIFLÒRUM (Lam. dict. 4. p. 170.) stem smooth, roundish, grey; leaves ovate-elliptical, smooth, acutish, stalked, veiny; sepals ovate, blunt; styles equal in length with the stamens. ♄. G. Native of China near the Straits of Bouton. H. Chinénse, Retz, obs. bot. 5. p. 27.

Two-flowered St. John's-wort. Shrub 2 feet.

SECT. III. PERFORA'RIA (from *perforatus*, perforated; because the leaves are full of pellucid dots, which gives them the appearance of being perforated). Chois. prod. hyp. p. 44. D. C. prod. 1. p. 546. Calyx of 5 equal sepals, toothed in some, but entire in others, or with glandular teeth, connected at the base. Stamens numerous, free or disposed in 5 sets. Styles commonly 3. —Herbs or undershrubs. Flowers axillary, or in terminal panicled corymbs. Leaves rarely linear.

* *Sepals entire.*

36 H. MICRA'NTHUM (Chois. prod. hyp. p. 44. t. 5.) stem round, dotted, purplish; branches straight; leaves oblong, obtuse, full of black dots; flowers crowded, terminal; calyx small, obtuse; corolla full of black dots, as well as the anthers. ♃. H. Native of Carolina.

Small-flowered St. John's-wort. Pl. 1 foot.

37 H. ANGULÒSUM (Mich. fl. bor. amer. 2. p. 78.) stem

quadrangular, erect; leaves distant, elongated, ovate, stem-clasping, acute, without dots, margins sinuated; flowers axillary, solitary; sepals lanceolate, acute; styles connected together. ♃. B. H. Native of North America in bogs and cedar swamps in New Jersey and Carolina. Flowers beautiful copper-coloured in terminal dichotomous panicles.

Angular-stemmed St. John's-wort. Fl. June, July. Clt. 1812. Pl. 1 foot.

38 H. uliginòsum (H. B. et Kunth, nov. gen. amer. 5. p. 194.) stem herbaceous, straight, tetragonal; leaves oblong, acutish, upper ones lanceolate, dotted; sepals linear-lanceolate, acuminate; styles 3-4; stigmas capitate. ♃. B. S. Native of South America near La Vente Grande of Caraccas.

Var. β, multiflòrum (D. C. prod. 1. p. 547.) flowers smaller and more copious. ♃. B. S. Native of South America on mount Saraguru near Loxa.

Bog St. John's-wort. Fl. July. Pl. 1 foot.

39 H. puncta'tum (Lam. dict. 4. p. 164.) stem round, full of black dots; leaves ovate-lanceolate, acutish, stem-clasping, also full of black dots; flowers corymbose; sepals lanceolate, and are as well as the corolla full of black dots. ♃. H. Native of North America in shady woods from New England to Carolina, particularly in the range of the Alleghany mountains. H. maculàtum, Walt. fl. carol. 189. H. corymbòsum, Willd. spec. 3. p. 1457. Flowers pale-yellow, smaller than those of *H. perforàtum*. Styles 3.

Dotted St. John's-wort. Fl. June, Aug. Clt. 1823. Pl. 1½ ft.

40 H. philonòtis (Cham. et Schlecht. Linnæa. 4. p. 218.) smooth, full of black dots; stem 4-winged or 4-angled, terete at the base; floriferous branches compressed, 2-edged; leaves oblong, 3-nerved, quite entire; floral leaves minute, hardly equal with the pedicels; flowers minute, pentandrous, and trigynous; sepals acute, entire; styles apiculate, pustulate. ♃. F. Native of Mexico near Jalapa. Styles purplish-brown. Petals yellow.

Water-loving St. John's-wort. Pl. ½ to 1 foot.

41 H. formòsum (H. B. et Kunth, nov. gen. amer. 5. p. 196. t. 460.) stem round, smooth, without dots; leaves ovate-oblong, blunt, somewhat stem-clasping, dotted beneath; flowers corymbose; sepals ovate-lanceolate, and petals obovate-cuneated, both covered with glandular dots. ♃. F. Native of South America near Pazcuaro. Scarcely distinct from *H. punctàtum*.

Beautiful St. John's-wort. Pl. 1 foot.

42 H. dolabrifórme (Vent. hort. cels. p. 45.) stem erect, purple; leaves linear-lanceolate, reflexed, full of pellucid dots; flowers corymbose; peduncles dichotomous; sepals unequal, acute, reflexed, dotted, with revolute edges. ♃. H. Native of North America on the dry hills of Kentucky. Flowers golden-yellow. Petals hatchet-shaped. Styles 3.

Hatchet-shaped-petalled St. John's-wort. Fl. June, July. Clt. 1821. Pl. 1½ foot.

43 H. prate'nse (Cham. ex Schlecht. Linnæa. 4. p. 218.) plant branched, smooth, but with black dots; stem tetragonal, rather winged; leaves erect, narrow, linear or oblong, tapering to the apex, with reflexed or revolute margins, floral ones or bracteas awl-shaped; stamens 20-30, icosandrous; flowers trigynous. ♃. F. Native of Mexico at Jalapa.

Meadow St. John's-wort. Pl. 2 feet.

44 H. colli'num (Cham. et Schlecht. in Linnæa. 4. p. 219.) smooth; stem purplish, terete, branched, or simple; branches forming a cymose panicle; leaves loose, obovate, rounded at the apex, cuneate at the base, full of pellucid dots; flowers pedicellate, icosandrous and trigynous; sepals oblong, obtuse, full of pellucid dots, and with a few black glands; capsule egg-shaped, acute, twice the length of the calyx. ♃. F. Native of Mexico.

Hill St. John's-wort. Pl. 1½ foot.

45 H. cistifòlium (Lam. dict. 4. p. 158.) stem angular; leaves ovate-oblong, acutish, stem-clasping, full of black dots beneath, with revolute edges; flowers disposed in dichotomous corymbs; sepals ovate; styles connected together. ♃. H. Native of South America.

Cistus-leaved St. John's-wort. Fl. June, July. Pl. 1 foot.

46 H. songa'ricum (Ledeb. ex Spreng. syst. append. p. 297.) stem compressed; leaves elliptical, cordate, obtuse, glaucous, with pellucid dots; sepals acuminated. ♃. H. Native of the Kirghisian Steppe in Siberia.

Soongarian St. John's-wort. Pl. 1 foot.

47 H. densiflòrum (Pursh, fl. sept. amer. 2. p. 376.) plant very branchy; branches roundish; leaves linear-lanceolate, bluntish, tapering to the base; panicle terminal, compound, dichotomous, dense-flowered; flowers solitary, pedicelled; sepals very short, ovate, deciduous; styles connected together. ♄. H. Native of North America on the dry ridges and savannahs of the Virginian mountains.

Dense-flowered St. John's-wort. Fl. June, Jul. Shrub 2 feet.

48 H. procu'mbens (Mich. fl. bor. amer. 2. p. 81.) stem procumbent, somewhat tetragonal; leaves linear-lanceolate, rather blunt, with revolute edges, full of pellucid dots; panicle terminal, dichotomous: sepals oblong-lanceolate, acute; styles connected together. ♃. H. Native of North America on the sunny hills of Kentucky. Calyx as large as corolla.

Procumbent St. John's-wort. Fl. July, Aug. Clt. 1822. Pl. procumbent.

49 H. rosmarinifòlium (Lam. dict. 4. p. 159.) stem round, erect; leaves blunt, stem-clasping, ovate, with revolute edges; sepals linear, obtuse, dotted; styles connected together. ♄. H. Native of Carolina.

Rosemary-leaved St. John's-wort. Fl. July, Aug. Clt. 1812. Shrub 2 feet.

50 H. virga'tum (Lam. dict. 4. p. 158.) stem straight, quadrangular; leaves ovate-lanceolate, stem-clasping, full of black dots; panicle few-flowered, dichotomous; sepals lanceolate; styles 2-3; stigmas capitate. ♃. H. Native of North America. Leaves with revolute margins.

Twiggy St. John's-wort. Fl. Ju. Aug. Clt. 1820. Pl. 1½ ft.

51 H. hedyotifòlium (Poir. suppl. dict. 3. p. 700.) stem straight, quadrangular; leaves sessile, decussate, lanceolate, acutish, pressed to the stem, covered with black dots beneath; sepals linear-lanceolate, full of black dots; styles 3-4, stigmas capitate. ♃. H. Native of North America.

Hedyotis-leaved St. John's-wort. Fl. Ju. Aug. Pl. 1½ foot.

52 H. myrtifòlium (Lam. dict. 4. p. 180.) stem round; leaves ovate-cordate, stem-clasping, or lanceolate-cuneated, with revolute edges; flowers in dichotomous cymes; sepals unequal, ovate, exceeding the corolla in length; styles connected together. ♃. H. Native of North America.

Myrtle-leaved St. John's-wort. Fl. June, Aug. Clt. 1818. Pl. 1½ foot.

53 H. Brasilie'nse (Chois. mss. D. C. prod. 1. p. 547.) smooth; branches tetragonal, ascending; leaves linear, acutish, or bluntish, spreading, 3-nerved, full of pellucid dots; flowers terminal, usually tern; sepals linear-oblong, acuminated, acute; corolla small; styles 5, unconnected, straight. ♃. S. Native of Brazil about Rio Janeiro and the province of Minas Geraes.

Var. β; leaves broader, oblong-lanceolate; flowers more numerous, subcymose; stamens all fertile. In the province of Minas Geraes, near the town called Mantiqueira.

Brazilian St. John's-wort. Fl. Oct. Shrub 2 feet.

54 H. denuda'tum (St. Hil. fl. bras. 1. p. 336.) smooth; stem much branched, lower part naked, upper tetragonal; leaves small, crowded, linear-sublanceolate, acute, full of pellucid dots; flowers at the tops of the branches, axillary and terminal, collected into corymbs, 4-5-gynous; segments of calyx linear-

awl-shaped. ♄. S. Native of Brazil in that part of the province of St. Paul called Campos Geraes. Stamens numerous, polyadelphous at the base. Stigmas subcapitate.

Naked-stemmed St. John's-wort. Fl. Feb. Shrub 1 to 2 feet.

55 H. TE'RNUM (St. Hil. fl. bras. 1. p. 330.) smooth; stem suffruticose, erect, nearly simple; leaves oblong-lanceolate, obtuse at the base, acutish at the apex, full of black dots, approximate, pressed to the stem, lower and rameal ones opposite, upper ones tern; flowers panicled, 3-4-gynous; segments of calyx equal, oblong-lanceolate. ♄. S. Native of Brazil in the southern part of the province of St. Paul. Stamens polyadelphous at the base. Stigmas subcapitate.

Tern-leaved St. John's-wort. Fl. Mar. Shrub 1 foot.

56 H. TAMARISCI'NUM (Cham. et Schlecht. Linnæa. 3. p. 124.) stem shrubby, branched, delequescent; leaves half-stem-clasping, lanceolate, acute, keeled, with involute margins, sometimes imbricate, full of pellucid dots; cymes terminal, with many small flowers, glandless; calycine segments oval, acute, one-half shorter than the corolla, but equal with the calyx; stamens 18, nearly free, length of petals; styles 3, distinct. ♄. S. Native of Brazil.

Tamarix-like St. John's-wort. Shrub 3 to 4 feet.

57 H. PELLETIERIA'NUM (St. Hil. fl. bras. 1. p. 334. t. 70.) smooth; stem suffruticose, much branched, tetragonal above; leaves crowded, small, linear-sublanceolate, acutish, full of pellucid dots, covered with resinous powder; flowers small, numerous, paniculately-corymbose, trigynous; segments of calyx ovate, bluntish, striated, quite entire; stamens 10-20, free. ♄. S. Native of Brazil in the province of Cisplatine in the eastern part, on a mountain called Pao de Assucar. Stigmas subcapitate.

Pelletier's St. John's-wort. Fl. Oct. Shrub 2 to 3 feet.

58 H. PARVIFÒLIUM (St. Hil. fl. bras. 1. p. 333.) smooth; stem suffruticose, branched, tetragonal above; leaves small, linear, obtuse, full of pellucid dots; flowers small, very numerous; paniculately corymbose, trigynous; segments of calyx ovate, obtuse, quite entire; stamens free. ♄. S. Native of Brazil in the province of the Missions on the banks of Ibicuy.

Small-leaved St. John's-wort. Fl. Feb. Shrub 2 feet.

59 H. EUPHORBIOÌDES (St. Hil. fl. bras. 1. p. 332. t. 69.) smooth; stem herbaceous, slender; leaves ovate, or elliptical, obtuse, full of pellucid dots, glaucous beneath; flowers small, trigynous; stamens 10-15, free. ♃. H. Native of Brazil on the banks of the river Parahyba near Rio Janeiro, as well as in the province of St. Paul. Stigmas capitate.

Var. β, *mìnus* (St. Hil. l. c.) stems shorter; leaves smaller; flowers more loose, in forked, paniculate spikes. Rio Janeiro.

Var. γ, *floribúndum* (St. Hil. l. c.) stems numerous; leaves smaller; flowers more or less dense. In Minas Geraes.

Euphorbia-like St. John's-wort. Fl. Sept. Pl. ½ to 1 foot.

60 H. CORDIFO'RME (St. Hil. fl. bras. 1. p. 330.) smooth; stem suffruticose, upper part tetragonal; leaves heart-shaped, coriaceous, approximate, pressed to the stem; flowers cymose, crowded, trigynous; segments of calyx ovate, acute. ♄. S. Native of Brazil in the southern part of the province of Minas Geraes. Stamens free. Stigmas subcapitate.

Heart-formed-leaved St. John's-wort. Fl. Mar. Sh. ½ to 1½ ft.

61 H. TERETIU'SCULUM (St. Hil. fl. bras. 1. p. 331.) smooth; stem erect, rather round; branches tetragonal; leaves ovate or ovate-oblong, bluntish, full of black dots beneath; flowers panicled, pentagynous; segments of calyx oblong-lanceolate, acute. ♄. S. Native of Brazil in the southern part of the province of St. Paul, where it is called *Arudo do Campo*. Stamens numerous, free. Stigmas subcapitate.

Roundish-stemmed St. John's-wort. Fl. Jan. Pl. 1 to 2 ft.

62 H. PUNCTULA'TUM (St. Hil. fl. bras. 1. p. 334.) smooth; stem erect, tetragonal, a little branched; leaves sublinear, obtuse, full of pellucid dots; cyme trifid; flowers pentagynous; segments of calyx oblong, acuminated, acute. ♃. S. Native of Brazil in the province of Minas Geraes, not far from the town of Mantiqueira. Stamens 10-20, free. Stigmas subcapitate.

Small-dotted St. John's-wort. Fl. Dec. Pl. 1 foot.

63 H. RI'GIDUM (St. Hil. fl. bras. 1. p. 336.) smooth; stem suffruticose, terete; leaves linear or sublinear or oblong-linear, acute, full of pellucid dots, rigid, coriaceous; flowers terminal, few, pentagynous; segments of calyx linear-lanceolate, acute. ♄. S. Native of Brazil in the southern part of the province of St. Paul, near the town called Curityba. Stamens numerous, free. Stigmas subcapitate.

Var. β, *brevifòlium* (Hil. l. c.) leaves shorter and more numerous; flowers cymose or paniculately cymose.

Stiff St. John's-wort. Fl. Mar. Sh. 2 to 3 feet.

64 H. LINOÌDES (St. Hil. fl. bras. 1. p. 333.) smooth; stem subherbaceous, erect, very straight, tetragonal above; leaves obtuse, hardly dotted, lower ones sublanceolate-linear; panicle terminal, elongated; segments of the calyx equal, linear, or ovate-lanceolate, acute; stamens free; styles 5. ♃. S. Native of Brazil in the western part of the province of Rio Grande de St. Pedro do Sul, on the banks of a rivulet called Garapuita. Stigmas capitate.

Flax-like St. John's-wort. Fl. Feb. Pl. 1 foot.

65 H. LAXIU'SCULUM (St. Hil. pl. us. bras. no. 62.) smooth; stem herbaceous, upper part tetragonal; leaves rather distant, obtuse, full of pellucid dots, lower ones narrow, lanceolate, upper and rameal ones linear-lanceolate; flowers corymbose, pentagynous; segments of the calyx equal, nearly linear, acute. ♃. S. Native of Brazil in the provinces of St. Paul and Minas Geraes, where the inhabitants employ a decoction of the leaves against the bites of serpents.

Loose-flowered St. John's-wort. Fl. Feb. Pl. 1 foot.

66 H. CAMPE'STRE (Cham. ex Schlecht. Linnæa. 3. p. 122.) stem shrubby, branched; leaves oblong, tapering to the base, full of pellucid dots; cymes terminal, leafless, glandless; calycine segments narrow, lanceolate, ending in long acute acumens, shorter than the corolla, but longer than the capsule; stamens numerous, short, nearly free; styles 5, free, diverging. ♄. S. Native of Brazil at Rio Negro. Petals yellow, orange at the tip.

Field St. John's-wort. Shrub 2 to 3 feet.

67 H. MYRIA'NTHUM (Cham. et Schlecht. Linnæa. 3. p. 123.) stem shrubby, straight, corymbosely branched; leaves linear, obtuse, glaucous, full of pellucid dots; cymes terminal, small, and many-flowered, glandless; calycine segments lanceolate, acute, one-half shorter than the corolla, but equal in length with the capsule; stamens 12, nearly free, length of petals; styles 3, distinct. ♄. S. Native of Monte Video.

Many-flowered St. John's-wort. Shrub 2 to 3 feet.

68 H. PROLI'FICUM (Lin. mant. 106.) stem round; branches angular; leaves linear-lanceolate, with revolute edges, full of pellucid dots; corymbs few-flowered; sepals ovate-lanceolate, stamens very numerous; styles usually connected together. ♄. H. Native of North America in Virginia or Canada. Wats. dend. brit. t. 88. H. foliòsum, Jacq. hort. Schœnbr. 3. p. 27. t. 299. H. Kalmiànum, Du Roi. harbk. 1. p. 310. A very common shrub in the gardens.

Prolific St. John's-wort. Fl. June, Aug. Clt. 1758. Shrub 1 to 2 feet.

69 H. TENUIFÒLIUM (St. Hil. fl. bras. 1. p. 337.) smooth; stem short, tetragonal above; leaves narrow-linear, acute, full of pellucid dots, revolute beneath; flowers very few, axillary, and terminal, trigynous; segments of calyx unequal, oblong, with long, acute acumens. ♄. S. Native of Brazil in dry

fields near the town of St. Paul. Stamens polyadelphous to the middle.

Fine-leaved St. John's-wort. Fl. Mar. Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot.

70 H. GLAU'CUM (Mich. fl. bor. amer. 2. p. 78.) stem round; leaves cordate, stem-clasping, obtuse, with revolute margins, glaucous, full of pellucid dots; flowers in very leafy panicles; sepals ovate, obtuse; stamens very numerous. ♃. F. Native of Florida. Flowers large.

Glaucous-leaved St. John's-wort. Fl. July, Aug. Clt. 1812. Pl. 1 to 2 feet.

71 H NUDIFLÒRUM (Mich. fl. bor. amer. 2. p. 78.) stem tetragonal and winged; leaves ovate-oblong, obtuse, full of sharp dots; panicle of flowers naked; sepals linear-lanceolate, acute; styles connected together. ♃. H. Native of North America, particularly in Carolina. Flowers pale-yellow.

Var. β, ovàtum (D. C. prod. 1. p. 548.) sepals ovate; leaves stem-clasping. H. lævigàtum, Ait. hort. kew. ed. 2. vol. 4. p. 425.

Var. γ, ramòsum (D. C. prod. 1. p. 548.) stem more branched and leafy.

Naked-flowered St. John's-wort. Fl. Aug. Oct. Clt. 1811. Pl. $1\frac{1}{2}$ foot.

72 H. SPHÆROCA'RPON (Mich. bor. amer. 2. p. 78.) stem angular, erect; leaves oblong, obtuse, sessile, without dots; panicle naked, dichotomous; sepals linear-lanceolate, acute; styles connected together; capsules globose. ♃. H. Native of North America in Kentucky and near Philadelphia.

Nuttall gives the following character: stem 2-edged at the top; leaves oblong, full of pellucid dots, obtuse; cymes naked, compact; calyx foliaceous, at first shorter than the petals; styles 3, united or distinct; stamens shorter than the petals; not very numerous; capsule globose.

Round-capsuled St. John's-wort. Pl. $1\frac{1}{2}$ foot.

73 H. GRAMI'NEUM (Forst. prod. 53.) stem tetragonal, dichotomous; leaves ovate-lanceolate, stem-clasping, sessile, without pellucid dots; peduncles terminal, solitary, 1-flowered; sepals linear-lanceolate; styles short, free; stigmas capitate. ♃. H. Native of New Caledonia.

Grassy St. John's-wort. Pl. 1 foot.

74 H. FASTIGIA'TUM (H. B. et Kunth, nov. gen. amer. 5. p. 195.) stem straight, branched at the top; leaves oblong-lanceolate, with revolute edges; sepals linear-lanceolate; stigmas somewhat funnel-shaped; branchlets fastigiate. ♃. H. Native of Mexico near Pazcuaro.

Fastigiate-branched St. John's-wort. Pl. 2 feet.

75 H. QUADRA'NGULUM (Lin. spec. 1104.) stem quadrangular, straight, branched; leaves ovate, obtuse, full of pellucid dots, and with black dots on the edges; panicle many-flowered; sepals lanceolate; anthers each tipped with dark purple glands. ♃. H. Native throughout Europe in moist meadows and thickets. Plentiful in Britain. Smith, engl. bot. t. 370. Curt. lond. fasc. 4. t. 52. Fl. dan. t. 640. Petals sometimes dotted, and streaked with dark purple. Root somewhat creeping.

Var. β, undulàtum (Willd. enum. p. 811.) leaves with wavy edges. ♃. H. Native of the South of Europe and north of Africa.

Quadrangular-stemmed St. John's-wort or St. Peter's-wort. Fl. July, Aug. Brit. Pl. 1 to 2 feet.

76 H. DU'BIUM (Leers. 162. Willd. spec. 3. p. 1460.) stem obscurely quadrangular, erect, branched; leaves obtuse, almost destitute of pellucid dots, but commonly with a broken row of coloured ones close to the margin; sepals elliptical; panicles many-flowered. ♃. H. Native of Europe in rather mountainous groves and thickets. In England, about Sapey, near Clifton, Worcestershire; Luton, Bedfordshire; North Mimms, Herts; at Dowton Castle, near Ludlow, and Hafod, Cardiganshire, very abundantly. Smith, engl. bot. t. 296. H. Delphinénse, Vill. dauph. 3. p. 497. t. 44. H. quadrángulum, *β* dùbium, D. C. prod. 1. p. 548. The petals and calyx are blotched and dotted with dark-purple.

Var. β, maculàtum (Crantz. austr. fasc. 2. p. 64.) stems more branched; flowers more numerous; petals with black dots. ♃. H. Native of Europe in groves and thickets, particularly in Austria and France. H. maculàtum, Vill. dauph. no. 1433. t. 83. f. 1.

Doubtful or Imperforated St. John's-wort. Fl. July, Aug. Britain. Pl. 1 to 2 feet.

77 H. CONFE'RTUM; stem almost simple, quadrangular, winged, destitute of black dots; leaves short, obtuse, nearly destitute of pellucid dots, but with an irregular row of black ones near the margin; sepals acute, with pellucid dots. ♃. H. Native of Europe. H. quadrángulum, var. *δ*, confértum, D. C. prod. 1, p. 448. Panicles crowded. Petals without dots.

Crowded-flowered St. John's-wort. Fl. July, Aug. Pl. 1 to 2 feet.

78 H. TETRA'PTERUM (Fl. nov. suec. vol. 2. Schlecht. Linnæa. 4. p. 413.) stem 4-winged; leaves ovate, obtuse, somewhat mucronulate, full of minute pellucid dots, very much reticulated; segments of the calyx lanceolate, mucronate. ♃. H. Native of Europe, Sweden, &c. Flowers small. H. quadrángulum, Schlecht. fl. berl. 1. p. 397.

Four-winged-stemmed St. John's-wort. Pl. 2 feet.

79 H. TETRA'PTERA-QUADRA'NGULUM (Schlecht. l. c. p. 414.) stem obsoletely quadrangular; leaves elliptic, full of pellucid dots, reticulately veined; calycine segments broad-lanceolate, acute. ♃. H. Native with the last. There is a variety with less membranous angles, less reticulated leaves, and oblong, blunt, calycine segments, and larger flowers.

Four-winged-four-angled-stemmed St. John's-wort. Fl. June, July. Pl. $1\frac{1}{2}$ foot.

80 H. PERFORA'TO-QUADRA'NGULUM (Schlecht. l. c. p. 415.) stem obsoletely quadrangular; leaves elliptic, full of pellucid dots, reticulately veined; calycine segments lanceolate or oblong-elliptic, acutish. ♃. H. Native of Sweden? Flowers large. There is a variety with dotless leaves.

Perforated-quadrangular St. John's-wort. Fl. June, July. Pl. $1\frac{1}{2}$ foot.

81 H. ATTENUA'TUM (Chois. prod. hyp. p. 47. t. 6.) stem round, erect, full of black dots; leaves ovate-oblong, obtuse, somewhat stem-clasping, full of black dots; sepals lanceolate, with black dots; petals with black dots at the apex. ♃. H. Native of Siberia.

Tapering St. John's-wort. Fl. July, Aug. Clt. 1822. Pl. 1 to $1\frac{1}{2}$ foot.

82 H. RE'PENS (Lin. spec. 1103.) stem suffruticose, round, purplish, ascending and prostrate; leaves ovate-linear, obtuse, approximate, scarcely perforated; corymbs few-flowered; sepals ovate-lanceolate, acute, with black dots. ♃. H. Native of the Levant and of Europe in the region of the Mediterranean.

Creeping St. John's-wort. Fl. Pl. prostrate.

83 H. CONNA'TUM (Lam. dict. 4. p. 168.) smooth; stem nearly simple; leaves connately-perfoliate, the free part ovate, acutish or obtuse, girded by an elevated margin, glaucous and dotted with black beneath, coriaceous; flowers cymose, pentagynous; bracteas linear-awl-shaped; segments of calyx ovate, acuminated. ♄. S. Native of Brazil. St. Hil. pl. us. bras. no. 61. This plant is astringent, and a decoction of it is used in Brazil as a gargle for a sore throat.

Connate-leaved St. John's-wort. Shrub $1\frac{1}{2}$ foot.

84 H. CHLORÆFÒLIUM (St. Hil. fl. bras. 1. p. 329.) smooth; stem simple; leaves connately perfoliate, the free part semicircular, mucronulate, girded by an elevated margin, glaucous

beneath and full of black dots, coriaceous, distant; flowers cymose, pentagynous; segments of calyx ovate, acuminated. ♄. S. Native of Brazil in that part of the province of St. Paul called Campos Geraes. Stamens very numerous, nearly free. Stigmas subcapitate.

Chlora-leaved St. John's-wort. Fl. Feb. Shrub 1½ foot.

85 H. ERE'CTUM (Thunb. fl. jap. p. 296.) stem round, purple, straight; leaves lanceolate, acute, stem-clasping, with revolute edges; sepals lanceolate. ♃. F. Native of Japan in the mountains of Nagasaki.

Erect St. John's-wort. Pl. 1 to 2 feet.

86 H. JAPO'NICUM (Thunb. fl. jap. p. 295. t. 31.) stem weak, tetragonal, smooth, decumbent; leaves broad-ovate or oval, mucronate, somewhat cordate, obtuse, with revolute edges, full of pellucid dots; flowers solitary, loosely panicled; sepals almost equal in length with corolla and stamens; styles 3, short, diverging. ♃. H. Native of Japan and of Nipaul in bogs near the town of Katmandu. H. dichótomum, Hamil. mss. Peduncles solitary or tern, 1-flowered. Stems decumbent. Branches erect. Flowers small.

Var. β, *ramòsum* (D. C. prod. 1. p. 549.) stem branched; leaves and flowers more crowded.

Japan St. John's-wort. Fl. May. Clt. 1823. Pl. 1 foot.

87 H. DICHO'TOMUM (Lam. dict. 4. p. 167.) stem suffruticose at the base, round, dichotomously branched; leaves small, linear-elongated, obtuse, tapering to the base, full of obscure pellucid dots; sepals ovate-lanceolate, acute; stamens 9, free. ♄. S. Native of St. Domingo. Perhaps this species belongs to *Elòdea*.

Dichotomous-leaved St. John's-wort. Shrub 2 feet.

88 H. CRI'SPUM (Lin. mant. 106.) stem round, much branched; leaves sessile, lanceolate, sinuately waved at the base, full of pellucid dots; sepals small, blunt. ♃. H. Native of the regions of the Mediterranean.—Bocc. mus. 2. p. 34. t. 12.

Curled-leaved St. John's-wort. Fl. July, Aug. Clt. 1688. Pl. 1 foot.

89 H. PILÒSUM (Walt. fl. carol. 190.) stem twiggy, simple; leaves dilated, ovate, sometimes tapering to the base; panicles terminal, few-flowered. ♄. F. Native of North America in Virginia and Carolina. H. Virginiànum, &c. Pluk. alm. t. 245. f. 6. A'scyrum villòsum, Willd. spec. 2. p. 1474.

Pilose St. John's-wort. Shrub 1 foot.

90 H. SI'MPLEX (Mich. fl. bor. amer. 2. p. 80.) pilose; stem simple, round, woolly; leaves oblong, pressed to the stem, channelled, pubescent; flowers few, almost sessile; sepals ovate, ciliated; styles 3, free; stigmas capitate. ⊙. H. Native of Lower Carolina and Georgia.

Simple-stemmed St. John's-wort. Fl. July, Aug. Clt. 1825. Pl. ½ foot.

91 H. NUTTA'LLII; leaves oblong-ovate, partly connate at the base, and always pressed close to the stem. ♃. H. Native of North America. H. new, Nutt. gen. 2. p. 17. Differs from H. simplex, Michx. Stem simple. The whole plant is covered with matted, somewhat scabrous pubescence.

Nuttall's St. John's-wort. Pl. 1 foot.

92 H. HETEROPHY'LLUM (Vent. hort. cels. t. 68.) stem suffruticose, round; leaves linear-lanceolate, full of pellucid dots, axillary ones crowded, imbricate, very short, blunt; sepals acute, somewhat unequal. ♄. F. Native of Persia.

Various-leaved St. John's-wort. Clt. 1712. Fl. July, Aug. Shrub 1 to 2 feet.

93 H. ÆGYPTI'ACUM (Lin. spec. 1103.) stem round; leaves small, ovate, crowded, without dots; flowers few, almost sessile; sepals lanceolate, acute; styles small, diverging. ♄. F. Native of Egypt. Lin. amœn. 8. p. 323. t. 8. f. 3. Ker. bot. reg. 196. Leaves glaucous. Flowers small.

Egyptian St. John's-wort. Fl. June, July. Clt. 1787. Shrub ½ to 1½ foot.

94 H. NA'NUM (Poir. dict. suppl. 3. p. 699.) stem suffruticose; leaves ovate-roundish, very blunt, mucronulate, full of pellucid dots; sepals very thin, acute, lanceolate. ♄. F. Native of Syria.

Dwarf St. John's-wort. Shrub ½ foot.

95 H. AUSTRA'LE (Tenore, fl. neap. app. 5th. ex Linnæa. 3. p. 103.) petals and calyx entire, full of black dots; leaves opaque, dotless, veiny, oblong-elliptic, obtuse, full of black dots on the margins; stem herbaceous, obsoletely quadrangular at the base; flowers cymose; petals 3 times larger than the calyx; filaments and anthers dotless. ♃. H. Native of Lucania. H. humifùsum, Tenore, prod. H. dùbium, Mauri. rom. pl. cent. 13. p. 27. exclusive of the synonymes.

Southern St. John's-wort. Pl. trailing.

96 H. CUNEA'TUM (Poir. suppl. dict. 3. p. 699.) branches roundish, smooth; leaves obovate, cuneated at the base, obtuse, on short petioles, with a few black glandular dots; flowers few; sepals linear-lanceolate, longer than the corolla; stamens 15-20. ♃. F. Native of the Levant.

Cuneated-leaved St. John's-wort. Pl. prostrate.

97 H. HUMIFU'SUM (Lin. spec. 1103.) stem compressed, prostrate; leaves elliptical, blunt, full of fine pellucid and black dots on the margins; flowers cymose, terminal; sepals ovate, longer than the corolla; stamens 15-20. ♃. H. Native of most parts of Europe and Caucasus in sandy, gravelly, heathy, and rather boggy places; frequent in Britain. Smith, engl. bot. t. 1226. Curt. fl. lond. fasc. 3. t. 50. Oed. fl. dan. t. 141. This species has a lemon-like scent, as well as *H. dùbium* and *H. perforàtum*.

Trailing St. John's-wort. Fl. July. Britain. Pl. trailing.

98 H. CÆSPITÒSUM (Cham. et Schlecht. Linnæa. 3. p. 126.) stems herbaceous, prostrate, rising from a woody root, and ascending, tufted; leaves linear, obtuse, full of pellucid dots; cymes terminal, leafy, few-flowered, glandless; calycine segments lanceolate, shorter than the corolla, but longer than the capsule; stamens about 25, nearly free; styles 3, short, free. ♃. S. Native of Chili on dry hills about Talcaguano.

Tufted St. John's-wort. Pl. trailing.

99 H. ANAGALLOI'DES (Cham. et Schlecht. Linnæa. 3. p. 127.) herbaceous, trailing, and creeping; leaves 5-7-nerved, ovate, obtuse, full of pellucid dots; cyme terminal, leafy, few-flowered, glandless; calycine segments obovate, shorter than the corolla; stamens 15-20, nearly free; styles 3, free. ♃. H. Native of California. Like *H. humifùsum*.

Pimpernel-like St. John's-wort. Pl. trailing.

100 H. LIOTTA'RDI (Vill. dauph. t. 44.) stem erectish; leaves oblong, blunt, full of fine pellucid and black dots on their margins; flowers cymose, sometimes 4-parted, terminal; sepals linear-lanceolate, longer than the corolla. ♂. H. Native of Dauphiny.

Liottard's St. John's-wort. Fl. July. Clt. 1819. Pl. ½ foot.

101 H. PUSI'LLUM (Chois. prod. hyp. p. 20.) stem weak, prostrate, tetragonal; leaves ovate, obtuse, full of pellucid dots; sepals lanceolate; petals upright; stigmas capitate. ♃. F. Native of New Holland. A'scyrum humifùsum, Lab. ill. nov. holl. 2. p. 33. t. 175.

Small St. John's-wort. Fl. Ju. Aug. Clt. 1818. Pl. trailing.

102 H. INVOLU'TUM (Chois. prod. hyp. p. 50.) stem ascending, 4-winged, slender; leaves ovate-oblong, obtuse, full of pellucid dots; panicle loose, dichotomous; sepals lanceolate, acute; corolla involute; stigmas capitate. ♃. F. Native of New Holland. A'scyrum involùtum, Lab. ill. nov. holl. 2. p. 32. t. 174.

Involute-flowered St. John's-wort. Fl. July, Aug. Clt. 1822. Pl. ½ foot.

103 H. A'FRUM (Lam. dict. 4. p. 166.) stem suffruticose, round, winged; leaves oblong, obtuse; full of fine pellucid dots,

and with black ones beneath and at the margins; sepals acute, rather unequal, sometimes serrated. ♄. F. Native of Barbary, Spain, and Syria.

African St. John's-wort. Shrub 6 feet.

104 H. perfora'tum (Lin spec. 1105.) stem 2-edged; leaves ovate or elliptical, with copious, pellucid dots; flowers panicled; sepals lanceolate, full of pellucid dots; anthers with black dots; styles short, erect. ♃. H. Native every where throughout Europe, north of Africa, Siberia, in groves, hedges, and thickets. Abundant in Britain. Smith, engl. bot. t. 295. Curt. lond. fasc. 1. t. 57. Oed. fl. dan. 1043. Turp. in dict. sc. nat. with a figure. Root tufted. Flowers bright-yellow, dotted, and streaked with purple. This plant has a powerful lemon-like scent when rubbed, staining the fingers with dark purple, from the great abundance of coloured essential oil lodged in the herbage, and even in the petals. As this plant was found to bleed at the slightest touch, it was supposed to have a vulnerary quality, and became the "balm of the warrior's wound," giving a blood-red colour to every composition, whether of a spiritous or oily nature into which it entered. The essential oil, the seat of this colour, is aromatic, and possibly tonic or stimulating, without much acrimony.

Although in the present practice this plant is not much regarded as a medicine, yet its sensible qualities, and the repeated testimonies of its virtues, entitle it to further trials. To the taste it is astringent and bitter, and it seems to be chiefly diuretic. It has been given in ulcerations of the kidneys, and has even been supposed to possess virtues as a febrifuge. The leaves given in substance are said to destroy worms. The dried plant, boiled with alum, dyes wool yellow.

The common people in France and Germany gather this species of *St. John's-wort* with great ceremony on St. John's day, and hang it in their windows, as a charm against storms, thunder, and evil spirits; mistaking the meaning of some medical writers, who have fancifully given this plant the name of *Fuga Dæmonum*, from a supposition that it was good in maniacal and hypochondriacal disorders. Formerly it was also carried about by the people of Scotland as a charm against witchcraft and enchantment; and they fancy it cures ropy milk, which they suppose to be under some malignant influence, by milking afresh upon the herb. Kine and goats eat it, but horses and sheep refuse it.

Var. β, latiglandulòsum (D.C. prod. 1. p. 550.) glands broader and fewer; leaves more crowded at the top; panicles more straight and fewer flowered.

Var. γ, elàtum (D. C. l. c.) stem taller, with more distant internodes; leaves smaller, with revolute margins; branches straighter; panicles loose, few-flowered.

Var. δ, punctàtum (D. C. prod. 1. p. 550.) stem dwarfer; sepals blunter, sometimes with glandular margins; corolla with black dots.

Var. ε, microphýllum (D.C. l. c.) all parts of the plant are more crowded and smaller; panicles straight, many-flowered.

Var. ζ, albiflòrum (D. C. l. c.) flowers white.

Perforated or Common St. John's-wort. Fl. June, Sept. Brit. Pl. 1 to 2 feet.

105 H. quinquene'rvium (Walt. fl. carol. 190.) stem tetragonal; leaves somewhat stem-clasping, ovate, obtuse, obscurely 5-nerved, full of pellucid dots, which are acute on the under surface; corymbs dichotomous; sepals linear-lanceolate. ♃. H. Native from Canada to Carolina in overflowed places and on Mount Quindiu in South America. H. stellarioìdes, H. B. et Kunth, nov. gen. amer. 5. p. 196. H. parviflòrum, Willd. spec. 3. p. 1456. H. mùtilum, Willd. spec. 3. p. 1471. Corolla shorter than the calyx.

Five-nerved-leaved St. John's-wort. Fl. June, Sept. Clt. 1759. Pl. 1 foot.

106 H. thymifòlium (H. B. et Kunth, nov. gen. amer. 5. p. 186. t. 455.) stem shrubby; branches dichotomous; leaves oblong, small, bluntish, full of pellucid dots; sepals oblong; styles free; stigmas peltate. ♄. G. Native of South America near Santa Fe de Bogota?

Thyme-leaved St. John's-wort. Shrub.

107 H. brevi'stylum (Chois. prod. hyp. p. 51. t. 7.) stem prostrate, slender; leaves oblong-lanceolate, rather blunt, full of pellucid dots; panicles few-flowered; sepals lanceolate; styles connected, very short; stigmas capitate. ♃. F. Native of South America.

Short-styled St. John's-wort. Pl. prostrate.

108 H. elonga'tum (Ledeb. ex Spreng. syst. 3. p. 347.) branches round; leaves sessile, linear, glaucous, without dots, with revolute margins; peduncles opposite; sepals blunt, striated, entire; petals large, with glandular margins. ♃. H. Native of Siberia in the Kirghisean Steppe at Lake Saisan.

Elongated St. John's-wort. Pl. 1 to 2 feet.

109 H. denticula'tum (H. B. et Kunth, nov. gen. amer. 5. p. 191. t. 458.) stem ascending; leaves linear-lanceolate, with retrograde teeth at the margins; flowers decandrous; sepals oblong-lanceolate; petals obovate-cuneated; styles free, very short; stigmas subcapitate. ♃. F. Native of Mexico near Guanaxuato.

Toothletted-leaved St. John's-wort. Pl. 1 foot.

110 H. Cervante'sii (Willd. herb. ex Spreng. syst. 3. p. 347.) stem erect, 2-edged at the apex, dichotomous; leaves stem-clasping, linear, acuminate, with revolute margins; flowers cymose, leaning to one side; sepals lanceolate, entire. ♃. F. Native of Mexico.

Cervantes's St. John's-wort. Pl. 1 foot.

111 H. Lala'ndii (Chois. mss. D. C. prod. 1. p. 50.) stem tetragonal, with black dots; leaves lanceolate, acute, with revolute margins, rather stem-clasping, and pressed against the stem; panicle few-flowered, dichotomous; sepals linear-lanceolate, longer than the corolla; styles 3, free. ♃. G. Native of the Cape of Good Hope.

Laland's St. John's-wort. Pl.?

112 H. silenoi'des (Juss. ann. mus. 3. p. 162. t. 16. f. 3.) leaves lanceolate, with revolute edges; flowers leaning to one side; sepals narrow, acute, glandular. ♃. G. Native of Peru on the Andes. Panicle dichotomous.

Silene-like St. John's-wort. Pl. 1 foot.

113 H. inde'corum (H. B. et Kunth, nov. gen. amer. 5. p. 193.) stem branched at the base; branches elongated, tetragonal; flowers usually pentandrous; leaves oblong-lanceolate, acute, dotted; stigmas somewhat capitate. ♃. F. Native of South America near Loxa.

Var. β, paniculàtum (D. C. prod. 1. p. 550.) stem straight, many-flowered; flowers small, pentandrous or heptandrous; petals linear. ♃. F. Native of South America near Ario. H. paniculàtum, H. B. et Kunth. nov. gen. 5. p. 195. t. 459.

Indecorous St. John's-wort. Pl. 1 foot.

114 H. Canade'nse (Lin. spec. 1104.) stem herbaceous, straight, 4-winged; leaves linear, bluntish, full of very fine pellucid dots, but with black ones beneath; panicles elongated, dichotomous; sepals lanceolate; styles very short; capsules conical, red. ♃. H. Native of North America from Canada to Carolina, and of Mexico, in low gravelly places. Flowers very small.

Var. β, mínimum (D. C. prod. 1. p. 550.) much smaller in stature; flowers fewer. H. thesiifòlium, pauciflòrum and Moranénse of H. B. et Kunth, nov. gen. 5. p. 192 and 193. appear to be only varieties of this plant. ♃. F. Native of Mexico.

Canadian St. John's-wort. Fl. June, Aug. Clt. 1770. Pl. ½ foot.

115 H. TARQUE'NSE (H. B. et Kunth, nov. gen. amer. 5. p. 193.) stem straight, branched, dichotomous, corymbosely-many-flowered; leaves lanceolate-oblong, dotted, with revolute margins; sepals lanceolate, acuminate; styles 3-5; stigmas somewhat capitate. ♃. G. Native of South America in mountainous places of Quito.

Tarquo St. John's-wort. Pl. 1 foot.

116 H. GALIOÌDES (Lam. dict. 4. p. 161.) stem suffruticose, round, straight; leaves linear-lanceolate, tapering to the base, broadest at the apex, acute, with revolute dotted margins; sepals linear, acute, reflexed after flowering; styles at first connected, but at length free; capsules conical, very acute. ♄. H. Native of North America from New Jersey to Carolina in sandy moist places near rivulets. Petals equal in length to the stamens, scarcely longer than the calyx.

Galium-like St. John's-wort. Fl. July, Sept. Shrub 2 feet.

117 H. AXILLA'RE (Lam. dict. 4. p. 160.) stem shrubby, round, diffuse; leaves lanceolate-linear, narrowed at the base, with revolute margins; sepals rather unequal; styles at first joined, but afterwards free. ♄. H. Native of North America in the pine-woods of Georgia and Florida. H. fasciculàtum, Willd. spec. 3. p. 1452. exclusive of the synonyme of Mich. Pursh, fl. amer. sept. 2. p. 376. H. Còris, Walt. fl. carol. 190. Peduncles on the top of the branches, axillary, 3-flowered, with the middle flower sessile. Flowers about the size of those of *H. perforàtum*.

Axillary-flowered St. John's-wort. Fl. Jul. Sh. 1 to 2 feet.

118 H. ORIGANIFÒLIUM (Willd. spec. 3. p. 1467.) stem ascending, downy; leaves ovate, blunt, pubescent, full of pellucid dots; flowers large, few; sepals linear, acute, smooth, with a few black dots at the apex; corolla full of black dots; stamens very numerous. ♃. F. Native of the East about Constantinople, Armenia, and Thrace. H. Lusitánicum, Poir.

Marjoram-leaved St. John's-wort. Pl. 1 foot.

* * *Sepals toothed, usually with the teeth glandular.*

119 H. ELÒDES (Lin. spec. 1106.) stem villous, round, procumbent; leaves roundish-ovate, blunt, shaggy, tomentose, full of pellucid dots; panicle loose, few-flowered; calyx hardly divided half-way down into 5 ovate, obtuse segments, fringed with glands; stamens few; stigmas capitate. ♃. H. Native throughout the north of Europe in marshes. In Britain in spongy, especially mountainous, bogs. Schkuhr. handb. 3. 213. 5. Smith, engl. bot. t. 109. H. tomentòsum, Lob. icon. 400. f. 1. Petals expanding in the sun only, pale-yellow, with green ribs.

Marsh St. John's-wort. Fl. July, Aug. Brit. Pl. prostrate.

120 H. TOMENTÒSUM (Lin. spec. 1106.) stem round, ascending, tomentose; leaves ovate, blunt, rather stem-clasping, with black-dotted margins; panicles loose, dichotomous; sepals acuminated; stigmas simple. ♃. H. Native of the south of Europe, particularly in the regions of the Mediterranean, in moist meadows.—Clus. hist. 2. p. 181. f. 1.—Mor. hist. 2. p. 470. sect. 5. t. 6. no. 5.

Tomentose St. John's-wort. Fl. July, Aug. Clt. 1648. Pl. ½ to ¾ foot.

121 H. LANUGINÒSUM (Lam. dict. 4. p. 171.) woolly; stem suffruticose, round, straight; leaves stem-clasping, ovate, obtuse, with black-dotted margins; corymb of flowers large, dichotomous, many-flowered; calyx obtuse; anthers with black dots. ♃. F. Native of the Levant and Greece.

Woolly St. John's-wort. Pl. 1 to 2 feet.

122 H. HIRSU'TUM (Lin. spec. 1105.) stem round, hairy, erect; leaves ovate-oblong, downy, ribbed, full of pellucid dots, intermixed with a few dark ones; panicle long, racemose; calyx lanceolate, somewhat acute; fringed like the bracteas with numerous black, viscid glands, on shortish stalks, such as also terminate the petals; styles diverging. ♃. H. Native of most parts of Europe and Caucasus in shady places. In Britain in thickets and hedges, chiefly on a dry chalky soil. Smith, engl. bot. t. 1156. Curt. fl. lond. fasc. 3. t. 49. Œd. fl. dan. t. 802. Flowers of a bright-yellow colour; according to Linnæus they close at night.

Hairy St. John's-wort. Fl. June, Aug. Brit. Pl. 2 to 3 ft.

123 H. NUMMULA'RIUM (Lin. spec. 1106.) stem round, ascending; leaves orbicular, stalked; calyx ovate, obtuse. ♃. H. Native of the south of France, Piedmont, &c. on rocky mountains. Lam. ill. t. 643.—Pluk. phyt. t. 93. f. 4.

Money-wort-leaved St. John's-wort. Fl. June, July. Clt. 1823. Pl. ¼ to ½ foot, rather prostrate.

124 H. E'LEGANS (Steph. in Willd. spec. 3. p. 1469.) stem erect, winged, full of black dots; leaves ovate-lanceolate, rather stem-clasping, bluntish, full of pellucid dots; calyx ovate-lanceolate, acute, with pellucid dots; anthers with black dots. ♃. H. Native of Siberia, and near Hale in Saxony, also of Bohemia and Moravia. H. Kohliànum, Spreng. fl. hal. no. 864. t. 9. H. anagalidifòlium, Presl. This is an elegant plant.

Elegant St. John's-wort. Fl. June, Aug. Clt. 1817. Pl. 1 ft.

125 H. GLANDULÒSUM (Ait. hort. kew. ed. 1. vol. 3. p. 107.) stem shrubby, round, erect, branched; leaves elliptical-lanceolate, acute, with glandular margins, and pellucid dots; calyx lanceolate, acute. ♄. G. Native of Madeira and Teneriffe. Corolla pale-yellow, full of brown dots.

Glandular St. John's-wort. Fl. May, Aug. Clt. 1777. Shrub 1 to 2 feet.

126 H. PU'LCHRUM (Lin. spec. 1106.) stem herbaceous, erect, round; leaves stem-clasping, cordate, smooth, blunt, full of pellucid dots, with revolute margins; calyx ovate, obtuse, with glandular serratures, like those of the petals. ♃. H. Native of most parts of Europe in shady places. In Britain in woods and bushy heathy places, on a clay soil, frequent. Smith, engl. bot. t. 1227. Curt. lond. fasc. 1. t. 56. Œd. fl. dan. t. 75. no. 73. Flowers golden, tipped externally with scarlet, which, combined with the red anthers, has a very gay appearance.

Fair St. John's-wort. Fl. July. Brit. Pl. 1 to 1½ foot.

127 H. ANNULA'TUM (Mor. sard. elench. p. 9.) plant cinereously-pubescent below but smooth above; leaves oval-oblong, stem-clasping, full of pellucid dots, and with black dots on the margin; bracteas glandular, crowded, pedicellate, and annular at the base, and are lanceolate as well as the sepals, which are ciliated with glands. ♃. H. Native of Sardinia in the fissures of rocks. Styles 3. Anthers full of black dots.

Annular-bracted St. John's-wort. Pl.

128 H. ELODIOÌDES (Chois. mss. D. C. prod. 1. p. 551.) stem round, smooth, simple, without dots; leaves oval, obtuse, many-nerved, smooth, stem-clasping, glandular at the base, glaucous beneath; panicle crowded; sepals lanceolate, acute, fringed with glands; petals oval, with glandular margins. ♃. H. Native of Nipaul at Narainhetty. H. nervòsum, D. Don, prod. fl. nep. p. 219. Leaves and calyxes full of pellucid dots. Petals sulphur-coloured, tipped with black dots.

Elodes-like St. John's-wort. Fl. June, Aug. Clt. 1820. Pl. ½ to 1 foot.

129 H. BARBA'TUM (Lin. amœn. 8. p. 323.) stem round or somewhat angular, erect, smooth; leaves stem-clasping, ovate, smooth, full of black dots; calyx and petals fringed with pale hairs, and beset with black dots as well as the anthers. ♃. H. Native of Austria and many parts of the south of Europe, particularly in the region of the Mediterranean. In Scotland by the side of a hedge near the wood of Aberdalgy in Strathearn, Perthshire. Jacq. austr. 3. p. 33. t. 259. Smith, engl. bot. t. 1986.

Var. β, Calábricum (D. C. prod. 1. p. 551.) leaves more erect, pressed to the stem. H. Calábricum, Spreng. neue. entd. 3. p. 300.

Bearded St. John's-wort. Fl. Sept. Oct. Scotl. Pl. 1 foot.

130 H. PERFOLIA'TUM (Lin. syst. 707.) stem 2-edged; leaves ovate, stem-clasping, dotted, and glandular; sepals and petals fringed, and dotted; cymes with sessile flowers. ♃. H. Native of Italy.

Perfoliate-leaved St. John's-wort. Fl. May, Jul. Clt. 1785. Pl. 1 foot.

131 H. DENTA'TUM (Lois. fl. gall. p. 499. t. 17.) stem suffruticose, round, ascending; leaves stem-clasping, oblong, bluntish, full of pellucid dots, upper ones sometimes toothed; calyx lanceolate, acute, and is as well as the corolla and anthers furnished with black dots. ♃. H. Native of the Stœchades Islands.

Toothed-leaved St. John's-wort. Fl. July, Oct. Clt. 1820. Pl. 1 foot.

132 H. MONTA'NUM (Lin. spec. 1105.) stem round, erect, smooth; leaves stem-clasping, ovate, acutish, besprinkled with pellucid dots, and marked on the margins with black dots; calyx lanceolate, with dense, prominent, glandular serratures; anthers dotted with black. ♃. H. Native of the mountainous parts of Europe. In Britain on wild bushy hills on a chalky or gravelly soil. Smith, engl. bot. t. 371. Œd. fl. dan. t. 173. Leaves 1½ to 2 inches long. Bracteas fringed like the calyx, resembling the glands of a moss-rose. Petals pale-lemon coloured, without spots or glands.

Mountain St. John's-wort. Fl. July. Brit. Pl. 2 feet.

133 H. MÆ'SICUM (Spreng. syst. 2. p. 348.) stem round, erect, full of black dots; leaves lanceolate, stem-clasping, obtuse, full of black dots; panicle corymbose; sepals lanceolate, fringed, with glandular teeth. ♃. H. Native of Galacz in Moldavia. Flowers lemon-coloured.

Mæsian St. John's-wort. Fl. July, Aug. Pl. 1 foot.

134 H. FIMBRIA'TUM (Lam. dict. 4. p. 148.) stem round, purplish, simple; leaves stem-clasping, ovate, with black dots, margins without any pellucid dots; calyx ovate, acute, fringed; styles 3-4-5. ♃. H. Native of the Alps and the Pyrenees. H. Richèri, Vill. dauph. 3. p. 501. t. 44.

Var. β, androsæmifòlium (Vill. dauph. 3. p. 502. t. 44.) stem more creeping; leaves more ovate. H. alpìnum, Waldst. et Kit. pl. hung. 3. p. 294. t. 265.

Var. γ, Bursèri (D. C. fl. fr. suppl. p. 630.) stem taller; leaves blunter; bracteas longer; calyx shorter, less fringed.

Var. δ, pentágynum (D. C. prod. 1. p. 552.) stems thicker; leaves blunter; calyx longer; flowers all pentagynous.

Fringed-calyxed St. John's-wort. Fl. July, Aug. Clt. 1821. Pl. 1 to 2 feet.

135 H. ÆTHIO'PICUM (Thunb. prod. 1. p. 138.) stem round, smooth, reddish; leaves ovate, somewhat stem-clasping, full of pellucid dots, with revolute margins; panicle terminal, dichotomous; calyx very acute; corolla and anthers full of black dots. ♃. G. Native of the Cape of Good Hope.

Ethiopian St. John's-wort. Fl. Jul. Aug. Clt. 1817. Pl. 1 ft.

136 H. CILIA'TUM (Lam. dict. 4. p. 170.) stem round, rather 2-edged; leaves stem-clasping, somewhat cordate, ovate-oblong, obtuse, full of pellucid dots, and with black ones on the margins; calyx rather acute, fringed; anthers with black dots. ♃. H. Native of the south of Europe, particularly in the regions of the Mediterranean.—Bocc. mus. 2. t. 127.—Column. ecphr. p. 77. t. 78. f. 1.

Var. β, acutifòlium (D. C. prod. 1. p. 552.) leaves smaller, more acute; flowers on longer pedicels.—Bocc. mus. 2. p. 117. t. 91, 92.

Ciliated-calyxed St. John's-wort. Fl. July, Aug. Clt. 1739. Pl. 1 to 1½ foot.

137 H. SERPYLLIFÒLIUM (Lam. dict. 4. p. 176.) stem suffruticose, round; leaves ovate, obtuse, on very short petioles, with revolute margins; calyx ovate, obtuse, fringed. ♄. F. Native of Persia.—Mor. hist. 2. p. 469. sect. 5. t. 6. f. 2.

Wild-thyme-leaved St. John's-wort. Fl. July, Aug. Clt. 1688. Shrub 1½ foot.

138 H. CONFE'RTUM (Chois. prod. hyp. p. 55. t. 8.) stem round, villous at the base; leaves lanceolate, acute, villous, full of pellucid dots, and with revolute margins; calyx lanceolate. ♃. F. Native of the Levant.

Crowded-flowered St. John's-wort. Pl. 1 foot.

139 H. TRIPLINE'RVE (Vent. hort. cels. t. 58.) stem with 2 angles, decumbent at the base; leaves linear, spreading, obtuse, with revolute margins; calyx ovate, acute, fringed with glandular serratures; petals unequal. ♃. H. Native of North America on the banks of the Ohio. Flowers about the size of those of *H. perforàtum*, pale-yellow.

Triple-nerved-leaved St. John's-wort. Fl. July, Aug. Clt. 1821. Pl. 1 foot.

140 H. HYSSOPIFÒLIUM (Vill. dauph. 3. p. 505. t. 44.) stem suffruticose, round, ascending; leaves oblong-lanceolate, bluntish, tapering to both ends, full of pellucid dots, in fascicles in the axils; calyx bluntish; styles 3-4. ♃. H. Native of the south of France, particularly in Dauphiny, also of Tauria.

Var. β, pauciglandulòsum (D. C. prod. 1. p. 552.) leaves broader; stem smaller; calyx more acute, with fewer glands.

Hyssop-leaved St. John's-wort. Fl. July, Aug. Clt. 1823. Pl. 1 foot.

141 H. LINEARIFÒLIUM (Vahl. symb. 1. p. 65.) stem straight, round; leaves linear, obtuse, with black-dotted margins, without pellucid dots; calyx lanceolate, full of black dots. ♃. H. Native of the west and south of France.

Linear-leaved St. John's-wort. Fl. July, Aug. Pl. 1 foot.

142 H. ORIENTA'LE (Lin. spec. 1103.) stem shrubby, slender, suffruticose, with 2 angles, erect and jointed; leaves stem-clasping, linear, obtuse, erect, fringed with glandular hairs; calyx ovate-oblong. ♃. F. Native of the Levant.—Tourn. voy. lev. 2. t. 220.

Eastern St. John's-wort. Pl. ½ to 1 foot.

143 H. PA'LLENS (D. Don, prod. fl. nep. p. 219.) stem round, slender, simple; leaves elliptical-oblong, blunt, membranaceous, sessile, usually fringed with glandular hairs, full of pellucid dots; flowers panicled; calyx lanceolate, acuminate; petals oval, mucronulate. ♃. H. Native of Nipaul. H. Nipaulénsis, Chois. mss. in D. C. prod. 1. p. 552. Flowers sulphur-coloured.

Pale-flowered St. John's-wort. Pl. ½ foot.

144 H. SCA'BRUM (Lin. amœn. 4. p. 287.) stem round, glandular, scabrous; leaves linear, smooth, acutish; flowers umbelled, terminal; calyx small, ovate, obtuse, without glands; styles 3, free. ♃. F. Native of Arabia and Barbary.

Scabrous-stemmed St. John's-wort. Pl. 1 foot.

145 H. CAPITA'TUM (Chois. prod. 1. p. 57. t. 9.) stem round, erect; leaves linear, obtuse, full of pellucid dots, with plaited margins, disposed in fascicles in the axils; calyx small, obtuse; petals with black glands. ♃. F. Native near Bagdad.

Capitate-flowered St. John's-wort. Pl. 1 foot.

146 H. EMPETRIFÒLIUM (Willd. spec. 3. p. 1452.) stem suffruticose, round, with subalate branchlets; leaves linear, tern, with revolute margins; calyx small, obtuse; petals without glands. ♄. F. Native of the south of Europe, particularly in the regions of the Mediterranean.

Empetrum-leaved St. John's-wort. Fl. May, Aug. Clt. 1820. Shrub ½ to 1 foot.

147 H. CÒRIS (Lin. spec. 1107.) stem shrubby, erect, round; leaves in whorles, linear, with revolute margins; calyx

linear, bluntish. ♄. F. Native of the Levant, and in dry places in the south of Europe. A pretty little shrub.

Coris-leaved St. John's-wort. Fl. May, Sept. Clt. 1640. Shrub ½ to 2 foot.

148 H. LUSITA'NICUM (Poir. suppl. dict. 3. p. 702.) stem villous, round, slender; leaves small, elliptical, obtuse, hispid; sepals linear-lanceolate, mucronate; anthers with black dots; styles 3, filiform. ♄. F. Native of Portugal.

Portugal St. John's-wort. Shrub ½ to 1 foot.

149 H. ERICOÌDES (Lin. spec. 1104.) stem suffruticose, round, twisted, small; leaves linear, acute, much crowded, dotted, glaucous, small; sepals acute, hardly glandular. ♄. F. Native of Spain, Portugal, and the Levant. Cav. icon. 2. p. 20. t. 122. —Pluk. phyt. t. 93. f. 5.

Heath-like St. John's-wort. Fl. June, Sept. Clt. 1821. Sh. ½ to 1 foot.

SECT. V. BRA'THYS (the Greek name of the savin-tree, which is from *βραζω, brazo,* to overheat; in allusion to the habit of the shrubs, which resemble savin-tree or juniper). Chois. prod. p. 58. D. C. prod. 1. p. 553. Calyx of 5 entire equal sepals, usually very like the leaves. Stamens numerous, disposed in bundles. Styles 3-4. Subshrubs, with axillary, solitary flowers, and imbricate, whorled, or crowded leaves, which are usually linear-awl-shaped.

*** *Styles 3, with simple stigmas.*

150 H. STRUTHIOLÆFÒLIUM (Juss. ann. mus. 3. p. 160. t. 16. f. 2.) stem slender, chinky; branches adpressed; leaves opposite, with revolute margins, without dots, those at the top of the branches imbricate; sepals lanceolate, without dots; petals lanceolate. ♄. S. Native of Peru.

Var. β, minimum (D. C. prod. 1. p. 553.) stature smaller.

Var. γ, strictum (D. C. prod. 1. p. 553.) branches longer, straight. H. strictum, H. B. et Kunth, nov. gen. amer. 5. p. 190.

Struthiola-leaved St. John's-wort. Shrub 1 foot.

151 H. ACERO'SUM (H. B. et Kunth, nov. gen. amer. 5. p. 187. t. 457.) branches scabrous, tetragonal; leaves all imbricate, feathery, thickish; sepals lanceolate-oblong; petals unequal-sided, obovate. ♄. S. Native of South America on the Andes about Quito.

Feathery-leaved St. John's-wort. Shrub 1 foot.

152 H. ACICULA'RE (H. B. et Kunth, nov. gen. amer. 5. p. 190.) branches scabrous, straight; leaves needle-shaped, spreading; flowers monogynous, middle-sized; sepals lanceolate; petals pointed. ♄. S. Native of South America near Loxa.

Needle-leaved St. John's-wort. Shrub 1 foot.

153 H. LARICIFO'LIUM (Juss. ann. mus. 3. p. 160. t. 16. f. 1.) stem round, scabrous, with spreading branches; leaves lanceolate, tapering to both ends, crowded; sepals lanceolate, without dots; petals lanceolate; styles very long; stigmas thick. ♄. S. Native of Peru.

Larch-leaved St. John's-wort. Shrub 1 foot.

154 H. THUYOÌDES (H. B. et Kunth, nov. gen. amer. 5. p. 187. t. 456.) branchlets scabrous, tetragonal, spreading; leaves decussately-opposite, ovate, acutish; flowers solitary; sepals elliptical-oblong; petals obovate; stigmas obtuse. ♄. S. Native of South America on the Andes about Quindiu.

Thuja-like St. John's-wort. Shrub 1 foot.

155 H. CARACCASA'NUM (Willd. spec. 3. p. 1458.) branches tetragonal, winged; leaves ovate-oblong, acute, approximate, somewhat imbricate; flowers terminal and lateral; stigmas thick, truncate. ♄. S. Native of South America, near Caraccas.

Caraccas St. John's-wort. Shrub 1 foot.

156 MEXICA'NUM (Lin. amœn. 8. p. 322. t. 8. f. 2.) branches somewhat tetragonal, ringed; leaves imbricate, ovate-oblong, obtuse, fan-nerved, smooth, viscid, dotted beneath; flowers solitary, terminal; stigmas depressed, capitate. ♄. S. Native of South America at Santa Fe de Bogota. H. Mutisiànum, H. B. et Kunth, nov. gen. amer. 5. p. 188.

Mexican St. John's-wort. Shrub 3 feet.

157 H. REVOLU'TUM (Vahl. symb. 1. p. 66.) branches wrinkled, somewhat tetragonal at the base, but 2-edged at the apex; leaves linear-lanceolate, approximate, revolute at the base; styles joined together. ♄. F. Native of Arabia Felix on the mountains. H. scàbrum? Lin. amœn. 4. p. 287. H. Kalmiànum, Forsk.

Revolute-leaved St. John's-wort. Shrub 1 foot.

158 H. NI'TIDUM (Lam. dict. 4. p. 160.) stem round; branches rather angular; leaves very narrow, without dots; sepals rather unequal; styles joined. ♄. S. Native of?

Shining-leaved St. John's-wort. Shrub 1 foot.

159 H. FASCICULA'TUM (Lam. dict. 4. p. 160. but not of Lapeyr.) stem round, compressed at the top; branches erect; leaves dense, without dots, channelled, with somewhat revolute margins; sepals equal, erect; styles joined. ♄. F. Native of Carolina. H. aspalathoìdes, Pursh, fl. sept. amer. 2. p. 376. Branches somewhat dichotomous. Leaves in fascicles, linear, acute. Flowers solitary, axillary, almost sessile. Stamens shorter than the petals.

Fascicled-leaved St. John's-wort. Fl. July, Aug. Clt. 1811. Shrub 1 foot.

160 H. TENUIFO'LIUM (Pursh, fl. sept. amer. 2. p. 377.) branches angular; leaves crowded, as if they were in whorled fascicles, filiform, linear, convex, obtuse, sessile; peduncles axillary at the top of the branches, 1-3-flowered; styles connected together; sepals leaf-formed. ♄. F. Native of Georgia. H. fasciculàtum, Mich. fl. bor. amer. 1. p. 80. H. Michaúxii, Poir. dict. suppl. 3. p. 696. H. fasciculàtum, var. β, laxifòlium. D. C. prod. 1. p. 554. Resembles the foregoing species, but differs in the branches being angular, and in the leaves being less fascicled.

Fine-leaved St. John's-wort. Shrub 1 foot.

**** *Styles 5, with capitate stigmas.*

161 H. BRA'THYS (Lam. dict. 4. p. 152.) stem round, with adpressed branches; leaves dense, channelled at the apex, without pellucid dots; margins of the sepals somewhat membranaceous; styles usually 5, rarely 4. ♄. S. Native of New Granada near Santa Fe de Bogota. Smith, icon. ined. t. 41. Bráthys junipérina, Lin. fil.

Var. β, junipérinum (D. C. prod. 1. p. 554.) leaves more robust; flowers larger. H. junipérinum, H. B. et Kunth, nov. gen. amer. 3. p. 189. Flowers trigynous.

Savin-like St. John's-wort. Shrub 1 foot.

† *Doubtful species.*

162 H. COCHINCHINE'NSIS (Lour. fl. coch. 472.) flowers trigynous; leaves on short petioles, very dense; stem arboreous; peduncles usually 5-flowered, axillary. ♄. G. Native of Cochin-china in woods. Flowers red or scarlet. Sepals entire, very acute. Stamens disposed in 3 bundles. Capsules 3-celled.

Cochin-china St. John's-wort. Clt. 1821. Shrub 16 feet.

163 H. EMARGINA'TUM (Lam. dict. 4. p. 154.) stem shrubby; flowers trigynous; leaves ovate-oblong, obtuse, stem-clasping, emarginate; sepals lanceolate, somewhat striated. ♄. G. Native of? This species is probably referable to *Elòdea*.

Emarginate-leaved St. John's-wort. Shrub 1 foot.

164 H. VERTICILLA'TUM (Thunb. prod. 137.) stem herbaceous; leaves 4 in a whorl. ♄. G. Native of the Cape of Good Hope.

Whorled-leaved St. John's-wort. Shrub?

165 H. fu'lgidum (Rafin. fl. lud. p. 88.) stem shrubby, tetragonal; branches slender; leaves sessile, linear, spreading; flowers almost sessile, axillary and terminal. ♄. F. Native of Louisiana.

Fulgid St. John's-wort. Shrub 4 feet.

†† *Species only known by name.*

166 H. Cre'ticum supinum, folio subrotundo, flore magno. Tourn. cor. 18.

167 H. orienta'le; foliis subrotundis auritis cauli adhærentibus. Tourn. cor. 18.

168 H. Androsæ'mo hirsuto simile sed glàbrum. Tourn. cor. 18.

169 H. linearifòlio. Tourn. cor. 18.

170 H. latifòlium subhirsutum, caule purpureo villoso. Tourn. cor. 18.

171 H. undula'tum (Schousb. Willd. Zucc.).

172 H. ni'gricans (Zucc. hort. flor.).

Cult. The greater part of the species are very shewy, although they have a common appearance. The hardy herbaceous kinds will grow in any common garden-soil, and are easily increased by dividing the plants at the root or by seeds; the stove, frame, and green-house herbaceous species should be increased in the same manner. The annual sorts only require to be sown in the open border about the beginning of April. The hardy shrubby kinds, being dwarf and shewy, are well fitted for the front of shrubberies; they will thrive in any common garden-soil, and are easily increased, by dividing the plants at the root, by seeds, or by cuttings planted under a hand-glass. The green-house and frame shrubby kinds will thrive well in a mixture of loam and peat, and young cuttings of them will root freely in sand under a bell-glass. The stove shrubby species will thrive in the same kind of soil as that recommended for the green-house species, and young cuttings of them will root in sand under a bell-glass, in heat.

IV. ELO'DEA (from *ελος, elos*, a marsh; habitation of plants). Adanson, Pursh. fl. amer. sept. 2. p. 379.

Lin. syst. *Polyadélphia, Polyándria.* Calyx 5-parted, equal. Petals 5, with nectariferous claws. Stamens 9-15, growing in 3 bundles. Glands between the parcels. Styles 3, diverging. Capsule partly 3-celled, many-seeded. Vegetation similar to *Hypéricum*, but the flowers are usually red. Stems terete.

1 E. petiola'ta (Pursh. fl. amer. sept. 2. p. 379.) leaves oblong, obtuse, tapering down the petiole, full of pellucid dots; flowers on short, axillary peduncles; sepals obtuse; stamens 9-10. ♃. H. Native of North America on the banks of lakes in Virginia and Carolina. Hypéricum petiolàtum, Walt. fl. car. 191. H. axillàre, Michx. fl. bor. amer. 2. p. 81. H. paludòsum, Chois. prod. hyp. p. 43. Flowers yellowish-red.

Stalked-leaved Elodea. Fl. July, Aug. Clt. 1821. Pl. 1 ft.

2 E. campanula'ta (Pursh. l. c.) stem suffruticose; leaves oblong, obtuse, somewhat stem-clasping, full of pellucid dots; flowers stalked, axillary; sepals lanceolate; stamens 9-12. ♃. H. Native of North America from Canada to Carolina, in bogs and wet places. Hypéricum Virgínicum, Lin. spec. 1104. Elòdea Virgínica, Nutt. gen. amer. 2. p. 17.—Andr. bot. rep. 552. Flowers yellowish-red, very handsome.

Var. β, emarginàta (Pursh. l. c.) H. emarginàtum, Lam. dict. 4. p. 154.

Campanulate Elodea. Fl. July, Sept. Clt. 1800. Pl. 1½ ft.

3 E. tubulòsa (Pursh. l. c.) leaves sessile; corolla tubular; stamens connected beyond the middle. ♃. H. Native of Carolina. Pursh discovered it in a dismal swamp in North Carolina. Hypéricum tubulòsum, Walt. fl. car. 191. The flowers are axillary, and almost sessile, solitary, twin or tern; the petals are long and acute, of a pale-red colour.

Tubular-flowered Elodea. Fl. July, Sept. Pl. 1 foot?

Cult. The species of this genus do best in pots, in a peat or vegetable soil, and the pots require to be sunk in water to their middle, either in a pond or a pan of water. All require protection during winter.

V. SARO'THRA (from *σαρωθρον, sarothron*, a besom; appearance of plant). Willd. spec. 1. p. 1515.

Lin. syst. *Pentándria, Trigýnia.* Calyx 5-parted. Petals 5, linear-oblong. Capsule oblong, acute, coloured, 1-celled, 3-valved, with the margins of the valves bearing the seeds.—A small plant, with the inflorescence of *Hypéricum*, much branched; branches erect and trichotomous. Leaves scarcely visible, linear. Flowers solitary, axillary, and terminal, sessile.

1 S. hypericoi'des (Nutt. gen. 1. p. 204.) ♃. H. Native of North America. Hypéricum Saròthra, Michx et Pursh, fl. amer. sept. 2. p. 378. Saròthra gentianoìdes, Willd. spec. 1. p. 1515.

St. John's-wort-like Sarothra. Fl. July. Clt. Pl. ½ foot.

Cult. This plant will grow in any kind of soil, and is easily increased by cuttings or seeds.

VI. LANCRE'TIA (probably from the name of some botanist). Del. fl. æg. p. 69. t. 25. D. C. prod. 1. p. 555.

Lin. syst. *Decándria, Monogýnia.* Calyx of 4 or 5 equal sepals. Petals 4-5. Stamens 10, unconnected, the 5 shortest of these are opposite the petals. Styles 4-5.—A shrub, with oblong, sessile, toothed or crenate leaves, and terminal flowers.

1 L. suffruticòsa (Del. l. c.) ♄. F. Native of Upper Egypt and Nubia. Ascyroìdes Africàna chamædryos fòlio, Lipp. mss. in Bibl. Juss. ex Delile. Leaves small, in fascicles, hoary-hispid. Flowers aggregate, white.

Suffruticose Lancretia. Shrub prostrate.

Cult. This pretty little shrub will require to be protected during winter by a frame. A mixture of loam and peat will suit it well, and young cuttings planted in sand, with a hand-glass placed over them, will strike root freely.

VII. A'SCYRUM (from *a* priv. and *σκυρος, skyros*, hard; that is to say, a plant which is soft to the touch). Lin. gen. 903. Juss. gen. p. 254. Chois. prod. hyp. 60. D. C. prod. 1. p. 555.—Hypericoìdes, Adans. fam. 2. p. 443.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 4 sepals, the 2 outer ones smallest. Petals 4. Stamens numerous, with the filaments disposed in 4 bundles. Styles 1-3.—Sub-shrubs, with sessile, entire leaves, destitute of pellucid dots, but usually furnished with black dots beneath. Flowers few, terminal and axillary, yellow. Plants resembling *Hypéricum*.

1 A. pu'milum (Michx. fl. bor. amer. 2. p. 77.) stem small, simple, quadrangular; leaves oval, obtuse, in fascicles; pedicels 6 lines long, reflexed; flowers with 1 or 2 styles. ♃. F. Native of North America, particularly in the pine barrens of Georgia. Flowers small.

Dwarf Ascyrum. Fl. June, Aug. Clt. 1806. Pl. ¼ foot.

2 A. pauciflòrum (Nutt. gen. amer. 2. p. 15.) plant decumbent, diffuse, with numerous slender stems; leaves approximate, linear-oblong, obtuse; flowers few; pedicels reflexed, each furnished with 2 bracteas at their base; style 1. ♃? F. Native of North America in the woods of Georgia.

Few-flowered Ascyrum. Fl. June, Aug. Pl. decumbent.

3 A. Cru'x-A'ndreæ (Lin. spec. 1107.) stem suffruticose, round; branches erect; leaves ovate-linear, obtuse, usually in bundles in the axils; corymbs terminal; flowers nearly sessile; each pedicel furnished with 2 bracteas; two inner sepals rather orbicular; styles 1-2. ♄. F. Native of North America in sandy fields and woods, from New Jersey to Carolina; and of Jamaica. Hypéricum frutéscens humifùsa, Plum. ed. Burm.

amer. p. 146. t. 152. Chois. prod. hyp. p. 61. Petals narrow, pale-yellow. Flowers in terminal corymbs.

St. Andrew's-cross Ascyrum. Fl. July. Clt. 1759. Shrub 1 foot.

4 A. multicau'le (Michx. fl. bor. amer. 2. p. 77.) stem suffruticose; leaves crowded, oblong-linear, obtuse; peduncles bibracteate, lateral, and terminal. ♄. F. Native of Virginia and Carolina in sandy fields and woods. A. hypericoïdes, Ait. hort. kew. A. Crúx-A'ndreæ var. β, angustifòlium, D. C. prod. 1. p. 555. Styles 1-2, conniving.

Many-stemmed Ascyrum. Fl. July. Shrub 1 foot.

5 A. hypericoi'des (Lin. spec. 1108.) stem suffruticose, round; branches 2-edged; leaves oblong-linear, obtuse, each furnished with 2 glands at the base; two inner sepals somewhat orbicular; styles 3. ♄. F. Native of North America in overflowed open places, from New Jersey to Carolina; and of Jamaica. Flowers terminal, solitary, on short pedicels, larger than those of *A. Crúx-A'ndreæ*.

St. John's-wort-like Ascyrum. Shrub 2 feet.

6 A. sta'ns (Michx. fl. bor. amer. 2. p. 77.) stem shrubby, erect, winged; branches straight; leaves ovate-elliptical, obtuse, glaucous; peduncles axillary, usually 3-flowered; two inner sepals cordate-orbicular; stamens connected at the base; styles 2. ♄. F. Native of Carolina. Vent. malm. p. 90. Hypéricum floridànum, Pluk. t. 412. f. 5.? Hypéricum tetrapétalum, Lam. dict. 4. p. 153. ex Chois. in D. C. prod. 1. p. 555.

Standing Ascyrum. Fl. July, Sept. Clt. 1806. Shrub 2 ft.

7 A. amplexicau'le (Michx. fl. bor. amer. 2. p. 77.) stem dichotomously panicled; leaves stem-clasping, ovate, cordate, sinuately-curled; corymbs naked; styles 3. ♄. F. Native of North America in low grounds and woods, from Virginia to Florida. Hypéricum stàns var. β, Chois. prod. p. 61. The flowers and leaves are longer in this than in any other of the species.

Stem-clasping-leaved Ascyrum. Fl. Jul. Aug. Clt. 1806. Sh. 2 ft.

Cult. A genus of elegant little herbs and shrubs. They require to be protected during winter by a frame; for this purpose they should be grown in pots, as they never exist long in the open border. A mixture of one-half peat, and the other sand, will suit them well; and young cuttings of the shrubby kinds will root in sand under a hand or bell-glass. The herbaceous kinds may be increased by parting the roots in spring. All may be raised from seeds.

Tribe III.

EUCRYPHIE'A (Cambess. in ann. scien. par. vol. 20. p. 402. Aug. 1830). Styles 3-12 (f. 103. *j*.). Seeds flat (f. 103. *f*.), winged.

VIII. CARPODO'NTOS (from καρπος, *carpos*, a fruit, and οδους οδοντος, *odous odontos*, a tooth; cells or carpels bidentate at the apex). Lab. nov. holl. 2. p. 122. Chois. prod. p. 61. D. C. prod. 1. p. 556.

Lin. syst. *Polyándria, Polygýnia.* Styles 5-8. Sepals and petals 4. Stamens numerous, free. Carpels 5-8, woody, 1-celled, opening on the inside, with filiform placentas. Ovary villous.—A tree with stalked, opposite leaves. Flowers white, axillary, solitary. Peduncles each with two scales at their base.

1 C. lu'cida (Lab. voy. rech. Lapeyr. 2. p. 16. t. 18.) ♄. G. Native of Van Diemen's Land. Flowers white.

Shining-leaved Carpodontos. Clt. 1820. Tree 20 feet.

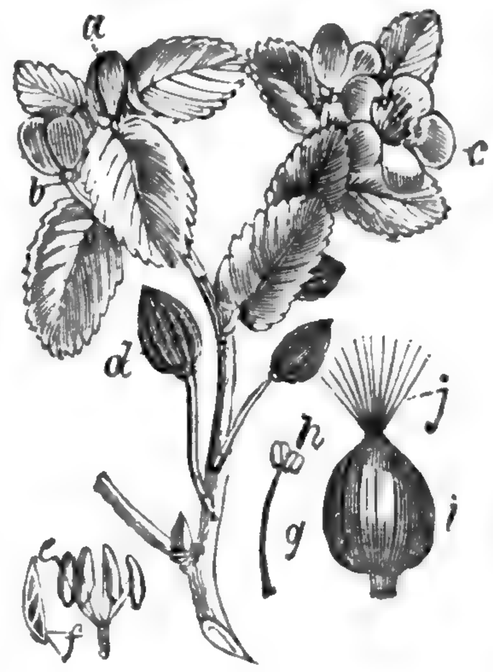
Cult. This tree will thrive well in a mixture of loam, peat, and sand; and young cuttings will root if planted in a pot of sand, with a hand-glass placed over them.

IX. EUCRY'PHIA (from ευ, *eu*, well, and κρυφια, *cryphia*, a cover; in allusion to the flower being covered by a calyptra before expansion) (f. 103. *a*.). Cav. icon. 4. p. 49. t. 372. Chois. prod. hyp. p. 62. D. C. prod. 1. p. 556.

Lin. syst. *Polyándria, Polygýnia.* Calyx of 5 sepals, connected at the base (f. 103. *a*.). Styles usually 12 (f. 103. *j*.). Petals 5 (f. 103. *c*.). Stamens numerous, somewhat connected at the base. Anthers didymous (f. 103. *h*.). Capsules ovate (f. 103. *i*.), with boat-shaped cells, hanging from funicles (f. 103. *e*.).—A tree with opposite leaves, and axillary, solitary flowers. Carpels many, many-seeded (f. 103. *f*.), fixed to the central axils (f. 103. *e*.).

1 E. cordifòlia (Cav. l. c.) ♄. S. Native of South America near San Carlos de Chiloe. A beautiful tree, with cordate-oblong, crenated, downy leaves, and white, stalked flowers. Mellìnia, Molin. (f. 103).

FIG. 103.



Cordate-leaved Eucryphia. Tree 40 feet.

Cult. This fine tree will grow well in a mixture of loam, peat, and sand; and young cuttings will root if planted in a pot of sand with a hand-glass placed over them, in a moderate heat.

X. ELIE'A (in honour of M. Elie de Beaumont, whose works have thrown so much light on the geological revolutions of our globe). Cambess. in Ann. scien. nat. par. Aug. 1830. vol. 20. p. 400. t. 13. Cussònia, Comm. mss. but not of D. C. Lanigerostèma, Chapel. mss. Hypéricum, Spec. Lam. and Chois.

Lin. syst. *Polyadélphia, Polyándria.* Calyx permanent, 5-parted. Petals 5. Stamens numerous, disposed in 3 bundles. Anthers fixed by their middle, 2-celled, bursting lengthwise. Styles 3, crowned by capitate stigmas. Capsule surrounded by the permanent calyx, petals, and stamens, 3-celled; cells divided by incomplete dorsal dissepiments, 3-valved; valves bent in so much at the margins as to constitute perfect dissepiments. Seeds 2 in each cell, each separated by the incomplete intervalvular dissepiment, flat, winged, fixed above the base of the central, filiform, trigonal receptacle. Embryo flat, near the hylum of the seed.—A shrub, with cruciately-opposite, jointed branches and leaves. Flowers cymose, yellow.

1 E. articula'ta (Cambess. l. c. p. 401. t. 13.) ♄. S. Native of Madagascar. Hypéricum articulàtum, Lam. dict. 4. p. 569. Chois in D. C. prod. 1. p. 546. Leaves oblong-obovate, with entire, revolute margins, coriaceous, full of pellucid and black dots, feather-nerved. Cymes of flowers axillary and terminal; pedicels tetragonal. Segments of calyx ovate, obtuse, marked with black lines. Petals imbricate in the bud, 3 times longer than the calyx. Filaments woolly, unequal.

Jointed-stemmed Eliea. Shrub 4 to 10 feet?

Cult. This shrub will grow freely in a mixture of loam and peat, and cuttings will root freely in sand under a hand-glass, in a moist heat.

XI. CRATO'XYLUM (from κρατος, *cratos*, strength, and ξυλον, *xylon*, wood; wood strong and hard). Blum. bijdr. ex Schlecht. Linnæa. 1. p. 667.

Lin. syst. *Polyadélphia, Polyándria.* Calyx profoundly 5-

parted, permanent. Petals 5. Stamens numerous, collected into 3 bundles at the base. Styles and stigmas 3. Capsule rather membranous. 3-celled, 3-valved, with a dissepiment in the middle of each valve. Seeds numerous, compressed, ending above in a leafy wing. Embryo straight, exalbuminous, with an inferior radicle.

1 C. Hornschu'chii (Blum. l. c.) ♄. S. Native of Java. A tall tree, with opposite, oblong-lanceolate leaves, which stand on short petioles, and terminal panicles of yellow? flowers.

Hornschuch's Cratoxylum. Tree 40 feet.

Cult. Loam and peat will be a good mixture for this tree, and young cuttings will readily root if planted in sand under a hand-glass, in heat.

XII. HARO'NGA (Ronga is the name of *H. Madagascariénsis* in Madagascar). Pet. Th. gen. nov. madag. no. 49. Chois. prod. hyp. 33. D. C. prod. 1. p. 541. Harongàna, Lam. ill. t. 645.—Arongàna, Pers. ench. 2. p. 91. Hæmocárpus, Noronh. Spreng.

Lin. syst. *Polyadélphia, Polyándria.* Berry drupaceous, 2-3-5-celled. Styles and stigmas 5. Stamens 15, connected in 5 equal bundles at the base; these bundles alternate with the scales on the ovary. Sepals and petals 5.—Shrubs with branching stems, and the flowers are disposed in branching, many or few-flowered panicles, which are yellow.

§ 1. *Leaves entire.*

1 H. Madagascarie'nsis (Chois. prod. hyp. p. 34.) stem round; leaves elliptic-lanceolate, large, on long stalks; corymbs terminal, very large, and very branchy. ♄. S. Native of Madagascar and Bourbon. Arongària paniculàta, Pers. ench. 2. p. 91. Hæmocárpus paniculàta, Spreng.

Var. β, pubéscens (D. C. prod. 1. p. 542.) leaves smaller and more pubescent. ♄. S. H. pubéscens, Poir. encycl. 4. p. 721.

Madagascar Haronga. Clt. 1822. Shrub 10 feet.

2 H. lanceola'ta (Chois. mss.) stem angular; leaves ovate-lanceolate, 1-2 inches long, very smooth, on short petioles; corymb terminal, few-flowered. ♄. S. Native of Madagascar. Hæmocárpus corymbòsa, Spreng.

Lanceolate-leaved Haronga. Shrub 8 feet.

3 H. revolu'ta (Chois. mss. D. C. prod. 1. p. 542.) leaves ovate-oblong, obtuse, with revolute margins, very large, with brownish nerves; corymbs straight, few-flowered. ♄. S. Native of Madagascar. Hæmocárpus, Spreng.

Revolute-leaved Haronga. Shrub 4 feet.

§ 2. *Leaves crenate.*

4 H. mollu'sca (Pers. ench. 2. p. 91.) leaves lanceolate, acuminated, obsoletely crenated; peduncles axillary, 3-4-flowered. ♄. S. Native of Madagascar.—Pluk. alm. t. 241. f. 5.

Molluscous Haronga. Shrub 4 feet.

5 H. crena'ta (Pers. ench. 2. p. 91.) leaves ovate, blunt, large, broadly crenated; peduncles axillary, many-flowered. ♄. S. Native of Madagascar.—Pluk. alm. t. 242. f. 1.

Crenated-leaved Haronga. Shrub 12 feet.

6 H. axilla'ris; leaves oblong, tapering to both ends, smooth, and opaque above, discoloured beneath; peduncles axillary, aggregate, shorter than the leaves. ♄. S. Native of Madagascar. Harónga, no. 49. Willd. herb.

Axillary-flowered Haronga. Shrub.

Cult. These shrubs will thrive in a mixture of loam and peat, and ripened cuttings will root in sand under a hand-glass, in heat.

Order XLI. GUTTI'FERÆ (from *gutta*, a drop, and *fero*, to bear; the trees when broke yield a quantity of yellow gluten). Juss. gen. p. 243. D. C. prod. 1. p. 557.

Calyx of 2-4-sepals, rarely many-sepalled or 5 (f. 104. *a.*) -6-parted. Sepals imbricate, usually cruciately disposed, outer ones shortest. Petals hypogynous, 4 (f. 104. *b.*) -6, rarely 8-10, usually yellow, free, alternate with or opposite the calycine leaflets. Stamens indefinite (f. 104. *c.*), rarely definite, hypogynous; filaments sometimes free, sometimes connected at the base, or in bundles (f. 104. *c.*). Anthers adnate, 2-celled, rarely 1-celled (as in *Havètia*), bursting by longitudinal chinks, rarely by pores at the apex. Receptacle fleshy, rarely drawn out into a 5-lobed disk, as in *Chrysòpia.* Style simple or nearly wanting, rarely with the stigmas distinct, subsessile (f. 104. *e.*). Ovary 2-8-celled, rarely 1-celled, as in *Calophýllum;* cells containing 1 or many ovulæ. Ovulæ fixed to the inner angle or base of the cells. Fruit sometimes capsular and dehiscent, sometimes fleshy (f. 104. *f.*) and indehiscent or drupaceous, 2 or many-celled, rarely 1-celled. Seeds wingless, usually arillate. Seed covering thin and papery. Albumen wanting. Embryo straight, with a small radicle, and large, coadunate, thick, entire cotyledons.

The *Guttíferæ* contains trees natives of the hottest parts of the world, and well known by their thick, entire, opposite leaves, and resinous juice. In the countries where they grow they are of great importance. The *Magostàna* bears a fruit, the equal of which is supposed not to exist. The gamboge is the inspissated juice of *Garcínia Cambògia* and *G. Morélla;* the juice of others is found an efficacious vermifuge, and also a remedy for the chiggers, one of the worst pests of equinoxial America. The flowers of all being shewy, and the properties interesting, every species deserves cultivation. The seeds do not retain their vegetative power for any length of time, therefore the surest way to obtain plants from the places of their natural growth, is to sow the seeds in tubs or boxes of earth, and when the plants have obtained strength, they may be brought to Europe, but there should be care taken in their passage to screen them from the spray of the sea, also not to give them too much water.

Guttíferæ is so nearly allied to the *Ternstrœmiàceæ* that it is difficult to distinguish the one from the other; in the *Ternstrœmiàceæ* the leaves are alternate, but this character offers a few exceptions, but in the *Guttíferæ* they are always opposite. In *Ternstrœmiàceæ* the calyx and corolla are always separate, but in *Guttíferæ* they are usually connected; in the first the petals are usually connected at the base, and twisted in æstivation; in the second the petals are always free and convolute in æstivation. The seeds in *Ternstrœmiàceæ* are either furnished with albumen or terminated by a prolonged membrane; in *Guttíferæ* these characters are always wanting. *Guttíferæ* differs from *Hypericíneæ* by the branches, leaves, and peduncles being articulated, by the seeds being large and usually solitary in the cells, by the anthers being adnate, not articulated at the summit. *Ternstrœmiàceæ* is distinguished from *Hypericíneæ* in the leaves being usually alternate, and in the seeds being furnished with albumen.

Synopsis of the Genera.

TRIBE I.

CLUSIE'Æ. *Ovary many-celled; cells* 1 *or many, ovulate. Fruit capsular, dehiscent, many-celled.*

1 VERTICILLA'RIA. Sepals 2. Petals 4. Stamens numerous. Style wanting. Stigma concave, 3-lobed. Capsule oblong, rather trigonal, 3-celled, 3-valved. Seeds solitary, oblong.

2 CLU'SIA. Flowers dioecious. Sepals 4, bibracteate at the base. Petals 4-8. Stamens numerous; the male flowers free. Anthers bursting outwards. Stigmas 5-12, thick, sessile in the female flowers. Capsule 5-9-celled, 5-9-valved. Seeds egg-shaped.

3 TOVOMI'TA. Sepals 2-4, bractless. Petals 4, rarely 6-10. Stamens 20-30, free. Anthers obliquely adnate. Styles 4-5, very short, each terminated by a stigma. Capsule 4-5-valved.

4 ARRU'DEA. Calyx many-leaved, imbricate. Petals 9-10, imbricate. Stamens numerous, closely connected. Anthers opening by 2 pores at the apex. Style short, crowned by an 8-lobed stigma. Ovary 8-celled; cells 1-2-seeded?

5 HAVE'TIA. Flowers dioecious. Sepals 4, petals 4, both orbicular. Anthers 4, alternating with the petals, immersed in the receptacle, 1-celled, 3-valved at the apex? Female flowers unknown.

TRIBE II.

CHRYSOPIE'Æ. *Ovary many-celled; cells containing many ovulæ. Fruit fleshy, indehiscent, many-celled.*

6 MORONO'BEA. Calyx 5-parted, bractless. Petals 5. Stamens 15-20, joined into a tube, which is deeply 5-cleft. Anthers adnate to the tube, bursting outwards. Stigmas 5, nearly sessile. Ovary 5-celled; cells containing 5 ovulæ.

7 CHRYSO'PIA. Sepals 5, bractless. Petals 5, inserted on the outside of the disk. Stamens joined into a thick urceolus at the base, profoundly 5-6-cleft at the apex. Style 5-cleft at the apex. Fruit fleshy, 5-celled.

TRIBE III.

GARCINIE'Æ. *Ovary many-celled; cells containing* 1 *ovulæ. Fruit fleshy* (f. 104. *f.*), *indehiscent, many-celled.*

8 MAMME'A. Sepals 2, deciduous, bractless. Petals 4-6, deciduous. Stamens free, or a little connected at the very base. Anthers bursting at the sides. Style short, crowned by a 4-lobed stigma; lobes emarginate. Fruit fleshy, 2-3-4-celled, with a large thick seed in each cell.

9 PENTADE'SMA. Sepals 3-4, permanent. Petals deciduous. Stamens numerous, collected into 5 bundles. Fruit fleshy, 3-5-celled; cells containing each a large, angular, thick seed.

10 RHEE'DEA. Calyx wanting? Petals 4. Stamens numerous. Style 1, crowned by a funnel-shaped stigma. Fruit fleshy, 3-seeded.

11 GARCI'NIA. Sepals 4, bractless, permanent. Petals 4, deciduous. Stamens 12-20, free. Anthers bursting outwards. Style short, crowned by a 4-8-lobed stigma. Fruit fleshy, 4-8-celled; cells each containing one large, thick seed.

12 STALA'GMITIS. Flowers dioecious (f. 104. *e.*) or hermaphrodite (f. 104. *c.*). Sepals 4-5 (f. 104. *a.*), permanent, bractless. Petals 4-5 (f. 104. *b.*), deciduous. Male flowers with a fleshy, 4-5-lobed receptacle, usually bearing many imperfect anthers (f. 104. *c.*). Stamens monadelphous, or disposed in 4-8 bundles (f. 104. *c.*). Anthers didymous, bursting at the sides. Hermaphrodite flowers, with stamens disposed into 4-8 bundles (f. 104. *c.*). Style short, crowned by a 3-5 (f. 104. *e.*) -8-lobed stigma. Fruit fleshy, 3-5-8-celled; cells containing one arillate seed each.

TRIBE IV.

CALOPHYLLIE'Æ. *Ovary* 1-2-*celled; cells containing* 1-2-*ovulæ. Fruit drupaceous, indehiscent.*

13 MESU'A. Sepals 4, bractless, permanent. Petals 4. Stamens filiform, numerous, connected at the very base. Anthers fixed by their base, bursting at the sides. Ovary 2-celled; cells containing 2 ovulæ. Fruit 1-celled from abortion, 1-4-seeded. Seeds egg-shaped.

14 CALOPHY'LLUM. Sepals 2-4, bractless. Petals 4, rarely 2. Stamens definite or indefinite, short, free or connected at the very base. Anthers fixed by their base, bursting inwards. Style twisted, crowned by a capitate, usually lobed stigma. Fruit 1-celled, containing one globose or egg-shaped seed.

† *Genera allied to Guttiferæ, but are not sufficiently known.*

15 MACA'NEA. Fruit baccate, large, pear-shaped, 1-celled, pulpy inside, 4-6-seeded. Seeds fixed laterally to the receptacle, ovate, coriaceous, imbedded in the pulp.

16 SINGA'NA. Calyx 3-5-parted. Petals 3-5, unguiculate, with a serrulated limb. Stamens numerous. Anthers roundish. Style incurved, crowned by a concave, capitate stigma. Capsule long, cylindrical, 1-celled, many-seeded, Seeds large, enwrapped in pulp, fixed to the receptacle.

17 MACO'UBEA. Fruit the shape of an orange, rather compressed, 1-celled, many-seeded. Seeds oblong, arillate, fixed to the parietes of the fruit.

Tribe I.

CLUSIE'Æ. Ovary many-celled; cells 1 or many, ovulate. Fruit capsular, dehiscent, many-celled.

I. VERTICILLA'RIA (from *verticillum*, a whorl; the branches are disposed in a regular whorl at the top of the tree). Ruiz et Pav. syst. fl. per. p. 140. Chlorómyrum, Pers. ench. 1. p. 73.

LIN. SYST. *Polyándria, Monogýnia.* Calyx of 2 coloured sepals. Petals 4. Stamens numerous; filaments filiform; anthers ovate. Style none. Stigma concave, 3-lobed. Ovary oblong, somewhat 3-lobed. Capsule oblong, rather trigonal, 3-celled, 3-valved; valves corky. Seeds solitary, oblong.—A tree with oblong, acuminated, entire leaves and slender branches.

1 V. PERUVIA'NUM. ♄. S. Native of Peru. Chlorómyrum verticillàtum, Pers. ench. 1. p. 73. Ruiz et Pav. fl. per. p. 18. t. 15. f. 4.

Peruvian Verticillaria. Tree.

Cult. This tree will thrive well in light loam mixed with a little peat; and ripe cuttings will root in sand under a hand-glass, in heat.

II. CLU'SIA (in honour of Charles de le Cluse or Clusius, of Artois, an acute botanist, and author of Historia Plantarum and many other works; died in 1609). Lin. gen. no. 1154. Juss. gen. p. 256. D. C. prod. 1. p. 558.—Quapòya, Aubl. guian. Xánthe, Willd.

LIN. SYST. *Polygàmia, Dioècia.* Calyx of 4 imbricate, coloured, permanent sepals, outer ones smallest, usually bibracteate at the base. Corolla of 4-6 deciduous petals. Stamens numerous in the male flowers, rarely definite, free, in the female flowers few and sterile, connected at the base. Style wanting. Stigmas 5-12, radiately-peltate, sessile, permanent. Flowers usually polygamous, and in the female flowers the ovary is surrounded by a short staminiferous nectary. Capsule fleshy, coriaceous, 5-12-celled, 5-12-valved, opening from the top to the base, with a dissepiment in the middle of each valve. Placenta thick, triangular, central. Seeds egg-shaped, enwrapped in pulp, suspended from the inner angle of the cells. Embryo straight, inverted. Cotyledons separable.—Trees and shrubs, usually parasitical, abounding in viscid juice, with large, coriaceous, opposite leaves, and usually tetragonal stems. The genera *Quapòya* and *Clùsia* are so similar in habit, the internal fabric of the flowers and fruit are too little known, and the number and form of the stamens of too slight a character to separate them.

§ 1. *Clùsia* (*see Genus*). *Stamens numerous.*

1 C. RO'SEA (Lin. spec. 1495.) flowers polygamous; calyx 5-6-leaved, rose-coloured; tops of dense nectaries awl-shaped; stigmas 8-12, leaves obovate, obtuse, veinless, sometimes emarginate, on short, striated petioles. ♄. S. Native of Carolina, St. Domingo, and many other parts of America within the tropics. Jacq. amer. 270. pict. 131. Catesb. car. t. 99. A parasite on rocks and trees. Flowers large, beautiful rose-coloured in the Brazilian plant, according to St. Hilaire the petals are red beneath the middle, and from the middle to the apex white. Fruit large, opening in 8 parts, containing many scarlet glutinous seeds, like those of the *Pomegranate.* The resin is used to cure sores in horses, and instead of tallow for boats.

Rose-coloured-flowered Balsam-tree. Fl. July, Aug. Clt. 1692. Shrub 7 to 20 feet.

2 C. A'LBA (Lin. spec. 1495.) flowers usually hermaphrodite; calyx many-leaved; corolla 5-8-petalled, white; tops of dense nectaries retuse, naked, or with 5-10 short stamens; stigmas 5-6; leaves like those of the preceding, but not emarginate. ♄. S. Native of South America. Jacq. amer. 271. t. 166. pict. 131. t. 250. Plum. gen. 22. icon. 87. f. 1. Flowers large, white, and inelegant. Fruit scarlet, 6-celled, 6-valved; seeds involved in scarlet pulp; the birds are very fond of them, and when the capsules burst open, hang over them on the wing, and pluck out the seeds with the pulp adhering. The tree is parasitic, and very common in the woods of Martinico, where it is called *Aralie.* The Caribbees use the tenacious balsamic juice, which is of a greenish colour, but becoming of a brownish red on being exposed to the air, for painting their boats.

White-flowered Balsamic-tree. Clt. 1752. Tree 30 feet.

3 C. FLA'VA (Lin. spec. 1495.) flowers polygamous; calyx many-leaved; corolla 4-petalled, yellow; stamens numerous, short; stigmas about 12; leaves as in both the preceding. ♄. S. Native of Jamaica and many of the other West India islands, on the lower hills, delighting in a dry soil. Jacq. amer. 272. t. 167. pict. 132. t. 251. Sloan. jam. 2. p. 91. t. 200. f. 1. Flowers yellow. The resinous juice is sometimes used among the negroes in Jamaica as a vulnerary; it has no extraordinary smell or pungent taste.

Yellow-flowered Balsam-tree. Clt. 1759. Tree 15 feet.

4 C. VENÒSA (Lin. spec. 1495.) calyx 4-leaved; corolla 4-petalled, white; stamens numerous; stigmas 5; leaves obovate, obtuse, veiny. ♄. S. Native of Martinico on moist mountains.—Plum. amer. t. 87. f. 2. Leaves serrated, of a shining brown beneath. Young branches downy. Flowers in loose spikes at the ends of the shoots. This tree is called in Martinico *Paletwoier de montagne.*

Veiny-leaved Balsam-tree. Clt. 1733. Tree 30 feet.

5 C. PEDICELLA'TA (Forst. fl. aus. no. 390.) calyx 4-leaved; corolla 4-petalled, yellow? leaves obovate-oblong, veiny; cymes axillary. ♄. S. Native of New Caledonia.

Pedicelled-flowered Balsam-tree. Fl. Sept. Tree 14 feet.

6 C. CRIU'VA (St. Hil. fl. bras. 1. p. 317. t. 65.) leaves stalked, obovate, or obovate-lanceolate, veiny, white beneath; flowers terminal, sub-corymbose, 5-petalled. ♄. S. Native of Brazil in the province of St. Paul, where it is called *Criuva* by the natives. Ovary 5-celled. Stigma 5-lobed. Flowers white.

Criuva Balsam-tree. Shrub 5 to 6 feet.

7 C. GAUDICHAU'DI (Chois. mss. St. Hil. fl. bras. 1. p. 317.) leaves stalked, obovate, or subelliptic, nearly veinless; flowers terminal, cymose, 5-petalled. ♄. S. Native of Brazil. Flowers whitish. Stigma 5-lobed.

Gaudichaud's Balsam-tree. Shrub 5 to 6 feet.

8 C. RETU'SA (Poir. dict. 5. p. 183.) calyx of 8 unequal sepals; corolla 6-petalled; stigmas very numerous; capsules globular; leaves obovate, retuse, veiny. ♄. S. Native of South America. Lam. ill. t. 852.

Retuse-leaved Balsam-tree. Tree.

9 C. NEMORÒSA (Meyer. prim. esseq. p. 203.) flowers polygamous; calyx 6-8-leaved; corolla 4-petalled, white, but purple within; sterile stamens awl-shaped, intermixed with others; stigmas 5; leaves oblong-obovate, acute, approximate, veiny. ♄. S. Native of Essequebo in the island Wacanama. Flowers white, purple within.

Grove Balsam-tree. Tree 20 feet.

10 C. PARVIFLÒRA (H. B. in Willd. spec. 4. p. 976.) corolla white, 5-petalled, about equal in length with the calyx; leaves obovate, obtuse, veinless. ♄. S. Native of South America in the island of Margarita. This species is much smaller than *C. álba* in every part.

Small-flowered Balsam-tree. Tree 20 feet.

11 C. ELLI'PTICA (H. B. et Kunth, nov. gen. amer. 5. p. 199.) flowers white; calyx 4-sepalled; stigmas 6; leaves sessile, elliptical, rounded at both ends; peduncles 2-3-flowered. ♄. S. Native of Peru on the Andes, near Loxa. Flowers white.

Elliptical-leaved Balsam-tree. Tree 12 to 24 feet.

12 C. LANCEOLA'TA (St. Hil. fl. bras. 1. p. 318.) leaves stalked, lanceolate, veiny; flowers terminal, sub-corymbose, 6-8-petalled. ♄. S. Native of Brazil near Rio Janeiro. Petals white? veiny.

Lanceolate-leaved Clusia. Shrub 6 to 7 feet.

13 C. MULTIFLÒRA (H. B. et Kunth, nov. gen. amer. 5. p. 200.) calyx 4-sepalled; corolla 5-petalled, a little longer than the calyx; stigmas 5; leaves sessile, obovate, rounded at the apex; peduncles many-flowered. ♄. S. Native on the Andes about Quindiu. Flowers white?

Many-flowered Balsam-tree. Tree.

14 C. VOLU'BILIS (H. B. et Kunth, nov. gen. amer. 5. p. 200.) stigmas 6; stem twining; leaves stalked, elliptical, blunt at both ends, thick, coriaceous. ♄. C. S. Native, growing along with the preceding species. Flowers white?

Twining Balsam-tree. Shrub tw.

15 C. SE'SSILIS (Forst. prod. 391.) flowers axillary, solitary, almost sessile, 4-petalled; leaves obovate and elliptical. ♄. S. Native of the island of Togatabu in the South Seas.

Sessile-flowered Balsam-tree. Tree.

§ 2. *Quapòya* (*Quapoy is the Caribbean name of C. Quapòya*). *Stamens definite, 5 or 6.*

16 C. Quapòya (Chois. mss. D. C. prod. 1. p, 559.) flowers dioecious, stalked; calyx of 5 or 6 sepals; corolla of 5 or 6 yellow petals; nectary short, 4-5-lobed; stigmas 5; fruit globose; leaves obovate, acute. ♄. ◡. S. Native of Guiana in the woods. Quapòya scándens, Aubl. guian. 2. p. 898. t. 343. C. microcárpa, Spreng. syst. 2. p. 5. Xánthe, Schreb. A climbing shrub with yellow flowers, when broke or cut yields a white transparent juice. It is called *Quapoy* in Guiana. Panicle terminal, diffuse, dichotomous.

Quapoy Balsam-tree. Shrub cl.

17 C. Pa'na-pana'ri (Chois. mss. D. C. prod. 1. p. 559.) flowers dioecious, almost sessile; fruit oblong; leaves ovate-oblong, acute, small. ♄. ◡. S. Native of Guiana in woods. Quapòya Pána-panàri, Aubl. guian. 2. p. 901. t. 344. C. macrocárpa, Spreng. syst. 2. p. 599. Xánthe parviflòra, Willd. Panicle terminal, trichotomous. Flowers yellow, like those of the preceding. This climbing shrub is called *Pana-panari* in Guiana. When cut it yields a yellow juice.

Pana-panari Balsam-tree. Shrub cl.

18 C. acumina'ta (Spreng. syst. 2. p. 599.) leaves roundish, tapering abruptly to both ends, ending in a spiny point, veiny beneath; flowers axillary, on short peduncles. ♄. S. Native of Porto-Rico on the higher mountains. A climbing shrub with white? flowers.

Acuminated-leaved Balsam-tree. Shrub cl.

A species hardly known.

19 C.? sessiliflòra (Poir. dict. 5. p. 183.) leaves obovate, somewhat veined; flowers sessile, clustered. ♄. S. Native of Madagascar.

Sessile-flowered Balsam-tree. Tree.

Cult. All the species of this genus grow well in light sandy soil, and the pots will require to be well drained with potsherds. Cuttings root freely in sand under a hand-glass, in heat.

III. TOVOMI'TA (Tovomite is the Caribbean name of *T. Guianénsis*). Aubl. guian. 2. p. 956.—Mariálva, Vand. in Rœm. script. bras. p. 118.—Beauharnòisia, Ruiz. et Pav. ann. mus. 11. p. 71.—Ochrocárpus, Pet. Th. gen. nov. mad. p. 15.—Micranthèra, Chois. mem. hist. nat. par. 1. t. 11 and 12.

Lin. syst. *Polyándria, Tetra-Pentagýnia.* Calyx bractless, of 2-4 sepals. Petals 4, rarely 6-10. Stamens 20-15, free, in many series; filaments thick; anthers small, at the top of the filaments, obliquely adnate. Styles 4-5, very short or wanting, each terminated by a thick stigma. Capsule crowned by the permanent styles and stigmas, 4-5-celled, 4-5-valved; cells 1-seeded; seeds enwrapped in pulp. Embryo thick, with a small radicle.—Trees, rarely shrubs. Leaves lined or full of pellucid dots. Flowers racemose, rarely cymose, axillary and terminal, dioecious, polygamous and hermaphrodite.

1 T. Madagascarie'nsis; calyx of 2 sepals; stamens in 3 series, connected at the very base; stigma 4-6-lobed, sessile; leaves coriaceous, approximate, sometimes 3 in a whorl; pedunceles few-flowered, axillary. ♄. S. Native of Madagascar. Ochrocárpus Madagascariénsis, Pet. Th. gen. mad. p. 15. Flowers white? hermaphrodite.

Madagascar Tovomita. Tree 30 feet.

2 T. Guiane'nsis (Aubl. guian. 2. p. 956. t. 364.) sepals 2; petals 4; stamens in 1 series; style short, crowned by 4 sessile stigmas; leaves ovate-oblong, bluntly acuminated, somewhat stem-clasping, coriaceous, 4-5 inches long, white beneath; peduncles corymbose, dichotomous, thick, terminal; pedicels jointed; petals acutish. ♄. S. Native of Guiana and Brazil. Vand. t. 8. f. 6. Mariálva Guianénsis, Chois mss. D. C. prod. 1. p. 560. Mart. fl. bras. 2. p. 84. Flowers with green petals and white anthers, dioecious.

Guiana Tovomita. Tree 10 feet.

3 T. fructipe'ndula; sepals 2; petals 4; stamens in one series; capsule crowned by 4 distinct styles; leaves oblong, acutely and sharply acuminated, 3 inches long; peduncles filiform, axillary, and terminal, 2-3-flowered, elongated; pedicels jointed. ♄. S. Native of Peru in groves on the Andes at Chicaplaya and of Cayenne. Beauharnòisia, Ruiz et Pav. ann. mus. 11. p. 71. f. 9. Mariálva fructipéndula, Chois. mss. D. C. prod. 1. p. 560. Mart. fl. bras. 1. p. 85. Flowers yellowish, dioecious? Fruit turbinate, pendulous, crowned by the permanent styles. When cut transversely, it yields a quantity of yellow resinous viscid juice, which is also observed in the calyx and anthers. The bark is used by the inhabitants of Chicoplaya in Peru to dye lint of a reddish-purple colour; they also use it as a medicine.

Pendulous-fruited Tovomita. Fl. Jan. Feb. Tree 18 feet.

4 T. uniflòra (Chois. mss. D. C. prod. 1. p. 560. under the name of *Mariálva,*) leaves lanceolate, bluntish; peduncles axillary, 1-flowered, scarcely half an inch long. ♄. S. Native of Guiana. Flowers yellowish, dioecious?

One-flowered Tovomita. Tree 20 feet.

5 T. panicula'ta (St. Hil. fl. bras. 1. p. 315.) leaves oblong-lanceolate, toothed; flowers panicled; calyx 4-leaved. ♄. S. Native of Brazil near Rio Janeiro. Petals green.

Panicled-flowered Tovomita. Shrub 6 feet.

6 T. Brasilie'nsis (Mart. nov. gen. 1. p. 83. t. 167. under *Mariálva,*) leaves broad-lanceolate, acute at both ends, smooth; peduncles in pairs, 1-flowered; petals obtuse. ♄. S. Native of Brazil. Flowers white but at length reddish. Capsule crowned by distinct styles.

Brazilian Tovomita. Tree 20 feet.

7 T. clusiæfòlia; sepals 2; petals 8-10; flowers dioecious; stamens numerous, in many series; fruit crowned by a 6-toothed, peltate stigma; leaves oblong, acute, smooth; peduncles racemose. ♄. S. Native of Cayenne. Clùsia longifòlia, Rich. act. soc. hist. nat. par. 1. p. 113. Micranthèra clusiæfòlia, Chois. in mem. hist. nat. par. 1. p. 11-12. Flowers yellow, dioecious.

Clusia-leaved Tovomita. Clt. 1823. Tree.

Cult. These fine trees will thrive in a mixture of loam, peat, and sand, and ripened cuttings will root freely in sand under a hand-glass, in heat.

IV. ARRU'DEA (in honour of Manoel Arruda da Camara, M. D., who has written on Brazilian plants). Cambess. in mem. mus. 16. p. 421. St. Hil. fl. bras. p. 319.

Lin. syst. *Monadélphia, Polyándria.* Calyx of many imbricate unequal sepals, outer ones smallest. Petals 9-10, imbricate. Stamens numerous, inserted in the conical receptacle, closely connected together into a compact mass; anthers adnate, 2-celled, bursting at the top by 2 pores. Style short, crowned by an 8-lobed stigma, the lobes of which are distinct and wedge-shaped. Ovary immersed in the fleshy receptacle, 8-celled; cells 1 or 2-seeded. A small tree with quite entire stalked leaves, and with solitary polygamous flowers, at the tops of the branches.

1 A. clusioìdes (Cambess. in St. Hil. fl. bras. 1. p. 319. t. 66.) ♄. S. Native of Brazil in the province of Minas Geraes. Leaves obovate or elliptic, veiny. Petals of a pale-red colour. Stigma yellow.

Clusia-like Arrudea. Tree 15 feet.

Cult. A mixture of loam and peat will suit this tree; and ripened cuttings will strike root if planted in sand with a hand-glass placed over them, in heat.

V. HAVE'TIA (in honour of M. Havet, a young botanical collector, who was sent to the island of Madagascar to collect plants, where he died). H. B. et Kunth, nov. gen. amer. 5. p. 204. t. 462.

Lin. syst. *Dioècia, Tetrándria.* Male flowers. Calyx of 4 orbicular, concave sepals, 2 outer ones smaller. Petals 4, orbicular, concave, equal. Receptacle fleshy, orbicular, convex. Anthers 4, alternating with the petals, and immersed in the disk, 1-celled, 3-valved at the apex. Female flowers unknown.—A tree abounding in yellow, clammy juice, with opposite branches, and quite entire obovate leaves, and terminal bractless panicles of flowers. Flowers at the tops of the branches, twin, nearly sessile.

1 H. laurifòlia (H. B. et Kunth, l. c.). ♄. S. Native on the Andes about Popayan. Clùsia tetrándria, Willd. spec. 4. p. 978.

Laurel-leaved Havetia. Tree.

Cult. This tree will grow well in a mixture of loam and peat, and ripened cuttings will root in sand or mould under a hand-glass, in heat.

Tribe II.

CHRYSOPIE'Æ. Ovary many-celled; cells containing many ovulæ. Fruit fleshy, indehiscent, many-celled.

VI. MORONO'BEA (Moronobo or Coronobo is the Caribbean name of *M. coccínea*). Aubl. guian. 2. p. 788. t. 313.—Symphònia, Lin. fil. suppl. p. 302.

Lin. syst. *Polyadélphia, Polyándria.* Calyx 5-parted, bractless, imbricate. Petals 5, alternating with the calycine lobes. Stamens 15-20, joined into a tube at the base, which is deeply 5-cleft at the apex; bearing the anthers on the outside, 3 or 4 on each segment, they are linear, 2-celled, bursting lengthwise behind. Stigmas 5, nearly sessile. Ovary 5-celled; cells containing 5 ovulæ. Fruit fleshy.—Trees with corymbose flowers, rarely solitary, terminal and axillary, hermaphrodite.

1 M. cocci'nea (Aubl. guian. 2. p. 789. t. 313.) bud of flower globose; style very short; leaves oblong, acute at both ends, with an incurved point, coriaceous, without dots. ♄. S. Native of Guiana in moist woods and on mountains. Symphònia globulífera, Lin. fil. suppl. 302. Perhaps *Symphònia esculénta*, Arrud. is not distinct from this. A lofty tree. Leaves approximating at the ends of the branchlets, smooth, glaucous. Flowers about the size of those of *Thèa*, red, axillary, solitary, or in terminal, few-flowered corymbs. The coriaceous rind of the fruit covers the painted seeds, which are covered with a deep yellow mucous substance interposed between them. The resinous juice which flows from all parts of the tree when cut, is used by the Creoles to tar their boats and ropes, and they also make flambeaus of it mixed with other resins of the country. It is also used by the Caribbees to attach the iron and the poison to their arrows.

Scarlet-flowered Moronobea. Tree 40 feet.

2 M. grandiflòra (Chois. in mem. hist. nat. p. 1. D. C. prod. 1. p. 563.) bud of flowers conical-ovate; style very long; flowers larger in all parts than in *M. coccínea;* leaves elliptical-lanceolate. ♄. S. Native of Guiana. Flowers red.

Great-flowered Moronobea. Tree.

Cult. These fine trees will grow in a mixture of loam and peat; and well-ripened cuttings will root in sand, under a hand-glass, in a moist heat.

VII. CHRYSO'PIA (from χρυσος, *chrysos*, gold, and οπυς, *opys*, juice; trees yielding yellow juice when cut). Pet. Th. gen. mad. no. 48.

Lin. syst. *Polyadélphia, Polyándria.* Calyx bractless, of 5 sepals, imbricate. Petals 5, inserted on the outside of the disk. Disk urceolate at the base, sometimes entire at the apex, sometimes 5-lobed. Stamens connected at the base into a thick urceolus, fixed to the inner side of the disk, 5-cleft at the top; each segment bearing 3-5 adnate linear anthers, bursting lengthwise. Style short, 5-furrowed, 5-cleft at the apex, each segment furnished with a peculiar kind of stigma on the inside; segments spreading. Fruit fleshy, 5-celled. Seeds ovate, oblong. Cells of ovary 5-10-ovulate. Trees with terminal, few-flowered corymbs or umbels of hermaphrodite flowers.

1 C. microphy'lla (Hils. et Bojer. ex Cambess. mem. mus. 16. p. 423. t. 4.) leaves spatulate, small; flowers umbellate; disk nearly entire. ♄. S. Native of Madagascar. Flowers white.

Small-leaved Chrysopia. Tree 40 feet.

2 C. fasciula'ta (Pet. Th. l. c.) leaves spatulate, coriaceous; flowers in corymbs; disk 5-cleft. ♄. S. Native of Madagascar. Branches umbellately crowded at the apex. Flowers purple. There is an oil expressed from the seeds.

Fascicled-flowered Chrysopia. Tree 60 feet.

Cult. These beautiful trees will thrive in a mixture of sandy loam mixed with a little peat; and ripe cuttings, not deprived of their leaves, will root readily in sand under a hand-glass, in a moist heat.

Tribe III.

GARCINIE'Æ. Ovary many-celled; cells containing 1 ovulæ. Fruit fleshy, indehiscent, many-celled.

VIII. MAMME'A (Mamey, its vernacular name in South America). Lin. gen. 1156. Juss. gen. 257.

Lin. syst. *Polyándria, Monogýnia.* Calyx bractless, of 2 deciduous sepals. Petals 4-6, deciduous. Stamens numerous, free, or connected at the very base, deciduous; filaments short; anthers adnate, 2-celled, bursting lengthwise at the sides. Style short, crowned by a 4-lobed stigma; lobes emarginate. Fruit crowned by the permanent base of the style, fleshy, 4-celled or 2-3-celled from abortion; cells 1-seeded. Seeds large, thick. Trees with leaves full of pellucid dots. Flowers usually solitary, male or hermaphrodite in different plants.

1 M. America'na (Lin. spec. 731.) leaves obovate, very blunt, quite entire; fruit very large, containing usually 4 large seeds. ♄. S. Native of the Caribbean Islands and the neighbouring continent. Jacq. amer. 268. t. 181. f. 82. pict. 130. t. 248.—Plum. gen. 44. t. 170.—Sloan. jam. 2. p. 123. t. 217. f. 3. A tall handsome tree with a thick, elegant, spreading head. It has a long downright tap root, which renders it very difficult to transplant. The leaves are oval or obovate, shining, leathery, opposite, from 5 to 8 inches in length. Peduncles 1-flowered, short, scattered over the stouter branches. The flowers are sweet-scented, white, an inch and a half in diameter; calyx sometimes 3-sepalled; corolla sometimes 6-petalled; but this arises from 2 of the segments or petals being cut. Fruit large, round, obsoletely 3 or 4-cornered, about the size of a cannon ball; it is covered with a double rind, the outer leathery, a line in thickness, tough, brownish-yellow, the inner thin, yellow, adhering closely to the flesh, which is firm, bright-yellow, has a singular pleasant taste, and a sweet, aromatic smell, but the skin and seeds are very bitter and resinous. It is eaten alone, or cut into slices with wine and sugar, or preserved in sugar. In Martinico they distil the flowers with spirit, and make a liquor which they call *Eau-Creole.* The English and Spaniards call the fruit *Mammee;* and the French *Abricot sauvage*, from the yellowness of the pulp, like that of the apricot. Swartz remarks that the trees which bear hermaphrodite flowers are very lofty, but that the male trees are much smaller. Browne gives the hermaphrodite and male trees as distinct species. He informs us that they are among the largest trees in the Island of Jamaica, abound with a strong resinous gum, and are esteemed

among the best timber trees; that the fruit is large and agreeable, but too strong and gross for a weakly stomach, leaving a bitterness behind it, that continues for a considerable time upon the palate, containing 4 large, oblong, angular seeds, having as many kernels of the same shape.

American Mammee-apple. Clt. 1739. Tree 60 feet.

2 M. emargina'ta (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 561.) leaves obovate, very blunt, emarginate, at the apex; fruit globose, 2-seeded. ♄. S. Native of Mexico. Fruit like that of the preceding, but smaller, eatable. Flowers whitish.

Emarginate-leaved Mammee-apple. Tree 40 feet.

3 M. hu'milis (Vahl. ecl. 2. p. 40.) leaves acute; peduncles longer than the petioles; berry 3-seeded. ♄. S. Native of Montserrat. Fruit eatable?

Dwarf Mammee-apple. Tree.

4 M. Africa'na (Hort. trans. lond. vol. 5. p. 457.) leaves oblong, acuminated; fruit large, round. ♄. S. Native of Sierra Leone on the mountains. A large tree, with long, shining, dark-green leaves, abounding in a yellow resinous gum. The wood is applied to many useful purposes. The fruit is twice the size of a man's fist, the rind is brown and thick, the pulp is yellow, of equal excellence to that of the American *Mammee-apple*.

African Mammee-apple. Tree 60 feet.

Cult. *Mammèa* is a genus of fine fruit-trees. They will grow freely in sandy loam, or a mixture of loam and peat; ripe cuttings, with the leaves not shortened, will root in sand under a hand-glass, in a moist heat. They all require a strong heat to thrive well.

IX. PENTADE'SMA (from πεντε, *pente*, five, and δεσμη, *desme*, a bundle; in allusion to the stamens being disposed in 5 bundles). Hort. trans. lond. vol. 5. p. .

Lin. syst. *Polyadélphia, Polyándria.* Calyx of 4 to 5 permanent sepals. Petals deciduous. Stamens numerous, connected into 5 bundles. Style 1. Berry large, fleshy, crowned by the rudiment of the style. Seeds 3-5, large, angular.—A lofty tree, abounding in yellow greasy juice, with long, lanceolate, coriaceous leaves.

1 P. butyra'cea (Hort. trans. lond. vol. 5. p. 457.). ♄. S. Native of Sierra Leone in the low lands. This tree grows to the height of 40 or 60 feet, but produces its flowers when 20 feet high. The leaves are entire, lanceolate, coriaceous, smooth, shining. The fruit is about the size of the common *Mammee-apple*, inversely pear-shaped, being pointed at the apex, it contains from 3-5 large, angular, brown seeds; the rind is rough, coarse, and of a dark-brown colour. The yellow greasy juice, from which the tree derives its vernacular name, is given out copiously when the fruit is cut or opened; it is mixed by the natives of Sierra Leone with their food, but it is not used by the settlers on account of a strong turpentine flavour which belongs to it; we believe that the juice is that which the *country butter* brought to the market of Freetown is made of. The flowers are very large and shewy, and probably reddish.

Butter and Tallow-tree. Fl. Jan. Clt. 1822. Tree 60 feet.

Cult. The tree is extremely difficult to transplant, on account of the long tap root, which, if broken or cut, will kill it. The root must have sufficient depth of mould to enable it to descend or the plant will not live. It requires a strong moist heat to flourish well. A mixture of loam and peat suits it best, and ripened cuttings, with their leaves not shortened, will probably root in sand under a hand-glass, in a moist heat.

X. RHEE'DIA (in honour of Henry Rheede Van Draakenstein, once governor of a Dutch establishment on the coast of Malabar; author of Hortus Malabaricus in 10 vols. folio). Lin. gen. 641. Juss. gen. p. 258. D. C. prod. 1. p. 564.—Van Rhéedia, Plum. gen. 45.

Lin. syst. *Polyándria, Monogýnia.* Calyx none. Petals 4. Stamens numerous, with oblong anthers. Style 1. Stigma funnel-shaped. Berry ovate, 1-celled. Seeds 2-3, ovate-oblong, fleshy, thick, imbedded in the pulp.—Tree with opposite, blunt, stalked leaves.

1 R. lateriflòra (Lin. spec. 719.). ♄. S. Native of Martinico.—Burm. amer. t. 257. Leaves large, oblong; peduncles axillary, 3-flowered.

Lateral-flowered Rheedia. Tree.

2 R. Java'nica (Hort. kew. Loud. hort. brit. p. 214.). ♄. S. Native of Java. Leaves large, obovate, blunt.

Java Rheedia. Clt. 1820. Tree.

Cult. These fine broad-leaved trees will thrive well in a mixture of loam, peat, and sand; and ripened cuttings will root in sand under a hand-glass, in a moist heat.

XI. GARCI'NIA (in honour of Laurence Garcin, M.D. a French botanist, and traveller in India, author of numerous botanical memoirs). Lin. gen. 594. Juss. gen. 256.—Garcínia and Cambògia, Lin. and Juss.—Mangostàna, Gært. Garcínia species, Chois. in D. C. prod. 1. p. 566.

Lin. syst. *Polyándria, Monogýnia.* Calyx bractless, of 4 permanent sepals. Petals 4, deciduous. Stamens 12-20, free, deciduous; filaments short; anthers adnate, 2-celled, bursting lengthwise behind. Style short, crowned by a 4-8-lobed stigma. Fruit fleshy, 4-8-celled; cells 1-seeded, crowned by the permanent stigmas.—Trees with hermaphrodite or monoecious flowers, usually solitary at the tops of the branches.

1 G. Mangosta'na (Lin. spec. 635.) leaves elliptic-oblong, acuminated; flowers terminal, solitary; corolla red; stigma 6-8-lobed; berry very beautiful and eatable; pericarp spongy. ♄. S. Native of the Molucca Islands, whence it has been transplanted to Java and Malacca.—Plench. icon. t. 360.—Rumph. amb. 1. p. 132. t. 43.—Garc. phil. trans. vol. 38. p. 232. abr. 8. p. 755. t. 8. Mangostàna Garcínia, Gært. fruct. 2. t. 105. The *Mangostan* rises with an upright stem near 20 feet high, sending out many branches on each side, which are opposite. The trunk is full of cracks. The leaves are entire, about 7 or 8 inches long, and about half as much in breadth at the middle, gradually tapering to both ends, of a shining green above, but of an olive colour beneath. The flower resembles a single rose, composed of 4 roundish petals, which are thick at the base, but thinner towards the margins; they are of a dark-red colour. The fruit is round, about the size of a middling orange, and is crowned by the broad peltate-lobed stigma; the rind is like that of the pomegranate, but softer, thicker, and fuller of juice; it is green at first, but changes to a dark-brown, with some yellowish spots; the inside is of a rose-colour, and is divided into several cells by their partitions, as in oranges, in which the seeds are lodged, surrounded by a soft juicy pulp, of a delicious flavour, partaking of the strawberry and the grape, and is esteemed one of the richest fruits in the world. The trees naturally grow in the form of a parabole, and the branches being well garnished with large shining green leaves, they have an elegant appearance, and afford a kindly shade in hot countries, therefore are worthy of cultivation in all those countries where there is warmth enough to ripen the fruit.

It is esteemed the most delicious of the East Indian fruits, and a great deal of it may be eaten without any inconvenience; it is the only fruit which sick people are allowed to eat without scruple. It is given with safety almost in every disorder, and it is said that the late Dr. Solander, in the last stage of a putrid fever at Batavia, found himself insensibly recovering by sucking this delicious and refreshing fruit. The pulp has a most happy

mixture of the tart and sweet, and is no less salutary than pleasant, for which reason in hot climates, with the sweet orange, it is given in any quantity to those who are afflicted with fevers, either of the putrid or inflammatory kind. The dried bark is used with success in dysentery and tenesmus, and an infusion of it is esteemed a good gargle for a sore mouth, or ulcers in the throat. The Chinese dyers use the bark for the ground or basis of a black colour, in order to fix it the firmer. *Mangostama* or *Magostana* is the Malay name of the tree.

Mangostan Garcinia. Clt. 1789. Tree 20 feet.

2 G. co'rnea (Lin. syst. 368.) leaves oblong-elliptic, emarginate; flowers solitary and umbellate, lateral and terminal, drooping; stigma entire; berry the form of a plum. ♄. S. Native of the East Indies in the high remote mountains of Amboyna.—Rumph. amb. 3. p. 55. t. 30. The trunk of this tree is very lofty, but not very thick; it is covered with a black bark. The branches extend wide, and divide into many short branches, which have a pair of leaves at each joint; these are large, from 11 to 15 inches long, and 4 broad, but on old trees shorter, smooth, firm, and shining. The flower rises between the upper leaves, drooping, having the form of a small rose, of a yellow colour. Fruit the size of a plum, crowned by the entire stigma, which appears like a wart. It is of a dusky-brown or smoky colour on the outside, and within it has a mucous pulp, in which lie a few seeds in the shape of a half moon. It has a resinous smell when fresh. The wood is heavy and very hard, like horn, whence Rumphius names it *lignum corneum;* it is used for the handles of tools, and the young trees in building, the old ones being too hard to work.

Horny-wooded Garcinia. Clt. 1817. Tree 30 to 40 feet.

3 G. More'lla (Desrous. in Lam. dict. 3. p. 701.) leaves oblong-elliptic, tapering to both ends; panicles terminal and lateral; berry small, 4-celled, striated, crowned by a 4-lobed stigma. ♄. S. Native of the East Indies? Mangostàna Morélla, Gært. fruct. 2. p. 106. t. 105. Flowers yellowish. Fruit small, eatable. The name is derived from the morella cherry, in allusion to the size and shape of the fruit. Gamboge is also obtained from this tree.

Morella Garcinia. Tree.

4 G. pedunculà'ta (Roxb. hort. beng. p. 42.) leaves obovate-oblong, rounded at the apex, with strong transverse veins; racemes terminal and axillary; pedicels long; flowers large. ♄. S. Native of the East Indies.

Long-peduncled Garcinia. Tree 40 feet.

5 G. Cambò'gia (Desr. in Lam. dict. 3. p. 701.) leaves elliptic, tapering to both ends; flowers terminal, solitary; corollas yellowish; stigma 8-lobed; berry 8-furrowed. ♄. S. Native of Malabar and other parts of the East Indies.—Rheed. mal. 1. p. 41. t. 42. Mangostàna Cambògia, Gært. fruct. 2. p. 106. t. 105. Cambògia Gútta, Lin. spec. 728. Blackw. t. 392. Cambògia, Lewis, mat. med. 289. This is a tall tree, with a trunk as thick as two men can compass, with spreading, opposite branches. The leaves are 5 inches long, and half that in breadth. The flowers, according to Rheede, are axillary and sessile, of a saffron colour. Fruit about 2 inches in diameter, drooping, on peduncles an inch in length; the rind is thin, smooth, and yellowish; the pulp is yellow, succulent, sweet, and eatable. According to Rheede, the fruit is first green, then yellowish, and when ripe whitish. It is very common about Siam and Cambodia, where incisions are made in the bark, and a great quantity of gummi-guttæ or gamboge is extracted, and exported into foreign countries. This concrete is a gum-resin, in part inflammable, compact, dry, inclining to orange-colour, without smell, and almost without taste, producing, however, a slight sensation of acrimony in the throat. A greater quantity of it is dissolved in spirits of wine than in water, to which it imparts a lemon-colour. It is used medicinally in the east, as a purgative, hydrogogue, and emetic, particularly in dropsies and worm cases. It is said to lose the latter quality when dissolved in vinegar. The principal use of gamboge is in painting in miniature and water-colours. The fruit is eaten at meals in the East Indies, and being much esteemed for provoking the appetite, is a frequent ingredient in their sauces. The name *Cambogia* is derived from the province of Camboja or Cambodge, because it comes from that country.

Gamboge Garcinia. Fl. Nov. Clt. 1822. Tree 40 feet.

Cult. The species of this interesting genus deserve to be cultivated in every collection of stove plants. A light loamy soil, mixed with a little peat, will suit them well. Ripened cuttings will root readily in sand under a hand-glass, in heat. All the species require a strong heat to thrive well.

XII. STALA'GMITIS (from *σταζω, stazo,* to run out; because the trees exude a yellow resinous juice when cut). Murr. comm. gœt. 9. p. 175.—Xanthochymus, Roxb. cor. 2. p. 51.—Brindònia, Pet. Th. dict. scien. nat. 5. p. 339.

Lin. syst. *Polyadélphia, Polyándria.* Calyx bractless, of 4-5 (f. 104. *a.*) permanent, unequal sepals. Petals 4-5 (f. 104. *b.*), deciduous. Male flower with a fleshy, 4-5-8-lobed receptacle, bearing numerous imperfect anthers. Stamens monadelphous or disposed in 4-5-8 (f. 104. *c.*) bundles. Anthers didymous, small, 2-celled, bursting at the sides, with a small rudiment of a pistil. Hermaphrodite flowers with a receptacle, as in the male flowers (f. 104. *c.*), and the stamens disposed in 4-5 (f. 104. *c.*) -8 bundles. Style short, crowned by a 4-5 (f. 104. *e.*) -8-lobed stigma. Fruit crowned by the permanent stigma, fleshy (f. 104. *f.*), 3-8-celled; cells 1-seeded. Seeds large, thick.—Trees with axillary or lateral, usually fascicled or umbellate flowers, rarely racemose, male or hermaphrodite in the same, or in different individuals. Branches tetragonal.

Sect. I. Xanthochy'mus (*ξανθος, xanthos,* yellow, and *χυμος, chymos,* juice). Flowers hermaphrodite. Stamens disposed in 5 bundles.

1 S. pictò'rius (Roxb. cor. 2. p. 51. t. 196. under *Xanthochymus,*) leaves lanceolate, acuminated; petioles wrinkled; fruit 1-4-seeded. ♄. S. Native of the East Indies in valleys among the Circar mountains. X. tinctòrius, D. C. prod. 1. p. 562. This is a large tree, with rather large, white flowers, and yellow fruit, like those of the orange; they are very inviting to the eye, and not inferior to many apples, and are eaten by the natives. They could be much ameliorated by culture. The fruit when full grown, but not ripe, yields a quantity of yellow, resinous, acrid gum like gamboge, of the consistence of rich cream. It makes a pretty good water-colour, either by itself as a yellow, or in mixture with other colours to form green. It is imperfectly soluble in spirits, and still less so in water; alkaline salt enables the water to dissolve more of the gum.

FIG. 104.

Painters' Stalagmitis. Tree 40 feet.

2 S. du'lcis (Roxb. cor. 3. t. 270. under *Xanthochymus,*) leaves ovate-oblong, lanceolate, acuminated; pedicels numerous, aggregate, lateral; fruit 5-seeded. ♄. S. Native of the Moluccas. Fruit sweet and esculent. Stamens in 5 bundles.

Sweet-fruited Stalagmitis. Clt. 1820. Tree.

3 S. ovalifòlius (Roxb. hort. beng. 42. under *Xanthochỳmus*,) branches angular; leaves oval or oblong, rounded at both ends; flowers small, aggregate, in clusters; pedicels short; fruit 3-seeded. ♄. S. Native of Ceylon.

Oval-leaved Stalagmitis. Clt. 1820. Tree.

4 S. Guinee'nsis (G. Don, in Loud. hort. brit. p. 320.) leaves oval, tapering to both ends; fruit? ♄. S. Native of Sierra Leone on the mountains. Branches square.

Guinea Stalagmitis. Clt. 1824. Tree 20 feet.

5 S. cambogioi'des (Murr. comm. goett. 9. p. 175.) stamens 30, disposed in 5 bundles; stigmas 3-4; berry globose, 3-4-seeded; leaves ovate acute. ♄. S. Native of Ceylon and Camboja. This tree yields a quantity of yellow resin, which is used by painters as gamboge, and is scarcely distinguishable from it.

Gamboge-like Stalagmitis. Tree 30 feet.

Sect. II. Brindònia. Flowers dioecious or hermaphrodite. Stamens of the male flowers connected in one bundle; those of the hermaphrodite flowers connected in several bundles.

6 S. Cochinchine'nsis (Chois. mss. D. C. prod. 1. p. 561. under *Garcínia*,) leaves ovate-oblong, acutish; branches tetragonal; flowers lateral, crowded, on very short peduncles, whitish; berry the form of a pear; stigma 6-lobed. ♄. S. Native of the East Indies, China, and Cochin-china. G. Amboinénsis, Spreng. syst. 2. p. 448.—Rumph. amb. 3. p. 58. t. 32. Oxycárpus Cochinchinénsis, Lour. fl. coch. 648. This is a large tree, with tetragonal branches. The leaves are 7-8 inches long, and about 3 or 4 inches broad, very smooth and thick. Flowers small, whitish. Fruit about the size of a plum, usually in the shape of a pear, of a reddish colour when ripe; the pulp is juicy, and smells somewhat like an apple, and is eatable in a raw state; it is acid, as well as every other part of the tree. The bark of the tree is brownish, and yellow within, containing a quantity of yellow, viscid juice, which flows copiously on the least incision being made. This juice possesses the same quality as that of *Garcínia Cambògia*. The wood is of little use, being too soft, and not durable. The leaves are used in Amboyna as a condiment to fish. The tree is very common in Amboyna in the plains about the shore and on the mountains.

Cochin-china Stalagmitis. Tree 40 feet.

7 S. elli'ptica (Chois. mss. D. C. prod. 1. p. 561. under *Garcínia*,) branches tetragonal; leaves elliptical, ovate, veiny, acute, large, of a shining-green colour, with black dots; flowers lateral, in fascicles, small, on short peduncles; stamens connected in 5 bundles; female flowers unknown. ♄. S. Native of the islands of Timor and Java. Perhaps this tree is sufficiently distinct from *S. Cochinchinénsis*. Bark yielding a quantity of yellow, thick juice, as the rest of the species. Fruit probably eatable.

Elliptical-leaved Stalagmitis. Tree.

8 S. Cele'bica (Lin. spec. 635. under *Garcínia*,) leaves ovate-lanceolate, acute; branchlets tetragonal; flowers terminal, umbellate, on very short peduncles; stigma 8-lobed; berry globose. ♄. S. Native of the Island of Macassar, whence it has been transplanted into Amboyna and Java, where, however, it seldom bears ripe fruit. Mangostàna Celébica, Rumph. amb. 1. p. 134. t. 44. Brindònia Celébica, Pet. Th. dict. scien. nat. 5. p. 339. This is not a lofty tree, but it has an elegant spreading head. The leaves are thick, 8 inches long, and about 3 fingers broad, but are larger in younger trees. The fruit resembles that of the common Mangostan, but sometimes grows to a larger size; it is of a yellowish-red or saffron colour, like the pomegranate, crowned by the 8-lobed stigma, which is hollow above, and broader there than at its origin.

Celebes Stalagmitis. Tree 20 feet.

9 S. I'ndica (Chois. mss. D. C. prod. 1. p. 561. under *Garcínia*,) leaves ovate, acuminated; flowers terminal, male ones 4-5, crowded, hermaphrodite ones solitary, on short peduncles; berry globose, 5-6-celled. ♄. S. Native of the East Indies. Brindònia I'ndica, Pet. Th. dict. scien. nat. 5. p. 339. Fruit probably eatable.

Indian Stalagmitis. Tree.

10 S. Còwa (Roxb. hort. beng. p. 42. under *Garcínia*,) leaves ovate, acuminated; branches round; male flowers lateral, 4-5 together, hermaphrodite ones solitary, terminal, on short peduncles; stigma entire, rugged, 6-furrowed; berry ovate-globose. ♄. S. Native of the East Indies, where it is called *Kuwa*. G. dioíca, Smith in Rees' cyclop. vol. 15. Flowers yellowish.

Kuwa Stalagmitis. Clt. 1822. Tree 20 feet.

11 S. panicula'ta (Roxb. hort. beng. p. 42. under *Garcínia*,) stamens many, polyadelphous; leaves elliptical, tapering to the base; flowers terminal, panicled. ♄. S. Native of the East Indies.

Panicled-flowered Stalagmitis. Tree 40 feet.

12 S. umbella'ta (Roxb. hort. beng. p. 42. under *Garcínia*,) leaves oblong, obtuse at both ends; peduncles lateral, umbellately many-flowered; corolla 4-5-lobed; calyx 4-5-toothed. ♄. S. Native of the East Indies. This is certainly a distinct genus, on account of the calyx and corolla being monapetalous. Stamens not seen.

Umbellate-flowered Stalagmitis. Tree 40 feet.

† *Species not sufficiently known.*

13 S. lu'teus; Lodd. cat. 14. S. macrophýllus, Lodd. cat. both under *Xanthochỳmus*.

‡ *Species only known by name from Roxb. hort. beng. p. 42, under the genus Garcínia.*

S. Kydiàna, S. purpùrea, S. Gútta, S. lanceæfòlia, S. Boobicòwa.

Cult. These fine trees will thrive well in a turfy loam, mixed with a little peat, but require a strong heat to flourish well. Ripened cuttings will root in sand under a hand-glass, in a moist heat.

Tribe IV.

CALOPHYLLIE'Æ. Ovary 1-2-celled; cells containing 1-2-ovulæ. Fruit drupaceous, indehiscent.

XIII. MESU'A (in honour of Mesue, the father and son, two celebrated Arabian physicians and botanists, who resided at Damascus, and flourished in the 8th and 9th centuries. The works of the younger Mesue, both medical and botanical, were published in folio with annotations at Venice in 1581.) Lin. gen. no. 665. Juss. gen. 258. Cambess. in mem. mus. 16. p. 426. t. 11. B.

Lin. syst. *Monadélphia, Polyándria.* Calyx bractless, of 4 unequal sepals, permanent. Petals 4. Stamens indefinite, connected at the base; filaments filiform; anthers inserted by the base, erect, 2-celled, bursting lengthwise at the sides. Style short, crowned by a thick, concave stigma. Ovary 2-celled; cells containing 2 erect ovulæ. Fruit drupaceous, globose or egg-shaped, 1-celled from abortion, 1-4-seeded. Seeds egg-shaped. Trees with axillary, solitary, hermaphrodite flowers.

1 M. fe'rrea (Lin. spec. 734.) leaves elliptical-lanceolate, acute, glaucous beneath; flowers stalked, axillary; petals somewhat unguiculate, regular; mature nut 1-seeded from abortion. ♄. S. Native of Java and other parts of the East Indies. Calophýllum Nagassàrium, Burm. ind. 121.—Rumph. amb. 7. p. 3. t. 2. Flowers white, about the size of those of the sweet-briar, sweet-scented. Fruit rufous and wrinkled, containing 1 seed, which is eatable. This tree is much cultivated in Java and Amboyna for the beauty and scent of its flowers.

Iron-wooded Mesua. Fl. July, Aug. Tree 40 feet.

2 M. speciòsa (Chois. mss. D. C. prod. 1. p. 562.) leaves linear-lanceolate, rather acute, long; flowers hardly stalked; petals rounded, regular; mature nut 4-seeded. ♄. S. Native of the East Indies. Rheed. mal. 3. p. 63. t. 53. Rheede says this tree is much cultivated in Malabar for the odour and beauty of its flowers; they are about the size and shape of those of the sweet-brier, but with only 4 white petals; when dry they are mixed with other aromatics, such as the white sandal-wood, and used for perfuming ointment. The fruit is reddish, and wrinkled when ripe, with a rind like that of the chesnut, containing 3 or 4 seeds the size, shape, substance and taste of the chesnut. The tree bears fruit in 6 years from the nut, and continues to bear during three centuries. It is planted near houses, and affords an excellent shade. The bark, wood, and roots are bitter, and sweet-scented.

Shewy-flowered Mesua. Fl. July, Aug. Tree 50 feet.

Cult. These trees bear very shewy flowers; they are therefore worth cultivating in every collection of stove plants. They will thrive in a mixture of loam, peat, and sand, and ripened cuttings will root in sand under a hand-glass, in a moist heat.

XIV. CALOPHY'LLUM (from καλος, *calos*, beautiful, and φυλλον, *phyllon*, a leaf; the leaves are large, of a beautiful green, and elegantly veined). Lin. gen. no. 658. Juss. gen. p. 258. D. C. prod. 1. p. 562. Cambess. in mem. mus. 16. p. 427. t. 11. C.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx bractless, of 2-4, unequal, coloured sepals. Petals 4, rarely 2, opposite the sepals. Stamens indefinite, rarely definite, free or connected at the base; filaments short; anthers inserted by their base, 2-celled, bursting lengthwise. Style twisted, crowned by a large, capitate stigma, which is usually lobed. Fruit drupaceous, globose or egg-shaped, 1-celled, 1-seeded. Seeds large, globose or egg-shaped.—Trees with the leaves furnished with numerous transverse, parallel nerves. Flowers disposed in axillary racemes, and panicles polygamous or hermaphrodite.

§ 1. *Calyx of 4 sepals.*

1 C. parvifòlium (Chois. in act. soc. nat. par. 1. p. 229.) leaves cordate-ovate, bluntish, on short stalks, smooth, veined; branches twisted; panicles loose, few-flowered. ♄. S. Native of the Moluccas.

Small-leaved Calophyllum. Tree.

2 C. inophy'llum (Lin. spec. 732.) leaves oblong or obovate, obtuse, but usually emarginate; branches round; flowers loosely racemose; racemes axillary; peduncles 1-flowered, usually opposite. ♄. S. Native of the East Indies.—Rumph. amb. 2. p. 211. t. 71.—Rheede, mal. 4. p. 79. t. 38.—Burm. zeyl. t. 130. t. 60.—This is a large tree, with snow-white flowers. Fruit when ripe reddish, the size of a walnut, under a fleshy bark and a woody shell, having a very oily nut, which is bitter, and yields a yellow resinous juice. It is a tree about 90 feet in height, and 12 in thickness, with the younger branches when ripe of a reddish colour, and when wounded exudes a yellowish, bitter juice, frequently hardening to a gum. The nut of the fruit is at first sweet, but afterwards very bitter. The tree is common in Malabar in sandy soils, and bears fruit twice a year, in March and September, frequently to the age of three hundred years. An oil is expressed from the nuts to burn in lamps, to assuage pain, and to make ointments. The bark and gum are also used for medical purposes. In Java they plant this tree about their houses for the elegance of the shade, and the sweetness of the flowers.

Fibrous-leaved Calophyllum. Clt. 1793. Tree 90 feet.

3 C. tetrape'talum (Roxb. hort. beng. p. 93.) leaves ovate or oblong-lanceolate, obtusely acuminated; racemes axillary, short, corymbose, 2-3 together. ♄. S. Native of the East Indies.

Four-petalled Calophyllum. Tree 60 feet.

4 Tacamaha'ca (Willd. berl. mag. 1811. p. 79.) leaves ovate-elliptical, acutish, rarely emarginate; branches round; flowers loosely racemose; racemes axillary; peduncles 1-flowered, usually opposite. ♄. S. Native of the islands of Bourbon and Madagascar. C. inophýllum, Lam. dict. 1. p. 552.—Pluk. alm. 41. t. 147. f. 3. Flowers white.

Tacamahaca Calophyllum. Clt. 1822. Tree 60 feet.

5 C. specta'bile (Willd. mag. berl. 1811. p. 99.) leaves elliptical-lanceolate or rarely ovate-elliptical, usually acute at both ends; flowers in loose, short, axillary racemes; peduncles 1-flowered. ♄. S. Native of the East Indies and the Mauritius. C. acuminàtum, Lam. dict. 1. p. 553.—Rumph. amb. 2. p. 218. t. 72. C. Soulàtri, Burm. ind. p. 121. Petals yellow or white. This tree is very commonly cultivated in Amboyna for its shewy, yellow blossoms. The nuts are eatable. The bark is manufactured into ropes. In fact, it possesses all the qualities of *C. inophýllum*.

Shewy Calophyllum. Clt. 1820. Tree 90 feet.

§ 2. *Calyx of 2 sepals.*

6 C. Ca'laba (Jacq. amer. p. 269. t. 165.) leaves obovate or oblong, obtuse or emarginate; flowers hermaphrodite or male; racemes lateral, very short. ♄. S. Native of the Caribbee Islands. Flowers white, sweet-scented. Fruit green, with little pulp, and that hardish, involving a smooth, yellowish, ash-coloured nut, in which is a white, solid kernel. It is not eaten, but the Caribbees express an oil from it for domestic uses, as for burning in lamps. Browne says, that the wood is pretty good timber, but does not bear the weather well, and that it is frequently used for staves and cask headings. The tree is called *Calaba* both by the Caribbees and the French.

Calaba Calophyllum. Clt. 1780. Tree 60 feet.

7 C. Madru'nno (H. B. et Kunth, nov. gen. amer. 5. p. 202.) leaves oblong, acute at both ends; peduncles few-flowered; capsules large, usually 2-seeded. ♄. S. Native of South America in the kingdom of New Granada, where it is called *Madrunno*.

Madrunno Calophyllum. Tree.

8 C. Calaboi'des; leaves wedge-shaped, præmorsely-emarginate; racemes axillary, about the length of the leaves; sepals 2. ♄. S. Native of the East Indies. C. Cálaba, Roxb. but not of Jacq.

Calaba-like Calophyllum. Tree 50 feet.

9 C. Brasilie'nse (St. Hil. fl. bras. 1. p. 320. t. 67.) leaves elliptic or obovate; cymes shorter than the leaves; calyx 2-leaved; petals usually 2; stamens few. ♄. S. Native of Brazil. Petals white.

Brazilian Calophyllum. Tree 60 feet.

§ 3. *Calyx wanting?*

10 C. spu'rium (Chois. mss. D. C. prod. 1. p. 563.) leaves ovate, obtuse; peduncles elongated. ♄. S. Native of the East Indies. C. Cálaba, Lin. spec. 723. C. apétalum, Willd. mag. berl. 1811. p. 79.—Rheed. mal. 4. p. 81. t. 39. Rheede says the wood of this tree is very hard and of a reddish colour. The fruit when ripe is of a red colour; in taste sweet, mixed with acid; in shape, size, and colour, not unlike our cornelian cherry. It is eaten by the natives of Malabar, and an oil is expressed from it for lamps. The petals are yellow.

Spurious Calophyllum. Clt. 1780. Tree 60 feet.

† *Species very little known.*

11 C. longifòlium (Willd. berl. mag. 1811. p. 80.) leaves

oblong-elliptical, roundish-obtuse. ♄. S. Native of South America. (H. B.)

Long-leaved Calophyllum. Tree.

12 C. acumina'tum (Willd. mag. berl. 1811. p. 80.) leaves oblong, acuminated. ♄. S. Native of South America in New Granada. (H. B.)

Acuminate-leaved Calophyllum. Tree.

13 C. Cu'ssi (H. B. et Kunth, nov. gen. 5. p. 203.) leaves oblong, blunt at both ends. ♄. S. Native of South America in inundated places at St. Balthasar, where it is called *Cussi*.

Cussi Calophyllum. Tree.

† *Species only known by name from Roxb. Hortus Bengalensis, p. 41 and 93.*

14 C. lanceola'rium (Roxb. hort. beng. p. 41.) ♄. S. Native of the Mauritius.

15 C. Bi'ntagor (Roxb. hort. beng. p. 43.) ♄. S. Native of the Moluccas.

16 C. Su'riga (Roxb.) ♄. S. Native of Malacca.

Cult. *Calophýllum* is a genus of fine trees, which grow well in a mixture of loam, sand, and peat; and cuttings will root freely, taken from ripe wood, in sand under a hand-glass, in a moist heat.

† *Genera allied to Guttíferæ, but not sufficiently known.*

XV. MACA'NEA (Macaca-hana is the name of this tree in Guiana). Juss. gen. p. 257. D. C. prod. 1. p. 564. Macahànea, Aubl. guian. suppl. p. 6.

Lin. syst. *Polyándria, Monogýnia?* Berry large, pear-shaped, gibbous and unequal on the outside, with a thick rind, 1-celled, pulpy inside, 4-6-seeded. Seeds fixed laterally to the receptacle, ovate, coriaceous, enwrapped in a membrane, and imbedded in white pulp.

1 M. Guiane'nsis (Aubl. guian. suppl. p. 6. t. 371.) ♄. S. Native of Guiana. A rambling shrub, with climbing branches, opposite, ovate, acute, smooth, toothed, stalked leaves, and axillary racemes of flowers.

Guiana Macaca-hana. Shrub climbing.

Cult. This fine climbing shrub will thrive in a mixture of loam and peat, and ripened cuttings will root in sand under a hand-glass, in a moist heat.

XVI. SINGA'NA (Singan-singa is the name of the tree in Guiana). Aubl. guian. 1. p. 574. Juss. gen. p. 257. D. C. prod. 1. p. 564.

Lin. syst. *Polyándria, Monogýnia.* Calyx 3-5-parted. Petals 3-5, unguiculate, with a serrulated border. Stamens numerous; anthers roundish. Style 1, incurved at the apex. Stigma capitate, concave. Capsule long, cylindrical, 1-celled, many-seeded. Seeds large, enwrapped in a pulp. Tree climbing.

1 S. Guiane'nsis (Aubl. guian. p. 257. t. 230.) ♄. ◡. S. Native of Guiana in the woods. Leaves opposite, ovate, acute, stalked, smooth, entire. Flowers white, in axillary corymbs. Pulp of fruit sweet.

Guiana Singana. Shrub climbing.

Cult. This shrub will thrive well in a mixture of loam and peat, and ripened cuttings will root in sand under a hand-glass, in a moist heat.

XVII. MACOU'BEA (the Caribbean name of the tree). Aubl. guian. suppl. 2. p. 17. Juss. gen. p. 257. D. C. prod. 1. p. 564.

Lin. syst. *Polyándria, Monogýnia?* Fruit the form of an Orange, somewhat compressed and trigonal, with a thin, roughish, rather dotted rind, 1-celled, many-seeded. Seeds oblong, somewhat curved, convex above, furrowed beneath, covered with a white membrane, fixed to the central placenta of the fruit.—Tree abounding in a milky juice. Branches opposite. Leaves opposite, entire, with secondary transverse nerves. Fruit in racemes, from the divarication of the branches.

1 M. Guiane'nsis (Aubl. guian. suppl. 2. p. 17. t. 378.) ♄. S. Native of Guiana. Leaves ovate, acute, smooth, entire, standing on half-stem-clasping petioles. Fruit rough, rufescent, with a few irregular dots.

Guiana Macoubea. Tree 40 feet.

Cult. This tree will thrive well in a mixture of loam and peat, and ripened cuttings will root in sand under a hand-glass, in a moist heat.

Order XLII. MARCGRAVIA'CEÆ (plants agreeing with *Marcgràvia* in important characters). Juss. in ann. mus. 14. p. 397. D. C. prod. 1. p. 565.

Calyx of 2-7 sepals; sepals ovate, usually coriaceous, imbricate. Corolla hypogynous, sometimes monopetalous, hood-formed, entire, or jagged at the apex, sometimes 5-petalled, after flowering circumscised and caducous. Stamens definite but usually numerous, sometimes inserted in the receptacle, sometimes in a hypogynous membrane; filaments dilated at the base; anthers elongated, 2-celled, fixed by the base, bursting on the inside. Ovary 1, free, usually furrowed. Style 1, of various lengths, crowned by a simple or capitate stigma. Capsule coriaceous, commonly globose, many-valved, hardly dehiscent, with a dissepiment in the middle of each valve. Dissepiment in *Marcgràvia* slender, arched, joined at the base and apex, distant from the centre, and the fruit is therefore 1-celled. Seeds very minute, numerous, imbedded in pulp. Embryo unknown.—Usually ascendant shrubs with alternate leaves. Flowers umbellate or spicate. Peduncles naked, but usually furnished with bracteas, which are either simple, concave on the outside, or hood-formed. This order is distinguished from *Guttíferæ* in the leaves being alternate, and by the singular form of the bracteas of the flowers; in this last respect it differs also from *Ternstræmiàceæ*.

Synopsis of the Genera.

Suborder I. Marcgravie'æ. *Corolla hood-formed. Stamens inserted in the receptacle.*

1 Antholo'ma. Calyx of 4 caducous sepals, rarely 2. Corolla ovate, cylindrical, with a crenate-toothed margin.

2 Marcgra'via. Calyx permanent, 6-parted. Corolla conical, entire.

Suborder II. Nora'nteæ. *Corolla of 5 petals. Stamens pressed to the corolla, and appear as if they were inserted in it.*

3 Nora'ntea. Calyx 5-7-parted. Corolla with reflexed petals. Stamens numerous, in one series.

4 Ru'yschia. Stamens 5, alternating with the petals. The rest as in *Norántea*.

Suborder I.

MARCGRAVIE'Æ plants agreeing with *Marcgràvia* in important characters). D. C. prod. 1. p. 565. Corolla in the shape of a hood. Stamens inserted in the receptacle.

I. ANTHOLO'MA (from *ανθος, anthos*, a flower, and *λωμα, loma*, a fringe; in allusion to the fringed or crenulated limb of corolla). Labill. nov. holl. 2. p. 121. D. C. prod. 1. p. 565.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 4, rarely of 2, ovate, caducous sepals. Corolla ovately cylindrical, with a crenate, rather toothed margin. Stamens about 100, inserted in a spongy disk; anthers oblong, bursting at the apex. Ovary bluntly 4-sided. Style long, crowned by an acute stigma. Unripe fruit 4-celled, and probably capsular—A tree, with elliptical-oblong, coriaceous, stalked leaves, which are scattered at the top of the branchlets. Racemes of flowers axillary, somewhat umbellate, reflexed, with naked peduncles.

1 A. monta'na (Labill. voy. t. 41.). ♄. G. Native of New Caledonia. Flowers white?

Mountain Antholoma. Clt. 1810. Tree 20 feet.

Cult. This fine tree will thrive best in a light loamy soil, mixed with a little peat, and ripened cuttings will root in sand under a hand-glass.

II. MARCGRA'VIA (in honour of George Marcgrave, who was born at Leipstadt in Germany; he published a Natural History of Brazil in 1718, wherein many singular plants are mentioned). Plum. amer. 29. Lin. gen. 640. Juss. gen. 244. D. C. prod. 1. p. 566.

Lin. syst. *Polyándria, Monogýnia.* Calyx 6-parted, permanent, ovate-roundish, coriaceous, imbricate, unequal. Corolla coriaceous, conical, entire at the apex. Stamens in 1 row, inserted in a little membrane which surrounds the ovary; anthers oblong, bursting lengthwise. Style almost wanting. Stigma thick, permanent. Capsule coriaceous, baccate, somewhat globose.—Shrubs commonly with ascending stems, as in the ivy, with the flower-bearing branches pendulous. Leaves alternate. Peduncles furnished with pitcher-shaped bracteas. Flowers white?

1 M. umbella'ta (Lin. spec. 503.) leaves sessile, ovate-elliptical, acute, hardly veined, those on the sterile branches ovate, blunt; peduncles umbellate, usually tubercled and furnished with spoon-shaped bracteas. ♄. S. Native of the Caribbee Islands and South America in cool, wooded mountains. Jacq. amer. p. 156. t. 96. ed. pict. 77. t. 143. Plum. gen. 7. t. 173. f. 1. Lam. ill. t. 447.—Browne, jam. 244. t. 26.—Sloan. jam. 1. p. 74. t. 28. f. 1. This is a shrubby, creeping plant, but not properly parasitical, at first it is radicant, but as it advances in age it becomes shrubby, but adhering still by its fibres to the trunks of trees. Leaves distich. The seeds and pulp are usually of a shining-scarlet colour.

Umbellate-flowered Marcgravia. Clt. 1792. Shrub rooting, attached to trees.

2 C. coria'cea (Vahl. eccl. 2. p. 39.) leaves elliptical, coriaceous, veinless; pedicels in whorles to the number of 17 or 18, spreading much, tubercled; ovary depressed, globose; stigma 6-cleft, convex, rayed. ♄. S. Native of Guiana in woods. This shrub has the habit of the last.

Coriaceous-leaved Marcgravia. Clt. 1820. Shrub like the last.

3 M. spiciflòra (Juss. ann. mus. 14. p. 402. t. 25.) leaves ovate, obtuse, rarely acuminated; pedicels racemose, furnished with simple bracteas; stigma 4-lobed. ♄. S. Native of Guiana and Guadaloupe on wooded mountains. Habit of ivy.

Spiked-flowered Marcgravia. Shrub rooting like the rest.

4 M. pi'cta (Willd. mag. berl. 1808. p. 172.) leaves of the sterile branches elliptical, cordate, roundish, very blunt, about an inch long, dark-green above, and netted with white veins, but pale-green beneath (Willd.). ♄. S. Native of Brazil. Shrub with the habit of ivy.

Painted-leaved Marcgravia. Shrub rooting like the rest.

Cult. These singular shrubs will thrive well in a mixture of turfy loam and peat, and cuttings will root in sand under a hand-glass, in heat. They are well adapted for covering the walls or rafters of stoves.

Suborder II.

NORA'NTEÆ (plants agreeing with *Norántea* in the corolla being of 5 petals). D. C. prod. 1. p. 566. Corolla of 5 petals. Stamens pressed to the corolla and appearing as if they were inserted on it.

III. NORA'NTEA (altered from the Caribbean name of *N. Guianénsis, Gonora-antegri*). Aubl. guian. 1. p. 554. Juss. gen. p. 245. D. C. prod. 1. p. 566.—A'scyum, Vahl. Willd.

Lin. syst. *Polyándria, Monogýnia.* Calyx 5-parted, rounded, coriaceous. Petals 5, free, reflexed. Stamens few or numerous, small, disposed in a simple or double series, adhering to the bottom of the petals. Filaments flat. Anthers fixed by the back. Ovary free, conical, furrowed, 3-5-celled; cells many-seeded. Seeds fixed to the central axis. Style nearly wanting. Stigma capitate or acute. Trees or shrubs, rarely climbing or rooting, excepting those species, natives of Guiana. Leaves scattered, jointed, entire, exstipulate. Flowers disposed in terminal racemes or spikes. Pedicels jointed at the base, furnished with 3 bracteas each, lower one sack-formed or cucullate, stalked, the 2 upper ones small, usually guarding the calyx, and therefore appear as if they were sepals.

1 N. Guiane'nsis (Aubl. guian. 1. p. 554. t. 220.) spikes of flowers long; flowers nearly sessile; bracteas large, bladdery, or cucullate; anthers numerous, very minute, scarcely exserted; leaves oblong, blunt, emarginate. ♄. S. Native of Guiana and Trinidad in woody mountains. A'scyum violàceum, Vahl. ecl. p. 41. A beautiful shrub, with oblong, mucronate, coriaceous leaves. Branches red, throwing out roots by which it supports itself on the trees which it grows near. Flowers of a violet colour, with scarlet bracteas.

Guiana Norantea. Clt. 1818. Shrub rooting on trees.

2 N. Brasilie'nsis (Chois. mss. D. C. prod. 1. p. 566. St. Hil. fl. bras. 1. p. 311.) leaves obovate, stalked; flowers racemose, on long peduncles; bracteas about one-half the size of those of the preceding plant; anthers ovate, emarginate at the base, with scarlet bracteas; petals green in the middle but white on the margins. ♄. S. Native of Brazil. Habit of the preceding species.

Brazilian Norantea. Clt. 1820. Shrub 6 feet.

3 N. adame'ntum (St. Hil. fl. bras. 1. p. 313. t. 62.) leaves obovate, nearly sessile; flowers racemose, on long pedicels; anthers ovate, emarginate at the base. ♄. S. Native of Brazil in the province of Minas Geraes near Tejuco, in the district of the Diamonds. Petals green marked with red.

Adamant Norantea. Shrub 6 feet.

4 N. Goyase'nsis (St. Hil. fl. bras. 1. p. 313.) leaves obovate, nearly sessile; flowers racemose, on short pedicels; anthers subtrigonal, entire at the base. ♄. S. Native of Brazil in the province of Goyaz near Villa Boa. Petals dark-purple.

Goyaz Norantea. Fl. July. Shrub 5 to 6 feet.

5 N. ano'mala (H. B. et Kunth, nov. gen. amer. 7. t. 647. b.) flowers somewhat spiked, octandrous; bracteas hemispherical, helmet-shaped; leaves oblong, obtuse, somewhat coriaceous, tapering to the base. ♄. S. Native of South America. A'scyum anómalum, Spreng. syst. app. p. 207. Flowers violet-coloured. Habit of the preceding two species.

Anomalous Norantea. Shrub 4 to 6 feet.

6 N. Sellòi; flowers racemose; bracteas almost sessile, rather remote from the flower, roundish; leaves obovate-oblong, retuse. ♄. S. Native of Brasil. A'scyum Sellòi, Spreng. syst. 2. p. 599.

Sello's Norantea. Shrub 6 feet.

7 N. Berte'rii; flowers racemose; bracteas sessile, approximating the flower, mucronated beneath; leaves oblong, mucro-

nated, of a different colour beneath. ♄. S. Native of the West Indies. A'scyum Bertèrii, Spreng. syst. 2. p. 599.

Bertero's Norantea. Shrub 6 to 8 feet.

8 N. OBOVA'TA; leaves nearly sessile, obovate, entire, terminated by a small mucrone; bracteas cucullate at the base, and bifid at the apex, equal in length to the pedicel; calyx one-half shorter than the corolla. ♄. S. Native of Peru. Marcgràvia obovàta, Ruiz et Pav. fl. per. 5. t. 437. Flowers large, disposed in corymbose racemes.

Obovate-leaved Norantea. Shrub 6 to 8 feet.

9 N. CORDACHI'DA; leaves oblong-lanceolate, entire, acute, tapering to the base; flowers disposed in long terminal racemes; pedicels 2 together, one of which is very short; fruit obovate. ♄. S. Native of Peru. Marcgràvia cordachìda, Ruiz et Pav. fl. per. 5. t. 438. A.

Cordachida Norantea. Shrub 6 to 8 feet.

10 N. CACABI'FERA; leaves oblong or obovate-lanceolate, obtuse, mucronate; racemes long; flowers 2 together, the one sessile, the other pedicellate. ♄. S. Native of Peru. Marcgràvia cacabífera. Ruiz et Pav. fl. per. 5. t. 439.

Kettle-bearing Norantea. Shrub 6 feet.

11 N. MACROCA'RPA; leaves obovate-oblong, mucronate, on short petioles; flowers corymbose, terminal; pedicels long; petals reflexed; fruit large. ♄. S. Native of Peru. Marcgràvia macrocárpa, Ruiz et Pav. fl. per. 5. t. 436.

Large-fruited Norantea. Shrub.

Cult. *Norántea* is a genus of beautiful and singular shrubs. They will thrive well in a mixture of loam and peat, and cuttings will root readily in sand or mould under a hand-glass, in a moist heat.

IV. RU'YSCHIA (in honour of Frederick Ruysch, a Dutch physician, who published Hortus Amsteladamensis, a posthumous work of John Commelin; he died 1731). Jacq. amer. p. 75. D. C. prod. 1. p. 566. Souróubea, Aubl. guian. 1. p. 244.

LIN. SYST. *Pentándria, Monogýnia.* Stamens 5, alternating with the petals; the rest as in the preceding genus.

1 R. SOURÓUBEA (Willd. spec. 1116.) leaves obovate, obtuse, on short petioles; flowers in loose spikes; peduncles elongated, with sessile bracteas, which approximate the calyx, each of which are furnished with 2 long auricles. ♄. S. Native of Guiana in woods on the banks of the river Gallion. Souróubea Guianénsis, Aubl. guian. 1. p. 244. t. 97. Souróubea Aublètii, Meyr. esseq. prim. p. 119. Logània pentácrina, Scop. introd. gen. 1076. A sarmentose shrub, with long, round, divaricating, flexile, rambling, rooting branches. Leaves alternate, acuminated at the base, but emarginate at the apex, with a mucrone in the middle, smooth, fleshy. Racemes terminal, simple, long, many-flowered. Flowers alternate, somewhat remote from each other. Calyx 5-6-parted. Bracteas opposite, scarlet. Petals oblong, deciduous, yellow. Filaments red; anthers brown. Stigma fleshy, flat, 5-rayed. *Souroubea* is the Guiana name of the plant.

Souroubea Ruyschia. Shrub rambling, and rooting on trees.

2 R. CLUSIÆFÒLIA (Jacq. amer. p. 75. t. 51. f. 2.) leaves obovate; flowers densely spiked; peduncles very short; bracteas not cucullate, but concave on the outside. ♄. S. Native of Guiana and the Caribbee islands in moist woods. Jacq. amer. ed. pict. t. 76. This is a parasitical under-shrub. Leaves alternate, thick, shining, about 4 inches long. Racemes terminal, many-flowered, about a foot long; bracteas obovate, acute, thick, deflexed, concavo-convex, scarlet, dotted with red. Petals purple, deciduous. Filaments purple. Stigma 5-rayed.

Clusia-leaved Ruyschia. Clt. 1823. Shrub rooting on trees like ivy.

3 R. PAVÒNII; leaves obovate, mucronate, with revolute margins; racemes terminal; pedicels single, bracteate; flowers pentandrous. ♄. S. Native of Peru. Marcgràvia pentándra, Ruiz et Pav. fl. per. 5. t. 440.

Pavon's Ruyschia. Shrub.

Cult. These pretty radicant shrubs will thrive well in a mixture of loam and vegetable mould, and ripened cuttings will root freely in sand under a hand-glass, in a moist heat.

ORDER XLIII. HIPPOCRATEA'CEÆ (plants agreeing with *Hippocràtea* in important characters). H. B. et Kunth, nov. gen. amer. 5. p. 135. D. C. prod. 1. p. 567.—Hippocratíceæ, Juss. in ann. du. mus. 18. p. 486.

Calyx of 5 (f. 105. *a.*), rarely of 4 or 6 sepals, small, and joined to the middle, permanent. Petals equal in number to the sepals (f. 105. *b.*), equal, somewhat imbricate in æstivation. Disk occupying the bottom of the calyx, expanded between the petals and the stamens. Stamens 3 (f. 105. *c.*), rarely 5 or 10; filaments free at the apex, dilated at the base (f. 105. *c.*). Anthers (ex Kunth) 1-celled, bursting transversely at the apex or 2-4 celled at the base. Ovary hidden within the urceolus or staminiferous tube, trigonal, free. Style 1, crowned by 1-3 stigmas. Fruit sometimes of 3 samara-like carpels, sometimes baccate, 1-3-celled. Seeds in each cell usually numerous, fixed by pairs to the central axis, erect, exalbuminous, often solitary from abortion. Embryo straight, with an inferior radicle pointing to the base, and flat, elliptic, oblong, fleshy cotyledons.—Arborescent or climbing shrubs, usually smooth, with opposite, entire, toothed, feather-nerved, rather coriaceous, stipulate leaves, and axillary corymbs or fascicles of small, inelegant flowers. According to Jussieu, this order is allied to *Acerineæ* in the ternary number of the stamens. It differs from all the foregoing orders in the singular form of the disk or urceolus, which is either separate from the stamens or formed from the cohesion of the filaments.

Synopsis of the Genera.

1 HIPPOCRATE'A. Petals foveate at the apex. Stamens 3; anthers 1-celled, opening transversely at the apex. Carpels 3, samara-like, or only 1-2 from abortion, 2-valved. Seeds winged downwards.

2 RADDI'SIA. Calyx of 5 sepals. Ring girding the ovary on the outside of the stamens. Stamens 3; anthers 2-celled. Capsule 3-celled; cells many-seeded.

3 SALA'CIA. Calyx 5-parted. Petals 5, with a fleshy urceolus between the petals and pistillum. Stamens 3; anthers adnate, 2-celled. Berry roundish, 3-celled, many-seeded.

4 CALY'PSO. Calyx 5-parted. Petals 5, with the urceolus expanded between the petals and stamens. Stamens 3; anthers adnate, 2-celled. Berry usually 1-celled from abortion, sometimes 3-celled; cells 1-seeded.

5 JO'HNIA. Anthers 3, seated on the top of the urceolus. Fruit baccate, younger ones 3-celled, with 1 or 2 peltate ovulæ in each cell, adult ones few-seeded.

† *Spurious Hippocrateàceæ, with stamens beyond 5.*

6 TRIGO'NIA. Calyx 5-parted, unequal. Petals 5, arched at the apex, 2 lateral ones wing-formed, 2 inferior ones connected in the form of a keel. Stamens 10-12, fertile, irregularly connected at the base. Capsule trigonal, 3-valved, 3-celled, woolly inside, containing many woolly seeds.

7 Lacepe'dea. Calyx 5-parted, unequal. Petals 5, unguiculate. Stamens 5; anthers 2-celled, bursting lengthwise. Ovary 3-celled. Stigma 3-parted. Berry tricuspidate from the styles, 6-9-seeded.

I. HIPPOCRATE'A (in honour of Hippocrates, the celebrated physician; he is regarded as one of the fathers of botany). Lin. gen. no. 54. D. C. prod. 1. p. 567.—Còa, Plum. gen. p. 8. t. 35.

Lin. syst. *Triándria, Monogýnia.* Calyx 5-parted (f. 105. *a.*). Petals 5 (f. 105. *b.*), inserted between the disk and the calyx. Stamens 3 (f. 105. *c.*), inserted between the disk and the ovary, or on the top of the disk; filaments flat, dilated at the base, free; anthers 1-celled, bursting transversely. Style short, with a continuous stigma. Ovary more or less immersed in the disk, 3-celled, each cell containing 2-6 ovulæ. Carpels 3, or from abortion only 1 or 2, compressed, 1-celled, 2-valved; valves keeled. Seeds oblong, compressed, winged downwards.—Trees or climbing shrubs, with twisted branches, opposite, entire leaves, very deciduous stipulas, and small insignificant flowers, disposed in dichotomous, axillary panicles, with the branchlets and pedicels furnished with bracteas.

1 H. obcorda'ta (Lam. ill. 1. p. 100. t. 28. f. 1.) carpels obcordate; racemes corymbose, shorter than the leaves; leaves ovate, lanceolate, serrated. ♄. ◡. S. Native of the Caribbee Islands and New Spain. H. scándens, Jacq. amer. 9. t. 9. Petals ovate, obtuse, greenish-yellow.

Obcordate-carpelled Hippocratea. Fl. July, Aug. Clt. 1793. Shrub cl.

2 H. uniflòra (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 567.) carpels obcordate; peduncles 1-flowered; leaves oblong, cordate at the base and entire. ♄. ◠. S. Native of Mexico. Petals ovate, obtuse, greenish-white.

One-flowered Hippocratea. Shrub cl.

3 H. ova'ta (Lam. ill. 1. p. 100. t. 28. f. 2.) carpels ovate; panicles axillary, somewhat dichotomous; leaves oblong-ovate or elliptical-serrated. ♄. ◠. S. Native of St. Domingo. Vahl. enum. 2. p. 27. H. volùbilis, Lin. syst. 84.—Plum. ed. Burm. 76. t. 88. but the carpels of this plant are rounder, and the leaves are narrower.

Var. β, oblongifòlia (D.C. prod. 1. p. 568.) leaves more oblong. ♄. ◠. S. Native of Porto-Rico.

Ovate-carpelled Hippocratea. Clt. 1793. Shrub cl.

4 H. læviga'ta (Rich. in Vahl. enum. 2. p. 27.) carpels?; panicles axillary, somewhat dichotomous; pedicels 2 together, 1-flowered in the forks; leaves ovate-oblong, obsoletely crenated. ♄. ◠. S. Native of Cayenne.

Smooth Hippocratea. Shrub cl.

5 H. affi'nis (St. Hil. fl. bras. 2. p. 103.) leaves elliptic, acutish, serrate-toothed, smooth; panicle clothed with rusty tomentum, usually crowned by a leaf; calyx pubescent, ciliated; petals 4-times longer than the calyx, oblong, obtuse, clothed with rusty down on the outside, and bearded on the inside. ♄. S. Native of Brazil near to the town of St. Paul. A sarmentose shrub.

Allied Hippocratea. Fl. Nov. Tree 30 to 40 feet, supporting itself on other trees.

6 H. micra'ntha (St. Hil. fl. bras. 2. p. 103.) leaves elliptic-oblong, acuminated, very obsoletely serrate-toothed, smoothish; panicle smooth, much branched, shorter than the leaves; calyx smooth, denticulated; petals 3 times longer than the calyx, elliptic-oblong, obtuse, smooth. ♄. ◡. S. Native of Brazil in the province of St. Paul in woods near Registro Velho. Petals yellowish.

Small-flowered Hippocratea. Fl. Dec. Shrub cl.

7 H. di'scolor (Meyer, prim. esseq. 19.) carpels ovate; panicles axillary, somewhat dichotomous, brown-velvety; smaller branches many-flowered; leaves oval, with short points, obsoletely crenate-serrated. ♄. S. Native of Guiana in woods by the sea-side. Leaves rusty beneath.

Two-coloured-leaved Hippocratea. Shrub 12 feet.

8 H. vi'ridis (Ruiz et Pav. fl. per. 1. p. 44. t. 74. f. a.) carpels oval, emarginate; corymbs dichotomous, shorter than the leaves; leaves ovate, bluntly acuminated, entire, and serrated. ♄. ◠. S. Native of Peru in groves on the Andes. Petals obtuse, greenish.

Green-flowered Hippocratea. Shrub cl.

9 H. acutiflòra (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 568.) carpels obovate; corymbs dichotomous, shorter than the leaves; petals acute; leaves oblong-oval, toothed. ♄. ◠. S. Native of Mexico. Petals greenish, acute, and appear as if they were bifoveolate at the apex. Anthers 4-lobed. Stigma simple.

Acute-flowered Hippocratea. Shrub cl.

10 H. celastroi'des (H. B. et Kunth, nov. gen. amer. 5. p. 136.) carpels roundish-ovate; corymbs dichotomous, smooth, one-half shorter than the leaves; petals roundish-obtuse; leaves lanceolate-oblong, each with an acute point. ♄. ◠. S. Native of Mexico near Venta del Estola. Flowers greenish-white.

Celastrus-like Hippocratea. Shrub cl.

11 H. Acapulce'nsis (H. B. et Kunth, nov. gen. amer. 5. p. 136.) carpels obovate; peduncles dichotomous, many-flowered, smooth, about equal in length with the leaves; petals ovate; leaves obovate, oblong, each with a short point; branches warted. ♄. ◠. S. Native of New Granada. Flowers greenish-white.

Acapulca Hippocratea. Shrub cl.

12 H. verrucòsa (H. B. et Kunth, nov. gen. amer. 5. p. 136.) carpels obovate; peduncles much branched, dichotomous, many-flowered, smooth, about equal in length with the leaves; petals ovate; leaves elliptical-oblong, acutish, remotely serrulated; branches warted. ♄. ◠. S. Native of New Granada. Flowers greenish-white.

Warted-branched Hippocratea. Shrub cl.

13 H. malpighiæfòlia (Rudge, pl. guian. 10. t. 8.) carpels? panicles axillary and terminal; leaves narrow-oval, quite entire, acuminated, rough beneath, as well as the branches. ♄. ◠. S. Native of Guiana. Anthers 4-lobed.

Malpighia-leaved Hippocratea. Shrub cl.

14 H. comòsa (Swartz, fl. ind. occ. 1. p. 77.) carpels oblong or obovate; peduncles of panicles multifid, capillary; leaves ovate, acuminated, quite entire, obtuse at the base or rather cordate. ♄. ◠. S. Native of Hispaniola in the remote parts of woods. Carpels 2 or 3 inches long. Flowers white.

Tufted Hippocratea. Shrub cl.

15 H. emargina'ta (Rudge, pl. guian. p. 11. t. 9.) carpels? panicles axillary, short, dichotomous; leaves obovate, quite entire, emarginate; stem rough, with minute warts. ♄. ◠. S. Native of Guiana. Anthers roundish. (f. 105.)

Emarginate-leaved Hippocratea. Shrub cl.

16 H. panicula'ta (Vahl. enum. 2. p. 28.) carpels? panicles axillary, dichotomous, shorter than the leaves; leaves oblong, acute at both ends, bluntly serrated. ♄. ◠. S. Native of Sierra Leone on the mountains. Branches spreading much, rather compressed at the top.

FIG. 105.

Panicled-flowered Hippocratea. Shrub cl.

17 H. Richardia'na (St. Hil. fl. bras. 2. p. 102.) leaves elliptic-oblong, bluntish, nearly entire, smooth; panicles puberulous, equal in length with the leaves; calyx puberulous, ciliated; petals much longer than the calyx, acutish, puberulous; capsule obovate, obtuse, 4-seeded. ♄. ⌒. S. Native of Senegal.

Richard's Hippocratea. Shrub cl.

18 H. macrophy'lla (Vahl. enum. 2. p. 28.) carpels? panicles axillary, dichotomous, shorter than the leaves; leaves ovate, quite entire, shining, blunt at the base, but acuminated at the apex. ♄. ⌒.? S. Native of Sierra Leone. Leaves pale-green, as in the preceding species.

Long-leaved Hippocratea. Shrub cl.?

19 H. veluti'na (Afz. in Spreng. new entd. 3. p. 234.) carpels? racemes axillary; leaves oblong, acuminated, quite entire, veiny beneath, as well as being clothed with rufous villi. ♄. S. Native of Guinea.

Velvety Hippocratea. Shrub 6 feet?

20 H. I'ndica (Willd. spec. 1. p. 193.) carpels oblong, 2-seeded; panicles corymbose, dichotomous, about the length of the leaves; leaves oval, acute, serrated, shining. ♄. ⌒. S. Native of Coromandel on wooded mountains. Roxb. cor. 2. t. 130. Flowers yellowish.

Var. β, dispérma (Vahl. enum. 2. p. 28.) carpels lanceolate, obtuse at both ends; panicles shorter than the leaves; leaves elliptical, acuminated, serrulated. ♄. ⌒. S. Native of the East Indies in woody mountains.

Var. γ, euonymoìdes (Vahl. enum. 2. p. 28.) leaves oblong or obovate, entire or emarginate at the apex. ♄. ⌒. S. Flowers greenish-white.

Indian Hippocratea. Shrub cl.

21 H. obtusifòlia (Roxb. fl. ind. 1. p. 170.) carpels obovate, 4-seeded; corymbs terminal and axillary; leaves elliptical-oblong, entire, blunt; branches tendrilled. ♄. ⌒. S. Native of Coromandel. Flowers greenish-yellow. Anthers 2-lobed.

Blunt-leaved Hippocratea. Clt. 1818. Shrub cl.

22 H. arbòrea (Roxb. cor. 3. t. 205.) carpels linear-oblong, somewhat cuneated, 2-seeded; corymbs axillary, dichotomous; leaves elliptical, serrulated, terminating in a point; branches somewhat climbing. ♄. S. Native of Hindostan. Flowers 4-6-cleft, greenish-yellow. Anthers 4-lobed.

Tree Hippocratea. Clt. 1818. Tree 20 feet.

23 H.? cassinoi'des (D. C. prod. 1. p. 569.) carpels? corymbs axillary, dichotomous, 3 times shorter than the leaves; leaves elliptical, acuminated at both ends, somewhat serrulated, rather membranaceous; branches compressed at the apex. ♄. S. Native of the Island of Timor.

Cassine-like Hippocratea. Shrub 6 feet?

24 H.? pauciflòra (D. C. prod. 1. p. 565.) carpels? corymbs axillary, dichotomous, 5-7-flowered, scarcely longer than the petioles; leaves elliptical-oblong, very bluntly crenulated. ♄. ⌒? S. Native of the Island of Timor. Flowers 4 lines in diameter. Anthers somewhat 4-lobed.

Few-flowered Hippocratea. Shrub cl.

25 H. elli'ptica (H. B. et Kunth, nov. gen. amer. 5. p. 138.) carpels? peduncles clothed with very fine down, dichotomously quadrifid, shorter than the leaves; leaves elliptical, acute, remotely crenate-serrulated; branches quadrangular. ♄. ⌒? S. Native of Mexico. Flowers greenish-white.

Elliptical-leaved Hippocratea. Shrub cl.?

26 H. exce'lsa (H. B. et Kunth, nov. gen. amer. 7. p. 136.) carpels? peduncles bifid, many-flowered, powdery-hairy, 3 or 4 times shorter than the leaves; leaves elliptical-oblong, acuminated, wavy-crenulated; younger branches quadrangular; stem arboreous. ♄. S. Native of Mexico. Flowers yellow.

Tall Hippocratea. Tree 20 feet.

Cult. These shrubs are hardly worth cultivating unless in botanic gardens; the flowers being very minute, and without beauty. The species will thrive in a mixture of loam and peat, and ripened cuttings will root in sand under a hand-glass, in heat.

II. RADDI'SIA (in honour of Giuseppe Raddi, an Italian botanist and traveller in Brazil, author of Novæ Species Cryptogamicæ Firenze, 1808, and other works). Leand. sacram. in denk. sckr. munch. akad. 7. p. 244. t. 15. ex Schult. mant. 1. p. 252. D. C. prod. 1. p. 570.

Lin. syst. *Triándria, Monogýnia.* Calyx of 5 sepals. Corolla rotate, 5-cleft, with a ring girding the ovary on the outside of the stamens. Stamens 3, with linear filaments, and 2-celled anthers? Pistil longer than the stamens. Style short. Capsule 3-celled; cells many-seeded. Seeds rather globose, fixed to the central axis. This genus is perhaps sufficiently distinct from *Salàcia*.

1 R. arbòrea (Leand. l. c. Schrank. l. c. p. 244. ex Schult. mant. 1. p. 347.) ♄. S. Native of Brazil on the borders of Islands at the entrance to Rio Janeiro. Leaves elliptical, acute, smooth, serrated on short stalks. Flowers small, axillary, solitary or aggregate, greenish-yellow.

Tree Raddisia. Tree 20 feet.

Cult. This tree bears very insignificant flowers; therefore not worth cultivating except in botanic gardens. It will thrive in a mixture of loam and peat, and ripened cuttings will root in sand under a hand-glass, in heat.

III. SALA'CIA (from Salacia in mythology, wife of Neptune). Lin. mant. 293.—Toutèlea, Aubl. guian. 1. p. 31.—Tonsélla, Schreb. gen. no. 74.—Sicèlium, R. Brown, ex Poir. suppl. 5. p. 146.—A'nthodon, Ruiz et Pav. fl. per. 1. p. 45. D. C. prod. 1. p. 569.—A'nthodus, Mart. in Schult. mant. 1. p. 253.

Lin. syst. *Triándria, Monogýnia.* Calyx 5-parted; lobes rounded. Petals 5, entire or toothed, inserted between the disk and the ovary. Stamens 3, inserted between the disk and the ovary; filaments dilated at the base, free; anthers terminal, 1-celled, opening transversely at the apex. Style short or wanting. Stigma 3-lobed. Ovary more or less immersed in the disk, 3-celled, containing from 2 to 10 ovulæ in each cell, which are fixed to the inner angle of the cells, disposed in a double or triple series. Berry somewhat globose, fleshy, 2-3-celled; cells 1-seeded from abortion. Seeds ovate, enwrapped in mucilage. —Small trees and shrubs, rarely climbing, with entire leaves, deciduous stipulas; axillary, dichotomous panicles of greenish or yellowish flowers, or umbellate from abortion.

§ 1. A'nthodon (from *ανθος, anthos,* a flower, and *οδους οδοντος, odous odontos,* a tooth; petals toothed). Petals fringed or toothed (f. 105. *b.*).

1 S. decussa'ta (Ruiz et Pav. fl. per. 1. t. 74. f. 2. under *A'nthodon,*) leaves oblong-ovate, somewhat acuminated, bluntly serrated, shining; panicles axillary, dichotomous; petals ovate-oblong, sharply serrated. ♄. S. Native of Peru in groves on the Andes, and near Angustura, ex. H. B. et Kunth, nov. gen. amer. 5. p. 140. t. 443. Hippocratèa? A'nthodon, Pers. ench. 1. p. 40. Tonsélla decussàta, Vahl. enum. 1. p. 30.

Decussate-leaved Salacia. Shrub 6 feet.

2 S. panicula'ta (Mart. l. c. under *A'nthodus,*) leaves ovate, bluntish, obsoletely and rather undulately-crenated; flowers panicled; petals oval, unequally and remotely toothed. ♄. S. Native of Brazil at Rio Janeiro. All other particulars unknown, as well as those of the following.

Panicled-flowered Salacia. Clt. 1818. Shrub 6 feet.

3 S. undula'ta (Mart. l. c. under *A'nthodus,*) leaves elliptic, acute, tapering to both ends, bluntly, and rather undulately-ser-

rated; peduncles 3-5-flowered, axillary, short; calycine segments roundish, entire; petals obovate-roundish, fringe-toothed, 3 times longer than the calyx. ♄. S. Native of Brazil at Rio Janeiro. Shrub decumbent. Petals greenish-yellow.

Waved-leaved Salacia. Shrub 6 feet.

4 S. elli'ptica (Mart. l. c. under *A'nthodus*,) leaves thick, elliptic, rounded at both ends, with thickened, entire margins; flowers axillary and lateral, on short peduncles, in bundles; petals obovate-orbicular, serrulated. ♄. S. Native of Brazil at Rio Janeiro.

Elliptical-leaved Salacia. Clt. 1818. Shrub 6 feet.

5 S. Vahlia'na (St. Hil. fl. bras. 2. p. 105, in a note,) leaves elliptic-ovate, acuminated, quite entire, scabrous on both surfaces; calycine segments oblong-linear, acutish, clothed with grey tomentum; petals equal in length with the calyx, obovately-roundish, fringed. ♄. ◡. S. Native of Trinidad. Tontàlia scándens, ex herb. Vahl. but not of Aubl.

Vahl's Salacia. Shrub cl.

6 S. multiflòra (St. Hil. fl. bras. 2. p. 109.) leaves elliptic-oblong, acute, serrate-toothed; calycine segments ovate-roundish, ciliated; petals oblong, acutish, denticulated, 3 times longer than the calyx; cells of ovary 7-ovulate. ♄. S. Native of Brazil in the province of Goyaz. Petals clothed with rusty tomentum.

Many-flowered Salacia. Shrub 6 feet.

7 S. grandifòlia (Mart. l. c. under *A'nthodus*,) leaves thick, oblong, obtuse, quite entire; flowers axillary and lateral, aggregate, on very short peduncles; petals ovate-orbicular, toothletted. ♄. S. Native of Brazil at Rio Janeiro.

Great-leaved Salacia. Shrub 6 feet.

8 S. oblongifòlia (Mart. l. c. under *A'nthodus*,) leaves thick, oblong, bluntish, remotely and undulately crenated in front; flowers axillary and lateral, aggregate; petals obovate-oblong, toothletted. ♄. S. Native of Brazil in the province of Bahia, in woods at the river St. Francisco.

Oblong-leaved Salacia. Shrub 6 feet.

9 S. glomera'ta (Mart. l. c. under *A'nthodus*,) leaves thick, oblong-lanceolate, bluntish; flowers glomerated, axillary and lateral, sessile; petals orbicular, hardly toothletted. ♄. S. Native with the preceding species.

Glomerate-flowered Salacia. Shrub 6 feet.

10 S. Brasilie'nsis; leaves ovate, acute, quite entire, shining above, white-tomentose beneath; cymes axillary; petals fringed, villous inside. ♄. S. Native of Brazil. Tonsélla Brasiliénsis, Spreng. syst. 1. p. 177.

Brazilian Salacia. Shrub 6 feet.

11 S. trine'rvia; leaves oblong, acuminated, quite entire, triple-nerved, smooth on both surfaces; panicles terminal; petals fringed, villous inside. ♄. S. Native of Brazil. Tonsélla trinérvia, Spreng. syst. 1. p. 177.

Three-nerved-leaved Salacia. Shrub 6 feet.

12 S. micra'ntha (Mart. l. c. under *A'nthodus*,) leaves thick, linear-oblong, obtuse, quite entire; panicles axillary and terminal, few-flowered; petals obovate, hardly toothletted. ♄. S. Native of Brazil in the province of Bahia, in woods at Catingas.

Small-flowered Salacia. Shrub 6 feet.

13 S. crassifòlia (Mart. l. c. under *A'nthodus*,) leaves thick, somewhat marginated, elliptic-linear; flowers glomerated, sessile, axillary, and lateral: petals obovate-orbicular, quite entire. ♄. S. Native of Brazil in the province of Coyaz towards Vao la Paraxa.

Thick-leaved Salacia. Shrub 6 feet.

14 S. læviga'ta (D. C. prod. 1. p. 570.) panicles axillary, multifid; petals ciliated; leaves stalked, oblong, acute, somewhat waved, quite entire, smooth, but roughish beneath; branches smooth. ♄. S. Native of? Tonsélla lævigàta, Hoffmans. in Link. jahrb. 3. p. 68. ex Schult. mant. 1. p. 347. Very like the preceding species. Petals fringed.

Smooth Salacia. Shrub 6 feet.

15 S. prinoìdes (D. C. prod. 1. p. 571.) peduncles axillary, crowded, elongated, 1-flowered? Leaves elliptical, obtuse, obsoletely serrated at the apex; petals fringed. ♄. S. Native of the East Indies. Tonsélla prinoìdes, Willd. act. nat. berl. 4. p. 184. Berry 1-seeded.

Prinos-like Salacia. Shrub 6 feet.

16 S. velutì'na (St. Hil. fl. bras. 2. p. 108.) leaves oblong-lanceolate, acutish, or rounded at the apex, quite entire, velvety above; panicle nearly sessile, short; calycine segments ovate-roundish, rather ciliated; petals oblong, elliptic, twice the length of the calyx, erose; cells of ovary 2-ovulate. ♄. S. Native of Brazil in the province of Minas Geraes. Petals green. Stems many from the root.

Velvety Salacia. Fl. Sept. Shrub 2 to 3 feet.

17 S. erythroxyloìdes (St. Hil. fl. bras. 2. p. 106.) leaves elliptic, obtuse, quite entire; flowers umbellate, pedicellate; calycine segments roundish, erose; petals roundish-elliptic, erose; cells of ovary 5-ovulate. ♄. S. Native of Brazil in the province of Minas Geraes. Petals dirty-yellow.

Erythroxylum-like Salacia. Tree 15 feet.

§ 2. *Salácia* (*see Genus*). *Petals entire.*

18 S. sca'bra (D. C. prod. 1. p. 570.) panicles axillary and terminal, dichotomous, clothed with grey tomentum; leaves ovate-oblong, entire, veiny beneath and rough. ♄. ◡. S. Native of Cayenne and the Island of Trinidad in woods. Tontèlea scándens, Aubl. guian. 1. p. 31. t. 10. Hippocratèa áspera, Lam. illus. 1. p. 101. Tonsélla scàbra, Vahl. enum. 29.

Scabrous Salacia. Fl. Aug. Sept. Clt. 1824. Shrub cl.

19 S. calypsoi'des (St. Hil. fl. bras. 2. p. 107.) leaves obovate, elliptic, short-acuminate, quite entire; panicle sessile, short; calycine segments ovate, obtuse; petals elliptic-roundish, twice the length of the calyx, quite entire; cells of ovary 2-ovulate. ♄. S. Native of Brazil in the province of Rio Janeiro. Petals green.

Calypso-like Salacia. Fl. Sept. Shrub 4 feet.

20 S. obtusifòlia (St. Hil. fl. bras. 2. p. 105.) leaves oblong, obtuse, quite entire; flowers umbellate, pedicellate; calycine segments ovate-roundish, ciliated; petals twice the length of the calyx, elliptic, obtuse, quite entire; cells of ovary 2-ovulate. ♄. S. Native of Brazil in the province of Goyaz. Petals brownish-yellow.

Var. β, parviflòra; flowers much smaller and on shorter pedicels.

Obtuse-leaved Salacia. Fl. Aug. Tree 15 feet.

21 S. multiflòra (D. C. prod. 1. p. 570.) peduncles crowded, usually 3-flowered; leaves obovate, quite entire, shining. ♄. S. Native of Cayenne in woods. Hippocratèa obovàta, Rich in act. soc. hist. nat. par. 1. p. 106. Hippocratèa multiflòra, Lam. ill. 1. p. 101.

Many-flowered Salacia. Shrub 6 feet.

22 S. ra'dula (Spreng. syst. 1. p. 177. under *Tonsélla*) leaves elliptical, coriaceous, very smooth, quite entire; cymes axillary; branches with rough spots. ♄. S. Native of Brazil.

Rasp-branched Salacia. Shrub 6 feet.

23 S. Cochinchine'nsis (Lour. fl. coch. 526.) peduncles axillary, crowded, 1-flowered; leaves ovate, somewhat acuminated, rather serrated; petals roundish. ♄. G. Native of Cochin-china among bushes. Flowers of a reddish-yellow colour.

Cochin-china Salacia. Shrub 6 feet.

24 S. serra'ta (St. Hil. fl. bras. 2. p. 109.) leaves elliptic, long-acuminated, sharply serrated; panicle nearly sessile, short; calycine segments ovate-roundish, ciliated; cells of ovary

2-ovulate. ♄. ◡. S. Native of Brazil in the province of Minas Geraes. Petals yellow.

Serrated-leaved Salacia. Fl. Jan. Shrub cl.

25 S. Chine'nsis (Lin. mant. 293.) peduncles axillary, crowded, 1-flowered; leaves alternate? oval, quite entire, smooth; branches angular. ♄. G. Native of China. Probably the same as *S. Cochinchinénsis*.

China Salacia. Shrub 6 feet.

Cult. Shrubs of no beauty, therefore hardly worth cultivating, except in general collections. They will thrive in a mixture of loam and peat, and ripened cuttings will root in sand under a hand-glass, those of the stove species in heat.

IV. CALY'PSO (in mythology daughter of Oceanus and Thetis; she reigned in the island of Ogygia). Pet. Th. veg. afr. 1. p. 29. t. 6. St. Hil. fl. bras. 2. p. 110. Salàcia, spec. D. C. prod. 1. p. 570.

Lin. syst. *Triándria, Monogýnia.* Calyx 5-parted. Petals 5, alternating with the segments of the calyx. Disk girding the ovary, expanded between the petals and stamens. Stamens 3, inserted between the margin of the disk and ovary; filaments flat, free. Anthers adnate, 2-celled; cells bursting outwards. Style short, crowned by an obsoletely 3-lobed stigma. Ovary more or less immersed in the disk, 3-celled; cells 2 or many-ovulate; ovulæ fixed to the inner angle of the cells. Fruit indehiscent, fleshy, globose, usually 1-celled from abortion. Seeds globose, solitary in the cells, clothed with mucilaginous pulp. Embryo straight, destitute of albumen, with thick cotyledons.—Shrubs with opposite, entire leaves, deciduous stipulas, axillary, dichotomous panicles of flowers, or from abortion subumbellate.

1 C. campe'stris (St. Hil. fl. bras. 2. p. 111. t. 104.) quite smooth; leaves oblong or oblong-lanceolate, narrow at the apex, somewhat acuminated, serrate-toothed; flowers panicled; petals twice the length of the calyx, denticulated; cells of ovary 2-ovulate. ♄. S. Native of Brazil in the provinces of Goyaz and St. Paul, where it is called *Bacopari do Campo*. This is a much-branched shrub, with green flowers.

Field Calypso. Fl. Sept. Feb. Shrub 2 to 3 feet.

2 C. Africa'na (D. C. prod. 1. p. 570. under *Salàcia*) peduncles crowded, 1-flowered; leaves oval, shining, toothletted; teeth somewhat glandular. ♄. S. Native of Guinea. Tonsélla Africàna, Willd. spec. 1. p. 194.

African Calypso. Shrub 5 feet.

3 C. Senegale'nsis (D. C. prod. 1. p. 570. under *Salàcia,*) peduncles crowded, 1-flowered, rising from an axillary tubercle; leaves oblong, acuminated, smooth, shining, serrated; branches scabrous. ♄. S. Native of Senegal. Hippocratèa Senegalénsis, Lam. ill. p. 101. H. verticillàta *a,* Pers. ench. 1. p. 40. Tonsélla Senegalénsis, Vahl. enum. 2. p. 31. Fruit eatable, very sweet.

Senegal Calypso. Shrub 5 feet.

4 C. pyrifórmis; peduncles axillary, 1-flowered, aggregate; leaves oblong, slightly toothed; fruit large, pear-shaped, 3-celled, 3-seeded. ♄. S. Native of Sierra Leone on the mountains, Flowers small, greenish-yellow. The fruit is about the size of a Bergamot pear, obscurely 3-sided, with a very sweet taste, and is eaten by the inhabitants of Sierra Leone. Tonsélla pyrifórmis, Hort. trans. vol. 5. p. 459.

Pear-shaped Calypso. Fl. Feb. Mar. Clt. 1822. Sh. 5 ft.

5 C. Madagascarie'nsis (D. C. prod. 1. p. 570. under *Salàcia;*) peduncles crowded, 1-flowered, rising from an axillary tubercle; leaves lanceolate-oblong, almost entire, acuminated, even, shining; petals linear. ♄. S. Native of Madagascar. Hippocratèa Madagascariénsis, Lam. ill. 1. p. 101. Hippocratèa verticillàta *β*, Pers. ench. 1. p. 40. Tonsélla Madagascariénsis, Vahl. enum. p. 29.

Madagascar Calypso. Shrub 6 feet.

6 C. salacioìdes (St. Hil. fl. bras. 2. p. 111.) peduncles usually in threes, 1-flowered, rising from an axillary tubercle; leaves oval-oblong, slightly and bluntly toothed, veiny; petals ovate. ♄. S. Native of Madagascar. Calýpso, Pet. Th. veg. afr. 1. p. 29. t. 6. Salàcia Calypso, D. C. prod. 1. p. 571. Berry globose, mucronate. Seeds albuminose (Pet. Th.).

Salacia-like Calypso. Shrub 5 feet.

7 C. de'bilis; branches weak; leaves ovate, acuminated, serrated; flowers in clusters in the axils of the leaves; pedicels 1-flowered. ♄. S. Native of Sierra Leone.

Weak-branched Calypso. Shrub cl.

8 C. ere'cta; branches erect; leaves oval-lanceolate, acuminated, obtuse, serrated, smooth; flowers axillary, nearly sessile; fruit ovate, acuminated. ♄. S. Native of Sierra Leone.

Erect Calypso. Shrub 6 feet.

Cult. These shrubs will thrive well in a mixture of loam and sand, and ripened cuttings will strike root freely in sand under a hand-glass, in heat.

V. JO'HNIA (in honour of the Rev. Dr. John, a missionary, once resident in Tranquebar, who has sent many curious plants to Roxburgh). Roxb. fl. ind. 1. p. 172. D. C. prod. 1. p. 571.

Lin. syst. *Monadélphia, Triándria.* Anthers 3, sessile, on the top of the urceolus. Fruit baccate; younger ones 3-celled; ovulæ peltate, 1 or 2 in each cell; adult fruit few-seeded.—Little trees, with 1-flowered, axillary peduncles.

1 J. salacioìdes (Roxb. fl. ind. 1. p. 172.) leaves broad-lanceolate, entire; calyx 5-parted; petals 5, sessile. ♄. S. Native of Chittagong. Flowers small, orange-coloured. Fruit dull-red, 2-3-seeded. The pulp of the fruit is white and is eaten by the natives.

Salacia-like Johnia. Clt. 1822. Shrub 10 feet.

2 J. Coromandelia'na (Roxb. l. c.) leaves serrulated; calyx 5-toothed; petals 5, unguiculate. ♄. ◡. S. Native of Coromandel on wooded mountains. Flowers small, greenish-yellow. Berry 1-seeded, about the size of a small cherry, as well as shape.

Coromandel Johnia. Clt. 1820. Shrub cl.

Cult. Jóhnia is a genus of very pretty little trees. The fruit of both species is eatable. They will thrive well in a mixture of loam and peat, and ripened cuttings will strike root in sand, under a hand-glass, in a moist heat.

† *Hippocrateàceæ spùriæ. Stamens 5 or more, but never exceeding* 12.

VI. TRIGO'NIA (from τρεις, *treis*, three, and γωνια, *gonia*, an angle; the fruit is 3-angled, 3-celled, and 3-valved). Aubl. guian. 1. p. 390. D. C. prod. 1. p. 571.

Lin. syst. *Monadélphia, Decándria.* Calyx 5-parted, unequal, permanent. Petals 5, broad at the base, unequal; upper one arched, gibbous and concave; 2 lateral ones small, wing-shaped; 2 lower ones connected into the form of a keel. Stamens 10-12, some of them sterile, and irregularly connected into a tube at the base, which is cleft in front. Anthers fixed by the back, 2-celled, bursting lengthwise. Glands 2-4, opposite the superior petal, situated at the base of the ovary. Ovary trigonal, 3-celled; cells containing many ovulæ. Style 1, crowned by a 3-lobed stigma. Capsule trigonal, 3-valved, 3-celled; valves woolly on the inside and constituting dissepiments. Seeds numerous, woolly, fixed to the axis. Albumen fleshy.—Sarmentose or climbing shrubs, with opposite, entire, bistipulate leaves, and racemosely-panicled flowers, either axillary or terminal.

1 T. seri'cea (H. B. et Kunth, nov. gen. amer. 5. p. 141.) leaves obovate, clothed beneath with silky or silvery down. ♄. ◠. S. Native on the Andes about Quindiu.

Silky-leaved Trigonia. Shrub cl.

2 T. NI'VEA (St. Hil. fl. bras. 2. p. 113.) leaves oblong, narrowed both at top and bottom, acute, and short-acuminated, smooth above, but white and tomentose beneath; capsule elongated, much wrinkled, covered with rufescent tomentum on the outside, but with silky tomentum within. ♄. S. Native of Brazil near Rio Janeiro.

White-leaved Trigonia. Fl. Dec. Shrub 4 feet.

3 T. PUBE'SCENS (St. Hil. fl. bras. 2. p. 114.) leaves elliptic-obovate, short-acuminated, smoothish above, pubescently tomentose beneath; capsule elongated, rufescently-tomentose outside, but silky-tomentose inside. ♄. ◡. S. Native of Brazil in the provinces of Minas Geraes and Rio Janeiro. Flowers whitish-green.

Pubescent Trigonia. Fl. Dec. Shrub cl.

4 T. VILLÒSA (Aubl. guian. 1. p. 390. t. 347. Lam. illus. t. 347.) leaves ovate, acute, quite entire, covered with cinereous down beneath, netted with nerves and nervelets. ♄. ◠. S. Native of Cayenne. Flowers with the upper and lateral petals yellow and the lower one red.

Var. α, obtusàta (D. C. prod. 1. p. 571.) leaves elliptical-obovate, blunt at both ends.

Var. β, cuneàta (D. C. l. c.) leaves obovate, cuneated at the base.

Var. γ, oblónga (D. C. l. c.) leaves oblong, acuminated at both ends.

Villous Trigonia. Clt.? Shrub cl.

5 T. MO'LLIS (D. C. prod. 1. p. 571.) leaves elliptical, acuminated, tapering to the base, clothed with villous pubescence above, but cinereous beneath from villi, not netted with nerves. ♄. S. Native of Brazil. Flowers yellowish-white.

Soft-leaved Trigonia. Shrub rambling.

6 T. CE'PO (St. Hil. fl. bras. 2. p. 115.) leaves obovate-elliptic, narrowed at the base, mucronulate, puberulous above, soft tomentose beneath. ♄. ◡. S. Native of Brazil near Rio Janeiro, where it is called *Cepo de Caboco*. Flowers racemose in the axils of the upper leaves, smelling like the hawthorn, greenish. This is perhaps the same as *T. móllis*.

Cepo Trigonia. Fl. Nov. Shrub cl.

7 T. CROTONOÌDES (St. Hil. bras. 2. p. 115. t. 105.) leaves ovate-oblong, acute, or acuminated, smoothish above, but puberulous or tomentose beneath; capsule roundish, 3-lobed. ♄. ◡. S. Native of Brazil near Rio Janeiro. Cròton eriospérmum, Lam. dict. 2. p. 211. Flowers yellow, racemose.

Var. β, incàna (St. Hil. l. c. p. 116.) leaves ovate, acuminated, pubescent above, and hoary-tomentose beneath. Near Rio Janeiro.

Var. γ, oblongifòlia (St. Hil. l. c.) leaves oblong, acuminated, smoothish above, puberulous beneath; flowers greenish-rufescent. In the province of Minas Geraes.

Croton-like Trigonia. Fl. Jan. Shrub cl.

8 T. LÆ'VIS (Aubl. guian. 1. p. 390. t. 150. Vahl. ecl. 2.) leaves ovate, acuminate, smooth on both surfaces and shining. ♄. ◡. S. Native of Guiana. Flowers white.

Smooth Trigonia. Shrub cl.

Cult. These shrubs are hardly worth cultivating, except in general collections. They will thrive well in a mixture of loam and peat, and ripened cuttings will strike root in sand under a hand-glass, in heat.

VII. LACEPE'DEA (in honour of Bernard Germain Stephen Count de La Cepede, professor of zoology in the museum of natural history at Paris). H. B. et Kunth, nov. gen. amer. 5. p. 142. t. 444. D. C. prod. 1. p. 571. Triceràja, Willd. in Rœm. et Schult, syst. 4. p. 803.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, unequal. Petals 5, with very short claws. Stamens 5, with unconnected filaments; anthers 2-celled, bursting lengthwise. Ovary 3-celled, each cell containing 8-ovulæ. Style 3-furrowed, and at length dividing into 3 parts. Berry 6-9-seeded, 3-pointed from the permanent styles.—A tree with serrulated leaves and terminal panicles of white, sweet-scented flowers. It is nearly allied to *Trigònia*.

1 L. INSI'GNIS (H. B. et Kunth, l. c.). ♄. S. Native of Mexico near Xalapa. Triceràja tinifòlia, Willd. l. c. Tríceras Xalapénsis, Spreng.

Shewy Lacepedea. Tree 20 feet.

Cult. This fine tree will probably thrive well in a mixture of loam, sand, and peat, and ripened cuttings will root in sand under a hand-glass, in a moist heat.

Order XLIV. ERYTHROXY'LEÆ. H. B. et Kunth, nov. gen. amer. 5. p. 175.

Sepals 5 (f. 106.), permanent, concrete at the base. Petal 5, hypogynous, broadest at the base, furnished each with a scale on the inside, with the margins incumbent before expansion. Stamens 10 (f. 106. *c.*), filaments concrete into an urceolus at the base (f. 106. *c.*). Anthers versatile, erect, 2-celled, bursting lengthwise at the sides. Ovary 1-celled, containing a solitary, pendulous ovula, or 3-celled, the lateral cells empty. Styles 3, (f. 106. *d.*), distinct, crowned each by a capitate stigma (f. 106. *d.*) or connected almost to the apex. Drupe 1-seeded (f. 106. *f.*); seeds angular. Albumen fleshy or wanting. Embryo linear, straight, central. Cotyledons linear, flat, leafy. Radicle superior, straight, terete, pointing towards the hylum, with an inconspicuous plumule.—Trees and shrubs with the younger branches compressed, and usually covered with imbricate scales (f. 106.). Stipulas axillary, concave. Leaves alternate, rarely opposite, quite entire, smooth in most parts of the species and perhaps in all. Pedicels angular, gradually thickened. Flowers solitary, twin, or in fascicles, rising from axils of stipulaceous scales, small, white, or yellowish-green. This order has been separated by Kunth from *Malpighiàceæ*, on account of the petals being appendiculate, from the seeds being albuminous, and in the fruit being 1-celled from abortion, as well as from its peculiar habit. It differs from all the neighbouring orders in the appendiculate petals. From *Marcgraviàceæ*, *Guttíferæ*, &c. in the leaves being stipulate.

Synopsis of the Genera.

1 Erythro'xylon. Calyx 5-parted, 5-angled at the base. Styles 3, distinct.

2 Se'thia. Calyx 5-lobed. Styles 3, but joined together in one. Stigmas distinct.

I. ERYTHRO'XYLON (from ερυθρος, *erythros*, red, and ξυλον, *xylon*, wood; the wood of the trees is not red, as the name would imply, but the juice of the fruit is red). Lin. gen. no. 575. Cav. diss. 8. p. 399. Lam. ill. t. 383. H. B. et Kunth, l. c. D. C. prod. 1. p. 573.

Lin. syst. *Monadélphia, Decándria.* Calyx 5-parted, 5-angled at the very base. Styles 3 (f. 106. *d.*), unconnected to the base, not joined as in *Sèthia*.

§ 1. *Penninérvia (from penna, a feather, and nervus, a nerve or sinew; the nerves of the leaves are disposed in the manner of the feathers of a pen). Leaves feather-nerved* (f. 106. *g.*), *with the nerves small, conniving at the apex.*

* *Pedicels solitary.*

1 E. HYPERICIFÒLIUM (Lam. dict. 2. p. 394.) leaves obovate, usually emarginate; pedicels 3-times longer than the flower; fruit 3-celled. ♄. S. Native of the Mauritius, where it is called *Bois d'huile* and *Bois de Dames*. Venèlia, Comm. herb. —Cav. diss. 8. p. 400. t. 230. Leaves like those of *Spìrea hypericifòlia*, rather membranaceous and pale beneath.

Hypericum-leaved Red-wood. Clt. 1818. Tree 12 feet.

2 E. BRE'VIPES (D. C. prod. 1. p. 573.) leaves obovate, usually emarginate; pedicels lateral, hardly longer than the flowers; fruit 1-celled. ♄. S. Native of the islands of Porto-Rico and St. Domingo on rocks by the sea-side. Very like the preceding species, but differs in the leaves being coriaceous, 5 or 6 lines long, and in the pedicels being 4 times shorter than the leaves.

Short-pedicelled-flowered Red-wood. Tree 20 feet.

3 E. BUXIFÒLIUM (Lam. dict. 2. p. 394.) leaves lanceolate-obovate, obtuse, somewhat mucronate, with the middle nerve elevated; pedicels twice the length of the flower; fruit 1-celled. ♄. S. Native of Madagascar, and probably of the Mauritius. Cav. diss. 8. p. 403. t. 231. f. 1.

Box-leaved Red-wood. Shrub 6 feet.

4 E. FERRUGI'NEUM (Cav. diss. 8. p. 404. t. 231. f. 2.) leaves ovate, usually emarginate, shining above, somewhat rusty beneath; scales imbricate; pedicels scarcely longer than the flower. ♄. S. Native of Madagascar. E. buxifòlium β, Lam. dict. 2. p. 394.

Rusty-leaved Red-wood. Shrub 8 feet.

5 E. LU'CIDUM (H. B. et Kunth, nov. gen. amer. 5. p. 178.) leaves elliptical, somewhat acuminated, acutish at the base, coriaceous, smooth, shining; stipulas longer than the petiole; pedicels twin, axillary, and terminal? shorter than the bracteas. ♄. S. Native of New Granada between La Mesa and Honda.

Shining-leaved Red-wood. Shrub 6 feet.

6 E. PELLETERIA'NUM (St. Hil. fl. bras. 2. p. 100. t. 102.) leaves oblong, acute at the base, but obtuse and emarginate at the apex, rusty beneath; stipulas elongated, triangular; branches floriferous at the base; flowers solitary or twin from the axils of the scales. ♄. S. Native of Brazil in the province of Minas Geraes, where it is called *Fruta da Pomba*.

Pilletier's Red-wood. Fl. Jan. Shrub 10 to 12 feet.

** *Pedicels in twos, threes, or fours, never solitary.*

7 E. LIGUSTRI'NUM (D. C. prod. 1. p. 574.) leaves elliptical-oblong, tapering to both ends; pedicels 1-4, almost twice as long as the flowers; styles longer than the stamens. ♄. S. Native of Cayenne. Flowers larger in this than any other species, about 2-3 lines in diameter. Petals oblong-linear, acutish. Leaves an inch and a half long and 6 or 8 lines broad.

Privet-like Red-wood. Shrub 6 feet.

8 E. HONDE'NSE (H. B. et Kunth, nov. gen. amer. 5. p. 176.) leaves elliptical-obovate, retuse at the apex, obsoletely mucronate, acute at the base, membranous, smooth, glaucescent beneath; stipulas equal in length with the petiole; pedicels 1-2 or more, a little longer than the petioles. ♄. S. Native of New Granada in dry places near Honda.

Honda Red-wood. Shrub 6 feet.

9 E. OVA'TUM (Cav. diss. 8. p. 404. t. 233.) leaves ovate, obtuse, mucronate, somewhat membranaceous; pedicels in threes, twice as long as the flower; scales imbricate. ♄. S. Native of Guadaloupe, where the French call it *Vinette l'herminier*.

Ovate-leaved Red-wood. Tree.

10 E. CUMANE'NSE (H. B. et Kunth, nov. gen. amer. 8. p. 404.) leaves obovate-oblong, roundish at the apex, but narrowed at the base and blunt, membranaceous, smooth; stipulas equal in length with the petiole; pedicels 1-4, axillary, 3-times longer than the petiole. ♄. S. Native in dry shady places near Cumana.

Cumana Red-wood. Tree 15 feet.

11 E. HAVANE'NSE (Jacq. amer. 135. t. 87. f. 2.) leaves oval, tapering to both ends, rather coriaceous; pedicels usually twin, scarcely longer than the flower; branches compressed. ♄. S. Native of Cuba about Havannah on rocks near the sea-coast. Steudèlia Brasiliénsis, Nees. Flowers yellowish-green.

Havannah Red-wood. Clt. 1822. Shrub 3 feet.

12 E. ORINOCE'NSE (H. B. et Kunth, nov. gen. amer. 5. p. 176. t. 453.) leaves elliptical-oblong, emarginate at the apex, ovate at the base, stiff, smooth, shining; stipulas length of petiole; pedicels 2-3, axillary and terminal? twice as long as the petiole. ♄. S. Native on the banks of the Orinoco near St. Borja. This is scarcely distinct from *E. ovàtum*.

Orinoco Red-wood. Tree 15 to 20 feet.

13 E. SIDEROXYLOÌDES (Lam. dict. 2. p. 393.) leaves obovate-oblong, bluntish, shining; pedicels 2-3, about twice the length of the leaves; scales acute; branchlets compressed. ♄. S. Native of the island of Bourbon. Cav. diss. 8. p. 401. t. 228. Leaves almost like a species of *Laùrus*, 2-3 inches long, 3-9 lines broad.

Sideroxylon-like Red-wood. Tree 20 feet.

14 E. LONGIFÒLIUM (Lam. dict. 2. p. 392.) leaves oblong, shining, thickish; scales acute, deciduous; pedicels twin, twice as long as the flower. ♄. S. Native of the islands of Madagascar and Bourbon. Cav. diss. 8. p. 399. t. 225. Leaves 2 or 3 inches long and 4 or 5 lines broad. Flowers white.

Long-leaved Red-wood. Tree 16 feet.

15 E. OBTU'SUM (D. C. prod. 1. p. 474.) leaves obovate-oblong, rounded at the top, cuneated at the base, membranous, rather glaucous beneath; stipulas shorter than the petiole; pedicels axillary, in fascicles? twice as long as petiole. ♄. S. Native of Cuba near Havannah. E. Havanénse, H. B. et Kunth, nov. gen. amer. 5. p. 177. Very near *E. Hondénse*.

Blunt-leaved Red-wood. Shrub 8 feet.

16 E. POPAYANE'NSE (H. B. et Kunth, nov. gen. amer. 5. p. 177.) leaves elliptical, acute, somewhat mucronate, acute at the base, membranous, smooth; stipulas awl-shaped, bifid, shorter than the petiole; pedicels axillary, in fascicles, about equal in length with the petiole. ♄. S. Native of temperate places near Popayan.

Popayan Red-wood. Shrub 8 feet.

17 E. COTINIFÒLIUM (St. Hil. fl. bras. 2. p. 98.) leaves obovate, acute at the base, but very blunt at the apex, and emarginate; flowers rising along the branches in few-flowered fascicles from the scales; stipulas triangular. ♄. S. Native of Brazil in the province of Minas Geraes.

Cotinus-leaved Red-wood. Fl. April. Shrub 2 feet.

18 E. FRANGULÆFÒLIUM (St. Hil. fl. bras. 2. p. 99.) leaves ovate or lanceolate, acuminated; flowers solitary or tern, in the axils of the scales; stipulas 1-3-awned; stamens shorter than the pistil. ♄. S. Native of Brazil near Rio Janeiro.

Frangula-leaved Red-wood. Fl. Sept. Shrub.

19 E. SUBROTU'NDUM (St. Hil. l. c.) leaves roundish-obovate, very obtuse; flowers axillary, solitary, or few; stipulas 2-awned; stamens nearly twice the length of the pistil. ♄. S. Native of Brazil in the province of Rio Janeiro, where it is called *Fruta da Pomba*.

Roundish-leaved Red-wood. Fl. Sept. Shrub 4 to 6 feet.

*** *Pedicels many, aggregate.*

20 E. RU'FUM (Cav. diss. 8. p. 404. t. 232.) leaves ovate, blunt, coriaceous, brown beneath; scales imbricate; pedicels

many, axillary, twice as long as the flower. ♄. S. Native of St. Domingo.

Rufous-flowered Red-wood. Shrub.

21 E. macrophy'llum (Cav. diss. 8. p. 401. t. 227.) leaves lanceolate, very long, tapering to both ends, rather glaucous beneath; scales elongated, stem-clasping, acuminated; pedicels axillary, aggregate; fruit 3-celled. ♄. S. Native of Cayenne. —Vahl. ecl. 2. p. 33. The leaves of this species are larger than any other; they are about 6 inches long, and abòut 2 in breadth.

Long-leaved Red-wood. Shrub.

22 E. squamma'tum (Vahl. symb. 3. p. 60. t. 63.) leaves elliptical-lanceolate, bluntly acuminated; branches compressed, with distich scales and flowers; fruit somewhat hexagonal, 1-celled. ♄. S. Native of Cayenne and French Guiana, as well as the Caribbee Islands. Swartz, fl. ind. occ. 861. This species is easily distinguished from the numerous, short, permanent, distich scales on the branches.

Scaly Red-wood. Tree.

23 E. laurifòlium (Lam. dict. 2. p. 394. Cav. diss. 8. p. 400. t. 226.) leaves lanceolate; scales acute, concave; pedicels glomerated, terminal, somewhat umbellate, 3 times longer than the flowers. ♄. S. Native of the Mauritius. Roelàna laurifòlia, Comm. It is called by the French in the Mauritius *Bois de Ronde* or *Bois de Rongle*. Flowers greenish-yellow.

Laurel-leaved Red-wood. Clt. 1823. Tree 20 feet.

24 E. ni'tidum (Spreng. syst. 1. p. 390.) leaves obovate, obtuse, quite entire, very smooth, shining; peduncles axillary, aggregate, equal in length with the flowers. ♄. S. Native of Brazil.

Nitid-leaved Red-wood. Shrub 6 feet.

25 E. subcorda'tum (Bert. in herb. Balb. D. C. prod. 1. p. 575.) leaves ovate-rounded, rather cordate, somewhat emarginate, coriaceous, smooth, netted with nerves. ♄. S. Native of St. Domingo. Pedicels 4-5-together. Leaves feather-nerved, 4 or 5 lines long and broad.

Subcordate-leaved Red-wood. Tree.

26 E. Kunthia'num (St. Hil. fl. bras. 2. p. 96.) leaves elliptic-lanceolate, short-acuminated; stipulas 1-3-awned; flowers in fascicles, few or many-flowered; stamens shorter than the pistil. ♄. S. Native of Brazil in the province of Rio Janeiro.

Var. β; leaves blunter; flowers larger; calyx equal in length to the corolla. In the province of Minas Novas.

Kunth's Red-wood. Fl. May. Shrub 3 to 4 feet.

27 E. affi'ne (St. Hil. fl. bras. 2. p. 97.) leaves ovate-lanceolate, acuminated at the apex; fascicles few-flowered; stamens longer than the pistil. ♄. S. Native of Brazil in the province of Rio Janeiro. Very like the preceding, but the leaves are smaller.

Allied Red-wood. Fl. Sept. Shrub 3 to 4 feet.

28 E. na'num (St. Hil. fl. bras. 2. p. 97.) leaves obovate-oblong, very blunt; flowers in axillary fascicles; stamens shorter than the pistil; stipulas triangular. ♄. S. Native of Brazil in the province of Minas Geraes.

Dwarf Red-wood. Fl. March. Shrub ½ foot.

29 E. campe'stre (St. Hil. l. c.) stem nearly simple, suffruticose; leaves elliptic, very blunt, coriaceous; stipulas entire or bifid; flowers in fascicles; fascicles usually branched, short; stamens shorter than the pistil. ♄. S. Native of Brazil in the province of Minas Geraes.

Field Red-wood. Fl. Sept. Shrub 2 feet.

30 E. citrifòlium (St. Hil. fl. bras. 2. p. 94.) leaves lanceolate-oblong, acuminated; flowers in fascicles from the axils of the leaves and scales; stipulas bifid; stamens longer than the pistil. ♄. S. Native of Brazil in the province of Goyaz.

Citron-leaved Red-wood. Fl. July. Shrub 4 feet.

31 E. pu'lchrum (St. Hil. l. c.) leaves oblong; flowers axillary, in fascicles; stipulas 3-awned at the apex; stamens 2-3 times longer than the pistil. ♄. S. Native of Brazil near Rio Janeiro.

Neat Red-wood. Fl. Oct. Shrub.

32 E. suberòsum (St. Hil. fl. bras. 2. p. 95.) stem arboreous, covered with corky bark; leaves elliptical, coriaceous; flowers in fascicles; stamens longer than the pistil. ♄. S. Native of Brazil in the province of Minas Geraes, where it is called *Gallinha choco* and *Mercurio do campo*, and where the inhabitants make a red tincture from the bark.

Corky-barked Red-wood. Tree.

33 E. deci'duum (St. Hil. l. c.) leaves obovate-oblong, obtuse, acute at the base; stipulas somewhat triangular, acutish; flowers in fascicles; stamens longer than the pistil. ♄. S. Native of Brazil in the province of Minas Geraes. A small, twisted tree.

Deciduous Red-wood. Fl. Sept. Tree 15 feet.

§ 2. *Areolàta. Leaves areolate, especially two veins, almost parallel with the middle nerve, besides being in every part of the disk marked with feathery veins* (f. 106.).

34 E. areola'tum (Lin. amœn. 5. p. 397.) leaves elliptical, obovate, areolate, mucronate, glaucous beneath; pedicels lateral, many, aggregate, twice as long as the flower. ♄. S. Native of South America about Carthagena, and of the West Indies. E. Carthagenénse, Jacq. amer. 134. t. 187. f. 1.—Browne, jam. p. 128. t. 38. f. 2. The timber is flesh-coloured, and is considered excellent for the size of the tree. The flowers are white, with a scent not unlike that of the jonquil.

Areolate-leaved Red-wood. Tree 12 feet.

35 E. Mexica'num (H. B. et Kunth, nov. gen. amer. 5. p. 178.) leaves obovate-oblong, rounded at the apex, and usually retuse, acutish at the base, somewhat coriaceous, smooth, with 2 lines beneath; stipulas equal in length with the petiole; pedicels axillary, solitary, hardly longer than the petioles. ♄. S. Native of Mexico near Chilpacingo.

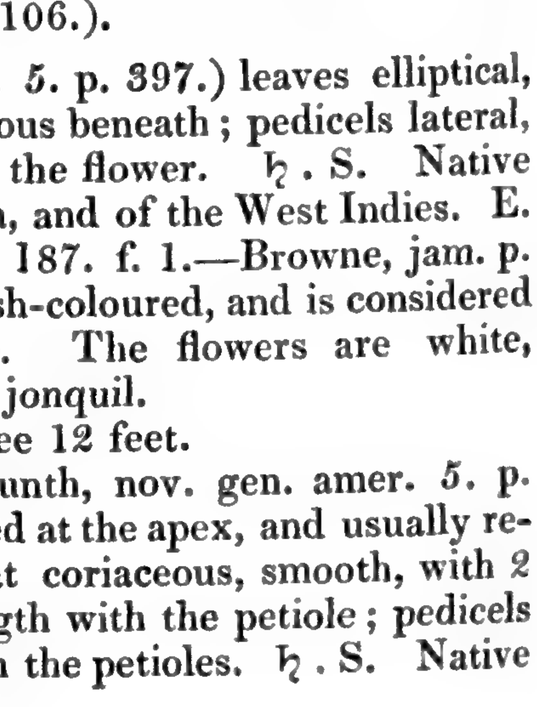
Mexican Red-wood. Tree 12 feet.

36 E. lineola'tum (D. C. prod. 1. p. 575.) leaves elliptical, rather mucronulate, membranaceous, areolate, somewhat glaucous beneath; pedicels lateral, 2-3-together, a little longer than the flower; fruit oblong, rather trigonal. ♄. S. Native of Cayenne. Cav. diss. 8. p. 404. in a note, under no. 555. t. 232. f. 10. Leaves 2 inches long, and almost an inch broad, with the middle nerve not very prominent. Flowers greenish-yellow.

Lined-leaved Red-wood. Tree 20 feet.

37 E. Cóca (Lam. dict. 2. p. 393.) leaves ovate, areolate, membranaceous; branches scaly; pedicels lateral, 2-3-together, hardly longer than the flower; fruit ovate, rather acute. ♄. S. Native of Peru. Ruiz et Pav. fl. per. 4. t. 398. The leaves of this shrub are mixed and masticated with *Quinoa*, which see. Flowers greenish-yellow. It is called *Coca* inPeru (f. 106.)

FIG. 106.



Coca Red-wood. Tree 20 feet.

38 E. rigi'dulum (D. C. prod. 1. p. 575.) leaves elliptical, blunt, somewhat cuneated at the base, stiff, areolate, pale beneath; branches scaly; pedicels aggregate; stamens longer than the calyx. ♄. S. Native of St. Martha. This species comes very near to *E. Cóca*, but differs in the leaves being stiff, not

soft, and in the pedicels and stamens being longer, and the styles shorter. Leaves an inch long. Flowers yellowish-green.

Stiff-leaved Red-wood. Tree 12 feet.

Cult. These trees and shrubs are hardly worth cultivating, except in general collections. They will thrive well in a mixture of loam and peat, and cuttings not too ripe will root in sand under a hand-glass, in a moist heat.

II. SE'THIA (in honour of S. Sethi, author of a work on culinary vegetables). H. B. et Kunth, nov. gen. amer. 5. p. 175. in a note. D. C. prod. 1. p. 576.

LIN. SYST. *Monadélphia, Decándria.* Calyx 5-lobed, and 5-parted. Styles 3, connected together, but with the stigmas distinct at the apex.

1 S. I'NDICA (D. C. prod. 1. p. 576.) leaves obtuse, feather-nerved, obovate-lanceolate; pedicels solitary, hardly longer than the flower; styles connate to the middle; calyx 5-lobed. ♄. S. Native of the East Indies on the Circars. Erythróxylon monógynum, Roxb. cor. 1. t. 88. Petals yellow, with white claws.

Indian Sethia. Fl. June, July. Clt. 1824. Tree 20 feet.

2 S. MICROPHY'LLA; leaves small, numerous, feather-nerved, obovate-oblong, obtuse, mucronulate; flowers few, axillary; styles connate at the base; calyx 5-parted. ♄. S. Native of Brazil in the province of Minas Geraes. Erythróxylon microphýllum, St. Hil. fl. bras. 2. p. 101.

Var. β; leaves obovate-roundish, a little larger than those of the species, and rather emarginate. In the province of Minas Geraes.

Small-leaved Sethia. Fl. Nov. Shrub 3 to 4 feet.

3 S. MAGNOLIÆFÒLIA; leaves large, obovate-elliptic, very blunt at the apex, acute at the base, glaucous beneath; flowers small, glomerate; calyx obovate, 5-cleft; stamens a little shorter or equal in length to the pistil; styles connate nearly to the apex. ♄. S. Native of Brazil in the province of Rio Janeiro. Erythróxylon magnoliæfòlium, St. Hil. fl. bras. 2. p. 93.

Magnolia-leaved Sethia. Fl. May. Shrub 3 feet.

Cult. The species will thrive well in a mixture of loam and peat, and cuttings not too ripe will root in sand under a bell-glass, in a moist heat.

ORDER XLV. MALPIGHIA'CEÆ (plants agreeing with *Malpighia* in important characters). Juss. gen. 252. ann. du. mus. 18. p. 479. D. C. prod. 1. p. 577.

Calyx 5-parted (f. 107. *a.* f. 109. *a.*), usually permanent. Petals 5 (f. 107. *b.* f. 109. *b.*), alternating with the lobes of the calyx, and inserted in the hypogynous disk, unguiculate (f. 107. *b.* f. 109. *b.*), sometimes unequal, but very seldom wanting. Stamens 10 (f. 107. *c.* f. 108. *e.*), alternating with the petals, and inserted with them, very rarely fewer. Filaments very rarely free, but usually connected together at the very base (f. 107. *c.*). Anthers roundish (f. 107. *c.* f. 108. *e.*). Ovary usually 3-lobed (f. 107. *e.*), constantly of 3 carpels, which are more or less joined together (f. 109. *d.*). Styles always 3 (f. 107. *d.* f. 109. *d.*), distinct or connected together. Fruit of 2-3 carpels (f. 107. *e.* f. 108. *e.* f. 109. *f.*) or of 3 cells, but sometimes with only 1 or 2 cells from abortion, dry (f. 108. *e.* f. 109. *f.*) or baccate (f. 107. *e.*), with 1-seeded cells (f. 108. *f.*). Seeds pendulous in the cells, perhaps always without albumen. Embryo more or less curved or straight, with a short radicle, and leafy or fleshy cotyledons. —Shrubs and trees. Branches sometimes climbing. Leaves opposite, but in the genus *Anomalópteris* they are alternate, always simple, without dots, and usually stipulate on both sides. Flowers racemose or corymbose, rarely axillary, solitary; pedicels usually jointed, and furnished with 2 small scales at the middle.—Probably *Passiflòra pállida* of Lour. fl. coch. p. 527. exclusive of the synonyme, is referable to this order. The petals being unguiculate and undulated separates this from all the neighbouring orders. The timber of all is of a deep-red colour, and the bark is febrifuge. Their shewy pink or yellow flowers and neat foliage render all the order worthy of cultivation.

Synopsis of the genera.

TRIBE I.

MALPIGHIE'Æ. *Styles 3, distinct* (f. 107. *d.*) *or joined in one. Fruit fleshy indehiscent* (f. 107. *e.*) *Leaves opposite.*

1 MALPI'GHIA. Calyx furnished with 8-10 glands on the outside at the base. Petals unguiculate (f. 107. *b.*). Stamens monadelphous at the base (f. 107. *c.*). Styles distinct (f. 107. *d.*). Drupe containing 3 1-seeded nuts (f. 107. *e.*).

2 BYRSO'NIMA. Calyx furnished with 8-10 large glands on the outside at the base. Petals unguiculate. Stamens 10, connected at the very base. Styles distinct. Drupe containing a 3-celled, 3-seeded nucleus.

3 BUNCHÒSIA. Calyx furnished with 8-10 large glands on the outside at the base. Petals unguiculate. Stamens 10, monadelphous at the base. Style 1, simple, bifid or trifid at the apex. Drupe containing 2-3 1-seeded nuts.

4 GALPHI'MIA. Calyx glandless. Petals unguiculate. Stamens 10, nearly free. Styles 3. Drupe containing 3 1-seeded nuts, which open on the back.

5 CAUCA'NTHUS. Calyx glandless. Petals unguiculate. Stamens 10, awl-shaped. Anthers with a prominent margin. Styles 3, awl-shaped. Fruit unknown.

TRIBE II.

HIPTA'GEÆ. *Style one or concrete into one. Carpels of fruit dry* (f. 108. *e.*), *indehiscent*, 1-*seeded* (f. 108. *f.*), *usually winged* (f. 108. *e.*). Leaves opposite or verticillate.

6 HI'PTAGE. Calyx furnished with 5 glands at the base. Petals fringed (f. 108. *b.*). Stamens 10 (f. 108. *e.*), one of which is longer than the rest. Carpels 3 (f. 108. *e.*) or from abortion only 1-2, 4-winged; wings unequal (f. 108. *e.*).

7 TRISTELLATE'IA. Petals inflexed, unguiculate. Stamens 10, 5 alternate ones smaller. Ovary impressed by 3 pores. Carpels 3, crowned by 6 appendages.

8 THRYA'LLIS. Petals roundish, unguiculate. Stamens 10, awl-shaped. Capsule triquetrous, separable into 3 parts; cells opening by the outer angle.

9 ASPICA'RPA. Petals wanting. Stamen 1, inclosed within the calyx. Ovary roundish, 2-celled, cleft at the apex, with a very short style in the fissure. Fruit indehiscent, 1-celled, containing 1 orbicular seed.

10 GAUDICHAU'DIA. Calyx girded by 8-10 glands on the outside at the base. Petals roundish, unguiculate. Stamens 5, connate, unequal. Style 1. Carpels 3, free or connected at

the base, 1-seeded. Samaræ 2, drawn out into a spur-like membrane at the base, winged on the back.

11 CAMA'REA. Calyx girded by 10 glands at the base, each lobe having 2. Stamens 6, 3 fertile, with the filaments connected to the apex, the other 3 hardly connected, middle one of these fertile, the lateral ones sterile. Style 1. Carpels 3 or only 2 from abortion, rather connate, 1-seeded, indehiscent, crested on the back, and wrinkled on the sides.

TRIBE III.

BANISTERIE'Æ. *Styles* 3 (f. 109. *d.*), *distinct. Carpels of fruit dry, indehiscent,* 1-*seeded* (f. 108. *f.*), *variously expanded into wings* (f. 108. *d.*). *Leaves opposite, rarely verticillate or alternate.*

12 HIRÆ'A. Calyx of 5 sepals, glandless, or furnished with glands. Petals roundish, unguiculate. Stamens 10, awl-shaped, connected at the very base, alternate ones longest. Styles 3. Carpels 3, samara-formed, rarely 2, 1-seeded, crested on the back, and surrounded by a membranous wing.

13 TRIO'PTERIS. Calyx furnished with 10 glands on the outside. Petals roundish, unguiculate. Stamens 10, awl-shaped, cohering at the very base, alternate ones largest. Styles 3. Carpels 3, 1-seeded, connected at the base, expanded into 3 wings, 2 superior and 1 inferior.

14 VARGA'SIA. Calyx glandless. Petals nearly sessile. Stamens 10, connected at the base. Styles joined at the base, but revolute at the top. Samaræ 3, winged at the apex. Leaves verticillate.

15 TETRA'PTERIS. All as in *Triópteris*, except that the carpels are expanded into 4 wings, 2 superior and 2 inferior smaller.

16 BANISTE'RIA. Calyx girded by 8 or 10 glands. Petals roundish, unguiculate (f. 109. *b.*). Stamens 10, awl-shaped, cohering at the base (f. 109. *c.*). Styles 3, usually expanded into leaves at the apex (f. 109. *d.*). Carpels 3 (f. 109. *f.*), indehiscent, 1-seeded, nearly distinct, ending in a simple, membranous wing, which is thickened on the upper side (f. 109. *d.*).

17 HETERO'PTERIS. All as in *Banistèria*, but the styles are less dilated at the apex, and the wing of the carpels is thickened on the lower side, as in *Acér*, not on the upper, as in *Banistèria*.

18 ANOMALO'PTERIS. Calyx 5-parted. Petals roundish, fringed, unguiculate. Samaræ 2, 1-seeded, ending in a wing. This genus differs from all the rest in the leaves being alternate.

19 NIO'TA. Calyx 4-5-parted, 2 external lobes glandular. Petals 4-5, obtuse. Stamens 8-10, free, furnished with scales at the base. Ovary turbinate, 4-5-lobed above. Style 1, filiform, between the lobes of the ovary. Capsules 4-5, or from abortion only 1-3, compressed, 1-celled, 1-seeded.

Tribe I.

MALPIGHIE'Æ (plants agreeing with *Malpíghia* in having fleshy fruit). D. C. prod. 1. p. 577.—Malpíghia, Lin. gen. no. 572. Styles 3, distinct (f. 107. *d.*) or joined in one. Fruit fleshy, indehiscent (f. 107. *e.*). Leaves opposite.

I. MALPI'GHIA (in honour of Marcello Malpighi, an Italian naturalist, once professor of medicine at Pisa. We have from him many curious observations on natural history, but he is most distinguished by a treatise on the anatomy of plants, published in 1675; he died in 1694.) Rich. in Juss. ann. mus. 18. p. 480. D. C. prod. 1. p. 577.

LIN. SYST. *Monadélphia, Decándria.* Calyx 5-parted, furnished with 8 or 10 glands at the base on the outside. Petals unguiculate (f. 107. *b.*). Stamens 10, with the filaments monadelphous to a short way at the base (f. 107. *c.*). Styles 3, distinct (f. 107. *d.*). Drupe (f. 107. *e.*), containing 3 1-seeded nuts. Peduncles axillary 1-flowered, or bearing umbellate pedicels. —Trees or shrubs, never climbing. Fruit of all eatable, but *M. glàbra* and *ùrens* only are in common use.

SECT. I. URE'NTES (from *urens*, stinging, burning; the leaves are beset with stinging bristles, which adhere to the hand when touched). D. C. prod. 1. p. 577. Bristles, especially those on the leaves, fixed by their centre, horizontal, stiff, pungent at both ends, when touched adhering to the hands.

1 M. FUCA'TA (Ker, bot. reg. t. 189.) branches smooth; leaves elliptical, shining, clothed with decumbent bristles beneath, but nakedish above; pedicels axillary, umbellately corymbose, 4 times shorter than the leaves, upper petal rather larger than the rest, all with jagged margins. ♄. S. Native of the West Indies? M. macrophýlla, Desf. cat. 166. but not of Juss. Flowers pale-pink. Leaves 4 inches in length.

Painted Barbadoes Cherry. Fl. Mar. Aug. Clt. 1814. Sh. 8 ft.

2 M. U'RENS (Lin. spec. 6019.) branches smooth; leaves oblong-ovate, clothed with decumbent bristles beneath, smooth above; peduncles 1-flowered, aggregate, one-half shorter than the leaves; petals equal. ♄. S. Native of South America. Mill. ill. t. 181. f. 1. Cav. diss. t. 235. f. 1. Lam. ill. t. 381. f. 1. Flowers pink or pale-purple. It is called by the French *Bois de Capitain*, and by the English in the West Indies *Cowhage Cherry*. The fruit is insipid, and is only eaten by children and negroes.—Ker. bot. reg. 94.

Stinging Barbadoes Cherry. Fl. June, Oct. Clt. 1737. Shrub 3 to 6 feet.

3 M. GNI'DÆ (Spreng. neu. entd. 3. p. 51.) branches hairy; leaves elliptical-oblong, acute, hairy above, beset with stinging decumbent bristles beneath, and on the margin; peduncles 1-flowered, aggregate, one-half shorter than the leaves. ♄. S. Native of St. Domingo. Flowers pink.

Gnida's Barbadoes Cherry. Shrub 6 feet.

4 M. SETÒSA (Bert. ined. in Spreng. neu. entd. 3. p. 50.) branches smooth; leaves elliptical-oblong, obtuse, beset with decumbent, stinging bristles beneath, smooth above; pedicels axillary, 1-flowered, almost the length of the leaves, furnished with 2 scales just above their middle. ♄. S. Native of St. Domingo and Martinique. M. Martinicénsis, Jacq. amer. 136. Flowers pink. Jacquin and two of his companions ate a great quantity of the fruit of this tree, being very thirsty with travelling in the heat in Martinico, without suffering from them in any degree. It is the most prurient of all the species.

Bristly Barbadoes Cherry. Tree 14 feet.

5 M. CUBE'NSIS (H. B. et Kunth, nov. gen. amer. 5. p. 145.) branches rather hairy; leaves oblong-lanceolate, rather mucronate, rounded at the base, quite entire, smooth and shining above, but beset with stinging, pressed bristles beneath. ♄. S. Native of Cuba near Havannah. Flowers sulphur-coloured. Very like *M. angustifòlia.*

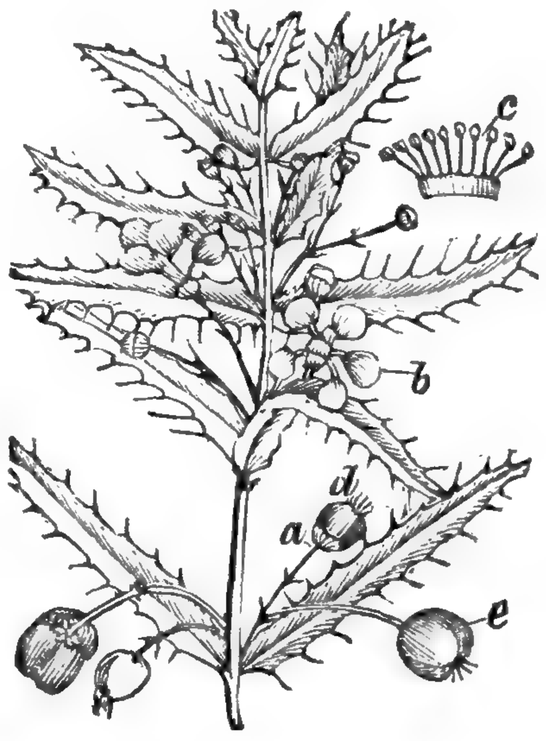
Cuba Barbadoes Cherry. Fl. July, Aug. Clt. 1824. Shrub 7 feet.

6 M. ANGUSTIFÒLIA (Lin. spec. 610.) branches smooth; leaves linear-lanceolate, acute, beset on both surfaces with decumbent, stinging bristles; peduncles axillary, umbellate. ♄. S. Native of South America, particularly in the West Indies. Cav. diss.

8. p. 409. t. 236. f. 1. Lodd. bot. cab. 321. M. lineàris, Jacq. 135. Flowers pale-purple or pink. Fruit small, oval, furrowed, when ripe of a dark-purple colour.

Narrow-leaved Barbadoes Cherry. Fl. July, Aug. Clt. 1737. Shrub 7 feet.

FIG. 107.



7 M. AQUIFÒLIA (Lin. spec. 611.) branches smooth; leaves lanceolate, with spiny teeth, beset with decumbent, stinging bristles beneath; peduncles axillary, solitary or twin, 2-flowered. ♄. S. Native of South America and the West Indies. Plum. ed. Burm. t. 168. f. 1. Cav. diss. 8. p. 409. t. 236. f. 2. M. illicifòlium, Mill. dict. no. 8. Flowers pale-blush or pink. Fruit of a dark-purple colour when ripe (f. 197.).

Holly-leaved BarbadoesCherry. Fl. Aug. Sept. Clt. 1759. Shrub 7 feet.

8 M. MACROPHY'LLA (Willd. enum. suppl. p. 37.) leaves large, oval, quite entire, beset with silky hairs above, and with stinging, decumbent bristles beneath; umbels of flowers lateral, sessile. ♄. S. Native of Brazil. Col. hort. rip. t. 11. Flowers red or pink.

Long-leaved Barbadoes Cherry. Fl. July, Aug. Clt. 1820. Tree 14 feet.

SECT. II. APY'RÆ (from απυρος, *apyros*, free from fire; in allusion to the leaves being without stinging bristles). D. C. prod. 1. p. 578. Leaves smooth or clothed with hairs, which are not stinging, nor fixed by their centre.

* *Leaves smooth.*

9 M. COCCI'FERA (Lin. ed. Reich. 2. p. 371.) leaves obovate or roundish, with spiny teeth, smooth, shining; peduncles axillary, solitary, furnished with two scales at their middle. ♄. S. Native of South America. A small bushy shrub, thickly beset with box-like leaves. Flowers pale-blush or pink. Fruit small, conical, furrowed, of a purple colour when ripe. Ker. bot. reg. 568.

Berry-bearing Barbadoes Cherry. Fl. June, Aug. Clt. 1733. Shrub 2 feet.

10 M. GLA'BRA (Lin. spec. 609.) leaves ovate, quite entire, smooth, shining; peduncles axillary, umbellate. ♄. S. Native of South America, particularly in the West Indies. Mill. ill. t. 181. f. 2. Cav. diss. t. 234. f. 1.—Sloan. jam. 2. p. 106. t. 207. f. 2. Flowers rose-coloured or bright purple. Fruit round, red, and smooth, about the size and shape of a cherry, having one or more furrows on the outside, and containing within a reddish, sweetish, not unpleasant, copious, juicy pulp, and 3 or 4 triangular nuts, so fitted together as to appear one, but this is the case in all the species. This tree is cultivated in all the West Indian Islands, and in many parts of the main land of South America, for its fruit, which is esteemed there, but is much inferior to our cherries. It is called in the British West Indies *Barbadoes Cherry*.—Sims, bot. mag. 813.

Smooth-leaved or True Barbadoes Cherry. Fl. March, Sept. Clt. 1757. Tree 16 feet.

11 M. BIFLÒRA (Poir. dict. 4. p. 326.) leaves ovate, lanceolate, acute, smooth; peduncles axillary, 2-flowered. ♄. S. Native of South America in woods. M. punicifòlia, Cav. diss. 8. p. 406. t. 234. f. 2. Leaves entire. Flowers pale-red.

Two-flowered Barbadoes Cherry. Fl. July, Aug. Clt. 1810. Shrub 10 feet.

12 M. PUNICIFÒLIA (Lin. spec. 609.) leaves ovate, quite entire, smooth; peduncles axillary, 1-flowered. ♄. S. Native of South America, particularly of the West Indies.—Plum. ed. Burm. t. 166. f. 2.—Pluck. phyt. t. 57. f. 7. Flowers rose-coloured. Fruit about the size and shape of a cherry, very succulent, and of a pleasant, rather acid taste. This shrub has much the appearance of the pomegranate.

Pomegranate-leaved Barbadoes Cherry. Fl. July, Aug. Clt. 1690. Shrub 8 feet.

13 M. NI'TIDA (Mill. dict. no. 5. Lin. spec. 609.) leaves lanceolate, acute, quite entire, smooth, shining; peduncles umbellately-racemose, axillary and terminal. ♄. S. Native of South America, particularly about Carthagena, and in the West Indies. A beautiful shrub, with pink flowers.

Shining-leaved Barbadoes Cherry. Fl. March, July. Clt. 1733. Shrub 10 feet.

14 M. BERTERIA'NA (Spreng. syst. 2. p. 383.) leaves obovate, somewhat emarginate, membranaceous, opaque, smooth; peduncles axillary, aggregate, usually 1-flowered. ♄. S. Native of Guadaloupe. Flowers rose-coloured?

Bertero's Barbadoes Cherry. Shrub 10 feet.

15 M. EMARGINA'TA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 578.) leaves ovate, obtuse, wavy, emarginate at the apex, smooth; peduncles axillary, divided to the base into 4 or 5 umbellate pedicels. ♄. S. Native of Mexico. Flowers red or pale-pink?

Emarginate-leaved Barbadoes Cherry. Shrub 8 feet?

** *Leaves pubescent or downy.*

16 M. FAGI'NEA (Swartz, fl. ind. occid. 2. p. 850.) leaves oblong-ovate, quite entire, silky and shining beneath; peduncles axillary, 3-parted, umbellate. ♄. S. Native of the Caribbee Islands. Flowers yellow. Fruit unknown.

Beach-leaved Barbadoes Cherry. Fl. July, Aug. Clt. 1820. Shrub 10 feet?

17 M. MALIFÒLIA (Nees et Mart. in nov. act. bonn. 12. p. 21.) tomentose; leaves cordate, ovate, acute, quite entire, shining above, but villously tomentose beneath, furnished with 2 glands at the base; flowers in 3-parted umbels, axillary. ♄. S. Native of Brazil about Tamburil. Petals red and white, spotted, ciliated.

Apple-leaved Barbadoes Cherry. Shrub 6 to 8 feet.

18 M. SACCHARI'NA; leaves large, obovate, tapering to the base, pale beneath, on long footstalks; pedicels axillary, solitary, short, and thick. ♄. S. Native of Sierra Leone. The fruit of this tree is sold in great quantities in the market of Freetown, during the months of February and March, under the name of *sugar-plum*; they are about the size of the bullace-plum, round, rough on the outside, with scattered warts, of a greyish colour, and half-filled by 3 or 4 oval-flatted seeds, which are so fitted together as to appear one; surrounded by a very sweet agreeable pulp. It is a beautiful and lofty tree, sometimes quite clear of branches to the height of 60 feet, where it terminates in a fine head.

Sierra Leone *Sugar*-plum. Fl. Dec. Jan. Tree 80 feet.

19 M. INCA'NA (Mill. dict. no. 3.) leaves lanceolate, hoary beneath; peduncles axillary, umbellate. ♄. S. Native of Campechy. M. Campechiénsis, Poir. dict. 4. p. 333. Flowers rose-coloured. M. canéscens, Ait. hort. kew. ed. 1. vol. 2. p. 105?

Hoary-leaved Barbadoes Cherry. Clt. 1742. Tree 18 feet.

† *Doubtful species, with yellow flowers.*

20 M. GRANDIFÒLIA (Jacq. amer. p. 137.) leaves lanceolate-oblong, entire; peduncles axillary, in racemose corymbs. ♄. S. Native of Martinique in woods. Leaves a foot long. Flowers yellow. This is probably a species of *Bunchòsia*.

Great-leaved Barbadoes Cherry. Shrub 10 feet.

21 M. DU'BIA (Cav. diss. 8. p. 413. t. 242.) leaves ovate-acute, cartilaginous, entire, smooth; branches dotted; racemes axillary, panicled. ♄. S. Native of St. Domingo. Flowers small, yellow. Fruit unknown. It may be a species of *Bunchósia* or *Banistèria*. The styles are short, not exserted.

Doubtful Barbadoes Cherry. Fl. Jul. Aug. Clt. 1820. Sh. 10 ft.

22 M. OBOVA'TA (H. B. et Kunth. nov. gen. amer. 5. p. 146.) leaves obovate, acute, cordate, quite entire, coriaceous, shining above, rather hairy beneath; umbels axillary, twin, 4-flowered. ♄. S. Native of South America on the banks of the river Magdalena near Nares. There are 5 hypogynous scales seated between the stamens and the ovary. Flowers yellow. This plant may probably form the type of a distinct genus.

Obovate-leaved Barbadoes Cherry. Shrub 10 feet.

23 M. TERNIFÒLIA (H. B. et Kunth, nov. gen. amer. 5. p. 146.) leaves 3 in a whorl, oblong-lanceolate, acute, rounded at the base, quite entire, rather hairy above and shining, but clothed with soft down beneath; umbels axillary, compound, 3-4-rayed, many-flowered. ♄. S. Native of New Granada near Pandi. Flowers yellow. Fruit unknown. This is probably a species of *Vargàsia*.

Tern-leaved Barbadoes Cherry. Shrub 12 feet.

Cult. These trees and shrubs will thrive in any light soil, or a mixture of loam and peat; and ripened cuttings will root in sand under a hand-glass, in heat. *M. coccífera nítida*, and *aquifòlia* are the most worthy of general cultivation.

II. BYRSO'NIMA (from *byrsa*, a hide, and *nimius*, much used; because the bark of some of the species is used in tanning in Brazil). Rich. in Juss. ann. mus. 18. p. 481.

LIN. SYST. *Monadélphia, Decándria*. Calyx 5-parted, furnished with 8 or 10 large glands on the outside at the base. Petals unguiculate. Stamens 10, connected together at the base, but a very little way. Styles 3. Drupe containing a 3-celled, 3-seeded nucleus.—Racemes of flowers spicate and terminal, simple or branched. Flowers yellow, rarely white.

* *Leaves clothed with velvety down beneath.*

1 B. VERBASCIFÒLIA (D. C. prod. 1. p. 579.) leaves lanceolate-obovate, quite entire, downy on both surfaces; racemes terminal; trunk thick, knotted, dwarf. ♄. S. Native of Guiana by the sea-shore. Malpíghia verbascifòlia, Aubl. guian. 1. p. 460. t. 184. Cav. diss. 8. p. 411. t. 240. Leaves grey. The hairs on the upper surface of the leaves are fixed by their centre. Flowers yellow. A decoction of the roots and branches is used in Guiana as a detergent in ulcers. This decoction has a red tinge and is vulnerary and astringent.

Mullein-leaved Byrsonima. Fl. Jul. Aug. Clt. 1810. Sh. 1 ft.

2 B. LAURIFÒLIA (H. B. et Kunth, nov. gen. amer. 5. p. 147.) leaves ovate-oblong, narrowed towards the top, cuneated at the base, and rather complicated, hairy above, downy beneath and hoary; branches clothed with downy hairs; calyx silky-villous. ♄. S. Native of Llanos in Cumana. Malpíghia laurifòlia, Spreng. syst. 2. p. 385. Very like *B. verbascifòlia*.

Laurel-leaved Byrsonima. Shrub.

3 B. NÍTIDA (Ruiz et Pav. fl. per. vol. icon. under *Malpíghia*,) leaves ovate-oblong; racemes terminal and axillary, branched, panicled; petals fringed; fruit large, 3-seeded; stigmas 3. ♄. S. Native of Peru.

Shining-leaved Byrsonima. Shrub 10 feet.

4 B. ERIO'PODA (D. C. prod. 1. p. 579.) leaves oval, obtuse, tapering to the base, coriaceous, at length shining above, underneath as well as above hairy on the nerves; peduncles very hairy. ♄. S. Native of South America. Malpíghia rùfa, Poir. dict. 4. p. 332.

Hairy-peduncled Byrsonima. Shrub.

5 B. PHLOMOÌDES; leaves obovate-roundish, with 2 glands at the base of each, scabrous above, and clothed with cinereous down beneath; racemes compound, axillary. ♄. S. Native of Brazil. Malpíghia phlomoìdes, Spreng. syst. 2. p. 385. Flowers yellow.

Phlomus-like Byrsonima. Shrub.

6 B. NERVÒSA (D. C. prod. 1. p. 579.) leaves oval, blunt at both ends, shining above, wrinkled, but clothed with rufous down beneath, feather-nerved, with the nerves and nervelets prominent; racemes crowded with flowers and covered with brown down. ♄. S. Native of Brazil. Malpíghia macrophýlla, Juss. in Pers. ench. 1. p. 506. Flowers yellow.

Nerved-leaved Byrsonima. Shrub 8 feet.

7 B. COTINIFÒLIA (H. B. et Kunth, nov. gen. amer. 5. p. 152. t. 447.) leaves obovate, obtuse, tapering to the base, rather membranaceous, younger ones velvety on both surfaces, with rufous down, adult ones smooth above, but rather velvety beneath; racemes simple, crowded with flowers, rather velvety; glands of calyx continuous. ♄. S. Native of Mexico about Acapulca. Flowers copper-coloured.

Cotinus-leaved Byrsonima. Shrub 6-12 feet.

8 B. FERRUGI'NEA (H. B. et Kunth, nov. gen. amer. 5. p. 151. t. 446.) leaves obovate-roundish, each with a short point, cuneated at the base, covered with soft pubescence above, but clothed with rusty down beneath, as well as the branches and calyxes; racemes simple; calycine glands 10, distinct. ♄. S. Native about the river Orinoco in woods. Flowers yellow.

Rusty-leaved Byrsonima. Shrub.

9 B. ALTI'SSIMA (D. C. prod. 1. p. 579.) leaves ovate-oblong, covered with rufous down beneath but beset with bristles above, which are fixed by their centre; racemes clothed with rufous hairs. ♄. S. Native of Guiana in woods. Malpíghia altíssima, Aubl. guian. 1. p. 455. t. 181. A tree from 60-80 feet high. Flowers white. Drupe reddish, almost dry.

Tallest Byrsonima. Fl. July, Aug. Clt. 1820. Tree 80 ft.

10 B. CRASSIFÒLIA (D. C. prod. 1. p. 579.) leaves ovate, acute at both ends, at length smooth above, but clothed with brownish down beneath; racemes erect, elongated, brownish-velvety. ♄. S. Native of Guiana and Cayenne, and also at Orinoco? Malpíghia crassifòlia, Lin. spec. 610. Aubl. guian. 1. p. 457. t. 182. B. crassifòlia, H. B. et Kunth, nov. gen. amer. 5. p. 151.? Flowers yellow. Drupe greenish. The inhabitants of Guiana consider an infusion of the bark a febrifuge, and as stopping vomiting.

Var. β, Moureíla (Aubl. guian. 1. p. 459. t. 183.) leaves acute; flowers spiked. ♄. S. Native of Guiana and Cayenne in woods. Cav. diss. 8. p. 412. t. 241. Flowers yellow. This tree is called *Moureila* in Guiana. Tree 20 feet.

Thick-leaved Byrsonima. Fl. Jul. Aug. Clt. 1793. Sh. 6 ft.

11 B. CHRYSOPHY'LLA (H. B. et Kunth, nov. gen. amer. 5. p. 151.) leaves oblong, short-acuminated, acute at the base, rather wavy on the margin and revolute, smooth above, clothed beneath with silky down, which is of a golden rusty colour; racemes simple; calyxes glandless. ♄. S. Native of South America at St. Carlos del Rio Negro. Galphímia chrysophýlla, Spreng. syst. 2. p. 385. Flowers yellow.

Golden-leaved Byrsonima. Fl. Aug. Clt. 1823. Tr. 14 ft.?

12 B. MONTA'NA (H. B. et Kunth, nov. gen. amer. 5. p. 151.) leaves elliptical-oblong, acute at both ends, smooth above, pubescent beneath; branches and calyxes covered with rusty down; racemes branched. ♄. S. Native of Cumana on Mount Cocollar. Flowers yellow. Fruit unknown.

Mountain Byrsonima. Tree 20 feet.

13 B. LANCEOLA'TA (Poir. dict. 4. p. 332.) leaves lanceolate-oblong, at length becoming smooth above, but brownish-velvety

beneath: racemes erect, elongated, compound at the top. ♄. S. Native of Cayenne. Flowers yellow.

Lanceolate-leaved Byrsonima. Tree 20 feet.

14 B. PU'LCHRA (D. C. prod. 1. p. 580.) leaves oval-oblong, acute at both ends, brownish-velvety beneath; racemes erect, simple; drupe ovate, mucronated. ♄. S. Native of Mexico on the mountains. Malpíghia púlchra, Moc. et Sesse, fl. mex. icon. ined. Drupe scarlet. Petals cordate, yellow when young, but at last becoming reddish.

Fair Byrsonima. Tree 16 feet?

15 B. SERI'CEA (D. C. prod. 1. p. 580.) leaves elliptical-oblong, acuminated at both ends, smooth and shining above, but covered with silky rufous down beneath; racemes rather branched, somewhat velvety. ♄. S. Native of Brazil. Flowers yellow.

Silky-leaved Byrsonima. Shrub.

16 B. CINE'REA (D. C. prod. 1. p. 580.) leaves narrow-lanceolate, shining above, younger ones covered with rufous-velvety down on both surfaces, adult ones underneath as well as the branches clothed with cinereous down; racemes spicate, simple. ♄. S. Native of French Guiana. Malpíghia cinèrea, Poir. suppl. 4. p. 7. Flowers yellow.

Cinereous Byrsonima. Shrub.

17 B. RHOPALÆFÒLIA (H. B. et Kunth, nov. gen. amer. 5. p. 148.) leaves elliptical, bluntish, rounded at the base, complicated, smooth, younger ones underneath as well as the branches and calyxes clothed with rusty down; racemes simple. ♄. S. Native of Cumana and Caraccas in hot places. Flowers yellow. Fruit unknown.

Rhopala-leaved Byrsonima. Tree 20 feet.

18 B. NITIDI'SSIMA (H. B. et Kunth, l. c.) leaves nearly sessile, elliptical, rounded at both ends, puberulous above and shining, but clothed with rufous pubescence beneath as well as the branches; racemes simple; calyx clothed with rufous down, with 10 distinct glands. ♄. S. Native on the banks of the Orinoco in the mission of Panumana. Flowers white.

Most-shining-leaved Byrsonima. Tree 20 feet.

* * *Leaves in the adult state smooth on both surfaces.*

19 B. SPICA'TA (D. C. prod. 1. p. 580.) leaves lanceolate, smooth, rusty beneath; racemes spiked, erect, crowded, rather velvety; petals halbert-shaped, very blunt. ♄. S. Native of St. Domingo, Guadaloupe, Porto-Rico, and Brazil. Malpíghia spicàta, Cav. diss. 8. p. 409. t. 237. Flowers yellow.

Spiked-flowered Byrsonima. Fl. July, Aug. Clt. 1810. Shrub 6 feet.

20 B. LU'CIDA (D. C. prod. 1. p. 580.) leaves obovate, cuneiform, obtuse, or mucronate, smooth, veinless, shining; racemes spiked, erect, short, smooth; pedicels hispid; petals hastately kidney-shaped. ♄. S. Native of the Caribbee Islands, St. Thomas, and Guadaloupe. Malpíghia lùcida, Swartz, fl. ind. occ. 2. p. 852. Sims, bot. mag. t. 2462. Flowers pink. A beautiful shrub.

Lucid-leaved Byrsonima. Fl. May, Aug. Clt. 1759. Sh. 8 ft.

21 B. COCCOLOBÆFO'LIA (H. B. et Kunth, nov. gen. amer. 5. p. 148.) leaves sessile, roundish, ovate, blunt, obsoletely cordate, smooth as well as the branchlets; racemes simple; calyxes smoothish. ♄. S. Native of the Caraccas in arid places near Villa de Cura. Flowers white.

Coccoloba-leaved Byrsonima. Tree 16 feet.

22 B. LÆVIGA'TA (D. C. prod. 1. p. 580.) leaves ovate, obtuse, even, smooth; racemes spiked, crowded with flowers, elongated. ♄. S. Native of Cayenne and probably in Guadaloupe. Malpíghia lævigàta, Poir. dict. 4. p. 332. Petals yellowish-white.

Smooth-leaved Byrsonima. Shrub?

23 B. E'LEGANS (D. C. prod. 1. p. 580.) leaves oblong, or oblong-lanceolate, membranaceous, very smooth; racemes elongated, nodding; pedicels glandular. ♄. S. Native of the sea-shore in the island of Arowabisch in Guiana. Malpíghia élegans, Meyer, prim. esseq. 178. Flowers flesh-coloured.

Elegant Byrsonima. Tree 40 feet.

24 B. ANGUSTIFÒLIA (H. B. et Kunth, nov. gen. amer. 5. p. 153. t. 449.) leaves linear-oblong, retuse at the apex, acutish at the base, smooth, cretaceously-pruinose beneath; stipulas connate at the base; racemes branched; calyxes clothed with silky pubescence, furnished with 10 glands. ♄. S. Native of South America near where the rivers Atabapo and Orinoco join. Malpíghia pruinòsa, Spreng. syst. 1. p. 384. Flowers red.

Narrow-leaved Byrsonima. Tree 16 feet.

25 B. DE'NSA (D. C. prod. 1. p. 580.) leaves ovate-lanceolate, coriaceous, shining on both surfaces; racemes densely spiked; pedicels hairy. ♄. S. Native of Guiana. Malpíghia dénsa, Poir. dict. suppl. 4. p. 7. Flowers red.

Dense-racemed Byrsonima. Shrub.

26 B. CORIA'CEA (D. C. prod. 1. p. 580.) leaves ovate, acute, quite entire, smooth on both surfaces; racemes densely spiked, pubescent, erect. ♄. S. Native of the south of Jamaica among bushes on the lower mountains of Liguanea. Malpíghia coriàcea, Swartz, fl. ind. occ. 2. p. 854.—Sloan. hist. 2. p. 20. t. 163. f. 1. Flowers yellow, sweet-scented. Brown calls this tree *Locust-tree*.

Leathery-leaved Byrsonima. Fl. May, Aug. Clt. 1814. Tree 30 feet.

27 B. BRACHYSTA'CHIA (D. C. prod. 1. p. 581.) leaves oval, acute at both ends, quite entire, smooth; racemes spiked, erect, brownish-velvety, one-half shorter than the leaves. ♄. S. Native of Brazil. Flowers yellow.

Short-spiked Byrsonima. Shrub.

28 B. PA'LLIDA (D. C. prod. 1. p. 581.) leaves ovate, smooth on both surfaces, shining above, very coriaceous, pale; racemes spiked, with short, smooth pedicels; drupe small, globosely-pear-shaped. ♄. S. Native of Cayenne, Malpíghia pállida, Poir. suppl. 4. p. 7. Flowers yellowish.

Pale-leaved Byrsonima. Clt. 1820. Shrub 6 feet?

29 B. RETICULA'TA (D. C. prod. 1. p. 581.) leaves ovate-lanceolate, netted, smooth, shining above; racemes large, compound, reflexed at the apex; bracteas ovate. ♄. S. Native of Cayenne. B. spicàta, Poppig. Malpíghia reticulàta, Poir. suppl. 4. p. 8. Flowers pale-yellow.

Netted-leaved Byrsonima. Fl. Jul. Aug. Clt. 1823. Sh. 10 ft.

30 B. MO'LLIS (D. C. prod. 1. p. 581.) leaves ovate-oblong, smooth, even, coriaceous; racemes panicled, short, smooth. ♄. S. Native of Cayenne. Malpíghia móllis, Poir. suppl. 4. p. 6. Flowers yellowish.

Soft-leaved Byrsonima. Shrub 6 feet.

31 B. DIPHY'LLA (Jacq. amer. 136.) leaves oval, smooth, quite entire; racemes simple, on small 2-leaved branches. ♄. S. Native of Carthagena in woods by the sea-side. Flowers yellow. Fruit yellow.

Two-leaved-racemed Byrsonima. Shrub 8 feet.

32 B. GUADALUPE'NSIS; leaves elliptical-oblong, quite entire, shining above, rusty beneath, smooth; racemes terminal, loosely corymbose. ♄. S. Native of Guadaloupe. Flowers yellowish.

Guadaloupe Byrsonima. Shrub?

33 B.? VOLU'BILIS (D. C. prod. 1. p. 581.) leaves oval, acuminated, smooth, shining; branches twining, usually tubercled; racemes corymbosely-umbellate, terminal. ♄. ب. S. Native of the West Indies. Malpíghia volùbilis, Sims, bot. mag. t. 809. Flowers yellow. Fruit unknown. This plant is most probably a species of *Banistèria*.

Twining Byrsonima. Fl. Aug. Sept. Clt. 1793. Sh. tw.

Cult. All the species will thrive well in any light soil, or a mixture of loam and peat, and ripened cuttings will root freely in sand under a hand-glass, in heat. Most of the species are rather shewy.

III. BUNCHO'SIA (from *Bunchos*, the Arabic name for coffee; in allusion to the similarity between the seeds of this genus and those of coffee). Juss. ann. mus. 18. p. 481. H. B. et Kunth, nov. gen. amer. 5. p. 183. D. C. prod. 1. p. 581.

Lin. syst. *Monadélphia, Decándria.* Calyx 5-parted, furnished on the outside with 8 or 10 glands. Petals unguiculate. Stamens 10, monadelphous at the base. Style 1, simple, bifid or trifid at the apex. Drupe enclosing 2, but very rarely 3, nuts, which are flat on one side and convex on the other.—Racemes axillary, loosely spiked or somewhat panicled.

* *Leaves, petioles, or pedicels glandular.*

1 B. glandulòsa (D. C. prod. 1. p. 581.) leaves ovate-elliptical, acuminated, smooth; petioles furnished with 2 glands at the top; racemes simple, shorter than the leaves. ♄. S. Native of the Antilles. Malpíghia glandulòsa, Cav. diss. 8. p. 411. t. 239. f. 2. Flowers yellow.

Glandular-petioled Bunchosia. Clt. 1804. Tree 20 feet.

2 B. glanduli'fera (H. B. et Kunth, nov. gen. amer. 5. p. 154.) leaves elliptical-ovate, on short petioles, wavy, pubescent on both surfaces, furnished with 4 glands beneath at the base; racemes simple; pedicels each furnished with 1 gland. ♄. S. Native of Caraccas and of Guadaloupe in woods. Malpíghia glandulòsa, Jacq. icon. rar. t. 469. M. glandulífera, Jacq. coll. 4. p. 207. and 5. p. 5. f. 3. Flowers yellow. Fruit red.

Gland-bearing Bunchosia. Fl. Mar. May. Clt. 1806. Sh. 10 feet.

3 B. cornifòlia (H. B. et Kunth, nov. gen. amer. 5. p. 154.) leaves elliptical, acuminated, acute at the base, pubescent on both surfaces as well as the branches, with close-pressed silvery hairs, and furnished with 2 glands towards the base; racemes simple, each pedicel furnished with 1 gland. ♄. S. Native of New Granada between Turbaco and Carthagena. Petals white. Fruit yellow.

Dogwood-leaved Bunchosia. Shrub 12 feet.

4 B. polysta'chya (D. C. prod. 1. p. 581.) leaves oblong, acute, smooth, shining, furnished beneath at the base with 2 glands; racemes rather panicled; pedicels each furnished with 1 gland; stigma capitate, 2-lobed. ♄. S. Native of the West Indies and Cumana. Malpíghia polystàchya, Andr. bot. rep. t. 604. Flowers yellow. Fruit red, eatable.

Many-spiked Bunchosia. Fl. Mar. May. Clt. 1806. Sh. 10 ft.

5 B. me'dia (D. C. prod. 1. p. 581.) leaves oblong-lanceolate, acute, smooth, shining, furnished beneath with 2 glands, approximating to the midrib; racemes simple; pedicels each bearing 1 gland on the middle; stigma capitate, 2-lobed. ♄. S. Native of the West Indies. Malpíghia mèdia, Ait. hort. kew. ed. 2. vol. 3. p. 103. Flowers yellow.

Intermediate Bunchosia. Fl. Mar. May. Clt. 1790. Sh. 10 ft.

6 B. pilòsa (H. B. et Kunth, nov. gen. amer. 5. p. 154.) leaves almost sessile, oblong, acute, rounded at the base, hairy above, and covered beneath with bristly hairs, and hoary as well as the branchlets, and furnished with 7 or 9 glands towards the margin; racemes simple, each pedicel furnished with 1 gland above the middle. ♄. S. Native of New Granada near Turbaco. Flowers yellow.

Pilose Bunchosia. Tree 12 feet.

7 B. tubercula'ta (D. C. prod. 1. p. 581.) branches tubercled; leaves ovate-lanceolate, rather pubescent; racmees 3-times shorter than the leaves, each pedicel furnished with 1 gland above the base. ♄. S. Native of Caraccas. Malpíghia tuberculàta, Jacq. schœnbr. 1. p. 54. t. 104. Flowers yellow. Fruit red.

Tubercled-branched Bunchosia. Fl. May, Aug. Clt. 1806. Shrub 8 feet.

8 B. argе'ntea (D. C. prod. 1. p. 582.) branches puberulous; leaves lanceolate, silvery beneath; racemes opposite, simple, pubescent, each pedicel bearing 1 gland. ♄. S. Native of Caraccas. Malpíghia argéntea, Jacq. fragm. 106. t. 83. Flowers yellow. Glands of calyx elongated.

Silvery-leaved Bunchosia. Fl. Jul. Aug. Clt. 1810. Sh. 10 ft?

9 B. glau'ca (H. B. et Kunth, nov. gen. amer. 5. p. 155.) leaves elliptical-oblong, acuminated, acute at the base, smoothish above, covered beneath with close-pressed hairs, glaucescent, and furnished with 4-11 glands towards the margin; branches warted; racemes opposite, pubescent, each pedicel furnished with 1 gland. ♄. S. Native of New Granada near Honda. Very like *B. nítida*. Flowers yellow.

Glaucous-leaved Bunchosia. Shrub 12 feet.

** *Leaves, petioles, and pedicels without glands.*

10 B. ni'tida (D. C. prod. 1. p. 582.) leaves oblong, acuminated, smooth, glandless; racemes elongated, almost the length of the leaves. ♄. S. Native of Jamaica, Guadaloupe, and St. Domingo, in sunny places. Malpíghia nítida, Lin. spec. 609. Cav. diss. 8. p. 411. t. 239. f. 1. Flowers yellow. Fruit large, red, and are much eaten by turkeys and other large fowls. Leaves 4 inches long.

Shining-leaved Bunchosia. Fl. Jul. Aug. Clt. 1800. Sh. 4 ft.

11 B. armenì'aca (D. C. prod. 1. p. 582.) leaves ovate-oblong, acute, coriaceous, smooth; racemes elongated, almost the length of the leaves; styles rather distinct. ♄. S. Native of Peru in the province of Chanca. Malpíghia Armenìaca, Cav. diss. 8. p. 410. t. 288. The fruit in shape is compared to that of *Prunus Armenìaca*, and the nucleus is said to be poisonous. Leaves 4 or 5 inches long. Flowers yellow.

Apricot-fruited Bunchosia. Shrub.

12 B. odora'ta (D. C. prod. 1. p. 582.) leaves ovate, emarginate, downy on both surfaces; racemes opposite; stigma bifid or trifid. ♄. S. Native of Carthagena among bushes. Malpíghia odoràta, Jacq. amer. p. 136. t. 177. f. 41. Flowers yellow, sweet-scented.

Sweet-scented-flowered Bunchosia. Fl. May, Aug. Clt. 1806. Shrub 7 feet.

† *Species not sufficiently known.*

13 B.? panicula'ta (D. C. prod. 1. p 582.) leaves oblong, cordate, acuminated, smooth; racemes panicled, lateral, and terminal. ♄. S. Native of Jamaica. Malpíghia paniculàta, Mill. dict. no. 6. Flowers purple.

Panicled-flowered Bunchosia. Fl. May, Aug. Clt. 1790. Shrub 10 feet?

14 B. cane'scens (D. C prod. 1. p. 582.) leaves oblong, obtuse, pubescent; racemes axillary, compound. ♄. S. Native of the West Indies. Malpíghia canéscens, Ait. hort. kew. 2. p. 105. Flowers probably yellow.

Hoary-leaved Bunchosia. Clt. 1742. Tree 20 feet?

15 B.? sessilifòlia (D. C. prod. 1. p. 582.) leaves oblong-lanceolate, tapering to the base, almost sessile, acuminated at the apex; racemes opposite, simple; style thickish, with an orbicular stigma. ♄. S. Native of Mexico. Petals yellow, with fringed margins. Fruit unknown.

Sessile-leaved Bunchosia. Shrub?

Cult. All the species of this genus are rather ornamental. They will thrive well in a mixture of loam and peat, and ripened cuttings will root in sand under a hand-glass, in heat.

IV. GALPHI'MIA (an anagram of *Malpíghia*,) Cav. icon. 5. p. 61. D. C. prod. 1. p. 582.

Lin. syst. *Decándria*, *Trigýnia*. Calyx 5-parted, without glands. Petals unguiculate, oval or oblong. Stamens 10, almost free. Styles 3. Fruit (according to Cavanilles) 3-celled? containing 3 nuts; nuts opening on the back, 1-seeded. Flowers yellow. Racemes terminal, as in *Byrsónima*, but differs from it in the calyx being destitute of glands.

1 G. hirsu'ta (Cav. icon. 5. p. 62.) leaves ovate, acute, on short footstalks, hairy on both surfaces. ♄. S. Native of Mexico between Chilpancinga and Rio Azul.

Hairy Galphimia. Shrub 6 feet.

2 G. glau'ca (Cav. icon. 5. p. 61. t. 489.) leaves ovate, obtuse, smooth, glaucous beneath, and with one tooth on each side at the base; petioles without glands. ♄. ◡. S. Native of Mexico.

Glaucous-leaved Galphimia. Clt. 1830. Shrub cl.

3 G. glandulòsa (Cav. icon. 6. p. 43. t. 563.) leaves oval-lanceolate, smooth, each petiole furnished with 2 large glands at the top; petals oblong. ♄. S. Native of the western parts of Mexico on the declivities of mountains. H. B. et Kunth, nov. gen. amer. 5. p. 172. Malpíghia biglandulòsa, Poir. suppl. 4. p. 7. Perhaps several species are confounded below under the head of varieties. Flowers of all yellow.

Var. a, ovalifòlia (Moc. et Sesse, fl. mex. icon. ind. D. C. prod. 1. p. 582.) leaves oval, obtuse. ♄. S. Native of Mexico.

Var. β, oblongifòlia (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 582.) leaves oval-oblong, tapering to both ends. ♄. S. Native of Mexico.

Var. γ, lanceolàta (Cav. l. c.) leaves lanceolate, acuminated at both ends. ♄. S. Native of Mexico.

Glandular Galphimia. Shrub 3 to 4 feet.

† *Doubtful species, the calyxes of which are furnished with glands.*

4 G.? longifòlia (H. B. et Kunth, nov. gen. amer. 5. p. 173.) leaves lanceolate-oblong, acute, angularly-cuneated at the base, smooth, each petiole bearing 1 or 2 glands; racemes terminal, branched. ♄. ◡. S. Native of South America in shady places at the river Cassiquiare. Flowers yellow.

Long-leaved Galphimia. Tree 20 feet.

5 G.? móllis (H. B. et Kunth, nov. gen. amer. 5. p. 173.) leaves oblong, acute at both ends, coriaceous, smooth above, and shining, but clothed with soft hoary pubescence beneath, each petiole bearing 2 glands; umbels axillary? few-flowered. ♄. ◠. S. Native of the temperate parts of Mexico. Flowers yellow.

Soft-leaved Galphimia. Shrub cl.

Cult. The species of *Galphímia* are rather handsome shrubs. They will thrive well in a mixture of loam and peat, and ripened cuttings will strike root in sand under a hand-glass, in heat.

V. CAUCA'NTHUS (the Arabic name of this tree is *kauka*, and *ανθος*, *anthos*, a flower). Forsk. descr. 91. D. C. prod. 1. p. 583.

Lin. syst. *Decándria*, *Trigýnia*. Calyx campanulate, 5-parted, destitute of glands. Petals unguiculate, concave. Stamens 10; filaments awl-shaped. Margins of anthers rather prominent. Styles 3, awl-shaped. Fruit unknown. This genus is perhaps not sufficiently distinct from *Galphímia*.

1 C. Ara'bicus (Lam. dict. 1. p. 658.) ♄. G. Native of Arabia on the mountains at Taæs. Malpíghia Caucánthus, Poir. suppl. 4. p. 6. Galphímia Caúca, Spreng. syst. 2. p. 385. Leaves opposite, orbicular, smooth, usually emarginate. Corymbs of flowers terminal. Flowers white. The fruit is said to be about the size of a pigeon's egg, and perhaps therefore fleshy.

Arabian Caucanthus. Shrub or Tree?

Cult. This plant will probably thrive well in a mixture of loam, peat, and sand; and ripened cuttings will probably strike root in sand under a hand-glass.

Tribe II.

HIPTA'GEÆ (plants agreeing with *Hiptáge* in the shape of the fruit). D. C. prod. 1. p. 583. Style 1 (f. 108. *d.*) or 3, connected into one. Carpel a dry, indehiscent, 1-seeded fruit (f. 108. *e.*), which is usually expanded into wings of various shapes (f. 108. *e.*). Leaves opposite or in whorls.

VI. HI'PTAGE (probably from *ιπταμαι*, *hiptamai*, to fly; in allusion to the shape of the lateral petals, which appear like wings). Gært. intr. p. 126. fruct. 2. p. 169. t. 116.—Gærtnèra, Schreb, gen. no. 735. but not of Lam.—Molìna, Cav. diss. 9. p. 435. but not of Juss.

Lin. syst. *Decándria*, *Monogýnia*. Calyx 5-parted, and furnished with 5 glands at the base on the outside. Petals 5, unequal, fringed (f. 108. *b.*). Stamens 10 (f. 108. *c.*), one of which is much longer than the rest. Carpels 3 (but usually 1 or 2 from abortion), 4-winged (f. 108. *e.*); wings unequal.—Climbing shrubs.

1 H. Madablòta (Gært. fruct. 2. p. 169. t. 116.) leaves ovate-lanceolate, acuminated; racemes terminal. ♄. ◡. S. Native of the East Indies on the Circar mountains. Madablòta, Sonn. voy. ind. 2. p. 135. Molìna racemòsa, Cav. diss. 9. p. 435. t. 263. but not of Juss. Gærtnèra racemòsa, Roxb. cor. 1. p. 19. t. 18. Banistèria Bengalénsis, Lin. syst. p. 247. Banistèria unicapsulàris, Lam. Calophýllum Akàra, Burm. ind. 121. —Rheed. mal. 6. t. 59. This is a large, woody, climbing shrub, flowering in its native country in the wet and cold season. It is cultivated all over the coast of Coromandel on account of the beauty and fragrance of its blossoms, each of which is composed of five petals, one of them yellow, the rest white. *Madablota* is its name in some parts of the East Indies.

FIG. 108.

Madablota Hiptage. Fl. March, April. Clt. 1796. Shrub cl.

2 H. obtusifòlia (D. C. prod. 1. p. 583.) leaves obovate, obtuse, rather mucronated; racemes terminal and axillary. ♄. ◡. S. Native of China. Gærtnèra obtusifòlia, Roxb. hort. beng. p. 32. The flowers are composed of 5 petals, one of which is yellow, the rest white.

Obtuse-leaved Hiptage. Clt. 1810. Shrub cl.

Cult. *Hiptáge* is a genus of beautiful climbing shrubs; they are therefore very desirable for a stove-conservatory, where they can be trained upon the rafters. A mixture of loam and peat will suit them best, and cuttings will strike root in sand under a hand-glass, in heat.

VII. TRISTELLATE'IA (from *tres*, three, and *stella*, a star; disposition of the appendages of the capsule). Pet. Th. gen. mad. p. 14. no. 47.—Zýmum, Nor. Juss. ann. 18. p. 482. D. C. prod. 1. p. 583.

Lin. syst. *Decándria*, *Monogýnia*. Calyx 5-parted. Petals 5, unguiculate. Stamens 10, the 5 alternate ones smallest. Ovary impressed with 3 glandular pores. Carpels 3, crowned by 6 appendages, which are 3-toothed at the apex. Embryo convolute.

1 T. Madagascarie'nsis (Poir. suppl. 5. p. 367.) ♄. ◠. S. Native of Madagascar. This is a twining shrub, with the lower

leaves disposed 4 in a whorl, upper ones opposite, bearing glands at their base, entire. Flowers disposed in racemes, yellow.

Madagascar Tristellateia. Shrub tw.

Cult. This beautiful twining shrub will grow in a mixture of loam and peat, and ripened cuttings will strike root in sand under a hand-glass, in heat.

VIII. THRYA'LLIS (a name given by the Greeks to *Verbáscum*, which comes from θραυω, *thrauo*, to divide. The present plant has nothing to do with the plant of the Greeks unless in having yellow flowers). Lin. gen. 533. D. C. prod. 1. p. 583.

Lin. syst. *Monadélphia, Decándria.* Calyx 5-parted, permanent. Petals roundish, unguiculate. Stamens 10, awl-shaped, monadelphous at the base. Styles 3, connate at the base. Capsules inclosed within the large calyx, divisible into 3, triangular, 1-seeded nuts; cells opening by the exterior angle.

1 T. Brasilie'nsis (Lin. spec. 554.) branches jointed; leaves ovate, stalked; racemes of flowers terminal, ♄. S. Native of Brazil.—Marcg. bras. p. 79. f. 3. Flowers small, yellow.

Brazilian Thryallis. Shrub 2 feet?

2 T. longifòlia (Mart. fl. bras. 3. p. 78. t. 230.) leaves oblong-lanceolate, acutish, canescent beneath; petioles glandular towards the base; glands oblong. ♄. ◡. S. Native of Brazil in the province of Bahia. Petals yellow.

Long-leaved Thryallis. Shrub cl.

3 T. latifòlia (Mart. fl. bras. 3. p. 79. t. 231.) leaves broad, ovate, obtuse or emarginate, cordate at the base, white from tomentum beneath; petioles biglandular at the top; glands globose ♄. ◡. S. Native of Brazil. Petals yellow.

Broad-leaved Thryallis. Shrub cl.

4 T.? brachysta'chya (Lindl. bot. reg. 1162.) leaves ovate-lanceolate, glaucous-green above, white beneath; racemes short, panicled; petioles biglandular at the apex. ♄. ◡. S. Native of Brazil about Rio Janeiro. Petals yellow, on long claws.

Short-spiked Thryallis. Shrub 4 feet.

Cult. A mixture of loam and peat will suit these plants, and ripened cuttings will root in sand under a hand-glass, in heat.

IX. ASPICA'RPA (from ασπις, *aspis*, a shield, and καρπος, *karpos*, a fruit; form of fruit). Rich. in mem. mus. 2. p. 399. t. 12. D. C. prod. 1. p. 583.—Acósmus, Desv.

Lin. syst. *Monándria, Monogýnia.* Calyx 5-parted, connivent. Petals wanting. Stamen 1, enclosed. Ovary roundish, half-cleft, 2-celled. Style 1, very short, seated in the fissure of the ovary. Fruit dry, indehiscent, 1-celled from abortion, 1-seeded. Seeds orbicular, without albumen. Embryo recurved, with a basilar radicle, pointing to the hilum.

1 A. u'rens (Lag. nov. gen. et spec. 1. no. 5.) ♄. ◠. S. Native of New Spain. Stem somewhat shrubby, twining, filiform. Leaves cordate-oval, beset with stinging, hair-like bristles, which are fixed by their centre, and lie very close. Flowers disposed in axillary bundles, almost sessile, without petals.

Stinging Aspicarpa. Fl. June, July. Clt. 1821. Sh. tw.

Cult. This plant is hardly worth cultivating except in a botanic garden. It will thrive well in a mixture of loam and peat, and cuttings will strike root in sand under a hand-glass, in heat.

X. GAUDICHAU'DIA (in honour of Charles Gaudichaud, who accompanied Freycinet as naturalist in his voyage round the world). H. B. et Kunth, nov. gen. amer. 5. p. 156. t. 445. St. Hil. bull. philom. 1823. p. 132. D. C. prod. 1. p. 584.

Lin. syst. *Monadélphia, Pentándria.* Calyx 5-parted, or 5-cleft, furnished with 10, but usually with 8, glands on the outside. Petals 5, sometimes perigynous, roundish, spreading. Stamens 5, inserted with the petals; filaments flattened and connate at the base, unequal, two of them bearing smaller anthers than the others, or abortive. Style 1. Carpels 3, free, or connected at the very base, 1-seeded, one of them usually abortive. Samaræ 2, each drawn out at the base into a spur-like membrane, and winged on the back. Seeds erect at the top of a pendulous funicle. Albumen wanting. Embryo straight.—Shrubs with opposite entire leaves and yellow flowers.

1 G. cynanchoìdes (H. B. et Kunth, l. c.) stem twining; leaves stalked; racemes crowded with flowers, axillary or terminal. ♄. ◠. S. Native of Mexico near Valladolid.

Cynanchum-like Gaudichaudia. Shrub twining.

2 G. Guarani'tica (St. Hil. bull. philom. 1823. p. 132.) stem twining, shrubby; leaves stalked, ovate-oblong, obtuse, with a short mucrone; petioles with 2 glands at the top of each; umbels axillary, 2-3-flowered. ♄. ◠. S. Native of Brazil.

Guaranitic Gaudichaudia. Shrub tw.

3 G. linearifòlia (St. Hil. l. c.) stem suffruticose, erect; leaves linear, almost sessile, distant; umbels terminal. ♄. S. Native of Brazil.

Linear-leaved Gaudichaudia. Shrub 3 feet.

4 G. seríCea (St. Hil. l. c.) stem suffruticose, erect; leaves on short stalks, silky beneath, intermediate ones ovate-lanceolate; peduncles filiform, 1-flowered, rarely 2-flowered. ♄. S. Native of Brazil.

Silky-leaved Gaudichaudia. Shrub 3 feet.

5 G. a'lbida (Schlecht. et Cham. in Linnæa. 5. p. 217.) stem shrubby, climbing; leaves stalked, ovate, oblong, obtuse, silky-canescent beneath from adpressed pili; petioles glandless; umbels 2-4-flowered, terminal. ♄. ◡. S. Native of Mexico. Banistèria álbida, Schiede, mss. Sterile filaments longer than the fertile ones.

Whitened-leaved Gaudichaudia. Shrub cl.

Cult. Rather handsome flowering shrubs. They will thrive in a mixture of loam, peat, and sand, and ripened cuttings will strike root in sand under a hand-glass, in heat.

XI. CAMA'REA (καμαρα, *camara*, an arch?). St. Hil. bull. philom. 1823. p. 133. D. C. prod. 1. p. 584.

Lin. syst. *Hexándria, Monogýnia.* Calyx 5-parted or 5-cleft, with 2 glands at the base of each lobe, but sometimes naked. Petals 5, somewhat perigynous, rather unequal. Stamens 6, 3 of which are fertile, with the filaments of these almost joined to the top and bearing round anthers, the other 3 are hardly connected at the base, the middle one of these is fertile, the 2 lateral ones are sterile, but bearing petal-like twisted masses instead of anthers. Style 1. Carpels 3, or from abortion only 2, somewhat connate, 1-seeded, indehiscent, crested on the back and with a wrinkled crest on the sides. Seeds pendulous at the extremity of an erect funicle. Albumen wanting. Embryo straight, inverted.—Erect shrubs, all natives of Brazil. Flowers of all yellow.

1 C. hirsu'ta (St. Hil. l. c.) leaves lanceolate or oblong, or ovate-lanceolate, hairy, with silky margins; umbels terminal. ♄. S. Native of Brazil.

Hairy Camarea. Shrub.

2 C. axilla'ris (St. Hil. l. c.) leaves lanceolate, acute, cordate at the base, villous, spreading; flowers solitary, axillary. ♄. S. Native of Brazil.

Axillary-flowered Camarea. Shrub.

3 C. seri'cea (St. Hil. l. c.) leaves long, linear-lanceolate, acute, silky; umbels terminal. ♄. S. Native of Brazil.

Silky-leaved Camarea. Shrub.

4 C. ericoìdes (St. Hil. l. c.) leaves small, linear, narrow, crowded; flowers in umbels. ♄. S. Native of Brazil.

Heath-like Camarea. Shrub.

5 C. linearifòlia (St. Hil. l. c.) leaves linear, rather distant; flowers in umbels. ♄. S. Native of Brazil.

Linear-leaved Camarea. Shrub.

Cult. Shrubs with rather shewy flowers. They will thrive

well in a mixture of loam, sand, and peat, and ripened cuttings will strike root in sand under a hand-glass, in heat.

Tribe III.

BANISTERIE'Æ (plants agreeing with *Banistèria* in many important characters). D. C. prod. 1. p. 584. Styles 3, distinct. Fruit of 2-3 dry, indehiscent, 1-seeded carpels, which are variously expanded into wings.—Leaves opposite, very rarely in whorles.

XII. HIRÆ'A (in honour of John Nicholas de la Hire, a French physician, member of the Academy of Sciences, who discovered an exudation resembling manna on the leaves of orange trees; he died in 1727.) H. B. et Kunth, nov. gen. amer. 5. p. 167. D. C. prod. 1. p. 585.

Lin. syst. *Monadélphia, Decándria.* Calyx of 5 sepals, either bearing glands or without. Petals 5, roundish, unguiculate. Stamens 10, with awl-shaped filaments, which are a little connected at the base, the 5 alternate ones longest. Styles 3. Carpels 3, samaræform, rarely 2, 1-seeded, crested or naked on the back, and surrounded by a membranous wing, usually emarginate, at both extremities.—Climbing shrubs, all probably with panicles of white, yellow or reddish flowers.

§ 1. *Hiræ'a (see genus). Jacq. am.* 137. *D. C. prod.* 1. *p.* 585. *Calyxes destitute of glands.*

* *Carpels roundish.*

1 H. reclina'ta (Jacq. amer. p. 137. t. 176. f. 42. pict. p. 68. t. 260. f. 37.) leaves obovate, blunt at both ends, pubescent above and smooth beneath. ♄ . ◡ . S. Native of South America in the woods of Carthagena in New Spain, where it flowers in June. This small tree divides into many bending and reclining branches, by which it supports itself on the neighbouring trees. Flowers yellow, an inch in diameter.

Reclined-branched Hiræ'a. Fl. July, Aug. Clt.? Tree cl.

2 H. odora'ta (Willd. spec. 2. p. 743.) leaves ovate, acute, smooth above but downy beneath. ♄ . S. Native of Guinea. The fruit of *Flabellària paniculàta*, Cav. diss. 9. p. 436. t. 264. probably belongs to this plant, but the leaves, according to R. Brown, are probably referable to a species of *Pterocárpus*. A reclining shrub with yellow sweet-scented flowers.

Sweet-scented-flowered Hiræa. Clt. 1822. Shrub reclining.

3 H. gla'bra (Spreng. neue. entd. 2. p. 154.) leaves ovate-oblong, smooth on both surfaces, shining; panicle terminal, trichotomous; branchlets and calyxes clothed with pressed hairs. ♄. ◡ . S. Native of Brazil. Flowers yellow?

Smooth-leaved Hiræa. Shrub cl.

4 H. conca'va (Wall. pl. rar. asiat. 1. p. 13.) leaves oblong, tapering, obtuse, rounded at the base, smooth on both surfaces; samaræ nearly orbicular, crested on the back. ♄ . ◡ . S. Native of the East Indies in the province of Martaban.

Concave Hiræa. Shrub cl.

5 H. orbicula'ta (Roxb. hort. beng. app. p. 90.) leaves orbicular, villous beneath as well as the panicles; samaræ orbicular, crested on the back. ♄ . ◡ . S. Native of Chittagong.

Orbicular-leaved Hiræa. Shrub cl.

6 H. hypericoìdes (Burch. cat. no. 2486 and 2531.) leaves linear, smooth on both surfaces. ♄ . G. Native of the Cape of Good Hope. Wings of fruit roundish, half orbicular.

St. John's-wort-like Hiræa. Shrub.

* * *Carpels ovate or oblong.*

7 H. nu'tans (Roxb. hort. beng. p. 34.) leaves ovate, acuminated, smooth above, but clothed with close-pressed hairs beneath, which are fixed by their centre. ♄ . ◠ . S. Native of the East Indies in Bengal. Samaræ 2 or 3, oval-oblong. Flowers white.

Nodding Hiræa. Fl. June, Aug. Clt. 1820. Shrub cl.

8 H. I'ndica (Roxb. hort. beng. p. 90.) leaves ovate, acuminated, shining, smooth; panicles axillary and terminal. ♄ . ◡ . S. Native of the East Indies on the Circar mountains. Triópteris I'ndica, Willd. spec. 2. p. 744. Roxb. cor. 2. p. 31. t. 160. Samaræ 3, oblong. Calyxes pubescent. Flowers white.

Indian Hiræa. Fl. July, Aug. Clt. 1820. Shrub cl.

9 H. rotundifòlia (Roxb. hort. beng. p. 90.) leaves round. ♄ . ◡ . S. Native of the East Indies at Chittagong. Flowers white. The carpels are not known.

Round-leaved Hiræa. Shrub cl.

10 H. hirsu'ta (Wall. pl. rar. asiat. 1. p. 13. t. 13.) leaves obovate, short-acuminated, retusely obcordate at the base, hairy as well as the panicle; samaræ oblong, naked on the back, emarginate at the apex. ♄ . ◡ . S. Native of the Burman empire on mountains about Prome and at the bottom of Mount Taong Dong. Flowers white. This species is easily distinguished by the long and rust-coloured hairs, which cover all its parts, and nowhere, except on the partial peduncles, mixed with those decumbent centrally fixed hairs, so remarkable in the rest of the species.

Hairy Hiræa. Fl. Aug. Shrub cl.

11 H. lanugino'sa (Wall. pl. asiat. rar. 1. p. 13.) leaves ovate-cordate, attenuated, acuminated, smooth above, but clothed with adnate wool beneath; samaræ ovate, retuse, naked on the back. ♄ . ◡ . S. Native of Nipaul.

Woolly Hiræa. Fl. June. Shrub cl.

12 H. corda'ta (Heyne, ex Wall. l. c.) leaves cordate, drawn out at the apex into a broad, elongated acumen, woolly beneath. ♄ . ◡ . S. Native of the peninsula of India? Perhaps only a variety of *H. lanuginòsa* or *H. nùtans.*

Cordate-leaved Hiræa. Shrub cl.

§ 2. *Mascágnia (probably the name of some botanist known to Bertero). Bert. mss. D. C. prod.* 1. *p.* 585. *Calyxes bearing glands on the outside.*

13 H. macrade'na (D. C. prod. 1. p. 585.) leaves ovate, acuminated, smooth above, beneath as well as the branchlets and petioles without glands, but are clothed with close-pressed, silky villi; flowers racemose; pedicels jointed at the base. ♄ . ◡ . S. Native of South America at St. Martha. Mascágnia Americàna, Bert. Wings of fruit orbicular and emarginate at both ends. Calyx furnished with large glands. Flowers yellow.

Large-glanded Hiræa. Shrub cl.

14 H. oblongifòlia (D. C. prod. 1. p. 585.) leaves ovate-oblong, acuminated, smooth, with the nerves and petioles as well as the branchlets clothed with velvety pubescence; flowers panicled; pedicels jointed at the base. ♄ . ◡ . S. Native of St. Martha with the preceding species, to which it is very nearly allied. Mascágnia oblongifòlia, Bert. ined.

Oblong-leaved Hiræa. Shrub cl.

15 H. divarica'ta (H. B. et Kunth, nov. gen. amer. 5. p. 169.) leaves oblong, acuminated, acute at the base, somewhat quintuple-nerved, smooth; petioles bearing 3-7 glands; panicles axillary, composed of from 5-7 racemes, which are twice as long as the leaves; calyx clothed with close-pressed hairs. ♄ . ◡ . S. Native of South America near Cumana. Flowers pale violet.

Divaricate-branched Hiræa. Shrub cl.

16 H. ovatifòlia (H. B. et Kunth, nov. gen. amer. 5. p. 169.) leaves ovate, acuminated, rounded at the base, smooth and shining above; petioles glandless; panicles axillary, about equal in length with the leaves; fruit orbicular. ♄ . ◡ . S. Native of South America in shady woods near Cumana. Flowers probably white.

Ovate-leaved Hiræa. Shrub cl.

† *Species doubtful, the fruit being unknown.*

17 H.? prunifòlia (H. B. et Kunth, l. c.) leaves elliptical,

acute at both ends, smooth, with glandular margins; younger ones clothed with close-pressed hairs; petioles with 2 glands in the middle of each; racemes terminal; calyxes pubescent and bearing 8 glands. ♄. ◡. S. Native of South America in the province of Caraccas near La Victoria. Flowers white.

Plum-leaved Hiræa. Shrub cl.

18 H.? complica'ta (H. B. et Kunth, l. c.) leaves elliptical, acute, rounded at the base, somewhat cordate, complicated, smooth; petioles bearing 2-4 glands; racemes terminal and axillary; calyx silky brown and furnished with 10 glands; petals concave, keeled on the back. ♄. ◡? S. Native on the banks of the river Orinoco near Carichana.

Complicated-leaved Hiræa. Shrub cl.?

19 H.? ni'tida (H. B. et Kunth, l. c.) leaves ovate-elliptical, acutish, rounded at the base, somewhat coriaceous, smooth, shining above; racemes axillary, solitary, and terminal, usually in fives, panicled; calyxes clothed with rusty hairs, and furnished with 8 glands; petals concave, keeled on the back. ♄. ◡. S. Native of South America near St. Barbara at the head of the river Orinoco. Flowers white or reddish.

Shining-leaved Hiræa. Shrub cl.

†† *Mexican species not sufficiently known, but probably belonging to section Mascágnia.*

20 H.? mucrona'ta (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 586.) leaves oval, acutely mucronated at the apex, hardly cordate at the base; petioles longish, without glands; pedicels numerous, axillary, 1-flowered. ♄. ◡. S. Native of Mexico. This plant has the habit of *Banistèria*, fruit of *Hiræ'a*, and calyx of *Triópteris*.

Mucronate-leaved Hiræa. Shrub cl.

21 H.? cyclo'ptera (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 586.) leaves oval-oblong, acuminated at both ends, rather villous; petioles without glands; peduncles villous, axillary, somewhat corymbose. ♄. ◡. S. Native of Mexico. Wings of fruit large, orbicular, as in *Hiræ'a*, but the calyx is biglandular.

Round-winged-fruited Hiræa. Shrub cl.

22 H.? oxy'ota (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 586.) leaves oval-oblong, acute, villous, cordate at the base, with very small, acute auricles; petioles without glands, but are as well as the peduncles villous. ♄. ◡. S. Native of Mexico. Carpels 3, winged, on a pedicel within the calyx. Calyx biglandular.

Sharp-eared-leaved Hiræa. Shrub cl.

23 H. podoca'rpa (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 586.) leaves lanceolate, smooth, on short footstalks; peduncles trifid. ♄. ◡? S. Native of Mexico. Carpels 3, winged, on a pedicel within the calyx. Calyx probably without glands.

Foot-fruited Hiræa. Shrub cl.?

24 H. acumina'ta (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 586.) leaves oval, acuminate-mucronate, villous; petioles without glands; peduncles villous, twice as long as leaves, corymbiferous at the top. ♄. ◡. S. Native of Mexico. Samaræ 2-winged, emarginate at both ends. Calyx biglandular.

Acuminated-leaved Hiræa. Shrub cl.

25 H.? macro'ptera (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 586.) leaves oval, oblong, acuminated at both ends, smooth; petioles bearing 2 glands at the top; racemes axillary. ♄. ◡. S. Native of Mexico. Fruit exactly of *Hiræ'a*, as painted in Cavanilles, diss. 9. t. 264., but the fruit is 3-times larger. Lobes of calyx coarsely biglandular.

Long-winged-fruited Hiræ'a. Shrub cl.

Cult. *Hiræ'a* is a genus of climbing or reclining shrubs, with yellow, white or reddish flowers. They will thrive well in a mixture of loam and peat; and cuttings taken from ripe wood will strike root in sand under a hand-glass, in heat. All the species are extremely difficult to bring into flower in this country.

XIII. TRIO'PTERIS (from τρεις, *treis*, three, and πτερον, *pteron*, a wing; in allusion to the carpels being each furnished with 3 wings). Lin. gen. no. 574. Cav. diss. 9. p. 431. D. C. prod. 1. p. 586.

Lin. syst. *Monadélphia, Decándria.* Calyx 5-parted, each segment bearing 2 glands on the outside at the base. Petals 5, roundish, unguiculate. Stamens 10, with awl-shaped filaments, which are somewhat connected at the very base, each alternate one larger than the others. Styles 3. Carpels rather connected at the base, 1-seeded, expanded into 3 wings, especially 2 superior and 1 inferior, and sometimes into a small dorsal crest.—Twining shrubs with yellow flowers.

1 T. ri'gida (Swartz, fl. ind. occ. 2. p. 859.) leaves roundish, acuminated, marginated, lined, coriaceous, stiff, very smooth; petioles without glands. ♄. ◠. S. Native of St. Domingo on the mountains among bushes. Branches rather twining. Younger fruit puberulous. Racemes compound, axillary.

Stiff-leaved Triopteris. Shrub tw.

2 T. ova'ta (Cav. diss. 9. p. 431. t. 259.) leaves ovate, bluntish, somewhat cordate, smooth; petioles bearing 2 glands at the top. ♄. ◠. S. Native of St. Domingo. Panicle terminal.

Ovate-leaved Triopteris. Shrub tw.

3 T. lu'cida (H. B. et Kunth, nov. gen. amer. 5. p. 167. t. 451.) leaves roundish-elliptical, acute at both ends, coriaceous, smooth, shining; petioles without glands; panicles axillary, and terminal, simple. ♄. ◠. S. Native of Cuba in shady places. Flowers pale-rose coloured.

Shining-leaved Triopteris. Shrub tw.

4 T. Havane'nsis (H. B. et Kunth, l. c.) leaves oblong, rather mucronate, acute at the base, coriaceous, smooth, shining; petioles without glands. ♄. ◠. S. Native of Cuba near Havannah. Flowers and fruit unknown.

Havannah Triopteris. Shrub tw.

5 T. Jamaice'nsis (Lin. spec. 612.) leaves oblong, acuminated, veiny, smooth, shining; petioles without glands; flowers in 3-parted panicles, rising from the upper axils of the leaves and the tops of the branches. ♄. ◠. S. Native of Jamaica in hedges as well as of Hispaniola. Branches twining.

Jamaica Triopteris. Clt. 1822. Shrub tw.

6 T. Brasilie'nsis (Poir. dict. 8. p. 105.) leaves ovate-lanceolate, acute, coriaceous, smooth, shining; petioles short, without glands. ♄. ◠. S. Native of Brazil.

Brazilian Triopteris. Shrub tw.

7 T. lingula'ta (Poir. dict. 8. p. 104.) leaves linear-lingulate, obtuse, mucronate, smooth on both surfaces, shining above. ♄. ◠. S. Native of St. Domingo. Panicle terminal, with very long divaricating branches.

Tongue-leaved Triopteris. Shrub tw.

8 T. floribu'nda (Bilberg. in flora. 1821. p. 331.) leaves oblong, blunt, smooth. ♄. ◠. S. Native of Brazil. Panicle terminal.

Bundle-flowered Triopteris. Shrub tw.

9 T. serícea (Lodd. cat. Loud. hort. brit. p. 182.) leaves silky. ♄. ◠. S. Native of South America. This plant is hardly known.

Silky-leaved Triopteris. Clt. 1823. Shrub tw.

Cult. *Triópteris* is a genus of beautiful twining shrubs, but are extremely difficult to bring into flower in this country. They will thrive well in a mixture of loam and peat; and cuttings taken from ripened wood will strike root in sand under a hand-glass, in heat.

XIV. VARGA'SIA (probably an alteration from the vernacular name of one of the species in St. Domingo). Bert. ined. Spreng. syst. 2. p. 283. no. 1707.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-parted, without glands. Petals almost sessile. Styles joined at the base, but revolute at the top. Samaræ winged at the apex. Shrubs with 3 leaves in a whorl.

1 V. gla'bra (Bert. ined. in Spreng. syst. 2. p. 388.) leaves tern, obovate, acute, serrated, very smooth on both surfaces, veiny; racemes spiked, aggregate, reflexed. ♄. ◡. S. Native of St. Domingo. Flowers yellow.

Smooth Vargasia. Shrub cl.

2 V. tomentòsa (Bert. ined. in Spreng. syst. 2. p. 388.) leaves tern, spatulate-oblong, serrulated, clothed with white down beneath; racemes aggregate, erect. ♄. ◡. S. Native of St. Domingo.

Downy Vargasia. Shrub cl.?

Cult. These climbing shrubs will thrive well in a mixture of loam and peat; and ripened cuttings will strike root in sand under a hand-glass, in heat.

XV. TETRA'PTERIS (from τετρα, *tetra*, four, and πτερον, *pteron*, a wing; in allusion to the carpels being each expanded into 4 wings). Cav. diss. 9. p. 433. D. C. prod. 1. p. 587.—Triópteris, Willd. spec. 2. p. 743.

Lin. syst. *Monadélphia, Decándria.* Calyx 5-parted; each segment furnished with 2 glands at the base. Petals roundish, unguiculate. Stamens 10, with awl-shaped filaments, which are a little joined together at the base, each alternate one longer than the others. Carpels expanded each into 4 oblong wings, 2 superior, 2 inferior; these last are usually smaller. Petioles without glands. Flowers of all yellow.—Shrubs twining or climbing.

1 T. buxifòlia (Cav. diss. 9. p. 434. t. 262. f. 1.) leaves ovate, obtuse, almost sessile, small, very smooth; flowers in umbels, terminal. ♄. ◡. S. Native of St. Domingo. Triópteris buxifòlia, Willd. spec. 2. p. 745. Leaves 8 or 9 lines long and 5 or 6 broad. Wings of fruit purplish.

Box-leaved Tetrapteris. Clt. 1822. Shrub cl.

2 T. Acapulce'nsis (H. B. et Kunth, nov. gen. amer. 5. p. 168.) leaves ovate-elliptical, obtuse, on very short stalks, cordate, coriaceous, shining, smooth; umbels axillary, solitary, 4-flowered. ♄. ◡. S. Native of Mexico near Acapulca on the sea-shore. Flowers unknown, but probably yellow.

Acapulca Tetrapteris. Shrub cl.

3 T. mucrona'ta (Cav. diss. 9. t. 262. f. 2.) leaves ovate, mucronately acuminated, on short footstalks, very smooth; panicles axillary, somewhat umbellate at the tops of the branches. ♄. ◡. S. Native of Cayenne. Triópteris acuminàta, Willd. spec. 2. p. 745. Petioles 3 lines long. Leaves 4 inches long and 2 broad.

Mucronate-leaved Tetrapteris. Shrub cl.

4 T. acutifòlia (Cav. diss. 9. t. 261.) leaves ovate-lanceolate, acuminated, with the middle nerve beneath clothed with close-pressed hairs which are fixed by their centre; panicles terminal. ♄. ◡. S. Native of Cayenne. Triópteris acutifòlia, Willd. spec. 2. p. 744. Cavanilles says that his plant is smooth. It is therefore perhaps distinct, or the hairs are omitted in the description, or they may be deciduous.

Acute-leaved Tetrapteris. Shrub cl.

5 T. Schiedia'na (Schlecht. et Cham. in Linnæa. 5. p. 218.) leaves lanceolate, acuminate, acute, on short petioles, smoothish, middle nerve strigose; umbels usually 4-flowered, panicled at the apex; fruit with equal sides. ♄. ◡. S. Native of Mexico near Jalapa. Flowers orange-coloured. Differs from *T. acutifòlia* in the leaves being one-half smaller.

Schiede's Tetrapteris. Shrub cl.

6 T. citrifòlia (Pers. ench. 1. p. 505.) leaves ovate-oblong, acute, smooth; umbels axillary, stalked; wings of fruit twin, lower ones one-half shorter than the others. ♄. ◡. S. Native of Jamaica in the woods on the mountains. Tetrápteris inæquàlis, Cav. diss. 9. t. 260. Triópteris bifúrca, Gært. fruct. 2. p. 163. t. 116. Triópteris citrifòlia, Swartz, fl. ind. occ. 2. p. 857. Flowers small. Leaves cordate at the base.

Citron-leaved Tetrapteris. Clt. 1818. Shrub cl.

7 T. di'scolor (Meyer. esseq. prim. 182. under *Triópteris,*) leaves oblong, acuminated, smooth on both surfaces, discoloured beneath; umbels panicled, terminal, and axillary. ♄. S. Native of Guiana near the Essequebo in sandy woods. Exterior wings of fruit 3-times larger than the rest.

Discoloured-leaved Tetrapteris. Shrub 6 feet.

8 T.? pauciflòra (Meyer. prim. esseq. p. 183. under *Triópteris,*) leaves oblong-lanceolate, smooth on both surfaces, on very short footstalks; umbels axillary, shorter than the leaves. ♄. ◡. S. Native of Guiana in bushy places near the Essequebo.

Few-flowered Tetrapteris. Shrub cl.

Cult. This is a genus of rather ornamental shrubs, but extremely difficult to bring into flower in this country. They will all thrive in a mixture of sand, loam, and peat; and cuttings, taken from ripened wood, will strike root in sand under a hand-glass, in heat.

XVI. BANISTE'RIA (in honour of John Baptist Banister, a traveller in Virginia in the 17th century, author of a catalogue of Virginian plants, inserted in Ray's Historia Plantarum). H. B. et Kunth, nov. gen. amer. 5. p. 161. D. C. prod. 1. p. 587.—Banistèria with unconnected fruit, Lin. gen. no. 573. Cav. diss. 9. p. 421.

Lin. syst. *Monadélphia, Decándria.* Calyx 5-parted (f. 109. *a.*) furnished with 8 or 10 glands on the outside at the base. Petals roundish, unguiculate (f. 109. *b.*). Stamens 10 (f. 109. *c.*), with awl-shaped filaments, which are a little joined at the base (f. 109. *c.*) Styles 3 (f. 109. *d.*), usually expanded into a leaflet at the apex. Carpels 3, indehiscent (f. 109. *f.*), 1-seeded, somewhat distinct, and are at length separable, each ending in a membranous wing (f. 109. *a.*), thickened on the upper part (f. 109. *d.*) Seed pendulous, 1 in each cell. Cotyledons thick, unequal. Radicle pointing towards the hilum.—Trees or shrubs, usually climbing. Flowers of all yellow.

* *Leaves cordate at the base, lobed, or angularly toothed.*

1 B. palma'ta (Cav. diss. 9. p. 430. t. 257. f. 2.) leaves palmately cleft, downy beneath, with acuminated lobes; petioles biglandular at the top. ♄. ◠. S. Native of St. Domingo and Cayenne. Perhaps only a variety of *B. angulòsa.* Flowers sulphur-coloured.

Palmate-leaved Banisteria. Shrub tw.

2 B. angulòsa (Lin. spec. 611.) leaves cordate, bluntly angular, rather fiddle-shaped, downy or silky-pubescent beneath; petioles biglandular at the apex. ♄. ◠. S. Native of St. Domingo and Cayenne.—Plum. ed. Burm. t. 92. Cav. diss. 9. t. 252. Flowers sulphur-coloured.

Angular-leaved Banisteria. Shrub cl.

3 B. sinua'ta (D. C. prod. 1. p. 588.) leaves cordate, ovate-roundish, very bluntly sinuated, smooth above, and scarcely pubescent beneath; petioles biglandular at the apex. ♄. ◠. S. Native of Guiana. Flowers yellow. Carpels on the inner side have a larger appendage than in *B. angulòsa,* with the lateral wings almost reduced to a crest.

Scolloped-leaved Banisteria. Shrub cl.

4 B. variifòlia (D. C. prod. 1. p. 588.) leaves cordate, clothed with hoary down beneath, some of which are ovate and undivided, others are 3-lobed, and acute at the apex; petioles

biglandular at the top. ♄. ⌒. S. Native of South America at St. Martha. B. diversifòlia, Bert. ined. but not of Kunth. B. vitifòlia, Moc. et Sesse, fl. mex. icon. ined. is probably the same. B. vària, Spreng. syst. 2. p. 386.

Various-leaved Banisteria. Shrub cl.

5 B. sagitta'ta (Cav. diss. 9. t. 257. f. 3.) leaves hastately sagittate, downy beneath, acutely angular; petioles biglandular at the apex; auricles truncate. ♄. ⌒. S. Native of St. Domingo. Flowers yellow.

Arrow-leaved Banisteria. Shrub cl.

* * *Leaves cordate, entire.*

6 B. auricula'ta (Cav. diss. 9. p. 428. t. 255.) leaves profoundly cordate, somewhat sagittate, smooth, with rounded lobes; petioles glandular at the apex; flowers umbellate. ♄. ⌒. S. Native of Brazil near Rio Janeiro. Flowers orange-coloured.

Eared-leaved Banisteria. Clt. 1820. Shrub cl.

7 B. cilia'ta (Cav. diss. 9. t. 254. Lam. dict. 1. p. 369.) leaves cordate, orbicular, smooth, ciliated; petioles biglandular at the apex; flowers umbellate. ♄. ⌒. S. Native of Brazil. Flowers large, orange-coloured. Leaves glaucous.

Ciliated-leaved Banisteria. Clt. 1796. Shrub cl.

8 B. sple'ndens (D. C. prod. 1. p. 588.) leaves cordate, kidney-shaped, orbicular, clothed with silky down beneath; petioles each with 2 glands near the leaf; racemes axillary, dichotomous, umbellate. ♄. ⌒. S. Native of South America, particularly of the West India islands.—Sloan. hist. 2. t. 162. f. 2. B. fúlgens, Lam. dict. 1. p. 368. Cav. diss. 9. p. 426. t. 253. B. heterophýlla, Willd. spec, 2. p. 742. Floral leaves orbicular and nearly sessile. Flowers yellow.

Shining-leaved Banisteria. Clt. 1812. Shrub cl.

9 B. Humboldtia'na (D. C. prod. 1. p. 588.) leaves roundish-ovate, cordate, rather acuminated, mucronate, membranaceous, smoothish above, clothed beneath with soft hoary down as well as the branchlets, with 2 glands at the base of each leaf; umbels lateral and terminal, sessile. ♄. ⌒. S. Native of South America between Carthagena and Cerro de la Popa. B. tiliæfòlia, H. B. et Kunth, nov. gen. amer. 5. p. 162. but not of Vent. Flowers yellow. Carpels 2.

Humboldt's Banisteria. Clt. 1824. Shrub cl.

10 B. dichótoma (Lin. spec. 612.) leaves cordate or somewhat ovate, acuminated, smooth on both surfaces; petioles each bearing 2 glands near the leaf; umbels axillary, longer than the leaves, dichotomous, somewhat divaricating. ♄. ⌒. S. Native of South America.—Plum. ed. Burm. t. 13. B. convolvulifòlia, Cav. diss. 9. p. 428. t. 256. Flowers of a golden-yellow colour.

Dichotomous-racemed Banisteria. Shrub cl.

11 B. Timorie'nsis (D. C. prod. 1. p. 588.) leaves cordate, rarely subovate, acuminated, smooth on both surfaces; petioles biglandular at the apex; racemes axillary, shorter than the leaves, dichotomous, somewhat umbellate. ♄. ⌒. S. Native of the Island of Timor. Very like the preceding species. Flowers golden-yellow.

Timor Banisteria. Shrub cl.

12 B. emargina'ta (Cav. diss. 9. p. 425. t. 249.) leaves elliptical, cordate at the base, mucronated at the apex and emarginate, downy beneath; petioles short, each bearing 2 glands near the leaf; racemes terminal and axillary. ♄. ⌒. S. Native of Guadaloupe. Flowers yellow.

Emarginate-leaved Banisteria. Shrub cl.

* * * *Leaves ovate or oblong.*

13 B. microphy'lla (Jacq. obs. 3. p. 7. t. 56.) leaves elliptical, rounded at both ends, smooth on both surfaces, stiff, on short footstalks; racemes terminal. ♄. ⌒. S. Native of Carolina? Flowers yellow.

Small-leaved Banisteria. Shrub cl.

14 B.? umbelluta'ta (D. C. prod. 1. p. 588.) leaves elliptical, rounded at the base, emarginate at the apex, smooth on both surfaces, stiffish; petioles short, each bearing 2 glands near the leaf; umbels rather corymbose, terminal. ♄. ⌒. S. Native of St. Domingo. This plant is probably the same as the preceding, but differs in the disposition of the flowers, and the fruit is unknown.

Umbellutate-flowered Banisteria. Shrub cl.

15 B.? floribu'nda (D. C. prod. 1. p. 589.) leaves oval, obtuse, coriaceous and emarginate, smooth; petioles pubescent, without glands; racemes corymbose, stalked, length of leaves. ♄. ⌒. S. Native of Porto-Rico. Flowers large, numerous, yellow.

Bundle-flowered Banisteria. Shrub cl.

16 B. seri'cea (Cav. diss. 9. p. 429. t. 258.) leaves ovate, obtuse, with a mucrone, younger ones downy on both surfaces, adult ones only on the under surface; petioles biglandular in the middle; branches 2-edged; flowers racemose. ♄. ⌒. S. Native of Brazil. The down on the leaves is of a golden-shining colour. Flowers yellow.

Silky-leaved Banisteria. Clt. 1810. Shrub cl.

17 B.? tomento'sa (Desf. cat. 160.) leaves ovate, obtuse, with a mucrone, clothed with branched down beneath; petioles each bearing 2 glands near the leaf; corymbs rather panicled. ♄. ⌒. S. Native of the Antilles. Stamens 15, monadelphous at the base, the 5 in front of the petals are larger than the rest, which are nearly abortive. Flowers yellow.

Downy-leaved Banisteria. Clt. 1820. Shrub cl.

18 B. tiliæfòlia (Vent. choix. t. 50.) leaves orbicular, acuminated, downy beneath; petioles elongated, each bearing 2 glands near the leaf; umbels axillary, stalked, compound; petals nearly sessile. ♄. ⌒? S. Native of Java. Flowers purple.

Lime-tree-leaved Banisteria. Shrub cl.?

19 B. Quapa'ra (Aubl. guian. 1. p. 464. t. 186.) leaves ovate, acute, downy beneath, as well as the petioles, but beset with hairs above, which are fixed by their centre, and drawn out at both ends, which are close-pressed to the leaf; umbels axillary, stalked; wings of fruit erect. ♄. ⌒. S. Native of Guiana, on margins of fields, where it is called *Quapara*. Flowers yellow. This is a shrub 6 feet in height, putting out many rambling branches.

Var. β, mucronulàta (D. C. prod. 1. p. 589.) leaves smaller, mucronate. ♄. ⌒. S. Native of South America.

Quapara Banisteria. Fl. Aug. Shrub cl.

20 B. Sinemarie'nsis (Aubl. guian. 1. p. 462. t. 185.) leaves ovate, acuminated, smooth above, but covered with close-pressed bristles beneath, which are fixed by their centre, as well as the petioles, which also bear 2 glands near the leaf; corymbs racemose, axillary, on long stalks. ♄. ⌒. S. Native of Guiana on the margins of meadows, and of St. Domingo. Cav. diss. 9. t. 251. Flowers yellow.

Sinemarian Banisteria. Shrub cl.

21 B.? laurifo'lia (Lin. spec. 611.) leaves ovate-oblong, acute, somewhat coriaceous, smooth; petioles without glands; racemes panicled, terminal, clothed with rusty down; stigmas halved. ♄. ⌒. S. Native of Jamaica and St. Domingo among bushes on the mountains. Ker, bot. reg. 937. Perhaps a species of *Heterópteris*. Flowers yellow.

Laurel-leaved Banisteria. Fl. July, Aug. Clt. 1733. Shrub climbing.

22 B. murica'ta (Cav. diss. 9. p. 423. t. 246. f. 2.) leaves ovate, downy beneath, on short footstalks; racemes panicled,

terminal; carpels armed with a short prickle on the inside of each. ♄. S. Native of Peru. Flowers yellow.

Prickly-carpelled Banisteria. Shrub ?

23 B. LEÒNA (Cav. diss. 9. p. 424. t. 247. exclusive of the fruit and American species,) leaves ovate-oblong, acuminated, coriaceous, netted with veins, smooth, somewhat glaucescent beneath; petioles without glands, short; panicles clothed with rufous down, terminal. ♄. S. Native of Sierra Leone among bushes near the river side. Flowers yellow. Fruit brown when ripe.

FIG. 109.

Sierra *Leone* Banisteria. Fl. Jan. March. Shrub 6 to 8 feet.

24 B. MULTIFLÒRA (D. C. prod. 1. p. 589.) leaves ovate-oblong, acuminated, coriaceous, netted with veins, smooth, shining above, glaucous beneath; petioles without glands, short; panicles terminal, clothed with rufous down, longer than the leaves; young fruit velvety. ♄. S. Native of Cayenne. Very like *B. Leòna*. Flowers yellow.

Many-flowered Banisteria. Shrub 6 feet.

25 B. MUCRONA'TA (D. C. prod. 1. p. 589.) leaves oval, acuminated-mucronate, smooth on both surfaces, membranous; petioles short, each bearing 2 glands at the apex, and are, as well as the nerves of the leaves, clothed with close-pressed down; corymbs axillary, few-flowered. ♄. ◠. S. Native of New Spain. Flowers yellow.

Mucronate-leaved Banisteria. Shrub cl.

26 B. FERRUGÍNEA (Cav. diss. 9. p. 424. t. 248.) leaves ovate, acuminated, smooth above, and shining, rusty beneath, and are, as well as the petioles, clothed with close-pressed hairs; glands situated on the lower part of the limb of the leaf; racemes panicled; fruit pubescent, with erect wings. ♄. ◠. S. Native of Brazil. Leaves 2 inches long. Flowers yellow.

Var. β, *fúlgens* (Meyer. prim. esseq. p. 181.) leaves 5 or 6 inches long. ♄. ◠. S. Native of Guiana in woods. Flowers yellow.

Rusty-leaved Banisteria. Clt. 1820. Shrub cl.

27 B. PERIPLOCÆFÒLIA (Desf. cat. hort. par. ed. 2. p. 160.) leaves ovate or oblong, mucronated, somewhat coriaceous, smooth on both surfaces; petioles each bearing 2 glands at the apex; corymbs terminal; carpels hairy, and crested at the base. ♄. ◠. S. Native of Porto-Rico. Flowers yellow.

Var. α, *subovàta* (D. C. prod. 1. p. 589.) leaves ovate-oblong.

Var. β, *angustifòlia* (D. C. prod. 1. p. 590.) leaves oblong-linear.

Periploca-leaved Banisteria. Fl. June, Aug. Clt. 1818. Shrub cl.

28 B. FU'LGENS (Lin. spec. 612. but not of Cav.) leaves ovate, acuminated, smooth above, and clothed with silky pubescence beneath, as well as the petioles, each of which bear 2 glands at the apex; branches dichotomous; flowers in umbellate corymbs; fruit pubescent; wings furnished on the inside with a smaller wing. ♄. ◠. S. Native of Guadaloupe. Flowers yellow.

Fulgent Banisteria. Clt. 1759. Shrub cl.

29 B.? BRACHIA'TA (D. C. prod. 1. p. 590.) leaves oval, acuminated, smooth on both surfaces; petioles without glands; panicles terminal, furnished with round, opposite bracteas; ovaries pubescent. ♄. S. Native of Porto-Rico. Flowers yellow.

Armed Banisteria. Shrub ?

30 B.? FAGIFÒLIA (D. C. prod. 1. p. 590.) leaves oval-oblong, acuminated, smooth, with the middle nerve clothed beneath with close-pressed villi; petioles biligulate at the apex; corymbs axillary, dichotomous. ♄. S. Native of Cayenne. Flowers yellow.

Beach-leaved Banisteria. Shrub ?

31 B. ELLI'PTICA (H. B. et Kunth, nov. gen. amer. 5. p. 161.) leaves elliptical, rounded at both ends, pointed, membranous, smooth above, but clothed with adpressed hairs beneath, as well as the branches, and bearing 2 sessile glands at the base of each leaf; umbels axillary, few-flowered. ♄. ◠. S. Native of Peru near Loxa. Flowers probably yellow.

Elliptical-leaved Banisteria. Shrub cl.

32 B. LONGIFÒLIA (Swartz, fl. ind. occ. 2. p. 856.) leaves oblong, rounded at the base, acuminated at the apex, stiff, shining, on short footstalks; panicles terminal, with very wide-spreading branches. ♄. S. Native of the Caribbee Islands. Flowers yellow.

Long-leaved Banisteria. Shrub cl.?

33 B. PI'CTA (H. B. et Kunth, nov. gen. amer. 5. p. 160.) leaves oblong, narrowed, and acute at the apex, but rounded at the base, thickish, smooth above, but clothed with adpressed hairs beneath, each bearing 2 pea-like glands at the base; flowers terminal, umbellately-crowded. ♄. ◠. S. Native of New Spain between Carthagena and Panama in humid places. Flowers yellow.

Painted Banisteria. Shrub cl.

34 B. MACROCA'RPA (Pers. ench. 1. p. 507.) leaves oblong, acuminated; spikes of flowers compound; wings of fruit very broad, obliquely rounded. ♄. S. Native of Martinico.

Large-fruited Banisteria. Shrub.

35 B. LEDIFÒLIA (H. B. et Kunth, nov. gen. amer. 5. p. 159.) leaves oblong-linear, rounded at both ends, somewhat mucronate, coriaceous, smooth, shining above; petioles clothed with silky down; peduncles terminal and axillary, many-flowered. ♄. ◠. S. Native of Cuba near Havannah. Flowers yellow.

Ledum-leaved Banisteria. Shrub cl.

36 B. SALICIFÒLIA (D. C. prod. 1. p. 390.) leaves oblong, acute at both ends, clothed with silky down beneath, bearing 2 glands at the top of each petiole; racemes axillary, somewhat compound, length of leaves. ♄. ◠. S. Native of Brazil. Leaves irregularly opposite, therefore somewhat alternate. Flowers yellow.

Willow-leaved Banisteria. Shrub cl.

37 B. DIVERSIFÒLIA (H. B. et Kunth, nov. gen. amer. 5. p. 159.) leaves elliptical-oblong, ovate-lanceolate or lanceolate, somewhat mucronate, rounded at the base, coriaceous, smooth and shining above, puberulous beneath, each with 2 sessile glands at the base; peduncles terminal, twin, many-flowered. ♄. ◠. S. Native of Cuba in dry places near Havannah.

Diverse-leaved Banisteria. Shrub cl.

38 B. PAUCIFLÒRA (H. B. et Kunth, nov. gen. amer. 5. p. 159.) leaves elliptical-oblong, somewhat pointed, mucronate, rounded at the base, coriaceous, puberulous above, and pubescent beneath, each furnished with 2 stipitate glands towards the base; umbels terminal. ♄. S. Native of Cuba near Havannah. Flowers yellow.

Few-flowered Banisteria. Shrub cl. ?

39 B. OVA'TA (Cav. diss. 9. p. 429. t. 257. f. 1.) leaves ovate-lanceolate, acute, pubescent beneath; petioles each bearing 2 glands at the apex; umbels terminal; fruit hemispherical, with very short wings. ♄. S. Native of the Island of Dominique. Vent. choix. in a note, no. 51. t. 51. A. Flowers of a reddish-sulphur colour, with yellow anthers.

Ovate-leaved Banisteria. Fl. June, Aug. Clt. 1810. Shrub cl.

40 B. macrade'na (D. C. prod. 1. p. 590.) leaves oval, bluntly acuminated, coriaceous, smooth on both surfaces; petioles without glands; racemes numerous, disposed in a panicle, and clothed with rufous down; glands of calyx very large. ♄. S. Native of Cayenne or French Guiana. Flowers yellow.

Var. β, Guadalupénsis (D. C. prod. 1. p. 590.) racemes large, elongated; leaves larger, adult fruit also velvety. ♄. S. Native of Guadaloupe. Flowers yellow.

Large-glanded Banisteria. Shrub cl.?

41 B. eglandulòsa (D. C. prod. 1. p. 590.) leaves oval-oblong, acuminated, smooth and shining above; petioles and calyxes without glands; racemes panicled, terminal, rusty-velvety. ♄. ⌒. S. Native of Cayenne or French Guiana. Flowers yellow. Ovary hairy. Styles scarcely dilated at the apex. Fruit unknown.

Glandless Banisteria. Shrub cl.

42 B.? Orinoce'nsis (H. B. et Kunth, nov. gen. amer. 5. p. 162.) leaves oblong, acute, rounded at the base, coriaceous, smooth, as well as the branchlets; racemes about 5, seated on a common, terminal peduncle. ♄. ⌒. S. Native of South America on the banks of the river Orinoco near St. Borga. This plant is probably a species of *Hiræ'a*. Flowers yellow.

Orinoco Banisteria. Shrub cl.

43 B.? brachy'ptera (D. C. prod. 1. p. 591.) leaves oblong-lanceolate, acuminated, smooth; petioles without glands; branchlets compressed; umbels terminal, 4-flowered; carpels 2-3, each terminated by a thick, short wing. ♄. S. Native of Cayenne. This plant will probably constitute a distinct genus. Flowers yellow.

Short-winged-carpelled Banisteria. Shrub.

44 B.? paniculà'ta (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 591.) leaves oblong, acuminated; petioles without glands; peduncles and nerves of leaves clothed with rusty down; panicle terminal, branched from the base; wings of fruit divaricating, somewhat concave, and spreading horizontally. ♄. S. Native of Mexico. Flowers yellow? This plant will probably constitute a distinct genus from the wings of the fruit.

Panicled Banisteria. Shrub.

45 B.? pubiflòra (D. C. prod. 1. p. 591.) leaves oval-oblong, acuminated, coriaceous, smooth; petioles without glands; panicle terminal, much-branched, many-flowered, and are, as well as the calyxes, clothed with brown-velvety down. ♄. S. Native of Porto-Rico and Guadaloupe. Flowers yellow.

Downy-flowered Banisteria. Shrub?

† *Species little known, with whorled leaves; these belong most probably to Vargàsia of Bert.*

46 B.? bre'vipes (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 591.) leaves 3 in a whorl, ovate, mucronate, rather cordate at the base, villous, 8 times longer than the petiole; corymbs axillary, few-flowered. ♄. ⌒. S. Native of Mexico. Fruit unknown. Flowers yellow.

Short-stalked Banisteria. Shrub cl.

47 B.? terna'ta (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 591.) leaves 3 in a whorl, ovate, rather cordate at the base, mucronately-acuminated, smooth, 3 times longer than the petiole; umbels axillary, trichotomous. ♄. ⌒. S. Native of Mexico. Fruit unknown. Flowers yellow.

Ternate-leaved Banisteria. Shrub cl.

N. B. *B. aculeàta* of Mill. which has pinnated leaves and axillary prickles, should be removed from this order, but the plant is hardly known.

Cult. This genus of shrubs bear for the most part rather ornamental flowers and leaves, but they are extremely difficult to bring into flower in this country. They will grow in sandy loam, or a mixture of loam and peat, and cuttings taken from ripened wood will strike root freely in sand under a hand-glass, in heat.

XVII. HETERO'PTERIS (from ἕτερος, *heteros*, various, and πτερον, *pteron*, a wing; wings of carpels various in size and shape). H. B. et Kunth, nov. gen. amer. 5. p. 163. D. C. prod. 1. p. 591.—Banistèrias, with inverted seeds, Cav.

Lin. syst. *Monadélphia, Decándria.* The character of this genus is the same as that of *Banistèria*, but the styles are less dilated at the apex, and the wings of the carpels are thickened on the lower side (as in *A'cer*,), not on the upper side.

1 H. purpu'rea (H. B. et Kunth, l. c.) leaves roundish-ovate, obtuse, somewhat emarginate, smooth, as well as the branches; petioles biglandular; racemes axillary and terminal, few-flowered; calyxes clothed with adpressed hairs. ♄. ⌒. S. Native of St. Domingo, Porto-Rico, and near Cumana. Banistèria purpùrea, Lin. spec. 611. Cav. diss. t. 246. f. 1.—Plum. ed. burm. t. 15. Flowers purple.

Purple-flowered Heteropteris. Clt. 1759. Shrub cl.

2 H.? parvifòlia (D. C. prod. 1. p. 591.) leaves roundish, stiff, pubescent; petioles without glands; corymbs few-flowered, terminal; fruit pubescent. ♄. ⌒. S. Native of the Island of St. Thomas. Flowers purple. Very like *H. purpùrea* in habit. Banistèria parvifòlia, Vent. choix. t. 51.

Small-leaved Heteropteris. Clt. 1820. Shrub cl.

3 H. brachia'ta (H. B. et Kunth, l. c.) leaves obovate, obtuse; branches armed; flowering branches panicled. ♄. ⌒. S. Native of South America. Banistèria brachiàta, Lin. spec. 612. Lin. hort. cliff. 169? Flowers golden, but at length fade to scarlet.

Armed-panicled Heteropteris. Clt. 1759. Shrub cl.

4 H. chrysophy'lla (H. B. et Kunth, l. c.) leaves ovate, oblong, acutish, somewhat sinuated towards the top, clothed beneath with golden, shining down; petioles very short, each bearing 2 glands at the apex; flowers axillary, corymbose. ♄. ⌒. S. Native of Brazil and of the Caraccas. Banistèria chrysophýlla, Lam. dict. 1. p. 368. Cav. diss. 9. t. 245. Jacq. schœnb. t. 105. Galphìmia chrysophýlla, Spreng. Flowers deep-orange.

Golden-leaved Heteropteris. Clt. 1793. Shrub cl.

5 H. arge'ntea (H. B. et Kunth, l. c.) leaves elliptical-oblong, acuminated, acute at the base, membranous, pubescent above, silvery beneath, as well as the calyxes; petioles without glands; panicles axillary and terminal; flowers in crowded fascicles. ♄. ⌒. S. Native of New Granada. Banistèria argéntea, Spreng. syst. 2. p. 388. Flowers rose-colour.

Silvery-leaved Heteropteris. Shrub cl.

6 H. cæru'lea (H. B. et Kunth, l. c.) leaves ovate, acute, coriaceous, glaucous, on short stalks; branches tubercled; racemes axillary; fruit rather velvety at the base. ♄. ⌒. S. Native of Jamaica, Cuba, and St. Domingo. Banistèria cærùlea, Lam. dict. 1. p. 367. Cav. diss. 9. p. 421. t. 243.—Plum. ed. Burm. t. 14. Flowers bluish.

Blue-flowered Heteropteris. Clt. 1823. Shrub cl.

7 H. ni'tida (H. B. et Kunth, l. c.) leaves ovate-oblong, acuminated, shining above, silvery beneath; petioles without glands; panicle terminal, leafy. ♄. S. Native of Brazil. Banistèria nítida, Lam. dict. 1. p. 369. Cav. diss. 9. t. 244. Flowers yellow.

Var. β, rúfa (Lindl. bot. reg. t. 950.) leaves rufous beneath. Native of Brazil.

Shining-leaved Heteropteris. Fl. July, Aug. Clt. 1809. Shrub 6 to 10 feet.

8 H.? cornifòlia (H. B. et Kunth, l. c.) leaves elliptical, acute at both ends, smooth and shining above, but clothed with

adpressed hairs beneath, and rather glaucous; petioles without glands; panicles axillary and terminal; flowers in racemose corymbs; calyxes silky. ♄. S. Native of New Granada near Ibague. Banistèria cornifòlia, Spreng. syst. 2. p. 388. Flowers rose-coloured.

Dogwood-leaved Heteropteris. Shrub.

9 H. platy'ptera (D. C. prod. 1. p. 592.) leaves ovate-oblong, blunt at both ends, coriaceous, smooth; petioles very short, without glands; panicles terminal; wings of fruit broad. ♄. S. Native of Guadaloupe. Leaves 7-8 inches long, and about 3 in breadth. Flowers yellow.

Broad-winged-fruited Heteropteris. Shrub.

10 H. appendicula'ta (D. C. prod. 1. p. 592.) leaves oval, lengthened into a blunt acumen, somewhat coriaceous, smooth above, and pale beneath, with the nerves clothed with adpressed hairs; petioles very short, without glands; corymbs axillary; carpels each with a wing-like appendage on the inside at the base. ♄. ◠? S. Native of the Island of St. Vincent, where it is probably cultivated. Banistèria appendiculàta, Lamb. herb. Flowers yellow?

Appendiculate-carpelled Heteropteris. Clt. 1820. Shrub cl.?

11 H.? floribu'nda (H. B. et Kunth, nov. gen. amer. 5. p. 166.) leaves oblong, acute at both ends, somewhat coriaceous, smooth; branches and petioles clothed with rusty down, as well as the axillary and terminal panicles; petioles without glands. ♄. S. Native of Mexico on the mountains. Very like *H. cærùlea*, but the fruit is unknown. Flowers bluish?

Bundle-flowered Heteropteris. Clt. 1824. Shrub.

12 H.? longifo'lia (H. B. et Kunth, l. c.) leaves oblong, acute at both ends, rather coriaceous, smooth; petioles without glands; panicles axillary, and are, as well as the calyxes, clothed with rusty down, glandular; flowers racemose. ♄. S. Native near the city of Mexico. Flowers yellow?

Long-leaved Heteropteris. Shrub.

Cult. These shrubs will thrive well in sandy loam, or a mixture of loam, peat, and sand; and cuttings taken from ripened wood will root in sand under a hand-glass, in heat.

XVIII. ANOMALO'PTERIS (from *ανομος, anomos*, singular, and *πτερον, pteron*, a wing; fruit with unequal wings.)

Lin. syst. *Decándria, Digýnia.* Calyx 5-parted. Petals 5, unguiculate, with roundish, fringed limbs, upper one largest. Stamens 10. Anthers sagittate, obtuse. Styles 2, filiform. Samaræ 2, 1-seeded, each ending in a wing at the apex, thickened on the outer side.—Shrubs with alternate leaves, by which it differs from all the rest of the genera in this order, and yellow flowers.

1 A. spica'ta; leaves oval-oblong, acuminated, smooth, entire; racemes simple, spike-formed, terminal. ♄. S. Native of Sierra Leone. Heterópteris Smeathmánni, D. C. prod. 1. p. 592. (v. s. herb. Lamb.)

Spiked-flowered Anomalopteris. Shrub 8 feet.

2 A. obova'ta; leaves obovate, entire, rounded at the top, veiny, smooth; petioles covered with rusty down, as well as the racemes, which are simple and lateral. ♄. S. Native of Sierra Leone. (v. s. herb. Lamb.)

Obovate-leaved Anomalopteris. Shrub 6 to 8 feet.

3 A. longifòlia; leaves oblong-lanceolate, entire, with repand margins; flowers in terminal spicate racemes. ♄. S. Native of Guinea. Flowers pale-yellow.

Long-leaved Anomalopteris. Shrub 8 feet.

Cult. See *Heterópteris* for cultivation and propagation.

† *A genus allied to Malpighiàceæ.*

XIX. NIO'TA (*Karin njotti* is the name of one of the *N. pentapétala* in Malabar). Lam. ill. t. 299. D. C. prod. 1. p. 592.—Samadèra, Gært. fruct. 2. p. 352. t. 156.—Biporièia, Pet. Th. gen. mad. p. 14.

Lin. syst. *Octo-Decándria, Monogýnia.* Calyx 4-5-parted, permanent, with the 2 outer lobes glandular. Petals 4-5, obtuse, much longer than the calyx. Stamens 8-10, free, hypogynous, furnished with a scale at the base. Ovary turbinate, 4 or 5-lobed at the apex. Style 1, filiform, rising from between the lobes. Capsules 4-5, or from abortion only 1-3, compressed, 1-celled, 1-seeded.—Shrubs, with alternate leaves. Perhaps this genus is allied to *Banistèria* or *Balanópteris*. But according to Jussieu the fruit is referable to *Ochnàceæ* or *Simarubàceæ*.

1 N. tetrape'tala (Lam. ill. t. 299.) flowers 4-petalled, octandrous. ♄. S. Native of Madagascar. Mauduìta penduliflòra, Comm. ined. Vittmánnia ellíptica, Vahl. symb. 3. p. 51. t. 62. Leaves oval, rather coriaceous, veiny. Lateral peduncles nodding, bearing 5-7 1-flowered pedicels at the top. Flowers with the petals yellow, red, and white mixed.

Four-petalled Niota. Clt. 1820. Tree 30 feet.

2 N. pentape'tala (Poir. dict. 4. p. 490.) flowers of 5 petals, pentandrous. ♄. S. Native of Malabar.—Karin njòtti, Rheed. mal. 6, t. 18. Peduncles long, pendulous, nodding, umbellately many-flowered. Perhaps only a variety of the preceding. Flowers variegated. Fruit intensely bitter.

Five-petalled Niota. Tree 36 feet.

Cult. These trees will thrive well in a mixture of loam and peat, and cuttings taken from ripened wood will root in sand under a hand-glass, in heat.

Order XLVI. ACERI'NEÆ. D. C. Theor. ed. 2. p. 477.—A'cera, Juss. gen. 50. ann. mus. 18. p. 477. exclusive of sections 1 and 3. D. C. prod. 1. p. 593.—A'cer, Tourn. inst. 386. Lin. gen. no. 1115. Gært. fruct. 2. p. 166. t. 116.

Calyx 5, rarely 4-9-parted. Petals about the same number, inserted round the hypogynous disk, alternating with the calycine lobes, usually self-coloured, rarely wanting. Stamens inserted in the hypogynous disk, usually 8 in number, rarely 5-12; anthers oblong. Ovary twin. Style 1. Stigmas 2. Fruit constantly of 2 carpels (rarely 3), which are at length separable, indehiscent, samara-like, 1-celled, 1-2-seeded, compressed, ending at top in a membranous, diverging wing, which is thickened on the outer side. Seeds oblong, fixed to the base of the cell. Seed-cover rather fleshy. Albumen wanting. Embryo curved or convolute, with leafy, irregularly-wrinkled cotyledons and a roundish radicle, which is directed to the base of the cell.—Valuable timber-trees, with opposite, usually simple leaves, as in *Malpighiàceæ*, rarely compound, as in *Hippocastàneæ* and *Sapindàceæ*. Flowers inconspicuous, racemose or corymbose, axillary, usually dioecious or polygamous from abortion, and sometimes without petals. All the species abound in saccharine sap, from which sugar may be prepared. This order is truly intermediate between the two preceding and the two following, but is easily distinguished from them in the flowers being monoecious, dioecious or polygamous, never hermaphrodite.

Synopsis of the Genera.

1 A'cer. Flowers polygamous. Calyx 5-lobed. Stamens 7-9, rarely 5. Leaves simple, usually lobed.

2 Negu'ndo. Flowers dioecious. Calyx unequally 4-5-toothed. Anthers 4-5, linear, sessile. Leaves pinnate.

3 DOBI'NEA. Flowers monoecious. Calyx campanulate, 4-toothed. Stamens 8, connate into a column around the sterile style. Leaves simple.

I. A'CER (*acer*, in Latin, signifies hard or sharp, which comes from *ac*, a point, in Celtic. The name is applied to this genus because the wood is extremely hard, and was formerly much sought after for the purpose of making pikes and lances, &c.). Mœnch. meth. 334. and Nutt. gen. amer. 1. p. 253. —A'cer, spec. Lin. gen. no. 1115. D. C. prod. 1. p. 593.

LIN. SYST. *Polygàmia, Monoècia.* Flowers polygamous. Calyx 5-lobed, sometimes 5-parted. Stamens rarely 5, but usually 7-9. Leaves simple, usually lobed. Flowers of all greenish or greenish-yellow.

§ 1. *Flowers racemose.*

* *Leaves simple.*

1 A. OBLÓNGUM (Wall. in litt. D. C. prod. 1. p. 593.) leaves oblong-lanceolate, acuminated, quite entire, coriaceous, smooth, rounded at the base; racemes compound; wings of fruit parallel, smooth, separated. ♄. H. Native of Nipaul at Narainhetty. Leaves rather glaucous on the under surface. Young fruit hairy on the disk, with smooth short wings. A. laurifòlium, D. Don, prod. fl. nep. p. 249. A. Buzimpàla, Hamilt. mss. Flowers pale-yellow. This tree is called in Nipaul *Moogila* and *Buzimpala*.

Oblong-leaved Maple. Fl. Feb. Clt. 1824. Tree 20 feet.

2 A. LÆVIGA'TUM (Wall. pl. rar. asiat. 2. p. 3. t. 104.) leaves oblong, acuminated, serrulated, shining, smooth; corymbs terminal; petals cuneated; wings of fruit diverging, cultriform. ♄. H. Native of Nipaul on high mountains. Flowers white.

Smoothed-leaved Maple. Tree 40 feet.

3 A. TATA'RICUM (Lin. spec. 1495.) leaves cordate, undivided, serrated, with obsolete lobes; racemes compound, crowded, erect; wings of fruit parallel, young ones puberulous. ♄. H. Native of Tartary.—Pall. fl. ross. t. 3. Tratt. arch. 1. no. 1. with a figure. Wats. dend. brit. 160. Corolla white.

Tartarian Maple. Fl. May, June. Clt. 1759. Tr. 20 ft.

** *Leaves 3-lobed or trifid, very rarely 5-lobed.*

4 A. STRIA'TUM (Lam. dict. 2. p. 381.) leaves cordate, 3-lobed, acuminated, finely and acutely serrated; racemes simple, pendulous; petals oval; fruit smooth, with the wings rather diverging. ♄. H. Native of North America from Canada to Carolina. Mich. fil. arb. 2. t. 17. A. Pennsylvánicum, Lin. spec. 1496. Tratt. arch. 1. no. 11. with a figure. A. Canadénse, Duh. arb. 1. t. 12. Mill. t. 7. Trunk elegantly striped with white lines. Flowers greenish-yellow. There is a variety of this tree with undivided leaves, but it is extremely rare.

Striped-barked Maple. Fl. May. Ju. Clt. 1755. Tr. 20 ft.

5 A. SPICA'TUM (Lam. dict. 2. p. 381.) leaves cordate, 3 or slightly 5-lobed, acuminated, pubescent beneath, unequally and coarsely serrated; racemes compound, erect; petals linear; fruit smooth, with the wings rather diverging. ♄. H. Native of Canada and the Alleghany mountains. A. montànum, Ait. hort. kew. 3. p. 435. Tratt. arch. 1. no. 13. with a figure. A. Pennsylvánicum, Duroi. harbk. t. 2. A. parviflòrum, Ehrh. Flowers very small, greenish-yellow.

Spiked-flowered Maple. Fl. April, May. Clt. 1750. Tree 25 feet.

6 A. HY'BRIDUM (Bosc. dict. agr. 5. p. 251.) leaves rather cordate, somewhat coriaceous, smooth, profoundly trifid, with the lobes unequally and coarsely toothed; racemes pendulous; fruit smooth with diverging wings. ♄. H. Native of? Flowers greenish-yellow.

Hybrid Maple. Fl. May, June. Clt.? Tree 20 feet.

*** *Leaves 5-lobed.*

7 A. PSEU'DO-PLA'TANUS (Lin. spec. 1469.) leaves cordate, smooth, with 5 acuminated, unequally-toothed lobes; racemes pendulous, rather compound, with the rachis as well as the filaments of stamens hairy; fruit smooth, with the wings rather diverging. ♄. H. Native of Europe, particularly in Switzerland, Germany, Austria, and Italy in wooded mountainous situations. Duh. arb. 1. t. 36. Tratt. arch. 1. no. 2. with a figure. Schm. arb. 1. p. 3. 4. Flowers yellowish-green. A large tree, usually clear of branches to a considerable height. It was formerly much planted for walks and avenues, but has given way to better and more sightly trees. However this tree with some other species are peculiarly proper for making plantations near the sea, or to shelter other trees in that situation, for they resist the spray better than most trees. It grows sometimes to 13 or 14 feet in girth. Before earthenware came into use at the table, the wood of the *Sycamore*, which is soft and white, was in much request for trenchers. It is still used by turners for bowls, dishes, &c., by saddlers for saddle-trees, and is recommended as excellent for cart and plough-timber, being light and tough. It is, however, inferior to the ash for these purposes. It is a quick growing tree. In spring and autumn this tree will pour forth, from the wounded stem, in the same manner as the birch, abundance of saccharine juice, from which sugar and good wine may be made, as Ray affirms from the information of Dr. Martin Lister. The tree in England is vulgarly called *Sycamore-tree* and by some *Mock-plane*. In Scotland it is known by the appellation of *Plane-tree*.

Var. β, *variegàta*; leaves variegated.

Var. γ, *subobtùsum* (D. C. prod. 1. p. 594.) lobes of leaves blunter; fruit and wings larger. A. opulifòlium. Thuil. fl. par. 538. A. vitifòlium, Opiz.

Var. ε, *laciniàtum* (Loud. hort. brit. p. 412.) lobes of leaves jagged. Schm. arb. 1. 5.

Mock-plane-tree, Sycamore, or Great Maple. Fl. May, June. Clt. 1683. Tree 30 to 60 feet.

8 A. VILLÒSUM (Wall. pl. rar. asiat. 2. p. 4.) leaves cordate, 5-lobed, villous beneath as well as the petioles; lobes ovate, acute; racemes lateral; buds and young leaves silky-villous; petals bearded at the apex; fruit villous, with straightish cultriform, crenulated wings. ♄. H. Native of the high Alps near to perpetual snow in Sirmore and Kamaoon. Flowers fragrant.

Villous Maple. Tree 50 feet.

9 A. CAUDA'TUM (Wall. pl. rar. asiat. 2. p. 4.) leaves cordate, 5-lobed, pubescent beneath, and villous in the axils of the veins and nerves, but when aged smooth; lobes ovate, acuminated, doubly serrated; serratures awned; racemes smooth; wings of fruit diverging. ♄. H. Native of Nipaul towards Gosaingsthan. A. pectinàtum, Wall. mss.

Tailed-lobed-leaved Maple. Tree 50 feet.

10 A. MACROPHY'LLUM (Pursh. fl. amer. sept. 1. p. 267.) leaves digitately 5-lobed, with roundish recesses; lobes somewhat 3-lobed, repandly-toothed, pubescent beneath; racemes compound, erect; stamens 9, with hairy filaments; ovaries very hairy. ♄. H. Native of North America on the great rapids of the Columbia river, and of northern California. Flowers greenish-yellow.

Long or *Large-leaved* Maple. Fl. May, June? Clt. 1812. Tree 60 feet.

11 A. STERCÚLIA'CEUM (Wall. pl. rar. asiat. 2. p. 3. t. 105.) leaves cordate, puberulous beneath, 5-lobed; lobes ovate, acuminated, serrated, outer ones very short, and quite entire; racemes lateral; petals smooth. ♄. H. Native of Nipaul on Mount Shiapore. Flowers white. Tree 3 feet in diameter.

Sterculia-like Maple. Tree 50 feet.

12 A. CAMPE'STRE (Lin. spec. 1497.) leaves cordate, with 5 toothed lobes; racemes erect; wings of fruit much divaricated. ♄. H. Native of Europe in hedges and coppices; plentiful in Britain and Tauria. Smith, engl. bot. t. 304. The leaves are small. The flowers are greenish. We meet with high encomiums on the wood of this tree among the ancients; and Virgil introduces Evander sitting on a maple throne. It was chiefly valued among them for the firmness of its grain. The timber is far superior to that of the Beech for all the uses of the turner; particularly for dishes, trenchers, and bowls, and when it abounds in knots, as it very frequently does, it is highly esteemed by the joiners for inlaying, &c. On account also of the lightness of the wood, it is often used by musical instrument makers; from its hardness for gun-stocks; formerly in great request for tables; but the principal value of the tree is for underwood, it is of quick growth and affords good fuel.

Var. α, hebecárpum (D. C. prod. 1. p. 594.) fruit clothed with velvety pubescence. A. campéstre, Wallr. in litt. Tratt. arch. 1. no. 7. with a figure. A. mólle, Opiz.

Var. β, collìnum (Wallr. in litt. D. C. prod. 1. p. 594.) fruit smooth; lobes of leaves obtuse; flowers smaller. ♄. H. Native of France. A. affíne and A. macrocárpum, Opiz.

Var. γ, Austrìacum (Tratt. arch. 1. no. 6. with a figure) fruit smooth; lobes of leaves somewhat acuminated; flowers larger. ♄. H. Native of Austria, Podolia, and Tauria.

Common or *Field* Maple. Fl. May, July. Brit. Tr. 20 ft.

§ 2. *Flowers corymbose or in fascicles.*

* *Leaves 3-lobed.*

13 A. OBTUSIFÒLIUM (Sibth. et Smith, fl. græc. t. 361.) leaves rounded, bluntly 3-lobed, crenately toothletted, about the length of the petioles; fruit smooth, with the wings parallel and connivent. ♄. H. Native of Crete on the Sphaciotic mountains. A. Crética, Tourn. cor. 43. Flowers greenish-yellow, drooping.

Obtuse-leaved Maple. Fl. May, June. Clt.? Tree 15 ft.

14 A. CRE'TICUM (Lin. spec. 1497.) leaves permanent, cuneated at the base, acutely 3-lobed at the top; lobes entire or toothletted, lateral ones shortest; corymbs few-flowered, erect; fruit smooth, with the wings hardly diverging. ♄. H. Native of Candia on the mountains, as well as in the islands of the Grecian Archipelago. Tratt. arch. 1. no. 19. with a figure. Duh. arb. 1. p. 28. t. 10. f. 9.—Alp. exot. 9. t. 8.—Pocock. orient. 197. t. 85. An evergreen shrub, with small, dark-green leaves shaped like those of the ivy. Flowers greenish-yellow.

Cretan Maple. Fl. May, June. Clt. 1752. Shrub 4 feet.

15 A. MONSPESSULA'NUM (Lin. spec. 1497.) leaves cordate, 3-lobed; lobes almost quite entire, equal; corymbs few-flowered, erect; fruit smooth, with the wings hardly diverging. ♄. H. Native of south and middle Europe in exposed stony places, particularly in France and Italy. Tratt. arch. 1. no. 20. with a figure. A. trifòlium, Duh. arb. 1. t. 10. f. 8.—Pluk. alm. t. 251. f. 3. The leaves much resemble those of the common *maple*, but differ in being 3-lobed, and they are retained on the tree much longer in the autumn. Flowers greenish-yellow. It is sometimes seen only in the shape of a shrub about 10 feet high, sometimes a tree of 20 feet high, but at last attains a great height.

Montpelier Maple. Fl. May. Clt. 1739. Tree 20 feet.

16 A. IBE'RICUM (Bieb. fl. taur. 2. p. 447.) leaves shining, glaucous beneath, bluntly 3-lobed; lobes furnished with 1 or 2 teeth, lateral ones marked with the middle nerve to the insertion of the petiole; petioles a little shorter than the leaves. ♄. H. Native of Iberia. Flowers greenish-yellow.

Iberian Maple. Tree 20 feet.

17 A. HETEROPHY'LLUM (Willd. arb. 10. t. 1, f. 1.) leaves evergreen, ovate, entire, and 3-lobed, obsoletely serrated, smooth. ♄. H. Native of the Levant. A. sempervírens, Lin. mant. 128. Leaves small, dark-green. Flowers greenish-yellow.

Variable-leaved Maple. Fl. May, June. Clt. 1759. Sh. 4 ft.

18 A. BARBA'TUM (Mich. fl. bor. amer. 2. p. 252.) leaves ovate, somewhat cordate, with 3 short, unequal, serrated lobes, glaucous beneath; corymbs sessile, those of the female flowers with simple pedicels, those of the male flowers with branched pedicels; calyxes bearded on the inside; fruit smooth, with the wings hardly diverging. ♄. H. Native of North America from New York to Carolina in humid pine-barrens. A. Caroliniànum, Walt. fl. car. 251. Flowers greenish-yellow.

Bearded-calyxed Maple. Tree 20 feet.

19 A. PARVIFÒLIUM (Tauch. in flora. 1829. p. 545.) leaves somewhat 5-lobed and 3-lobed, obtusely toothed, same colour on both sides; corymbs many-flowered, nodding; wings of fruit erectly diverging. ♄. S. Native of the south of Europe. A. Créticum, Hort. vind. Usually confounded with *A. Monspessulànum*.

Small-leaved Maple. Tree 20 feet.

** *Leaves 5, rarely 7, lobed.*

20 A. O'PALUS (Ait. hort. kew. 3. p. 436.) leaves cordate, roundish, 5-lobed; lobes obtuse, bluntly and coarsely toothed; corymbs stalked, erect; ovaries hairy; fruit smooth, with the wings rather diverging. ♄. H. Native of Italy; plentiful about Rome. A. I'talum, Lauth. ac. no. 8. A. rotundifòlium, Lam. dict. 3. p. 382. A. villòsum, Presl. A beautiful tree with large leaves, deserving the attention of ornamental planters. Flowers yellowish.

Opulus or Italian Maple. Fl. May, June. Clt. 1752. Tree 20 to 50 feet.

21 A. OPULIFÒLIUM (Vill. dauph. 4. p. 802.) leaves cordate, roundish, 5-lobed; lobes obtuse, bluntly and coarsely toothed; corymbs almost sessile; ovaries and fruit smooth, with the wings rather diverging. ♄. H. Native of Valais, Dauphiny, Piedmont, and Catalonia in stony places. Tratt. arch. 1. no. 13. with a figure. A. Hispánicum, Pourr. act. toul. 3. p. 305. A. vérnum, Reyn. A. montànum, C. Bauh. pin. 431. Flowers greenish-yellow.

Guelder-rose-leaved Maple. Fl. May, Ju. Clt. 1823. Sh. 8 ft.

22 A. OBTUSA'TUM (Kit. in Willd. spec. 4. p. 984.) leaves cordate, roundish, 5-lobed; lobes bluntish, repandly-toothed, velvety beneath; corymbs pendulous; pedicels hairy; fruit rather hairy, with the wings somewhat diverging. ♄. H. Native of Hungary and Croatia. Tratt. arch. 1. no. 14. with a figure. Flowers greenish-yellow.

Var. β, Neapolitànum (Ten. att. act. neap. 1819. p. 121. with a figure). ♄. H. Native about Naples.

Blunt-lobed-leaved Maple. Fl. May, Ju. Clt. 1825. Sh. 10 ft.

23 A. CORIA'CEUM (Bosc. ex Tauch. in bot. zeit. flora. p. 545.) leaves coriaceous, the same length as breadth, 3-5-lobed, denticulated, smooth; corymbs loose; wings of fruit erectly diverging. ♄. H. Native of?

Coriaceous-leaved Maple. Tree 20 feet.

24 A. PLATANOÌDES (Lin. spec. 1496.) leaves cordate, smooth, 5-lobed; lobes acuminated, with a few coarse acute teeth; corymbs stalked, erectish, and are as well as the fruit smooth, with divaricated wings. ♄. H. Native of Europe in woods, particularly inGermany, Switzerland, Carniolia, Styria, and Savoy. Duh. arb. 1. t. 10. f. 1. Tratt. arch. 1. t. 4. Mill. ill. t. 8. f. 1. Trew. sel. t. 81. A. Lobèlii, Tenore. The scales of the leaf-bud are spreading and reflexed. This tree grows to a large size. The leaves are of a shining green, and are even larger than those of the *Sycamore*, they are seldom eaten or defaced by insects, because the tree abounds in a sharp milky juice dis-

liked by them, and when the flowers are out, which are of a yellow colour, this tree has great beauty. The leaves die to a golden-yellow colour in autumn, which produces a good effect at that season.—Linnæus recommends it for walks and plantations, as yielding a juice from which sugar may be made, if it be wounded in the winter, and as cutting out into a fine white wood, fit for the stocks of guns, the joiner, and the turner, and answers all the purposes of the *Sycamore*. The raising of this tree for use and ornament should not be neglected.

Var. β, variegàtum ; leaves variegated.

Var. γ, laciniàtum (Ait. hort. kew. 3. p. 435.) lobes of leaves deeply jagged, with acuminated, bristle-like teeth. A. críspum, Lauth. acer. no. 4. A. palmàtum, hort. Tratt. arch. 1. no. 5. with a figure. The bark of this tree is grey, with large white spots.

Platanus-like or Norway Maple. Fl. May, June. Clt. 1683. Tree 50 feet.

25 A. gla'brum (Torrey. in ann. lyc. nat. hist. new york, vol. 2. p. 163.) leaves roundish, 5-7-lobed, acutely toothed, smooth on both surfaces ; corymbs stalked ; fruit smooth ; wings diverging, broad-ovate. ♄. S. Native of North America on the Rocky Mountains.

Smooth Maple. Tree.

26 A. saccharìnum (Lin. spec. 1496.) leaves cordate, smooth, glaucous beneath, palmately 5-lobed ; lobes acuminated, sinuately toothed ; corymbs drooping, on short peduncles ; pedicels pilose ; fruit smooth, with the wings diverging. ♄. H. Native of North America from Canada to Pennsylvania in rich valleys. Michx. fil. arb. 2. t. 15. Tratt. arch. 1. no. 3. with a figure. The American sugar-maple will grow to the height of 40 feet. It has some resemblance to the Norway maple when the plants are young. The flowers are yellow, disposed in short compound corymbs, composed of imperfect hermaphrodite and perfect male flowers, the anthers being abortive in the first and perfect in the last. From this tree the inhabitants of North America make a very good sort of sugar in large quantities. It is very probable that the Americans make sugar from many species of maple, particularly *A. rùbrum* and *Negúndo fraxinifòlium*. The juice is obtained by tapping the trees ; warm days and frosty nights are most favorable to the plentiful discharge of the sap. A hole is made in the tree in an ascending direction by an augur, and a spout is introduced about half an inch, which projects from 3 to 12 inches ; it is generally of sumach or elder. The sap will sometimes flow 6 weeks, according to the temperature of the weather. Troughs are placed under the spouts to receive the sap, which is carried every day to a large receiver, from which it is conveyed, after being strained, to the boiler. Lime, eggs, or new milk is added to the sap in order to clarify it, but clear sugar may be made without any of these ingredients. The sugar, after being sufficiently boiled, is grained, clayed, and refined in the same manner as the cane sugar in the West Indies. The sooner the sap is boiled the better. It should never be kept more than 24 hours. The quality of maple sugar is superior to that which is made in the West Indies from the cane, and it deposits less sediment when dissolved in water. It has more the appearance of sugar-candy. "The sugar prepared from the sap of this tree is one of the greatest conveniences to the inhabitants of the Western Counties, is equal to any other sugar, and procured with little trouble." (Pursh.)

American *Sugar* Maple. Fl. Apr. May. Clt. 1735. Tr. 40 ft.

27 A. nìgrum (Michx. fil. arb. 2. p. 238. t. 16.) leaves cordate, with the recess closed ; palmately 5-lobed, pubescent beneath ; corymbs sessile, nodding ; fruit smooth, turgid at the base, with the wings diverging. ♄. H. Native of North America from New York to Carolina, on mountain lands. Flowers yellowish. This large tree produces sugar similar to the foregoing species, and occupies the same situation where the other is not found.

Black Maple. Fl. April, May. Clt. 1812. Tree 40 feet.

28 A. erioca'rpum (Mich. fl. amer. bor. 2. p. 253.) leaves truncate at the base, smooth and glaucous beneath, palmately 5-lobed, with blunt recesses, and unequally and deeply-toothed lobes ; flowers conglomerate, on short pedicels, apetalous, pentandrous ; ovaries downy. ♄. H. Native of North America on the banks of rivers from New England to Georgia. Desf. ann. mus. 7. p. 412. t. 25. A. dasycárpum, Willd. spec. 4. p. 985. Tratt. arch. 1. no. 8. with a figure. A. tomentòsum, Hort. par. A. glaúcum, Marsh. A. Virginiànum, Duh. A large tree with greenish-yellow seeds and flowers. It is known by the name of *White* or *Soft Maple*.

Hairy-fruited or White Maple. Fl. April, May. Clt. 1725. Tree 40 feet.

29 A. ru'brum (Lin. spec. 1496.) leaves cordate at the base, glaucous beneath, deeply and unequally toothed, palmately 5-lobed, with acute recesses ; flowers conglomerate, 5-petalled, pentandrous ; ovaries smooth. ♄. H. Native of North America in low woods from Canada to Florida. Mich. fil. arb. 2. t. 14. Desf. ann. mus. 7. p. 413. t. 25. Tratt. arch. 1. no. 9. with a figure. Schmidt. arb. 1. t. 6. A. Virginiànum, Herm. par. t. 1. Mill. ill. t. 8. f. 4. Trew. sel. t. 85, 86. A. floridànum, Hortul. Flowers and seeds red as well as the branches. A small tree, commonly known by the name of *Red, Scarlet*, or *Swamp Maple*. In Pennsylvania the natives use the wood for all sorts of wood-work ; with the bark they dye a dark blue, and make a good black ink. The Canadians tap the tree for the juice, of which they make sugar and treacle. With us it is grown for the sake of its red flowers, which are very shewy.

Red, Scarlet, or Swamp Maple. Fl. April, May. Clt. 1656. Tree 20 feet.

30 A. acumina'tum (Wall. mss. D. Don. prod. fl. nep. p. 249.) leaves cordate, smooth, 3-5-lobed ; lobes doubly serrated, long-acuminated ; corymbs few-flowered, erect, somewhat racemose, shorter than the leaves ; pedicels nearly opposite, elongated, smooth. ♄. H. Native of Nipaul in Sirinagur, where it is called *Khaunsing*. Flowers greenish-white ?

Acuminated-lobed Maple. Tree.

31 A. cultra'tum (Wall. pl. asiat. rar. 2. p. 4.) leaves cordate, 7-lobed, villous in the axils of the veins beneath, the rest smooth ; lobes acuminated, quite entire ; corymbs stalked, smooth ; flowers subumbellate ; petals wedge-shaped ; wings of fruit divaricate, cultriform. ♄. H. Native of the regions towards Himalaya in Kamaon and Sirinagur.

Cultrate-winged-fruited Maple. Tree.

§ 3. *Umbels stalked. Species not sufficiently known.*

* *Leaves 5 or 7-lobed, rarely 9-10-11-13.*

32 A. disse'ctum (Thunb. fl. jap. p. 160.) leaves 9-10-parted ; lobes oblong, acuminated, deeply serrated or pinnatifid ; umbels 4-6-flowered. ♄. H. Native of Japan.—Tratt. arch. 1. no. 18. with a figure. Corolla small, red.

Dissected-leaved Maple. Fl. May. Tree 30 feet.

33 A. Japo'nicum (Thunb. fl. jap. p. 161.) leaves roundish, villous, palmately multifid ; lobes 11-13, acuminated, serrated ; umbels many-flowered. ♄. H. Native of Japan. Trat. arch. 1. no. 16. with a figure. Branches and corollas purple. Fruit woolly.

Japan Maple. Fl. April, May. Tree 20 feet.

34 A. palma'tum (Thumb. fl. jap. p. 161.) leaves smooth, palmately divided into 5-7 lobes beyond the middle ; lobes

oblong, acuminated, serrated; umbels 5-7-flowered. ♄. H. Native of Japan. Tratt. arch. 1. no. 17. with a figure. Flowers greenish-yellow ?

Palmate-leaved Maple. Fl. May. Clt. 1820. Tree 20 ft.

35 A. SEPTE'MLOBUM (Thunb. fl. jap. p. 162.) leaves smooth, 7-lobed; lobes acuminated, equally and acutely serrated. ♄. H. Native of Japan.

Seven-lobed-leaved Maple. Fl. May. Tree 40 feet.

36 A. PI'CTUM (Thunb. fl. jap. p. 162.) leaves smooth, palmately 7-lobed; lobes acuminated, entire. ♄. H. Native of Japan. Tratt. arch. 1. no. 15. with a figure. Branches ash-coloured. Leaves variegated with white.

Painted-leaved Maple. Tree 30 feet.

37 A. CIRCINA'TUM (Pursh. fl. amer. sept. 1. p. 267.) leaves orbicular, rather cordate at the base, 7-lobed, smooth on both surfaces; lobes acutely toothed; nerves and veins hairy at their origin. ♄. H. Native of North America on the great rapids of the Columbia river and of Northern California. This beautiful species has leaves the size of *A. rùbrum*. The disposition of the flowers is unknown, therefore it is doubtful whether it belongs to this section.

Round-leaved Maple. Tree 56 feet.

38 A. LOBA'TUM (Fish. mss. Loud. hort. brit. p. 412.) leaves 7-lobed. ♄. H. Native of Siberia. This species is extremely doubtful. Disposition of flowers unknown.

Lobed-leaved Maple. Clt. 1820. Tree.

* * *Leaves trifid or undivided.*

39 A. TRI'FIDUM (Thunb. fl. jap. p. 163.) leaves undivided and trifid, entire. ♄. H. Native of Japan. The twigs are smooth and purplish.

Trifid-leaved Maple. Tree 20 feet.

Cult. Maples are for the most part trees of considerable size and beauty, and are chiefly used for plantations or avenues or the backs of shrubberies. Most of them will grow from cuttings, which should be taken off at a joint, and planted in a sheltered situation in the open air, the earlier in autumn this is done the better, particularly if the weather be moist; Mr. Sweet recommends the cuttings of most hardy trees and shrubs to be planted about the same time, as they succeed much better than if they are planted in spring, the usual time; the ground should be well fastened about them, so that the worms and frost may not loosen them. They may be also increased by layers put down in the autumn. The seeds of this genus should be sown if possible soon after they are gathered from the tree, because if sown then they will vegetate next spring, but if kept till spring few of them will vegetate the first year; these should be sown in a bed prepared for the purpose, and they should be covered over about an inch thick of mould; this bed should be dressed in spring before the plants make their appearance, and when the trees are of a sufficient size, which is generally after a year's growth, they should be planted out in rows, there they may remain until they are of sufficient size to be planted out into plantations or shrubberies.

II. NEGU'NDO (meaning unknown). Mœnch. meth. 334. D. C. prod. 1. p. 596.—Negúndium, Rafin.—A'cer. spec. Lin.

LIN. SYST. *Dioècia, Pentándria.* Flowers dioecious. Calyx small, unequally 4-5-toothed. Petals wanting. Male flowers in fascicles, on filiform pedicels. Anthers 4 or 5, linear, sessile. Female flowers in racemes.—Trees with impari-pinnate or trifoliate leaves.

1 N. FRAXINIFÒLIUM (Nut. gen. amer. 1. p. 253.) leaves pinnate, with 3 or 5 opposite, coarsely and deeply-toothed leaflets, with the odd one usually 3-lobed. ♄. H. Native of North America on the banks of rivers from Pennsylvania to Carolina. A'cer Negúndo, Lin. spec. 1497. Mich. fil. arb. 2. t. 16. Tratt. arch. 1. no. 10. with a figure. Wangh. amer. t. 12. f. 20. N. aceroìdes, Mœnch. meth. 334. Flowers green. The tree is commonly called *Box-elder* or *Ash-leaved Maple.*

Var. β, crìspa; leaflets curled.

Ash-leaved Negundo. Fl. May, June. Clt. 1688. Tr. 40 ft.

2 N. MEXICA'NUM (D. C. prod. 1. p. 596.) leaves all trifoliate. ♄. H. Native of Mexico. A'cer ternàtum, Moc. et Sesse, fl. mex. icon. ined. Perhaps this is only a variety of the preceding species. Flowers green.

Mexican Negundo. Tree 40 feet.

3 N. COCHINCHINE'NSE (D. C. prod. 1. p. 596.) leaves pinnate, usually with 4 pairs of alternate quite entire leaflets, and an odd one. ♄. H. Native of Cochin-china in woods. A'cer pinnàtum, Lour. fl. coch. 649. Petals 5, white. Wings of fruit fleshy. This may probably form a separate genus of *Sapindàceæ*, the stamens being 8. The wood is very hard.

Cochin-china Negundo. Tree 25 feet.

Cult. These trees are well adapted for the backs of shrubberies. Cuttings taken off at a joint, and planted in a sheltered situation early in autumn will strike root. They may be also increased by layers put down at the same time, or by seeds.

III. DOBI'NEA (an alteration from the Nipaulese name of the shrub). Hamilt. mss. D. Don, prod. fl. nep. p. 249.

LIN. SYST. *Monoècia, Monadélphia.* Flowers monoecious. Male flowers with a 1-leaved, 4-toothed, campanulate calyx. Stamens 8, joined into a column about the sterile style, 4 of which are shorter than the rest. Petals 4, oblong, unguiculate. Female flowers without a calyx or corolla. Ovary 1-seeded. Style crowned by a blunt stigma. Capsule compressed, with a winged margin, 1-celled, 1-seeded, sitting on the middle of a leafy pedicel. Seed flat. Albumen wanting. Shrub with simple leaves.

1 D. VULGA'RIS (Hamilt. mss. in D. Don, prod. fl. nep. p. 249.) ♄. H. Native of Nipaul at Narainhetty. Shrub branched; branches pubescent. Leaves elliptical, oblong, acutely serrated, hairy on both surfaces, acuminated and entire at the apex, 4-6 inches long, and about 2 in breadth. Flowers minute, loosely panicled, terminal, with pilose peduncles; female ones on leafy coloured pedicels.

Common Dobinea. Fl. Aug. Shrub 6 feet.

Cult. It is probable that the treatment and manner of propagation recommended for *Negúndo* will answer this shrub.

ORDER XLVII. HIPPOCASTA'NEÆ (this order only contains the horse-chesnut). D. C. theor. ed. 2. p. 244. prod. 1. p. 597.—Castaneàceæ, Link, enum. 1. p. 354.—Æ'sculus, Lin. gen. no. 462.

Calyx campanulate, 5-lobed. Petals 4 or 5, unequal, hypogynous. Stamens 7-8, inserted in the hypogynous disk, free, unequal. Anthers rather incumbent. Ovary roundish-trigonal. Style 1, filiform, conical, acute. Younger capsules 3-celled, 3-valved, each cell containing 2 ovulæ, with a dissepiment in the middle of each valve, which the ovulæ are fixed to; adult capsules coriaceous, rather globose, 2-3-celled, 2-3-valved, 2-4-seeded. Seeds large, somewhat globose, variously compressed and angled, covered by a very smooth, shining, ferrugineous shell, with a broad, cinereous-brown, basilar hilum. Albumen wanting. Embryo curved, inverted, with fleshy, thick, gibbous cotyledons, which are soldered together, through germination, within the seed cover. Plumule large, 2-leaved. Radicle

conical, curved, directed towards the hilum.—Trees and shrubs, with opposite, compound, palmate leaves, composed of 5 or 7 feather-nerved leaflets, and terminal, rather panicled racemes of flowers, with jointed pedicels. This order is much valued for the grandeur of the foliage and flowers of most of the species. Their bitter fruit has sometimes been used as a sternutary; it contains a large quantity of potash, and abundance of starch. The bark is astringent and febrifugal.

Synopsis of the Genera.

1 Æ'sculus. Capsule echinated.

2 Pa'via. Capsule smooth.

I. Æ'SCULUS (a name given by Pliny to a kind of oak, which had an eatable nut, derived from *esca*, nourishment). Lin. gen. no. 462. exclusive of some species. D. C. prod. 1. p. 597. —Hippocástanum, Tourn. inst. t. 612.

Lin. syst. *Heptándria, Monogýnia.* Calyx campanulate. Petals 4-5, expanded, with an ovate border. Stamens with the filaments recurved inwardly. Capsules echinated. Leaflets sessile or almost sessile.

1 Æ. Hippoca'stanum (Lin. spec. 488.) capsules echinated; petals 5; stamens 7; leaflets 7, obovately-cuneated, acute, toothed. ♄. H. Native of the north of India. Mill. ill. icon. Woodv. med. bot. t. 128.—Plenck. icon. t. 293.—Riv. pentap. irr. t. 123.—H. vulgàre, Gært. fruct. 2. t. 111. Petals white, and spotted with red and yellow. The common horse-chesnut is well known by the beautiful parabolic form in which it grows, and during the period of its flowering no tree possesses greater beauty, for the extremity of each branch is terminated by a raceme of shewy, variegated flowers, so that every part of the tree seems clothed with them. This tree, if grown singly in parks or lawns, has a more sightly appearance than if grown in avenues. The timber, though of inferior quality, is said to be used by the turner; however, its chief use is for fuel. In Turkey the nuts are ground and mixed with the provender for their horses, especially those which are troubled with coughs or are broken-winded. It is said that deer, sheep, and swine will fatten on them, and poultry have been kept with them boiled. The bark of this tree has been given in Italy, not without success, in intermittent fevers; it has also been used with good success in dyeing several sorts of yellow colours. The horse-chesnut was brought originally from the northern parts of Asia into Europe about the year 1550, and was sent to Vienna about the year 1558; from Vienna it migrated into Italy and France; but it came to us from the Levant. Gerard in his herbal speaks of it only as a foreign tree. In Johnson's edition of the same work it is said, "horse-chesnut groweth in Italy, and in sundry places of the East countries; it is now growing with Mr. Tradescant at South Lambeth." Parkinson says, "our Christian world had first the knowledge of it from Constantinople." The same author places the *horse-chesnut* in his orchard as a fruit-tree between the *walnut* and the *mulberry*. How little it was then (1629) known, may be inferred from his saying, not only that it is of greater and more pleasant aspect for the fair leaves, but also of as good use for the fruit, which is of a sweet taste, roasted and eaten as the ordinary sort. He also describes and figures the corolla with 4 petals. The tree does not appear to have been common even in the beginning of 1700.

Var. β, *flòre-plèno*; flowers double. This variety is rather of rare occurrence.

Var. γ, *variegàta*; leaves variegated.

Common *Horse-chesnut*. Fl. April, May. Clt. 1629. Tree 40 to 60 feet.

2 Æ. ca'rnea (Lindl. bot. reg. 1056.) capsules echinated; petals 5; stamens 7; flowers pubescent; leaflets 5, oblong, acuminated, serrated. ♄. H. Native of North America? This is one of the most beautiful of all hardy trees, resembling in general appearance the common horse-chesnut, but being small, and bearing a profusion of panicled racemes of rich flesh-coloured flowers, is more ornamental.

Flesh-coloured-flowered Horse-chesnut. Fl. July. Clt.? Tree 20 feet.

3 Æ. rubicu'nda (Lois. herb. amat. t. 367.) capsules echinated; petals 4, with the claws of the petals shorter than the calyx; stamens 8; leaflets 5-7, obovately-cuneated, acute, unequally serrated. ♄. H. Native of North America? Æ. cárnea, Hort. Wats. dend. brit. t. 121. This tree is very ornamental when in flower, the branches being terminated by racemes of fine scarlet flowers.

Reddish-flowered Horse-chesnut. Fl. June. Clt. 1820. Tree 20 feet.

4 Æ. gla'bra (Willd. enum. 405.) capsules echinated; corolla of 4 spreading petals, with their claws about the length of the calyx; stamens longer than the corolla; leaflets 5, very smooth. ♄. H. Native of North America in the western counties of Pennsylvania and Virginia. Flowers greenish-yellow.

Smooth Horse-chesnut. Fl. June. Clt. 1822. Tree 20 feet.

5 Æ. Ohioe'nsis (Mich. arb. 3. p. 242.) capsules echinated; corolla? leaflets 5, smooth, oval, acuminated, irregularly toothed. ♄. H. Native of North America on the banks of the river Ohio. Flowers white, numerous, racemose. Fruit about half the size of those of the common horse-chesnut.

Ohio Horse-chesnut. Fl. April, May. Clt.? Tree 30 feet.

6 Æ. pa'llida (Willd. enum. 406.) capsules echinated; corolla of 4 spreading petals, with their claws shorter than the calyx; stamens twice as long as the corolla; leaflets 5. ♄. H. Native of North America in the forests of Kentucky. Flowers greenish-yellow or whitish.

Pale Horse-chesnut. Fl. June. Clt. 1812. Tree 40 feet.

Cult. This is a genus of very shewy trees, well adapted for lawns or parks, having a beautiful effect when in flower. They will do well in any soil, but the deeper and more loamy the better. They may be either increased by layers put down in the spring, or by grafting or budding on the common horse-chesnut. Seeds of such species as can be procured should be sown singly in rows in spring, where they may remain until they are of sufficient size to be planted out permanently.

II. Pa'via (in honour of Peter Paw, a Dutch botanist, once professor of botany at Leyden). Boerh. lugd. 6. t. 260. D. C. prod. 1. p. 598.

Lin. syst. *Heptándria, Monogýnia.* Calyx tubular. Petals 4, erect, narrow. Stamens straight. Capsules unarmed. Leaves palmate, with stalked leaflets.

1 P. macrosta'chya (Lois. herb. amat. t. 212.) capsules unarmed; stamens much longer than the 4-petalled corolla; racemes very long; leaflets 5, downy beneath. ♄. H. Native of North America on the banks of rivers, particularly in Georgia near St. Augustin. Æ'sculus macrostàchya, Michx. fl. bor. amer. 1. p. 220. Jacq. eclog. 1. t. 9. Æ. parviflòra, Walt. car. 128. Pàvia álba, Poir. dict. 5. p. 95. Pàvia édulis, Poit. abr. fr. t. 88.—Coll. hort. rip. t. 19. A small shrub, with long racemes of small, very ornamental, white flowers. Roots stoloniferous. The whole of the North American species of this genus, as well

as those of the preceding, are known in their places of natural growth under the name of *Buck's-eye tree*.

Long-spiked Pavia. Fl. May, June. Clt. 1820. Shrub 6 ft.

2 P. RU'BRA (Lam. illus. t. 273.) capsules unarmed; stamens shorter than the 4-petalled corolla; leaflets 5, elliptical-oblong, acute at both ends, and are, as well as the petioles, smooth, but pilose at the origin of the nerves beneath. ♄. H. Native of North America in fertile valleys on the mountains of Virginia and Carolina; said also to be a native of Brazil and Japan. Æ'sculus Pàvia, Lin. spec. 488. Wats. dend. brit. t. 120. Duham. arb. 2. t. 19. Flowers of a dirty-scarlet colour in loose racemes. Usually a shrub, but sometimes a small tree.

Red-flowered Pavia. Fl. May, June. Clt. 1711. Shrub 4 feet. Tree 12 feet.

3 P. DI'SCOLOR; capsule unarmed; leaflets 5, acuminate at both ends, tomentose beneath, unequally serrulated; raceme thyrsoid, many-flowered; corolla of 4 conniving petals, with their claws the length of the calyx; stamens 7, shorter than the corolla. ♄. H. Native of North America, principally in the western territory of Georgia. *Æ'sculus díscolor*, Pursh. fl. amer. sept. 1. p. 255. Ker, bot. reg. 310. Flowers variegated with white, yellow, and purple.

Two-coloured-leaved Pavia. Fl. May. Clt. 1812. Sh. 4 ft.

4 P. HY'BRIDA (D. C. prod. 1. p. 598.) capsules unarmed; stamens shorter than the 4-petalled corolla; petioles smooth; leaflets 5, elliptical-oblong, acuminated at both ends, and clothed with velvety pubescence beneath. ♄. H. Native of North America, principally in the western territory of Georgia. *Æ'sculus hýbrida*, D. C. hort. monsp. 1813. p. 75. Flowers variegated with yellow, white and purple, disposed in thyrsoid racemes. Truly an intermediate plant between *P. rùbra* and *P. flàva*.

Hybrid Pavia. Fl. May, June. Clt. 1812. Shrub 4 feet.

5 P. HU'MILIS (G. Don, in Loud. hort. brit. p. 143.) capsules unarmed; stem decumbent; leaflets 5, lanceolate, stalked, unequally serrated, pubescent beneath; calyx cylindrically-funnel-shaped and pubescent, as well as the convolute corolla; stamens inclosed, a little longer than the calyx. ♄. H. Native of North America. *Æ'sculus hùmilis*, Lodd. cat. Lindl. bot. reg. t. 1018. Flowers blood-coloured, in loose terminal racemes. This plant is propagated by suckers.

Humble Pavia. Fl. May, June. Shrub 2 to 3 feet.

6 P. FLA'VA (D. C. prod. 1. p. 598.) capsules unarmed; stamens shorter than the 4-petalled corolla; petioles pubescent, flattish above; leaflets 5-7, elliptical-oblong, acute at both ends, pubescent beneath, as well as the nerves on the upper surface. ♄. H. Native of North America in the mountains of Virginia and Carolina, and the woods of Kentucky. *Æ'sculus flàva*, Ait. hort. kew, 1. p. 494. *Æ. lùtea*, Wangh. in act. nat. scrut. berl. 8. p. 133. t. 6. *Pàvia lùtea*, Poir. dict. 5. p. 94. Flowers pale-yellow disposed in thyrsoid racemes.

Yellow-flowered Pavia. Fl. May, June. Clt. 1764. Tree 20 to 30 feet.

7 P. NEGLE'CTA (G. Don, in Loud. hort. brit. p. 143.) capsules unarmed, but the ovary is tomentose; leaflets 5, lanceolate, serrulated, tapering to the base, flat, rather plicate, smooth beneath, but pilose in the axils of the veins; calyx campanulate, obtusely 5-toothed, about the length of the pedicel; stamens rather longer than the corolla; superior petal veined. ♄. H. Native of North America. *Æ'sculus neglécta*, Lindl. bot. reg. 1009. Leaves with rufous down on the veins on the upper side. Flowers pale-yellow, veined with red disposed in thyrsoid racemes.

Neglected Pavia. Fl. May, June. Tree 20 feet.

Cult. This genus is composed of shewy flowering shrubs and trees, well adapted for shrubberies. They will thrive well in any soil, but the more loamy the better. They may be increased by layers put down in the spring, or by grafting or budding on the common horse-chesnut. Seeds, when they can be procured, should be sown singly in rows, in the month of March or April, about an inch under ground; and when the plants are of sufficient size, they should be planted out where they are intended to remain.

ORDER XLVIII. RHIZOBO'LEÆ. D. C. prod. 1. p. 599.

Calyx usually of 5 sepals (f. 110. *a.*), rarely of 6, more or less connected at the base, therefore it is commonly called 5-6-parted or 5-6-cleft. Petals unequal, usually 5 (f. 110. *b.*), rarely 8, alternating with the sepals when the same number, inserted into the hypogynous disk with the stamens, and adnate to their tube. Stamens very numerous, disposed in a double order on the disk, inner series usually shortest, with sterile anthers, with the filaments monadelphous at the base, the rest filiform, awl-shaped, with round anthers. Ovary free, subglobose (f. 110. *e.*), somewhat tetragonal, 4-celled, 4-seeded. Styles 4 (f. 110. *d.*) 5-6. Stigmas simple. Fruit containing 4 adglutinated nuts, but usually fewer from abortion (f. 110. *f.*). Nuts indehiscent, 1-celled, covered with a hard shell, which is beset with bristles outside. Almonds or seeds kidney-shaped, keeled on the back, exalbuminous, tapering to both ends. Funicle dilated into a spongy 2-lobed caruncle. Embryo with a very large ascending radicle, which is the substance of the almond eaten, and with very small, ovate-lanceolate, leafy cotyledons, lying in the furrow of the radicle.—Trees with opposite, stalked, palmate, stipulate leaves, composed of 3-5 leaflets, and racemose bractless flowers. This is a very distinct order, approaching on one hand the *Terebinthàceæ*, and especially with *Mangífera*, but from the hypogynous insertion of the petals and stamens and form of fruit it comes more near to *Sapindàceæ*. It agrees also with *Hippocastàneæ* in the leaves being opposite, as well as being palmately compound, but in *Hippocastàneæ* the radicle is small and the cotyledons are large, but on the contrary in *Rhizobòleæ* the radicle is large and the cotyledons are small, but it differs also in the large regular flowers, and in the number of stamens. In both these orders the substance of the albumen appears as if it was consumed by various parts of the embryo. The order is remarkable for containing the *Soari Saouari* or *Suwarrow-nut* and *Butter-nut*. The first is not unfrequent in fruiterers' shops. It is sweet and palatable.

I. CARYO'CAR (from καρυον, *caryon*, a nut. The species bear large fruit containing eatable nuts). Lin. mant. 247. D. C. prod. 1. p. 599.—Rhizóbolus, Gært. fruct. 2. p. 93.—Pèkea and Saouári, Aubl. guian. 1. p. 594 and 599.

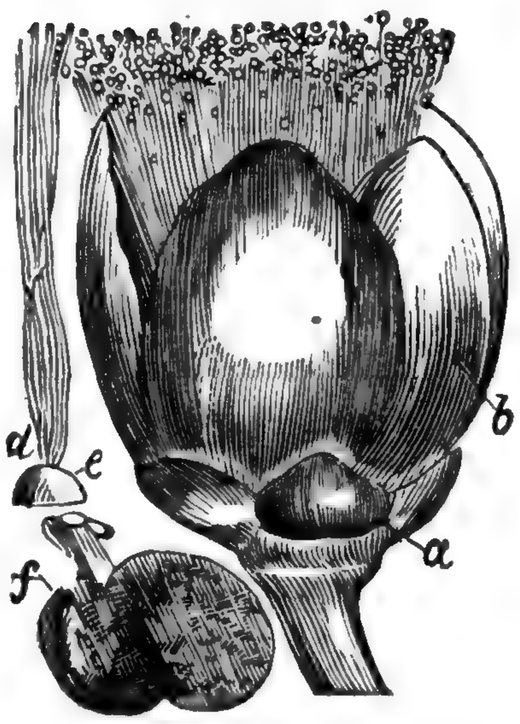
LIN. SYST. *Polyándria, Tetra-Hexagýnia.* Calyx 5 (f. 110. *a.*) -6-parted. Petals 5 (f. 110. *b.*) -8. Stamens numerous, monadelphous at the base. Styles 4 (f. 110. *d.*) 5-6. Ovary 5-6-celled; cells 1-ovulate. Drupe containing 4-5 reticulated hispid nuts, or from abortion 1-2 (f. 110. *b.*) or 3.

§ 1. *Saouári (the name of C. glàbrum in Guiana). Aubl. guian. 1. p. 599. D. C. prod. 1. l. c. Leaves trifoliate.*

1 C. NUCÍFERUM (Lin. mant. 247.) leaves trifoliate; leaflets

elliptical-lanceolate, obscurely serrated, smooth; calyx and corolla purple; petals 5; stamens very numerous, white; anthers oblong, yellow; drupe about the size of a man's head. ♄. S. Native of South America, Berbice, Essequibo. Hook, bot. mag. t. 2727 and 2728. Rhizóbolus Pèkea, Gærtn. fruct. p. 93. t. 98. f. 1. R. tuberculòsus, Smith, in Rees' cycl. Amýgdala Guianénsis, Clus. exot. p. 276. f. 1. The nuts of this tree are sold in fruit-shops under the name of *Saouari Suwarrow*, or *Suwarra-nut*, or *Butter-nut*. The fruit is 4-celled, containing 1 nut in each, embedded in white pulp; they are of a round kidney-shaped figure, compressed on one side. The shell of the nut is very hard and tubercled. The kernel or seed, which is the part eaten, is covered by a red-brown membrane, internally pure white, soft, and fleshy, and rather oily, which is of a very agreeable flavour.

FIG. 110.



Nut-bearing or Common Suwarrow-nut. Clt. 1825. Tree 100 feet.

2 C. gla'brum (Pers. ench. 2. p. 84.) leaves trifoliate, smooth; leaflets ovate, acuminated, a little toothed; drupe about the size of a hen's egg. ♄. S. Native of Guiana in the woods. Saouári glàbra, Aubl. guian. 1. p. 599. t. 241. Rhizóbolus Saouári, Corr. ann. mus. 8. p. 394. t. 5. f. 2. Flowers whitish. Kernels of nuts eatable. The fruit of this tree is sold in the markets of Cayenne under the name of *Saouari*.

Smooth Suwarrow-nut. Tree 100 feet.

3 C. villòsum (Pers. ench. 2. p. 84.) leaves trifoliate; leaflets ovate, roundish, rather acute, tomentose beneath. ♄. S. Native of Guiana in woods. Saouári villòsa, Aubl. guian. 1. p. 599. t. 241. Flowers and fruit unknown.

Villous-leaved Butter-nut. Tree 100 feet.

4 C. Brasilie'nse (St. Hil. fl. bras. 1. p. 322. t. 67.) leaves trifoliate; leaflets obovate-oblong, sinuately-toothed, tomentose beneath. ♄. S. Native of Brazil in the provinces of St. Paul and Minas Geraes, where it is called by the inhabitants *Pequi*. A small tree with a twisted stem. Petals coloured with saffron and rose-colour on the outside.

Brazilian Butter-nut. Tree 20 feet.

5 C. amygdalíferum (Cav. icon. 4. p. 37. t. 361 and 362.) leaves trifoliate, smooth; leaflets lanceolate, serrated, with a fascicle of hairs at the origin of each nerve beneath; anthers roundish. ♄. S. Native of South America in the woods of Maraquita in Santa Fe de Bogota. This tree grows to the height of 180 to 240 feet. Flowers greenish-yellow. Styles 2. Kernels of nuts eatable, with the taste of almonds.

Almond-bearing Butter-nut. Tree 240 feet.

6 C. amydalifo'rme (Ruiz et Pav. fl. per. 5. t. 570.) leaves trifoliate; leaflets oblong, acuminated, sinuately toothed; flowers corymbose, terminal; styles 3; fruit globose; nuts muricated. ♄. S. Native of Peru. The kernels of the nuts taste like almonds.

Almond-like Butter-nut. Tree 100 feet.

§ 2. Pe'kea (the name of *C. butyròsum* in Guiana). Aubl. guian. 1. p. 594. D. C. prod. 1. c. Leaves of 5 leaflets.

7 C. butyro'sum (Willd. spec. 2. p. 1243.) leaves of 5 smooth, oval-lanceolate, acuminated, entire leaflets; drupe smooth. ♄. S. Native of Guiana in woods. Pèkea butyròsa, Aubl. guian. 1. p. 594. t. 238. Lam. ill. t. 486. Flowers in terminal corymbs, with 5 white petals, 6-parted calyx, and yellow anthers. This tree is cultivated for its nuts in Cayenne, which are esculent, and taste somewhat like a Brazil-nut. The wood is useful.

Butter-nut. Tree 80 feet.

8 C. tomento'sum (Willd. spec. 2. p. 1244.) leaves of 5 oval, acuminated, entire leaflets, which are tomentose beneath; drupes clothed with blunt tubercles. ♄. S. Native of Guiana in woods. Pèkea tuberculòsa, Aubl. guian. 1. p. 397. t. 239. Flowers white, in terminal bunches. Kernels of nuts sweet and eatable, but not so buttery as those of the preceding.

Tomentose-leaved Butter-nut. Clt. 1820. Tree 100 feet.

Cult. These fine fruit-trees are of easy culture when once introduced, but they are truly difficult to import. The way to succeed is by planting the seeds in boxes of mould in the countries of their natural growth, and when these seeds have vegetated, and the plants arrived at a proper strength, they should then be sent off, at a time when they will arrive in the summer in this country. They will all thrive well in a mixture of loam, peat, and sand, and ripened cuttings will root in sand under a hand-glass, in a moist heat. Seeds soon become rancid.

Order XLIX. SAPINDA'CEÆ (plants agreeing with *Sapíndus* in important characters). Juss. ann. mus. 18. p. 476.—Sapíndi, Juss. gen. 246.

Flowers polygamous. Male ones with the calyx more or less profoundly 4-5-parted or 4-5-sepalled (f. 111. *a.*); imbricate in æstivation. Petals 4 (f. 111. *b.*) -5, rarely wanting, alternating with the sepals, inserted in the receptacle, sometimes naked, sometimes furnished with an appendage on the inside, imbricate in æstivation. Disk fleshy, sometimes occupying the bottom of the calyx, regular, nearly entire, expanded at the apex between the petals and stamens, sometimes glandular, incomplete, with the glands situated between the petals and the stamens. Stamens 8 (f. 111. *c.*) -10, rarely 5-6-7, but very rarely 20, sometimes inserted in the disk, sometimes in the receptacle, between the glands and the pistil; filaments free, or connected at the very base; anthers bursting inwards lengthwise. Rudiment of a pistil small or wanting. Hermaphrodite flowers with the calyx, petals, stamens, and disk, as in the male flowers. Ovary 3-celled, rarely 2-4-celled; cells 1-2-3, rarely many-ovulate. Style undivided (f. 111. *d.*), or more or less profoundly 3-cleft, rarely 2-cleft. Ovulæ erect or ascending when there is only one in each cell, rarely, as in *Hypelàte*, suspended; when there are 2 in each cell the superior one is erect or ascending, the inferior one suspended. Fruit sometimes capsular, opening at the cells or dissepiments, 2-3-valved, sometimes samaroid, sometimes fleshy and indehiscent. Seeds usually arillate. Outer covering crustaceous or membranous, inner one pellucid. Albumen wanting. Embryo rarely straight, usually curved or spirally convolute. Radicle pointing towards the hilum. Cotyledons incumbent, joined together into a thick mass. Plumule 2-leaved.—This order is composed of trees and shrubs, often climbing, and furnished with tendrils, rarely climbing herbs. The leaves are alternate, usually compound, rarely simple, stipulate or exstipulate, usually marked with pellucid lines or dots. The flowers are disposed in racemes or racemed panicles; they are small, white, or rose-coloured, rarely yellow. The most prominent distinctive peculiarity of this order con-

sists in the petals being each furnished on the inside with an additional scale or a tuft of hairs instead. The only plant in this order which will bear the climate of England is *Kœlreutèria paniculàta*, a beautiful tree, with panicles of yellow flowers. Many of the species of *Nephèlium* bear excellent fruit, as well as the *Blighia sápida* and *Melicócca bijùga*. The rind of the fruit of many species of *Sapíndus* is used instead of soap, in the places of their natural growth.

Synopsis of the Genera.

SECTION I.

SAPI'NDEÆ *(Cambess. in mem. mus.* 19. *p.* 18.*)* *Ovary containing one ovula in each cell. Embryo curved, rarely straight.*

* *Climbing shrubs or herbs, furnished with tendrils. The upper or fifth petal absent, and with its seat vacant.*

1 CARDIOSPE'RMUM. Sepals 4, unequal. Petals 4, furnished each with a scale on the inside, and with 2 glands on the disk, opposite the lower petals. Stamens 8, unequal. Style profoundly trifid. Capsule trigonal, membranous, bladdery, 3-celled, 3-seeded. Seeds fixed to the central placenta.

2 URVI'LLEA. Sepals 5, unequal. Petals 4, furnished with scales above the base inside, and with 4 glands opposite the petals. Stamens 8. Style trifid. Capsule membranous, 3-winged, bladdery, 3-celled, or composed of 3 indehiscent, 1-seeded carpels, fixed to the central axis.

3 SERJA'NIA. Sepals 4 (f. 111. *a.*) -5, unequal. Petals 4 (f. 111. *b*,), furnished each with a scale above the base on the inside, and with 2-4 glands at the base of the petals. Stamens 8. Style trifid (f. 111. *d.*). Capsule membranous, 3-winged (f. 111. *f.*), composed of 3 carpels, fixed to the filiform axis, which are drawn out each at the base into a wing, but 1-celled and 1-seeded at the apex.

4 PAULLI'NIA. Sepals 4-5, unequal. Petals 4, furnished each with a scale above the base, with 2-4 glands at the base of the petals. Stamens 8. Style trifid. Capsule pear-shaped, trigonal, usually with 3 short wings at the apex, 3-celled, 3-valved. Seeds fixed to the central axis at the bottom of the cells, half covered by a 2-lobed aril.

5 ENOU'REA. Calyx 4-parted, unequal. Petals 4, inserted in the calyx? furnished each with a scale on the inside at the claws, with 2 glands at the base of the larger petals. Stamens 13, connate at the base. Stigmas 3. Capsule spherical, 3-valved, 1-celled, 1-seeded. Seed enwrapped in mealy pulp.

* * *Upright trees and shrubs.*

6 TOULI'CIA. Calyx 5-parted, unequal. Petals 5, furnished each with a long, 2-parted, pilose appendage at the base inside. Stamens 8. Style trifid. Fruit 3-winged, composed of 3 carpels, adnate to the central axis, each drawn out in a wing at the base, and 1-celled, 1-seeded at the apex.

7 SCHMIDE'LIA. Calyx 4-parted, unequal. Petals 4, naked, or furnished each with a scale above the claw, with 4 glands on the disk, opposite the petals. Stamens 8. Style bifid or trifid, seated between the lobes of the ovary. Fruit indehiscent, 1-2, rarely 3-lobed; lobes roundish, fleshy or dry.

8 IRI'NA. Calyx 5-parted. Petals 5, naked. Disk emarginate. Stamens 5. Style crowned by an obtuse stigma. Carpel solitary from abortion, dry, indehiscent. Seed solitary, without aril.

9 PRO'STEA. Calyx 5-parted, unequal. Petals 5, furnished each with a small scale on the inside at the base. Stamens 20. Style undivided, seated between the lobes of the ovary. Ovary 3-lobed; lobes of 3, 1-ovulate cells. Fruit indehiscent, fleshy, 1-lobed from abortion, as well as 1-celled.

10 LEPISA'NTHES. Sepals 4, unequal. Petals 4-5, furnished each with a scale on the inside. Disk emarginate. Stamens 8. Ovary trigonal, 3-celled; cells 1-seeded. Style almost wanting, crowned by an obtuse stigma. Drupe tetragonal, containing a 3-celled, 3-seeded nut.

11 SAPI'NDUS. Calyx 5-parted. Petals 5, naked or furnished each with a scale. Stamens 8-10. Style undivided. Stigma terminal, 3, rarely 2-lobed. Fruit fleshy, 1-2-lobed from abortion, rarely 3-lobed; lobes 1-2, rarely 3-seeded.

12 ERIOGLO'SSUM. Sepals 5, unequal. Petals 4, furnished each with a strap-like, bifid, villous appendage inside. Stamens 8, unequal, villous. Style crowned by an obtuse stigma. Ovaries 3, 1-seeded. Carpels 3, elliptical, baccate, connate at the base, but usually solitary from abortion.

13 MOULI'NSIA. Calyx 5-parted. Petals 4, furnished each with a cucullate scale on the inside. Disk 4-lobed. Stamens 8. Style crowned by a 3-lobed stigma, seated between the lobes of the ovary. Fruit 3-lobed, or from abortion only 2-lobed, 2-3-celled.

14 CUPA'NIA. Calyx 5-cleft or 5-parted. Petals 5, furnished each with a small scale above the base. Stamens 10, or 5-9 from abortion. Style trifid or undivided. Capsule pear-shaped, 2-3-angled, 2-3-valved, 2-3-celled, 2-3-seeded. Seeds arillate.

15 HARPU'LIA. Calyx 5-cleft. Petals 5. Stamens 5, alternating with the petals. Style short, crowned by a 2-lobed stigma. Capsule 2-celled. Seeds solitary, arillate. Disk fleshy, villous.

16 BLIGHIA. Calyx 5-parted. Petals 5, hardly appendiculate at the base. Style trifid. Fruit 3-lobed, fleshy. Seeds solitary, seated on a thick fleshy aril.

17 TALÍSIA. Calyx 5-cleft. Petals 5, furnished each with a pilose scale above the base, nearly equalling the limb. Disk very fleshy. Stamens 8. Stigma nearly sessile, obsoletely 3-toothed. Ovary 3-4-celled, 3-4-seeded. Seeds fixed to the bottom of the cells.

18 STADMA'NNIA. Calyx 5-toothed. Petals wanting. Stamens 8. Style short, crowned by a trigonal stigma. Berry globose, 1-celled, 1-seeded from abortion.

19 MATA'YBA. Calyx deeply 5-cleft, with short appendages on the inside at the base. Stamens 8. Stigma subsessile, somewhat 3-toothed. Ovary 2-celled, 2-ovulate. Ovulæ fixed to the central axis at the middle of the cells, ascending.

20 NEPHE'LIUM. Calyx 5-6-toothed. Petals 5-6, rarely wanting, densely pilose inside. Stamens 8-10, rarely 6. Style crowned by a 2-3-lobed stigma. Ovary obcordate, didymous,

2-celled. Fruit indehiscent, usually 1-lobed from abortion, the other one being abortive, tubercled or muricated, rarely smooth. Seeds thick, covered by a thick fleshy aril.

21 THOUI'NIA. Calyx 4-5-parted. Petals 4-5, naked. Stamens 8-10. Style crowned by a trifid stigma, seated between the lobes of the ovary. Fruit of 3 carpels, adnate to the central axis, each drawn out into a wing both at the top and the back, 1-celled, 1-seeded.

22 HYPELA'TE. Calyx 5-parted. Petals 5, and wanting, naked inside. Stamens 8-10. Style short, crowned by a 2-3-lobed stigma. Ovary 2-3-celled, 2-3-ovulate; ovulæ pendulous. Fruit dry, indehiscent, 1-2-celled from abortion.

23 APHA'NIA. Calyx 4-parted, unequal. Petals 4, ciliated, with 2 little scales at the base of each on the inside. Stamens 5. Ovary ovate, compressed, 2-celled, 2-seeded. Style nearly wanting, crowned by an emarginate stigma.

24 MELICO'CCA. Calyx 4-5-parted. Petals 4-5, naked inside and wanting. Stamens 8-10. Style crowned by 2-3-lobed stigma. Ovary 2-3-lobed, 2-3-celled, 2-3-seeded. Fruit fleshy, 1-2-celled, 1-2-seeded from abortion. Seeds covered by a fleshy substance.

SECTION II.

DODONÆA'CEÆ *(Cambess. in mem. mus.* 19. *p.* 33.) *Cells of ovary containing* 2-3-*ovulæ* (f. 112. *g.*). *Embryo spirally twisted.*

25 KŒLREUTE'RIA. Calyx 5-parted. Petals 3-4, furnished each with a small, 2-parted appendage at the base. Disk fleshy. Stamens 8, rarely 5-6-7. Style truncate or acutish at the apex. Capsule bladdery, 1-celled above, but 3-celled below, 3-valved; valves seminiferous beneath the middle.

26 COSSI'GNIA. Calyx 5-parted. Petals 4, naked inside. Stamens 5-6. Style crowned by a capitellate stigma. Ovary 3-celled; cells 3-ovulate. Capsule 3-valved, 3-celled; cells 2-3-seeded. Seeds fixed to the central receptacle.

27 LLAGUNÒA. Calyx 5-cleft. Petals wanting. Disk fleshy. Stamens 8, rarely 9-10. Style crowned by a 3-lobed stigma, Capsule 3-lobed, 3-celled, 3-valved; valves with a dissepiment in the middle of each; cells 1-2-seeded.

28 DODONÆ'A. Calyx 3-4 (f. 112. *a.*), rarely 5-parted. Petals wanting. Stamens 8, rarely 9-10. Style short, 2-3, rarely 4-cleft (f. 112. *d.*). Capsule 2 (f. 112. *f.*) -3-4-winged, 2-3-4-celled, 2-3-4-valved; valves keeled, winged on the back (f. 112. *f.*).

29 MAGO'NIA. Calyx 5-parted, unequal. Petals 5, naked inside. Stamens 8. Style curved, crowned by a somewhat 3-lobed stigma. Capsule large, woody, 3-valved, many-seeded. Seeds large, flat, girded by a wing. Embryo straight.

30 ALE'CTRYON. Berry coriaceous, globose, with a crest on one side, 1-celled, 1-seeded. Seed erect, girded by aril at the base. Embryo spirally convolute.

† *Genera allied to Sapindàceæ, but they are not sufficiently known.*

31 EYSTA'THES. Sepals 5. Petals 5, ovate, equal with the sepals. Stamens 8. Style filiform, crowned by an obtuse stigma. Berry globose, fleshy, 1-celled, 4-seeded. Leaves simple.

32 RACA'RIA. Drupe ovate, 1-celled, containing 3 oblong, trigonal nuts, covered with a fragile integument. Leaves abruptly pinnate. Trunk spinose.

33 VALENTI'NIA. Calyx 5-parted, coloured. Petals wanting. Capsule baccate, pulpy inside, opening by 3-4 revolute valves. Seeds 3-4, oblong. Leaves simple.

34 PEDICE'LLIA. Flowers polygamo-dioecious. Calyx 5-parted. Petals wanting. Stamens 8. Ovary pedicellate. Style almost wanting, crowned by 3 reflexed stigmas. Capsule 3-valved, containing 1 pedicellate seed. Leaves opposite, simple.

35 PIERA'RDIA. Flowers monoecious. Calyx 4-parted. Petals 4. Stamens 8. Style crowned by 3 stigmas. Berry globose, 3-celled, 3-seeded. Leaves simple.

Section I.

SAPI'NDEÆ (plants agreeing with *Sapíndus* in important characters). Ovary containing 1 ovula in each cell. Embryo curved, rarely straight.

* *Climbing herbs and shrubs, furnished with tendrils. The upper or fifth petal absent and with its seat vacant. Leaves decompound or pinnate.*

I. CARDIOSPE'RMUM (from καρδια, *cardia*, the heart, and σπερμα, *sperma*, a seed; in allusion to the form of the seeds) Lin. gen. no. 498. D. C. prod. 1. p. 601. Cambess. in mem. mus. 19. p. 18. t. 1. A and B.—Corindum, Tour. inst. t. 246.

LIN. SYST. *Octándria, Monogýnia.* Calyx of 4 sepals, 2 outer ones smallest. Petals 4, 2 lateral ones usually adhering to the sepals, furnished each with an emarginate scale above the base, 2 lower ones remote from the stamens, with their scales furnished with a glandular crest at the apex, and ending in an inflexed appendage beneath the apex. Glands 2 on the disk, opposite the lower petals; they are either round or linear. Stamens 8, around the base of the ovary, the 4 which are nearest the glands are shortest. Style trifid, with the segments longitudinally stigmatose inside. Fruit a membranous, bladdery capsule, which is 3-celled, 3-valved, with a thin dissepiment opposite the valves, adnate to the central axis. Seeds globose, with a thick funicle, usually expanded into a 2-lobed aril.—Twining and climbing, tendrilled herbs or shrubs, with biternate or supra-decompound, exstipulate leaves, and the flowers disposed in short, compound racemes, with the common peduncle furnished with 2 opposite tendrils under the flowers.

* *Species with 2 short, rounded, hypogynous glands at the base of the lower petals.*

1 C. HALICA'CABUM (Lin. spec. 925.) stem, petioles, and leaves smooth; leaves biternate; leaflets stalked, deeply toothed. ☉. S. Native of the East Indies, and perhaps of the Caribbee Islands. Sims, bot. mag. t. 1049.—Rumph. amb. 6. t. 24. f. 2. Lam. ill. t. 317. Flowers white, on long, axillary peduncles.

Winter-cherry or Common Heart-seed, or Heart-pea. Fl. July. Clt. 1594. Pl. cl.

2 C. MICROCA'RPUM (H. B. et Kunth, nov. gen. amer. 5. p. 104.) branches smooth; leaves biternate; leaflets deeply-serrated, and clothed on both surfaces with close-pressed down; capsules rather turbinate, and clothed with hairy-pubescence.

4. ◡. S. Native of South America in humid places in the province of Orinoco. Flowers white.

Small-fruited Heart-seed. Pl. cl.

3 C. mo'lle (H. B. et Kunth, nov. gen. amer. 5. p. 104.) branches villous; leaves supra-decompound; leaflets sharply and deeply serrated, trifid, covered on both surfaces with long, close-pressed hairs, hoary beneath; capsules somewhat globose, and clothed with soft hairs. 4. ◡. S. Native of Mexico near Guanaxuata. Flowers white.

Soft Heart-seed. Pl. cl.

4 C. Loxe'nse (H. B. et Kunth, l. c.) branches clothed with white wool; leaves subternate; leaflets coarsely crenate-serrated, clothed with close-pressed hairs on the upper surface, but with silky hairs on the under, and hoary; capsules somewhat globose, and covered with hairy-pubescence. 4. ◡. S. Native of Peru near Loxa. Flowers white.

Loxa Heart-seed. Pl. cl.

5 C. Cori'ndum (Lin. spec. 526.) leaves tomentose beneath, biternate; leaflets on very short stalks, somewhat cordate, cut, obtuse; seeds marked with a black spot in the shape of a heart. ⊙. ◡. S. Native of Brazil. C. villòsum, Mill. dict. no. 3. Flowers white.

Indian-heart-seed. Fl. July, Aug. Clt. 1750. Pl. cl.

** *Species with 2 elongated, linear, hypogynous glands between the lower petals and the stamens.*

6 C. cane'scens (Wall. pl. rar. asiat. 1. t. 14.) hoary-villous; leaves biternate; leaflets cuneately obovate, coarsely serrated, intermediate one stalked, and entire at the base, lateral ones sessile; capsule nearly globose, glaucous, pubescent. ⊙. ◡. S. Native of Ava on the Irawaddi, also at Martaban. Flowers greenish-white.

Canescent Heart-seed. Shrub cl.

7 C. grandiflòrum (Swartz, fl. ind. occ. 2. p. 698.) stem rather shrubby at the base; petioles and leaves pubescent; leaves triternate; capsules acuminated, large, tomentose. ♄. ◡. S. Native of Jamaica in hedges and among bushes. Flowers white.

Great-flowered Heart-seed. Fl. July, Aug. Clt. 1817. Sh. cl.

8 C. Leuarttia'num (St. Hil. fl. bras. 1. p. 349.) stem twining, puberulous; leaves biternate; leaflets oblong, acute, dentately-serrated, smoothish, terminal one cuneated; glands on the receptacle elongated and linear. ⊙. ◡. S. Native of Brazil in the province of Minas Geraes. Panicle short, axillary. Allied to *C. élegans*.

Leuartt's Heart-seed. Pl. cl.

9 C. e'legans (H. B. et Kunth, nov. gen. amer. 5. p. 99. t. 439.) stem shrubby at the base; branches puberulous; leaves biternate; leaflets coarsely serrated, smooth; capsules somewhat globosely-elliptical, smooth. ♄. ◠. S. Native of Peru. Flowers white.

Elegant Heart-seed. Shrub cl.

10 C. coluteoi'des (H. B. et Kunth, nov. gen. amer. 5. p. 100.) leaves biternate; leaflets coarsely and deeply crenated, puberulous above, clothed beneath with soft pubescence, as well as the branches; capsules elliptical-oblong, smooth. 4. ◡. S. Native of South America near Caraccas on mountains. C. vesicàrium, Humb. rel. hist. 1. p. 39. Flowers whitish.

Colutea-like Heart-seed. Fl. July, Aug. Clt. 1822. Pl. cl.

11 C. macrophy'llum (H. B. et Kunth, nov. gen. amer. 5. p. 100.) leaves biternate; leaflets sharply and deeply serrated, clothed beneath, as well as the branches, with soft pubescence, and hoary. 4. ◠. S. Native of South America near Atures in the province of Orinoco. Fruit unknown. Flowers whitish.

Long-leaved Heart-seed. Pl. cl.

12 C. parviflòrum (St. Hil. fl. bras. 1. p. 351.) stem twining, pubescent; leaves biternate; leaflets deeply toothed, puberulous, terminal ones ovate-oblong, acutish, lateral ones oblong, obtuse; glands on the receptacle short. ⊙. ◡. S. Native of Brazil in the province of Rio Janeiro. Panicles short, corymbose.

Small-flowered Heart-seed. Pl. cl.

13 C. ano'malum (St. Hil. fl. bras. 1. p. 351. t. 73.) stem erect, hispid; leaves biternate; leaflets pinnate-lobed, acutish, cuneated, hispid; glands on the receptacle round, short. ♄. S. Native of Brazil in the province of Minas Geraes. Root fusiform. Tendrils wanting.

Anomalous Heart-seed. Shrub 1 foot.

14 C. hi'spidum (H. B. et Kunth, l. c.) branches and petioles covered with hispid hairs; leaves biternate; leaflets deeply crenate-serrated, smooth. 4. ◠. S. Native of South America on the banks of the river Amazon near Tomependa. Flowers whitish. Fruit unknown.

Hispid Heart-seed. Pl. cl.

15 C. hirsu'tum (Willd. spec. 3. p. 467.) stem and petioles hairy; leaves biternate; leaflets stalked, ovate, acuminated, smooth, but downy beneath at the origin of the veins. ⊙. ◠. S. Native of Guinea. Flowers white.

Hairy Heart-seed. Fl. July, Aug. Clt. 1822. Pl. cl.

† *Species not sufficiently known.*

16 C. pube'scens (Lag. gen. et spec. 14.) shrubby pubescent; capsules obtuse. ♄. ◠. S. Native of New Spain. Corolla blood-coloured, twice as large as that of *C. Halicácabum*.

Pubescent Heart-seed. Fl. July, Aug. Clt. 1823. Shrub cl.

Cult. The species of this genus are climbing plants hardly worth cultivating except in general collections. They are all of easy culture, but they will thrive best in a mixture of loam and peat; and cuttings will strike root readily in sand under a hand-glass, in heat. The annual species may be sown thinly in pots in spring, and then placed in a hot-bed, and when the plants are of considerable size they may be thinned, and the pots removed to the stove, where they may stand until the plants have ripened their seed.

II. URVI'LLEA (in honour of Captain Dumont D'Urville, of the French navy, who was sent out to ascertain the fate of La Perouse, an acute botanist, author of a paper on the plants of the Island of Melos). H. B. et Kunth, nov. gen. amer. 5. p. 105. t. 440. D. C. prod. 1. p. 602. Cambess. in mem. mus. 18. p. 19.

Lin. syst. *Octándria, Monogýnia.* Calyx of 5 sepals, 2 outer ones smallest. Petals 4, each furnished with a scale above the base, 2 lower ones remote from the stamens, the scales of the 2 lower petals, ending in inflexed appendages. Glands 4 on the disk, opposite the petals, 2 lowest ones largest. Stamens 8, connate around the base of the ovary. Style trifid, with the segments longitudinally stigmatose on the inside. Capsule membranous, 3-winged, a little inflated in the middle, 3-celled, or composed of 3 1-celled, indehiscent carpels, which are winged on the back. Seeds globose, with a thick funicle, expanded into a small, 2-lobed aril. Embryo hardly curved.—Climbing or twining-tendrilled shrubs, with ternate leaves, and with the flowers disposed in spike-formed racemes, the common peduncle usually furnished with 2 opposite tendrils under the flowers. Flowers white.

1 U. ulma'cea (H. B. et Kunth, l. c.) leaves ternate; leaflets ovate, acuminated, regularly serrated, pubescent beneath, as well as the petioles and branches. ♄. ◠. S. Native of South America on mountains near Caraccas. Kœlreutèria triphýlla, Pers. ench. 1. p. 414.

Elm-like Urvillea. Fl. May, July. Clt. 1824. Shrub cl.

2 U. Berteria'na (D. C. prod. 1. p. 602.) leaves ternate; leaflets ovate, coarsely and irregularly toothed, middle one cu-

neated at the base, smoothish beneath, as well as the branches and petioles. ♄ . ◠. S. Native of St. Martha. Paullìnia Berteriàna, Balb. mss.

Bertero's Urvillea. Shrub cl.

3 U. GLA'BRA (St. Hil. fl. bras. 1. p. 353. t. 74.) stem smooth; leaflets ovate-oblong, acutish, mucronulate, nearly entire, smooth. ♄ . ◡. S. Native of Brazil near Rio Janeiro. Leaves ternate. Racemes twin or solitary.

Smooth Urvillea. Shrub cl.

4 U. RUFE'SCENS (St. Hil. fl. bras. 1. p. 354.) stem tomentose; leaflets ovate, acutish, mucronulate, toothed, smoothish above, but pubescently-tomentose beneath, and rufescent. ♄ . ◡. S. Native of Brazil. Leaves ternate. Racemes solitary.

Rufescent Urvillea. Shrub cl.

5 U. FERRUGI'NEA (Lindl. bot. reg. 1077.) branches triquetrous, with the angles covered with long rufous hairs; leaflets cordate, toothed, somewhat lobed, villous; fruit villous. ♄ . ◡. S. Native of Brazil. Leaves ternate. Racemes solitary. Flowers white; anthers reddish.

Rusty Urvillea. Fl. May. Clt. 1823. Shrub cl.

Cult. Climbing shrubs hardly worth cultivating, except in botanic gardens. They will thrive well in a mixture of loam and peat, and large cuttings will strike root readily in sand under a hand-glass, in heat.

III. SERJA'NIA (in honour of Philip Serjeant, a French friar, and botanist). Plum. gen. 34. t. 35. D. C. prod. 1. p. 602.—Seriàna, Schum. act. soc. nat. hafn. 3. pt. 2. Cambess. in mem. mus. 18. p. 20.

LIN. SYST. *Octándria, Monogýnia.* Calyx 4-5 sepalled, 2 outer ones smallest. Petals 4, each furnished with a scale above the base, the 2 lower ones remote from the stamens, the scales of the lower petals ending in an inflexed appendage. Glands 2-4 on the disk at the base of the petals, the 2 upper ones usually abortive. Stamens 8, inserted in the receptacle, connate around the ovary at the base. Style trifid, with the segments longitudinally stigmatose inside. Capsule 3-winged, or composed of 3 carpels, adnate to the central, filiform axis. Carpels membranous, drawn out into a wing at the base, 1-celled and 1-seeded at the apex. Seeds fixed to the inner angle, with a very thick funicle, usually dilated into a small 2-lobed aril.—Climbing or twining-tendrilled shrubs, with ternate, biternate, rarely triternate, or impari-pinnate, stipulate leaves. Flowers white in racemes, with the common peduncle usually furnished with 2 opposite tendrils beneath the flowers.

* *Leaves ternate.*

1 S. SINUA'TA (Schum. l. c. p. 126. t. 12. f. 1.) leaves ternate; leaflets ovate-lanceolate, sinuately-toothed; wings of carpels dilated behind. ♄ . ◠. S. Native of the Caribbee Islands.—Plum. icon. ed. Burm. t. 113. f. 2. Paullínia Seriàna, Lin. spec. 524. Jacq. obs. 3. p. 11. t. 61. f. 2. Seriàna Plumeriàna, Spreng. syst. 1. p. 247.

Sinuated-leafletted Serjania. Shrub cl.

2 S. MO'LLIS (H. B. et Kunth, nov. gen. amer. 5. p. 108.) leaves ternate; leaflets ovate, crenate-serrated, rounded at the base, clothed with silky hairs above, but with silky tomentum beneath, terminal one 3-lobed; fruit hairy. ♄ . ◠. S. Native of Peru on the Andes between Querocotillo and Montan.

Soft Serjania. Shrub cl.

3 S. ACAPULCE'NSIS (H. B. et Kunth, l. c.) leaves ternate; leaflets oblong, rounded at the base, somewhat auricled on the sides, obsoletely crenated at the apex. ♄ . ◠. S. Native of Mexico between Acapulca and La Venta del Exido. Perhaps this plant is only a variety of *S. emarginàta.*

Acapulca Serjania. Shrub cl.

4 S. CUSPIDA'TA (St. Hil. fl. bras. 1. p. 356.) branches hairy; leaves ternate; leaflets ovate, somewhat 3-lobed, cordate, grossly and dentately serrated, cuspidate at the apex, densely clothed with silky pili; sepals 4; fruit pubescent. ♄ . ◡. S. Native of Brazil near Rio Janeiro.

Cuspidate-leaved Serjania. Shrub cl.

5 S. LANCEOLA'TA (St. Hil. fl. bras. 1. p. 356.) branches smoothish; leaves ternate; leaflets lanceolate, acuminated, dentately-serrated, smooth; sepals 5. ♄ . ◡. S. Native of Brazil in the province of Minas Geraes.

Lanceolate-leaved Serjania. Shrub cl.

6 S. EMARGINA'TA (H. B. et Kunth, l. c.) leaves rather biternate; leaflets quite entire, smooth, rounded at the apex and emarginate, with the sides somewhat auricled, intermediate one 3-lobed or 3-cut; fruit smooth. ♄ . ◠. S. Native of Mexico on the mountains.

Emarginate-leaved Serjania. Shrub cl.

* * *Leaves biternate.*

7 S. DIVARICA'TA (Schum. l. c. p. 126. t. 12. f. 2.) leaves biternate; leaflets ovate, quite entire, rather acute, shining, stalked; petioles naked; wings of carpels dilated and rounded behind. ♄ . ◠. S. Native of Jamaica in woods. Paullínia divaricàta, Swartz, fl. ind. occ. 2. p. 696.

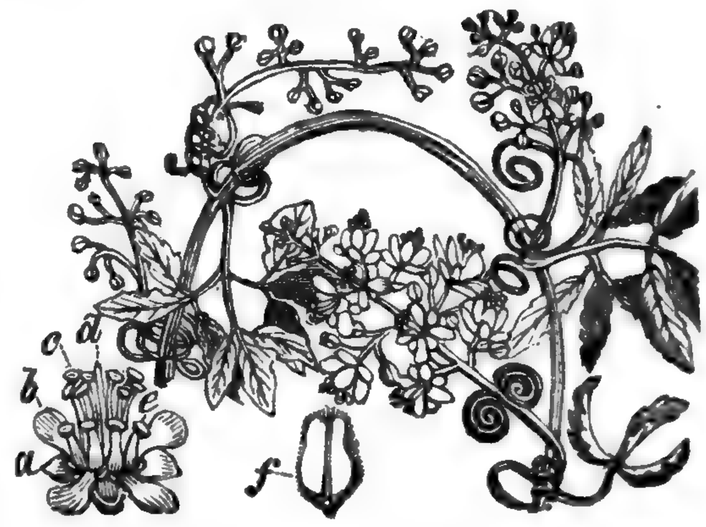
Divaricate Serjania. Clt. 1824. Shrub cl.

8 S. VELUTI'NA (St. Hil. fl. bras. 1. p. 357. t. 75.) branches tomentose; leaves biternate; leaflets ovate-oblong, grossly and deeply toothed, velvety above, and brownish tomentose beneath; sepals 5; fruit pubescent. ♄ . ◡. S. Native of Brazil in the province of Goyaz.

Velvety Serjania. Shrub cl.

9 S. CARACCASA'NA (Willd. spec. 3. p. 465.) leaves biternate; leaflets oblong, acute at both ends, very remotely toothed, very smooth; petioles naked; wings of carpels rounded behind. ♄ . ◠. S. Native of New Spain in Caraccas, as well as of Guadaloupe. Paullínia Caraccasàna, Jacq. hort. Schœnbr. 1. p. 52. t. 99.

FIG. 111.



Caraccas Serjania. Clt. 1816. Shrub cl.

10 S. GLABRA'TA (H. B. et Kunth, nov. gen. amer. 5. p. 110.) leaves biternate, smooth; leaflets elliptic-oblong, acuminated, cuneated at the base, coarsely crenate-serrated; petioles naked; wings of carpels rounded behind. ♄ . ◠. S. Native of the temperate parts of Peru. Very like the preceding species.

Smoothish Serjania. Shrub cl.

11 S. RACEMÒSA (Schum. l. c. p. 127. t. 12. f. 5.) leaves biternate; leaflets ovate, acute, profoundly serrated; petioles nearly naked; wings of carpels dilated behind, and somewhat sinuated in front. ♄ . ◠. S. Native of Vera Cruz.

Racemose-flowered Serjania. Shrub cl.

12 S. SPECTA'BILIS (Schum. l. c. p. 127. t. 12. f. 4.) leaves biternate; leaflets obovate, entire, terminal one retusely emarginate; petioles winged; wings of carpels dilated behind. ♄ . ◠. S. Native of South America.

Shewy Serjania. Shrub cl.

13 S. CLEMATIDIFÒLIA (St. Hil. fl. bras. 1. p. 361.) branches puberulous; leaves biternate; leaflets oblong, narrowed at both ends, acutish, deeply toothed, coriaceous, pale-green above and scabrous, pale and puberulous beneath; sepals 5; fruit densely-puberulous at the apex. ♄ . ◡. S. Native of Brazil.

Clematis-leaved Serjania. Shrub cl.

14 S. COMMU'NIS (St. Hil. fl. bras. 1. p. 362.) branches puberulous; leaves biternate; leaflets oblong, tapering to both ends, acute or bluntly mucronulate, deeply toothed, puberulous; sepals 4; fruit smooth. ♄. ◡. S. Native of Brazil in the province of Rio Janeiro.

Common Serjania. Shrub cl.

15 S. NÓXIA (St. Hil. fl. bras. 1. p. 363.) branches clothed with rusty tomentum; leaves biternate; leaflets elliptic-oblong, tapering to both ends, mucronulate, nearly entire, smoothish; sepals 4. ♄. ◡. S. Native of Brazil in the province of Rio Janeiro. This plant is hurtful to cattle.

Hurtful Serjania. Shrub cl.

16 S. DOMBEYA'NA (Juss. herb. St. Hil. fl. bras. 1. p. 364.) branches puberulous; leaves biternate; leaflets elliptic-oblong, tapering to both ends, acute or shortly acuminated, dentately serrated, smooth; sepals 5; fruit smooth. ♄. ◡. S. Native of Brazil near Rio Janeiro, and in the province of Minas Geraes.

Dombey's Serjania. Shrub cl.

17 S. PAUCIDENTA'TA (D. C. prod. 1. p. 603.) leaves biternate; leaflets oval, tapering to both ends, furnished on each side with 1 or 2 large teeth; petioles slightly winged; wings of carpels rounded and dilated behind. ♄. ◡. S. Native of Cayenne or French Guiana.

Few-toothed-leafletted Serjania. Shrub cl.

18 S. OSSA'NA (D. C. prod. 1. p. 603.) leaves biternate, smooth, dark-green, and somewhat shining above, but pale beneath; leaflets ovate, a little toothed at the apex, blunt, mucronulate; petioles naked; wings of carpels blunt behind. ♄. ◠. S. Native of Cuba near Havannah.

De la Ossa's Serjania. Shrub cl.

19 S. PUBE'SCENS (H. B. et Kunth, l. c.) branches villously pubescent; leaves biternate; leaflets ovate-oblong, obtuse, somewhat mucronated, quite entire or coarsely-crenated at the apex, smoothish above, and pubescent beneath. ♄. ◠. S. Native of South America in the province of Caraccas, in the valleys of Araguen.

Pubescent Serjania. Shrub cl.

20 S. MEXICA'NA (Willd. spec. 3. p. 465.) leaves biternate; leaflets obovate, entire or toothed, usually emarginate; petioles slightly winged; stem prickly; racemes compound; wings of carpels rounded and somewhat dilated. ♄. ◠? S. Native of Mexico. Paullínia Mexicàna, Lin. spec. 527. Schum. l. c. p. 124. t. 11. f. 3.

Mexican Serjania. Clt. 1823. Shrub cl.

21 S. ANGUSTIFÒLIA (Willd. spec. 3. p. 466.) leaves biternate; leaflets linear-lanceolate, quite entire, acute; petioles winged. ♄. ◡. S. Native of South America.—Plum. icon. ed. Burm. t. 113. f. 1. Paullínia Mexicàna, Jacq. obs. 3. p. 11. t. 61. f. 5. a leaf only.

Narrow-leaved Serjania. Shrub cl.

22 S. E'LEGANS (St. Hil. fl. bras. 1. p. 358.) branches puberulous; leaves biternate; leaflets oblong or oblong-lanceolate, acute, quite entire, rather scabrous; sepals 5; fruit smooth. ♄. ◡. S. Native of Brazil in the province of Minas Geraes. Flowers rose-coloured?

Var. β; leaves full of pellucid dots; leaflets narrower, long-acuminated. Flowers whitish-green.

Elegant Serjania. Shrub cl.

23 S. RETICULA'TA (St. Hil. fl. bras. 1. p. 359.) branches smooth; leaves biternate; leaflets oblong or elliptic-oblong, acuminated, dentately-serrated at the apex, reticulately-veined, quite smooth; sepals 5. ♄. ◡. S. Native of Brazil in the province of Minas Geraes.

Reticulated-leaved Serjania. Shrub cl.

24 S. GRANDIFLÒRA (St. Hil. fl. bras. 1. p. 360.) branches smooth; leaves biternate; leaflets elliptic-oblong, acuminated, obsoletely-toothed, smooth; sepals 4. ♄. ◡. S. Native of Brazil in the province of Rio Janeiro. Racemes forming a panicle at the tops of the branches.

Great-flowered Serjania. Shrub cl.

25 S. PANICULA'TA (H. B. et Kunth, nov. gen. amer. 5. p. 111. t. 441.) branches pubescent; leaves biternate; leaflets ovate-elliptical, acuminated, coarsely crenated, smooth, but hairy at the origin of the veins beneath; racemes panicled; fruit pubescent at the apex. ♄. ◡. S. Native of South America in the province of Caraccas in hot places. This plant is very like *S. Caraccasàna*.

Panicled-flowered Serjania. Shrub cl.

26 S. LUPULI'NA (Schum. l. c. p. 127. t. 12. f. 5.) leaves biternate; leaflets crenated, rusty beneath, terminal one somewhat rhomboid, lateral ones ovate; petioles slightly winged; wings of carpels semi-oval. ♄. ◠. S. Native of South America.

Wolf Serjania. Shrub cl.

27 S. LU'CIDA (Schum. l. c. p. 128.) leaves biternate; leaflets ovate, acute, serrated; petioles almost naked; wings of carpels half-oval. ♄. ◠? S. Native of Santa Cruz?

Shining-leaved Serjania. Shrub cl.

28 S. MULTIFLÒRA (St. Hil. fl. bras. 1. p. 365.) branches smoothish; leaves biternate; leaflets oblong, rather cuneated, acuminate, usually mucronulate, grossly and deeply toothed, smooth; sepals 5; fruit hairy at the apex. ♄. ◡. S. Native of Brazil in the province of Minas Geraes.

Many-flowered Serjania. Shrub cl.

29 S. MERIDIONA'LIS (St. Hil. fl. bras. 1. p. 366. t. 76.) branches smooth; leaves biternate; leaflets tapering to both ends, acute, and usually mucronate, smooth and dentately serrated, lateral ones oblong, terminal ones ovate, decurrent down the petiole; sepals 5; fruit smooth. ♄. ◡. S. Native of Brazil on the banks of the river Uruguay.

Meridional Serjania. Shrub cl.

30 S. LETHA'LIS (St. Hil. fl. bras. 1. p. 367. pl. rem. bras. p. 235.) branches smooth; leaves biternate; leaflets lanceolate-elliptic, tapering to both ends, quite smooth, shining above; sepals 5; fruit villous at the apex, and smooth at the base. ♄. ◡. S. Native of Brazil in the province of Minas Geraes. This plant is very poisonous.

Poisonous Serjania. Shrub cl.

31 S. OXYPE'TALA (H. B. et Kunth, l. c.) branches smooth; leaves biternate; leaflets ovate-oblong, acuminately mucronate, remotely serrated, smooth, upper ones trifid; fruit smoothish. ♄. ◠. S. Native of Peru on the Andes.

Sharp-petalled Serjania. Shrub cl.

32 S. DU'BIA (Spreng. syst. 2. p. 247.) leaves biternate; leaflets obovate-oblong, shining, mucronately-toothed; petioles awl-shaped; racemes compound. ♄. ◠. S. Native of Porto-Rico.

Doubtful Serjania. Shrub cl.

33 S. HIRSU'TA (St. Hil. fl. bras. 1. p. 367.) branches hairy; leaves biternate; leaflets oblong, tapering to both ends, acute, mucronulate, deeply-toothed, hairy; sepals 4; fruit puberulous. ♄. ◡. S. Native of Brazil in the province of Minas Geraes.

Hairy Serjania. Shrub cl.

34 S. LARUOTTEA'NA (St. Hil. fl. bras. 1. p. 368.) branches puberulous; leaves biternate; leaflets oblong, tapering to both ends, acute, serrated, smooth; sepals 4; fruit puberulous. ♄. ◡. S. Native of Brazil in the province of Minas Geraes.

Laruott's Serjania. Shrub cl.

35 S. PALUDÒSA (St. Hil. fl. bras. 1. p. 368.) branches tomentose; leaves biternate or impari-pinnate; leaflets unequally toothed, puberulous above, and tomentose beneath, terminal one elliptic, lower ones oblong; sepals 5; fruit hairy above, and

pubescent beneath. ♄. ◡. S. Native of Brazil in the province of Minas Geraes.

Marsh Serjania. Shrub cl.

* * * *Leaves triternate.*

36 S. TRITERNA'TA (Willd. spec. 3. p. 466.) leaves triternate; leaflets ovate, obtuse, repand; petioles winged; racemes panicled; wings of carpels rounded and dilated. ♄. ◡. S. Native of South America.—Plum. icon. ed. Burm. t. 112. Paullínia triternàta, Lin. mant. 236. Jacq. amer. p. 110. t. 180. f. 32. pict. p. 56. t. 260. f. 29. Paullínia polyphýlla, Lin. spec. 525. Jacq. obs. 3. p. 11. t. 61. f. 10? and f. 11.

Triternate-leaved Serjania or Supple-Jack. Fl. June, July. Clt. 1739. Shrub cl.

* * * * *Leaves impari-pinnate.*

37 S. PARVIFLÒRA (H. B. et Kunth, nov. gen. amer. 5. p. 113.) leaves pinnate, with 3 pairs of leaflets and an odd one; the lower pair trifoliate, ovate-oblong, crenate-serrated, sharply-mucronate at the apex, smooth above, puberulous beneath; fruit smooth. ♄. ◠. S. Native of South America on the banks of the river Amazon.

Small-flowered Serjania. Shrub cl.

38 S. CAMBESSEDIA'NA (Schlecht. et Cham. in Linnæa. 5. p. 214.) stem smooth, 6-furrowed; leaves bipinnate or somewhat tripinnate, 4 pairs, upper pinnæ ternate; leaflets nearly sessile, tapering into the petiole, mucronate, acuminate, grossly and unequally toothed, rather pilose on the nerves beneath, and with hairs in the axils of the veins; panicle raceme-formed, destitute of tendrils, pubescent; branches short, usually 5-flowered; flowers pedicellate, furnished with bracteas; wings of fruit dilated. ♄. ◡. S. Native of Mexico.

Cambessedes Serjania. Shrub cl.

39 S. HETEROPHY'LLA (D. C. prod. 1. p. 604.) lower leaves pinnate, with 2 pairs of leaflets, upper ones biternate; leaflets ovate, somewhat toothed, smooth, terminal one cuneated at the base; petioles subalate at the apex; racemes stalked; wings of carpels rounded behind. ♄. ◠. S. Native of St. Martha.

Variable-leaved Serjania. Shrub cl.

Cult. Climbing shrubs hardly worth cultivating unless in general collections. They will thrive well in a mixture of loam and peat. Large cuttings root more freely than small ones. These should be planted in a pot of sand and placed under a hand-glass, in a moderate heat.

IV. PAULLI'NIA (in honour of Simon Paulli, a Danish naturalist, author of Quadripartitum Botanicum; died in 1680). Schum. act. soc. hist. nat. hafn. 3. pt. 2. mss. ann. mus. 4. p. 340. D. C. prod. 1. p. 604. Cambess. in mem. mus. 18. p. 22. —Carùru, Plum. gen. p. 34. t. 35. Paullínia, spec. Lin.—Semarillària, Ruiz et Pav. fl. peru, vol. 4.

Lin. syst. *Octándria, Monogýnia.* Calyx of 4-5 sepals, 2 outer ones smallest. Petals 4, each furnished with a scale on the inside above the base, the 2 lower ones remote from the stamens, the scales of the lower petals ending in an inflexed appendage. Glands 2-4 on the disk, opposite the petals, the 2 superior ones usually abortive. Stamens 8, inserted in the receptacle and connate around the ovary at the base. Style trifid, with the segments longitudinally stigmatose on the inside. Capsule pear-shaped, trigonal, usually with 3 short wings at the apex, 3-celled, 3-valved; dissepiments membranous, adnate to the central axis. Seeds fixed to the inner angle at the base of the cells, half covered by a 2-lobed aril.—Climbing or twining-tendrilled shrubs, with ternate, biternate, triternate, pinnate, bipinnate, or decompound stipulate leaves, and axillary racemes of flowers, with the common peduncle usually furnished with 2 opposite twisted tendrils below the flowers. Flowers white.

* *Capsules pear-shaped, with wingless valves. Leaves ternate.*

1 P. TURBACE'NSIS (H. B. et Kunth, nov. gen. amer. 5. p. 114.) capsules obtuse, densely clothed with hairs; leaflets acuminated, coarsely serrate-toothed, smooth, shining; petioles naked. ♄. ◠. S. Native of New Granada in temperate places at Turbaco.

Turbaco Paullinia. Shrub cl.

2 P. CURU'RU (Lin. spec. ed. 1. p. 365.) capsules obtuse; leaflets oblong, serrate-toothed, somewhat acuminated; petioles winged. ♄. ◠. S. Native of the Antilles.—Plum. ed. Burm. t. 111. f. 2. Jacq. obs. 3. p. 11. t. 61. f. 4. *Cururu* is a Caribbean name.

Cururu Paullinia. Clt. 1824. Shrub cl.

3 P. NI'TIDA (H. B. et Kunth, l. c.) capsule pear-shaped; leaflets oblong, rather acuminated, coarsely serrate-crenate, smooth, shining; petioles naked. ♄. ◠. S. Native of South America on the banks of the river Orinoco, and in Peru. Semarillària nítida, Ruiz et Pav. fl. per. 4. t. 339.

Shining-leaved Paullinia. Shrub cl.

4 P. RIPA'RIA (H. B. et Kunth, l. c.) leaflets oblong, acute, coarsely-serrated, shining, smooth; petioles winged; racemes about equal in length with the leaves. ♄. ◡. S. Native of South America on the banks of the river Magdalena.

River-bank Paullinia. Shrub cl.

† *Capsules unknown; leaves ternate.*

5 P. NODÒSA (Jacq. enum. 35. obs. t. 61. f. 3.) petioles naked; leaflets ovate, a little toothed, smooth, middle one obovate; racemes knotted or thickened. ♄. ◠. S. Native of the Antilles.

Knotted-racemed Paullinia. Shrub cl.

6 P. DENSIFLÒRA (Smith, in Rees' cycl. no. 3.) petioles winged; leaflets obscurely serrated; racemes aggregate, much-branched, 4-times shorter than the petioles. ♄. ◠. S. Native of New Granada.

Dense-flowered Paullinia. Shrub cl.

* * *Capsules pear-shaped, wingless. Leaves pinnate.*

7 P. PINNA'TA (Lin. spec. ed. 1. p. 366.) young capsules with 3 tubercles at the apex; leaflets 5, ovate-lanceolate, sessile, crenated; petioles winged. ♄. ◠. S. Native of Brazil, Mexico, Guiana, Antilles, and equinoctial Africa. Jacq. obs. 3. p. 12. t. 62. f. 12.—Plum. ed. Burm. 76. t. 91.

Pinnate-leaved Paullinia. Fl. July, Sept. Clt. 1752. Sh. cl.

8 P. MACROPHY'LLA (H. B. et Kunth, l. c.) leaflets 5, oblong, obtuse, remotely and obsoletely toothed, membranaceous, smooth, but with the nerve and veins hairy; petioles and rachis winged. ♄. ◠. S. Native of South America on the banks of the river Magdalena.

Long-leaved Paullinia. Shrub cl.

9 P. ALA'TA; leaflets 5, oblong, distantly and deeply toothed, with winged petioles; branches qnadrangular; tendrils axillary, twisted and bifid; racemes short, crowded on the old wood. ♄. ◡. S. Native of Peru. Semarillària alàta, Ruiz et Pav. fl. per. 4. t. 340.

Winged-petioled Paullinia. Shrub cl.

10 P. CARPOPÒDEA (St. Hil. fl. bras. 1. p. 376. t. 78. B.) leaves with 3 pairs of oblong or oblong-lanceolate leaflets, which are narrowed at the base and puberulous beneath, acuminated, and mucronulate; lower pair trifoliate; petioles and rachis naked; capsule rather clavate, wingless. ♄. ◡. S. Native of Brazil in the province of Minas Geraes.

Fruit-footed Paullinia. Shrub cl.

11 P. AFFÌNIS (St. Hil. fl. bras. 1. p. 377. t. 78. A.) leaves with 2-3 pairs of oblong or oblong-lanceolate, acuminated, mucronulate leaflets, which are narrowed at the base, and silky tomentose beneath, lower pair trifolate; petioles naked; capsule

subclavate, wingless. ♄. ◡. S. Native of Brazil in the province of Minas Geraes.

Allied Paullinia. Sh. cl.

12 P. E'LEGANS (St. Hil. fl. bras. 1. p. 370.) leaves with 2 pairs of toothed, smooth leaflets; petioles and rachis naked; capsule pear-shaped, 3-lobed, wingless. ♄. ◡. S. Native of Brazil in the province of Minas Geraes. Flowers greenish-white.

Elegant Paullinia. Shrub cl.

13 P. RUBIGINÒSA (St. Hil. fl. bras. 1. p. 371.) leaves with 2 pairs of oblong, acuminated, sharply serrated leaflets, which are rusty-tomentose on the nerves beneath; petioles and rachis naked; capsule obovate or triquetrous, wingless. ♄. ◡. S. Native of Brazil in the province of Minas Geraes.

Rusted Paullinia. Shrub cl.

* * * *Capsules pear-shaped with winged and keeled valves. Leaves pinnate.*

14 P. TETRAGO'NA (Aubl. guian. 1. p. 355.) capsules 3-keeled, 3-horned; leaflets 5, ovate, rather serrated, acute, smooth; petioles naked; stem tetragonal. ♄. ◠. S. Native of Cayenne. Like *P. pinnàta*.

Tetragonal-stemmed Paullinia. Clt. 1825. Shrub cl.

15 P. VESPERTÍLIO (Swartz, fl. ind. occ. 2. p. 695.) capsules winged at the apex; wings horizontal; leaflets 5, ovate, remotely toothed, smooth; petioles naked. ♄. ◠. S. Native of the island of St. Christopher. Schum. act. soc. hist. nat. hafn. 3. p. 122. t. 11. f. 1.

Bat-capsuled Paullinia. Clt. 1823. Shrub cl.

16 P. AFRICA'NA; leaflets 5, ovate-lanceolate, acuminate, distantly toothed; petioles winged; racemes elongated, axillary; flowers nearly sessile. ♄. ◡. S. Native of Sierra Leone. Capsules winged?

African Paullinia. Shrub cl.

17 P. ACUTA'NGULA (Pers. ench. 1. p. 443.) plant hairy; capsules obovate, triangularly winged at the apex; leaflets 5, oblong-ovate or obovate, acuminated, serrate-toothed; racemes axillary, with 2 hooked tendrils at the base of each. ♄. ◡. S. Native of Peru in groves. Semarillària acutángula, Ruiz et Pav. fl. per. syst. p. 93. fl. per. 4. t. 337.

Acute-angled-capsuled Paullinia. Shrub cl.

18 P. AUSTRA'LIS (St. Hil. fl. bras. 1. p. 375. pl. rem. bras. p. 236. t. 24. B.) leaves with 3 pairs of oblong-cuneated, coarsely serrated, smoothish leaflets; lower pair trifoliate; rachis winged; common petiole naked; capsule pear-shaped, obtuse, winged. ♄. ◡. S. Native of Brazil on the banks of the Uruguay.

Southern Paullinia. Shrub cl.

19 P. MELIÆFÒLIA (Juss. ann. 4. p. 347. t. 66. f. 2.) capsules with 3 small wings at the apex, cohering with the style; leaves with 3 pairs of oblong-lanceolate, remotely toothed leaflets, pubescent beneath, lower pair trifoliate. ♄. ◠. S. Native of Brazil. Petioles naked; rachis winged. Shrub sarmentose, 6-7 feet.

Melia-leaved Paullinia. Clt. 1819. Shrub cl.

20 P. GRANDIFLÒRA (St. Hil. fl. bras. 1. p. 372.) leaves with 2 pairs of ovate, grossly-toothed, smooth leaflets; petioles and rachis winged. ♄. ◡. S. Native of Brazil in the province of Minas Geraes.

Great-flowered Paullinia. Shrub cl.

21 P. MICRA'NTHA (St. Hil. fl. bras. 1. p. 373.) leaves with 3 pairs of oblong-cuneated or subcuneated, bluntish, toothed, smoothish leaflets, lower pair trifoliate. ♄. ◡. S. Native of Brazil in the province of Minas Geraes. Petioles naked. Rachis winged. Fruit pear-shaped, 3-lobed, with 3 short wings.

Small-flowered Paullinia. Shrub cl.

22 P. SERI'CEA (St. Hil. fl. bras. 1. p. 374. t. 77. A.) leaves with 4-5 pairs of oblong-lanceolate, acuminated, toothed leaflets, which are smoothish above and silky-tomentose beneath, 2 or 4 of the lower ones trifoliate; petioles naked; rachis winged; capsule pear-shaped, with 3 short wings. ♄. ◡. S. Native of Brazil in the province of Minas Geraes. Calyx purple.

Silky Paullinia. Shrub cl.

* * * * *Capsules ovate, obovate or roundish. Leaves pinnate.*

23 P. OBOVA'TA (Pers. ench. 1. p. 443.) capsules obovate; leaflets 5, lanceolate, distantly serrated. ♄. ◠. S. Native of Peru in groves. Semarillària obovàta, Ruiz et Pav. fl. per. syst. 1. p. 93. fl. per. 4. t. 338.

Obovate-capsuled Paullinia. Shrub cl.

24 P. TOMENTÒSA (Jacq. amer. 37. obs. 3. t. 61. f. 13.) capsules obovate, and are as well as the leaves tomentose; leaflets 5, sessile, ovate, rhomboid, repand, obtuse; petioles marginate. ♄. ◠. S. Native of the Antilles. Old leaves almost smooth.

Tomentose Paullinia. Shrub cl.

25 P. SENEGALE'NSIS (Juss. ann. 4. p. 348.) capsules ovate, bluntly trigonal; leaflets 5, sessile, ovate, remotely crenated, the odd one largest; petioles marginate; stem angular, somewhat tomentose. ♄. ◠. S. Native of Guinea, particularly in Senegal.

Senegal Paullinia. Clt. 1822. Shrub cl.

26 P. CUPA'NA (H. B. et Kunth, nov. gen. amer. 5. p. 117.) capsules ovate, acute; leaflets 5, ovate-oblong, acuminated, coarsely crenate-serrated, coriaceous, smooth, but hairy on the nerves and veins beneath. ♄. ◠. S. Native of South America on the banks of the river Orinoco, and of Trinidad.

Cupana's Paullinia. Clt. 1818. Shrub cl.

27 P. SPHÆROCA'RPA (Rich. in Juss. ann. 4. p. 348.) capsules spherical, smooth; leaflets 5, almost sessile, ovate, smooth, remotely crenated, each ending in a blunt point. ♄. ◠. S. Native of Guinea.

Spherical-capsuled Paullinia. Clt. 1824. Shrub cl.

28 P. SUBROTU'NDA (Pers. ench. 1. p. 443.) capsules large, roundish; leaflets 5, oblong-obovate, serrated above. ♄. ◡. S. Native of Peru in groves. Semarillària subrotúnda, Ruiz et Pav. fl. per. syst. p. 92. fl. per. 4. t. 336. The aril which envelops the seeds is eatable.

Roundish-fruited Paullinia. Shrub cl.

29 P. PTERÓPODA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 605.) capsules somewhat spherical, 3-furrowed, and are as well as the leaves villous; leaflets 5, ovate, coarsely toothed, terminal one cuneated; petioles marginate. ♄. ◡. S. Native of Mexico.

Winged-petioled Paullinia. Shrub cl.

† *Capsules unknown. Leaves pinnate.*

30 P. CAULIFLÒRA (Jacq. icon. rar. 3. p. 458.) leaves pinnate, lower leaflets ternate; petioles naked at the base, but marginate at the top; flowers in capitate corymbs, axillary, and terminal. ♄. ◠. S. Native of Caraccas in South America.

Stem-flowered Paullinia. Fl. June, Aug. Clt. 1822. Sh. cl.

31 P.? JAPÓNICA (Thunb. fl. jap. 170.) leaflets 5, on marginate stalks, lower ones almost sessile, 3-lobed; stem herbaceous, unarmed. ♃. ◠. G. Native of Japan.

Japan Paullinia. Pl. cl.

32 P. CUPANIÆFÒLIA (Rich. in Juss. ann. mus. 4. p. 349.) leaflets 5, sessile, ovate-oblong, remotely crenated, very smooth; petioles naked at the base, but marginate between the leaflets. ♄. ◠. S. Native of Guiana in woods.

Cupania-leaved Paullinia. Shrub cl.

33 P. CONNARIFÒLIA (Rich. in Juss. l. c.) leaflets 5, sessile, coriaceous, ovate, bluntly mucronate, almost entire, smooth, but are rusty as well as the branches; petioles naked; peduncles

destitute of tendrils. ♄. ⌒. S. Native of Guiana on the borders of woods.

Connarus-leaved Paullinia. Shrub cl.

34 P. fibula'ta (Rich. in Juss. l. c.) leaflets 5, ovate, somewhat coriaceous, rather toothletted, and somewhat tomentose beneath, and are rusty as well as the branches; petioles naked; peduncles with thickened, clasp-like, floriferous tendrils. ♄. ⌒. S. Native of Guiana on the borders of woods, where it is called, on account of the tendrils, *Patte de chauve-souris*.

Clasp-peduncled Paullinia. Shrub cl.

35 P. rufe'scens (Rich. in Juss. l. c.). leaflets 5, on very short stalks, ovate-lanceolate, remotely crenated, clothed with rusty tomentum beneath, blackish-green above; petioles naked; branches rusty, rather angular. ♄. ⌒. S. Native of Guiana on the borders of woods. The peduncles are sometimes furnished with tendrils, and sometimes without.

Rufescent Paullinia. Shrub cl.

36 P. ingæfòlia (Rich. in Juss. l. c.) leaflets 7, coriaceous, smooth, lower ones trifoliate; petioles naked at the base but marginate at the apex; branches striated and scabrous from dots. ♄. ⌒. S. Native of Guiana in woods near the confines of the river Amazon. Peduncles sometimes branched-panicled, sometimes simple, cirrhose and floriferous beyond the middle.

Inga-leaved Paullinia. Shrub cl.

37 P. multiflòra (St. Hil. fl. bras. 1. p. 379.) leaves with 2-3 pairs of elliptic-oblong, mucronulate, smoothish leaflets, which taper to both ends, lower pair trifoliate; petioles and rachis winged ♄. ◡. S. Native of Brazil in the province of St. Paul. Fruit not seen.

Many-flowered Paullinia. Shrub cl.

* * * * * *Leaves biternate.*

38 P. vetulìna (D. C. prod. 1. p. 605.) the whole plant is clothed with velvety tomentum; capsules pear-shaped, 3-winged; leaflets ovate-lanceolate, acuminated at both ends, coarsely toothed; petioles naked. ♄. ⌒. S. Native of New Granada in the province of St. Martha.

Velvety Paullinia. Shrub cl.

39 P. Curassa'vica (Lin. spec. ed. 1. p. 366.) capsules ovate, with 3 semiobcordate valves; leaflets oval, crenated, odd one cuneated at the base; intermediate petiole marginate. ♄. ⌒. S. Native of Curassoa, and near Caraccas. Jacq. obs. 3. p. 12. t. 61. f. 8.—Plum. ed. Burm. t. 111. f. 2.

Curassoa Paullinia. Fl. Aug. Clt. 1739. Shrub cl.

40 P. enneaphy'lla (Ruiz et Pav. fl. per. 4. t. 337. under *Semarillària*,) leaves biternate, toothed, acuminated; valves of capsule winged on the back at the apex; racemes axillary, with 2 hooked tendrils at the base of each. ♄. ⌒. S. Native of Peru.

Nine-leaved Paullinia. Shrub cl.

41 P. Barbade'nsis (Jacq. enum. 36. obs. 2. p. 12. t. 61. f. 9.) capsules ovate, rather villous, with semiovate valves; leaflets oval, quite entire, and serrated, coriaceous; petioles somewhat marginate. ♄. ⌒. S. Native of Barbadoes and the Antilles.

Barbadoes Paullinia. Clt. 1786. Shrub cl.

42 P. Carthagene'nsis (Jacq. obs. 3. p. 11. t. 61. f. 6.) leaflets ovate, oblong, sinuated; petioles marginate; stem unarmed. ♄. ⌒. S. Native of South America at Carthagena.

Carthagena Paullinia. Clt. 1818. Shrub cl.

43 P.? Caribæ'a (Jacq. obs. 3. t. 62. f. 7.) leaflets oval, a little toothed at the apex, middle ones obovate-cuneated, petioles marginate; branches prickly. ♄. ⌒. S. Native of the Caribbee islands, and in the province of Caraccas? H. B. et Kunth, nov. gen. amer. 5. p. 118. This is probably a distinct species.

Caribbean Paullinia. Clt. 1818. Shrub cl.

44 P. pube'scens (H. B. et Kunth, l. c.) leaflets coarsely crenate-serrated, membranaceous, smooth, clothed beneath with golden-brownish tomentum; terminal leaflets ovate-oblong, acuminated; partial petioles somewhat marginated. ♄. ⌒. S. Native of South America on the banks of the river Amazon.

Pubescent Paullinia. Clt. 1820. Shrub cl.

45 P. mòllis (H. B. et Kunth, l. c.) leaflets coarsely crenate-serrated, membranous, with the nerves and veins on the upper surface hairy, but clothed beneath with soft hairy tomentum; terminal leaflets roundish-ovate, acute; petioles naked. ♄? ⌒. S. Native of South America on the banks of the river Magdalena.

Soft Paullinia. Shrub cl.

* * * * * * *Leaves triternate.*

46 P. triterna'ta (H. B. et Kunth, l. c.) leaflets 3-4-toothed, coriaceous, smooth, shining, terminal ones obovate; partial petioles and rachis winged. ♄. ⌒. S. Native of South America on the banks of the river Orinoco.

Triternate-leaved Paullinia. Shrub cl.

* * * * * * * *Leaves bipinnate or supra-decompound.*

47 P. thalictrifòlia (Juss. ann. mus. 4. p. 347. t. 66. f. 1.) capsules pear-shaped, 3-winged at the base; wings broadest at the top, divaricate; leaves somewhat tripinnate, upper ones simple; leaflets ovate, small, entire, or a little toothed. ♄. ⌒. S. Native of Brazil and St. Domingo.

Meadow-rue-leaved Paullinia. Shrub cl.

48 P. polyphy'lla (Schum. in act. soc. nat. hafn. 3. pt. 2. p. 462.) capsule with obovate valves; leaves supra-decompound; leaflets ovate-cuneated, crenated at the apex, smooth above, villous beneath as well as the petioles. ♄. ⌒. S. Native of South America.—Pluk. alm. t. 168. f. 5.? This plant should not be confounded with *Serjània triternàta*.

Many-leaved Paullinia. Shrub cl.

49 P. diversifòlia (Jacq. obs. 3. p. 12. t. 62. f. 14.) leaves supra-decompound, lower ones pinnate, the rest ternate; petioles marginate; leaflets ovate, smooth, a little toothed. ♄. ⌒. S. Native of the Antilles. This plant is probably a species of *Serjània* allied to *S. triternàta*, but perhaps the same as *Serjània heterophýlla*.

Diverse-leaved Paullinia. Shrub cl.

50 P. híspida (Jacq. hort. schoenbr. 3. t. 268.) leaves bipinnate at the bottom, and pinnate at the apex; leaflets lanceolate, acuminated, somewhat serrated; branches angular, hispid; stipulas ovate, ciliated; racemes aggregate. ♄. ⌒. S. Native of South America at Caraccas and in the island of Trinidad.

Hispid-leaved Paullinia. Clt. 1825. Shrub cl.

51 P. bipinna'ta (Poir. dict. 4. p. 99.) leaves bipinnate; leaflets ovate, nearly sessile, somewhat crenated at the apex; petioles naked and are as well as the branches somewhat tomentose; capsules winged, 2-lobed at the apex. ♄. ⌒. S. Native of Brazil at Rio Janeiro. This is probably a species of *Serjània*.

Bipinnate-leaved Paullinia. Clt. 1816. Shrub cl.

Cult. *Paullínia* is a genus of trifling, climbing shrubs, not worth cultivating, except in general collections. A mixture of loam and peat suits them well, and large cuttings will root in sand under a hand-glass, in heat.

V. ENOU'REA (*Eymara-enourou* is the name of the shrub in Guiana). Aubl. guian. 1. p. 588. t. 235. D. C. prod. 1. p. 618.

Lin. syst. *Monadélphia, Dodecándria.* Calyx 4-5-parted, 2 of the lobes are larger than the rest. Petals 4, inserted in the bottom of the calyx, 2 of which are larger than the rest, each fur-

nished with a petal-like scale on the inside at the claw, with 2 glands at the base of each of the larger petals on the disk. Stamens 13, inserted in the receptacle, unequal, connate at the base, somewhat leaning to one side. Ovary roundish. Style none. Stigmas 3. Capsules spherical, 1-celled, 3-valved, 1-seeded. Seed erect, clothed with farinaceous pulp.—A climbing shrub with impari-pinnate leaves and axillary tendrils. Racemes of flowers panicled. This shrub should perhaps be placed among the *Terebinthàceæ*, on account of the petals being perigynous, as well as from the plant abounding in milky juice.

1 E. CAPREOLA'TA (Aubl. guian. 1. t. 235.) leaflets 5, coriaceous, covered with rusty hairs beneath. ♄. ⌒. S. Native of Guiana in the small island formed by the river Sinemari. Flowers small, white, in clusters.

Climbing Enourea. Shrub cl.

Cult. A mixture of loam and sand will suit this plant, and large cuttings will root in sand under a hand-glass, in heat.

** *Upright trees and shrubs, with pinnate, trifoliate, rarely simple leaves.*

VI. TOULI'CIA (*Toulici* is the name of the tree in Guiana). Aubl. guian. 1. p. 359. t. 140. D. C. prod. 1. p. 612.—Ponæ'a, Schreb. gen. no. 682.

LIN. SYST. *Octándria, Monogýnia.* Calyx 5-parted. Petals 5, each furnished on the inside at the base with a long, 2-parted, pilose appendage. Disk occupying the bottom of the calyx, 5-lobed, 2 lower lobes largest. Stamens 8, inserted in the disk. Style short, trifid. Fruit 3-winged, composed of 3 carpels, adnate to the central filiform axis. Carpels drawn out into a wing at the base, but 1-celled, 1-seeded at the apex. Seeds fixed to the inner angle.—A tree, with abruptly pinnate leaves; leaflets opposite. Racemes of flowers forming a large terminal panicle.

1 T. GUIANE'NSIS (Aubl. guian. l. c. Lam. ill. t. 317.). ♄. S. Native of Guiana in woods. Ponæ'a saponarioìdes, Willd. spec. 2. p. 470. Leaves abruptly pinnate, with 8 pairs of opposite lanceolate leaflets, which are broadest at the base. Flowers small, white, disposed in terminal racemose panicles.

Guiana Toulicia. Tree 20 feet.

Cult. This tree will succeed well in a mixture of loam and peat, and ripened cuttings will root in sand under a hand-glass, in heat.

VII. SCHMIDE'LIA (in honour of Casimer Christopher Schmiedel, once a professor at Erlange, who wrote several botanical dissertations between 1751 and 1793). Lin. mant. 51. D. C. prod. 1. p. 610.—Ornítrophe, Juss. gen. 247. Pers. ench. 1. p. 412.—Allophýllus, Lin. gen. no. 476.—Toxicodéndron, Gært. fruct. 1. t. 44. but not of Tourn.—Aporètica, Forst. gen. no. 66. D. C. prod. 1610.—Gemélla, Lour. cochin. 762.

LIN. SYST. *Octándria, Monogýnia.* Calyx 4-parted, unequal. Petals 4, the fifth or superior one deficient, and its seat vacant; naked on the inside, or usually furnished with a scale above the claw. Disk incomplete, 4-glanded; glands opposite the petals. Stamens 8, inserted in the receptacle, and connate around the ovary at the base. Style immersed between the lobes of the ovary, usually seated on the axis, 2-3-cleft, with the segments longitudinally stigmatose inside. Fruit indehiscent, 1-2 rarely 3-lobed; lobes roundish, fleshy, or dry, 1-seeded. Seeds arillate or exarillate. Trees or shrubs, usually with trifoliate, rarely with simple exstipulate leaves and racemose white flowers. Racemes axillary.

* *Leaves trifoliate.*

1 S.? MACROPHY'LLA (D. C. prod. 1. p. 610.) leaflets stalked, ovate-acuminated, quite entire, coriaceous, rather pubescent beneath; racemes compound. ♄. S. Native of Cayenne. Ornítrophe macrophýlla, Poir. dict. 8. p. 263. Kunth thinks this a species of *Cupània*.

Long-leaved Schmidelia. Tree 20 feet.

2 S. INTEGRIFÒLIA (D. C. prod. 1. p. 610.) leaflets stalked, ovate-lanceolate, quite entire, smooth; racemes almost simple. ♄. S. Native of Bourbon. Ornítrophe integrifòlia, Willd. spec. 2. p. 322. Lam. ill. t. 309. f. 1. Merulària, Comm.

Entire-leaved Schmidelia. Clt. 1804. Tree 16 feet.

3 S. SERRA'TA (D. C. prod. 1. p. 610.) leaves scabrous; leaflets stalked, ovate, acuminated, serrated; racemes simple. ♄. S. Native of Coromandel, frequent on the mountains. Ornítrophe serràta, Roxb. cor. 1. p. 44. t. 61. Flowers small, white, polygamous. The fruit is small and red, and is eaten when ripe by the natives. The root is astringent, and is employed by the native physicians for diarrhœa.

Serrated-leaved Schmidelia. Clt. 1804. Tree 12 feet.

4 S. PUBE'RULA (St. Hil. fl. bras. 1. p. 382.) leaves trifoliate; leaflets on short petioles, elliptic, or elliptic-obovate, acute, serrated, puberulous on the nerves; racemes spike-formed, axillary. ♄. S. Native of Brazil near Rio Janeiro. Flowers greenish.

Puberulous Schmidelia. Shrub 3 to 6 feet.

5 S. LE'VIS (St. Hil. fl. bras. 1. p. 382.) leaves trifoliate; leaflets stalked, elliptic-oblong, acuminate, dentately serrated, smooth; racemes nearly simple. ♄. S. Native of Brazil near Sebastianople.

Smooth Schmidelia. Shrub.

6 S. CÓBBE (D. C. prod. 1. p. 610.) leaflets stalked, obovate, acute, serrated, pubescent beneath; racemes simple, with a tomentose peduncle. ♄. S. Native of Ceylon. Rhûs Cóbbe, Lin. spec. 382. Ornítrophe Cóbbe, Willd. spec. 2. p. 322. Toxicodéndron Cóbbe, Gært. fruct. 1. p. 207. t. 44. Toxicodéndron arbòreum, Mill. dict. no. 8. Berries small, black, poisonous. *Cobbe* is the name of the tree in Ceylon.

Cobbe Schmidelia. Tree 12 feet.

7 S. PANÍGERA; leaflets stalked, ovate, acute, serrated, tomentose beneath, as well as being bearded at the origin of the nerves; racemes simple, with a tomentose peduncle. ♄. S. Native of New Caledonia. Ornítrophe panígera, Lab. nov. caled. t. 52. Petals unguiculate. Stigmas 2.

Cloth-bearing Schmidelia. Tree 30 feet.

8 S. VITICIFÒLIA (H. B. et Kunth, nov. gen. 7. p. 215.) leaves ternate; leaflets stalked, acute at both ends, remotely crenate-serrated, smooth above, pubescent beneath, elliptic-oblong, lateral ones unequal-sided; racemes panicled. ♄. S. Native of Cuba near Havannah.

Vitex-leaved Schmidelia. Tree.

9 S. RACEMÒSA (Lin. mant. 67.) leaflets stalked, somewhat serrated, smooth; racemes simple. ♄. S. Native of the East Indies. Usúbis triphýlla, Burm. ind. t. 32. f. 1. Ornítrophe Schmidèlia, Pers. ench. 1. p. 412. Allophýllus racemòsus, Swartz, prod. p. 62. Branches flexuous. Flowers digynous. This species is very like *S. Cóbbe*.

Racemose-flowered Schmidelia. Fl. May, July. Clt. 1820. Tree 12 feet.

10 S. BOJERIA'NA (Cambess. in mem. mus. 18. p. 38.) leaves ternate, smoothish, pale-green above, paler beneath; leaflets oblong, nearly sessile and nearly entire, terminal one cuneated and somewhat acuminated, lateral ones bluntish; racemes axillary, branched. ♄. S. Native of Madagascar, where it is called *Lefoun-doula*.

Bojer's Schmidelia. Tree.

11 S. COMÍNIA (Swartz, fl. ind. occ. 2. p. 667.) leaflets stalked, oblong, tapering to both ends, serrated, pubescent beneath; racemes compound. ♄. S. Native of Jamaica in the western

mountains as well as of Cuba. Rhus Comìnia, Lin. amœn. 5. p. 395. Allophýllus Comìnia, Swartz, prod. 62. Ornítrophe Comìnia, Willd. spec. 2. p. 323.—Sloan. hist. 2. t. 208. f. 1. Flowers small, whitish-yellow. Fruit small orange-coloured. The tree is called *Cominia* by the natives of Jamaica.

Cominia Schmidelia. Clt. 1778. Tree 15 feet.

12 S. Africa'na (D. C. prod. 1. p. 610.) leaflets stalked, oval, tapering to both ends, serrate-toothed; peduncle divided into 2 or 3 somewhat spiked racemes. ♄. S. Native of Guinea in the kingdom of Waree, on the banks of the river Formosa. Allophýllus Africànus, Beauv. fl. d'ow. 2. p. 74. t. 107. S. racemòsa, Afz. mss.

African Schmidelia. Tree 20 feet.

13 S. dista'chya (D. C. prod. 1. p. 610.) leaflets stalked, ovate-lanceolate, acuminated, serrated, smooth; racemes axillary, twin, spike-formed. ♄. S. Native of Bengal. Very like *S. Africàna*.

Twin-spiked Schmidelia. Tree 20 feet.

14 S. occidenta'lis (Swartz, fl. ind. occ. 2. p. 665.) leaflets almost sessile, oblong, tapering to both ends, serrated, smooth, or somewhat tomentose beneath; racemes simple. ♄. S. Native of St. Domingo among bushes on the mountains, and on the Andes about Quindiu. Ornítrophe occidentàlis, Willd. spec. 2. p. 323. Lam. ill. t. 309. f. 2.

Western Schmidelia. Shrub 8 feet.

15 S. spica'ta (D. C. prod. 1. p. 611.) leaflets sessile, ovate, somewhat serrated, tomentose beneath, terminal leaflet twice the size of the lateral ones; racemes spicate, filiform. ♄. S. Native of? Ornítrophe spicàta, Poir. dict. 8. p. 265.

Spicate-flowered Schmidelia. Tree.

16 S. Timorie'nsis (D. C. prod. 1. p. 611.) leaflets sessile, ovate, acuminated, serrate-toothed, smooth; racemes compound. ♄. S. Native of the Island of Timor, and probably of Malabar. —This is probably Molàgo Màram of Rheed. mal. 5. t. 25.

Timor Schmidelia. Tree small.

17 S. glabra'ta (H. B. et Kunth, nov. gen. amer. 5. p. 122.) leaflets stalked, elliptical, obtuse, somewhat mucronated, quite entire, smooth; racemes ternate. ♄. S. Native of South America on the banks of the river Magdalena near Nares.

Smooth-leaved Schmidelia. Tree 40 feet.

18 S. móllis (H. B. et Kunth, nov. gen. amer. 5. p. 122.) leaflets stalked, elliptical-oblong, repandly-toothletted, hairy above, hairy-tomentose on the veins and nerves below; racemes compound. ♄. S. Native of New Granada in shady places.

Soft Schmidelia. Tree 60 feet.

19 S. Guarani'tica (St. Hil. bull. philom. 1823. p. 133.) leaflets coarsely toothed at the top, and pubescent beneath, intermediate one stalked, lanceolate, lateral ones ovate-lanceolate; common petiole downy; racemes simple, much shorter than the leaves. ♄. S. Native of Brazil.

Guaranitic Schmidelia. Tree.

20 S. Cochinchine'nsis (D. C. prod. 1. p. 611.) leaves on long petioles; leaflets serrated; racemes terminal; petals pilose, small. ♄. G. Native of Cochin-china on the banks of rivers. Allophýllus ternàtis, Lour. fl. coch. 232. This shrub is probably identical with *S. Cóbbe* or *Timoriénsis*. Flowers small, white. The inhabitants of Cochin-china use the leaves of this shrub as a cataplasm for contusions.

Cochin-china Schmidelia. Shrub 5 feet.

21 S. terna'ta (Cambess. in mem. mus. 18. p. 24.) leaves trifoliate; racemes axillary, nearly simple; petals smooth. ♄. G. Native of New Caledonia. Pomètia ternàta, Willd. spec. 3. p. 398. Aporètica ternàta, Forst. gen. p. 74. Flowers white? Calyx 4-parted. Petals 4. Stamens 8.

Ternate-leaved Schmidelia. Tree.

22 S. Geme'lla (Cambess. in mem. mus. 18. p. 24.) leaves trifoliate; racemes axillary, spiked; petals pilose. ♄. G. Native of Cochin-china. Geméllа trifoliàta, Lour. fl. coch. 649. Aporètica Geméllа, D. C. prod. 1. p. 610. Schmidèlia Cochinchinénsis, Spreng. syst. 2. p. 222. Flowers white. Leaflets ovate-lanceolate, unequally-serrated, smooth.

Twin-fruited Schmidelia. Shrub 6 feet.

23 S. heterophy'lla (St. Hil. fl. bras. 1. p. 383. t. 82.) leaves nearly simple, rarely trifoliate, terminal one oblong-cuneated, acuminated, sharply-serrated, smoothish; lateral leaflets small or abortive; racemes spike-formed, axillary. ♄. S. Native of Brazil near Rio Janeiro. Flowers yellowish-green. Thouínia dioíca, Nees et Mart. nov. act. bonn. 12. p. 21. t. 4.

Various-leaved Schmidelia. Shrub 4 feet.

* * *Leaves simple.*

24 S. ri'gida (Swartz, fl. ind. occ. 2. p. 663.) leaves ovate-lanceolate, spiny-toothletted; racemes simple. ♄. S. Native of Hispaniola on arid mountains. Ornítrophe rígida, Willd. spec. 2. p. 324. Allophýllus racemòsus, Swartz, prod. 62. This plant has the habit of *Thouínia simplicifòlia*.

Stiff Schmidelia. Shrub 6 feet.

25 S. Allophy'llus (D. C. prod. 1. p. 611.) leaves oval, acuminated, quite entire; racemes axillary, very short. ♄. S. Native of Ceylon. Allophýllus Zeylánicus, Lin. spec. 496. Ornítrophe Allophýllus, Pers. ench. 1. p. 412.

Foreign Schmidelia. Tree 20 feet?

Cult. A mixture of loam and sand will suit this genus well, and ripened cuttings will root in sand under a hand-glass, in heat. The species are not worth cultivating unless in general collections.

VIII. IRI'NA (meaning not evident). Blum. bijd. p. 229. Cambess. in mem. mus. 18. p. 24.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, permanent. Petals 5, naked inside, length of calyx. Disk emarginate, girding the genitals. Stamens 5, approximating the pistil in the male flowers, very long. Ovary didymous, 2-celled; cells 1-ovulate. Style crowned by an obtuse stigma. Carpel solitary from abortion, coriaceous, dry, indehiscent. Seed solitary, exarillate.—Trees with abruptly pinnate leaves, and spiked, terminal panicles of flowers.

1 I. gla'bra (Blum. bijdr. p. 230.) leaflets smooth, serrated; panicle composed of numerous spikes or racemes. ♄. S. Native of Java.

Smooth Irina. Tree.

2 I. tomentòsa (Blum. bijdr. p. 230.) leaves tomentose; leaflets serrated; panicle composed of numerous racemes, also tomentose. ♄. S. Native of Java.

Tomentose Irina. Tree.

3 I. intege'rrima (Blum. bijdr. p. 231.) leaflets smooth, quite entire; panicle composed of numerous spikes or racemes. ♄. S. Native of Java.

Very-entire-leafletted Irina. Tree.

Cult. Loam and sand will suit this genus well, and ripened cuttings will root in sand under a hand-glass, in heat.

IX. PRO'STEA (in honour of M. Prost, of Mende, who has published a catalogue of the plants of Lozere, and who deserves to be recognised by botanists on account of his distributing among them dried plants of that country). Cambess. in mem. mus. 18. p. 25. t. 1. e.

Lin. syst. *Polyándria, Monogýnia.* Calyx 5-parted, 2 outer lobes smallest. Petals 5, each furnished with a small scale on the inside at the base. Disk annular, occupying the bottom of the calyx. Stamens 20, inserted between the margin of the disk and the ovary, disposed in a double series. Style crowned by a somewhat 3-toothed stigma, immersed between the lobes of the

ovary. Ovary deeply 4-lobed; lobes roundish, 3-celled; cells 1-ovulate. Fruit indehiscent, 1-lobed from abortion, fleshy. 1-celled.—A tree with impari-pinnate, exstipulate leaves. Flowers fasciculate, in compound racemes. Petals pilose.

1 P. PINNA'TA (Cabess. l. c.) ♄. S. Native of Guinea. Ornítrophe pinnàta, Poir. 8. p. 266. Schmidèlia pinnàta, D. C. prod. 1. p. 611. Leaves with 6-7 pairs of smoothish, oblong-acuminated leaflets. Petioles and branchlets pubescent.

Pinnate-leaved Prostea. Tree.

Cult. Loam and peat will suit this tree, and ripe cuttings will root in sand under a hand-glass, in heat.

X. LEPISA'NTHES (from λεπις, *lepis*, a scale, and ανθος, *anthos*, a flower; in allusion to the scales on the petals). Blum. bijdr. 137 and 238. Cambess. in mem. mus. 18. p. 25.

Lin. syst. *Octándria, Monogýnia.* Calyx of 4 sepals, somewhat unequal, imbricate. Petals 4-5, a little longer than the calyx, each furnished with a scale on the inside. Disk emarginate, girding the genitals. Stamens 8, very short, approximating the pistil. Ovary trigonal, 3-celled; cells 1-ovulate. Style almost wanting. Stigma obtuse. Drupe? tetragonal, containing a 3-celled, 3-seeded nucleus.—A tree with abruptly-pinnate leaves; leaflets nearly opposite. Racemes simple, axillary, and lateral.

1 L. MONTA'NA (Blum. l. c.) ♄. S. Native of Java.

Mountain Lepisanthes. Tree.

Cult. A mixture of loam and sand will suit this tree, and ripened cuttings will root in sand under a hand-glass, in heat.

XI. SAPI'NDUS (a syncope of *Sapo-Indicus*, Indian-soap. The aril which surrounds the seeds of *S. saponària* is used as soap in South America). Lin. gen. no. 499. D. C. prod. 1. p. 607.

Lin. syst. *Octo-Decándria, Monogýnia.* Calyx 5-parted. Petals 5, naked on the inside, or furnished with a scale above the claw. Disk occupying the bottom of the calyx, regular, entire or crenulated. Stamens 8-10, inserted between the margin of the disk and ovary. Style crowned by a 3 rarely 2-lobed stigma. Fruit fleshy, 1-2-lobed from abortion, rarely 3-lobed; lobes roundish, indehiscent, 1-2-seeded from abortion, rarely 3-seeded. Seeds without aril. Embryo curved or straight.—Trees with exstipulate, impari or abruptly-pinnate leaves, or from abortion having only one leaflet; leaflets opposite or alternate. Racemes disposed in terminal panicles. Berries all red and saponaceous, and may be used in the same manner as those of *S. saponària*. Flowers small, white, or greenish-white.

* *Rachis winged.*

1 S. SAPONA'RIA (Lin. spec. 526. exclusive of the synonyme of Pluk.) rachis of leaves decurrent, broadly winged; leaflets quite entire, lanceolate, 3-4 pairs, with an odd one, which is terminated by a long point; panicles terminal; fruit round. ♄. S. Native of the Caribbee Islands and various parts of South America. Ruiz et Pav. fl. per. 4. t. 341.—Comm. hort. 1. t. 94. Flowers small and white. These are succeeded by oval or round berries as large as cherries, sometimes single, at others 3 or 4 are joined together; these have a saponaceous skin, which incloses a very smooth, roundish nut, of a shining-black when ripe. These nuts were formerly brought to England for buttons to waistcoats, some were tipped with gold, and others with different metals; they were very durable, as they did not wear, and seldom broke. The skin and pulp which surround the nuts are used in America to wash linen, but it is very apt to burn and destroy it if often used, being of a very acrid nature. The seed vessels, according to P. Browne, are very detersive and acrid; they lather freely in water, and will cleanse more linen than sixty times their weight of soap; but they are observed to corrode or burn the linen in time, and the water in which the tops or leaves have been steeped or boiled has the same quality in some degree. The seeds are round and hard, have a fine polish, and are frequently made into buttons and beads among the Spaniards. The whole plant, especially the seed-vessels, being pounded and steeped in ponds, rivulets, or creeks, are observed to intoxicate and kill fish.

Common *Soap-Berry.* Fl. July, Sept. Clt. 1697. Tree 20 ft.

2 S. MARGINA'TUS (Willd. enum. 432.) rachis of leaves with a narrow margin at the top; leaflets 6 pairs, lanceolate. ♄. G. Native of Georgia and Carolina on the sea-coast. S. saponària, Michx. fl. amer. bor. 1. p. 242. Fruit possessing the same qualities as those of the preceding species. Flowers small, white.

Marginate-petioled Soap-Berry. Fl. July, Sept. Clt. 1697. Tree 12 feet.

3 S. FORSY'THII (D. C. prod. 1. p. 607.) rachis of leaves with a narrow wing; leaflets quite entire, coriaceous, on very short petioles, elliptical, tapering to both ends, 3-5 pairs. ♄. S. Native of the Island of Granada on the sea-beach. The leaves when bruised have a smell like that of garlic. Fruit globose, possessing the same quality as that of the first species. Flowers small, white, numerous, disposed in dense terminal panicles.

Forsyth's Soap-Berry. Fl. July, Sept. Clt.? Shrub 8 feet.

4 S. STENO'PTERUS (D. C. prod. 1. p. 607.) rachis of leaves with a very narrow wing; leaflets 4 or 5 pairs, quite entire, coriaceous, ovate-oblong, and very much acuminated. ♄. S. Native of St. Domingo. Panicle terminal, loose. Flowers small, white. Very like *S. rígidus*, but differs in the petiole being winged and smooth.

Narrow-winged-petioled Soap-Berry. Shrub 10 feet.

5 S. MICROCA'RPA (Ruiz et Pav. fl. per. 4. t. 341.) leaves abruptly-pinnate, with 3-4 pairs of leaflets on a winged petiole; panicles terminal; fruit small, round. ♄. S. Native of Peru.

Small-fruited Soap-Berry. Shrub.

* * *Rachis or common petiole not winged.*

6 S. RI'GIDUS (Ait. hort. kew, 2. p. 36.) rachis pubescent; leaflets 3 pairs, ovate-oblong, smooth. ♄. S. Native of South America and the West Indies. Gært. fruct. 1. t. 70. f. 3.—Pluk. alm. t. 217. f. 7. Flowers small, white, disposed in super-decompound, terminal racemes, a foot long. Berry with a thin pulp, becoming towards the middle a white, tomentose, spongy substance, embracing a trigonal-globular, bony nut.

Stiff-leaved Soap-Berry. Fl. July, Sept. Clt. 1759. Tree 20 feet.

7 S. ARBORE'SCENS (Aubl. guian. 1. p. 357. t. 139.) leaflets 3 pairs, ovate, each with a short acumen, smooth; racemes axillary, nearly simple. ♄. S. Native of Guiana in woods. Flowers unknown. Fruit small, red.

Arborescent Soap-Berry. Clt. 1824. Shrub 7 feet.

8 S. FRUTE'SCENS (Aubl. guian. 1. p. 355. t. 138.) leaflets oblong-lanceolate, acuminated, smooth, 7 pairs; racemes axillary, almost simple. ♄. S. Native of Guiana in woods and cultivated fields. Flowers unknown. Fruit twin, globose, scarlet, about the size of a cherry. Stem straight.

Frutescent Soap-Berry. Clt. 1824. Shrub 8 feet.

9 S. DIVARICA'TUS (St. Hil. fl. bras. 1. p. 390.) rachis wingless; leaves with 3-5 pairs of lanceolate-falcate, acute, smoothish, unequal-sided leaflets: racemes short, branched; calyx pubescent; petals naked. ♄. S. Native of Brazil in the province of Minas Geraes. Racemes forming a panicle. Stamens 8-10.

Divaricate-panicled Soap-Berry. Tree 20 feet.

10 S. SURINAME'NSIS (Poir. dict. 6. p. 600.) leaflets 6-8 pairs, elliptical-lanceolate, very smooth, membranaceous; pani-

cles divaricate. ♄. S. Native of Surinam. Flowers greenish-white. Fruit globose, hardly the size of a cherry.

Surinam Soap-Berry. Shrub 10 feet.

11 S. INÆQUA'LIS (D. C. prod. 1. p. 608.) leaflets ovate-lanceolate, acuminated, smooth, broader on one side than the other, 4 pairs; panicles divaricate. ♄. S. Native of Guadaloupe. Lam. ill. t. 307. f. 1. S. laurifòlius, in herb. Balb. but not of Vahl. Flowers small, whitish.

Unequal-leaved Soap-Berry. Shrub 6 feet.

12 S. ANGULA'TUS (Poir. dict. 6. p. 665.) leaflets broad-ovate, obtuse, coriaceous, smooth and shining above, pubescent beneath, 3 pairs; fruit of 3 joined carpels, which are keeled on the back. ♄. S. Native of?

Angular-fruited Soap-Berry. Shrub 6 feet.

13 S. JUGLANDIFÒLIUS (St. Hil. fl. bras. 1. p. 391.) rachis wingless; leaves with 4-5 pairs of oblong, equal-sided, smooth leaflets, which are rounded at the apex; racemes branched; calyx hairy; petals each furnished with a 2-lobed scale on the inside. ♄. S. Native of Brazil near Rio Janeiro. Stamens 8.

Walnut-leaved Soap-Berry. Tree 25 feet.

14 S. ESCULE'NTUS (St. Hil. pl. usu. bras. no. 68. fl. bras. 1. p. 391.) rachis wingless; leaves with 2-4 pairs of oblong, attenuated, equal-sided, smooth leaflets; racemes spike-formed; calyx tomentose; petals each furnished with a bifid scale on the inside at the base. ♄. S. Native of Brazil in the province of Minas Geraes, where it is called *Pittombera*, and where the inhabitants eat the aril which surrounds the seeds.

Esculent Soap-Berry. Tree 20 feet.

15 S. SENEGALE'NSIS (Poir. dict. 6. p. 666.) rachis of leaves flattened and striped, somewhat pubescent; leaflets ovate, lanceolate, smooth, with strong nerves on both surfaces, 2-3 pairs. ♄. S. Native of Senegal. Fruit globose, the size of a strawberry.

Senegal Soap-Berry. Clt. 1823. Tree 10 feet.

16 S. GUINEE'NSIS; leaflets numerous, ovate-lanceolate; young branches, as well as panicles, clothed with rufous hairs; panicles large, terminal. ♄. S. Native of Guinea. Fruit red, about the size of a cherry, with a whitish farinaceous pulp.

Guinea Soap-Berry. Fl. April, May. Shrub 6 feet.

17 S. TETRAPHY'LLUS (Vahl. symb. 3. p. 54.) leaflets lanceolate-oblong, smooth, 2 pairs; racemes almost simple; petals smooth. ♄. S. Native of the East Indies.

Four-leaved Soap-Berry. Shrub 8 feet.

18 S. SALICIFÒLIUS (D. C. prod. 1. p. 608.) leaflets 2 pairs; linear-lanceolate, acuminated, smooth; racemes compound; petals bearded on the inside. ♄. S. Native of the Island of Timor. Fruit unknown.

Willow-leaved Soap-Berry. Shrub 6 feet.

19 S. LAURIFÒLIUS (Vahl. symb. 3. p. 54.) leaflets 3 pairs, ovate-oblong, attenuated, smooth; panicles loose; petals tomentose on the borders. ♄. S. Native of Malabar.—Rheed. mal. 4. t. 19. S. trifoliàta, Lin. spec. 625.

Laurel-leaved Soap-Berry. Clt. 1820. Tree 10 feet.

20 S. LONGIFÒLIUS (Vahl. symb. 3. p. 53.) leaflets 5 pairs, smooth, with a terminal, lanceolate leaflet. ♄. S. Native of the East Indies. Calyx tomentose-hoary. Fruit unknown.

Long-leaved Soap-Berry. Clt. 1820. Tree 10 feet.

21 S. EMARGINA'TUS (Vahl. symb. 3. p. 54.) leaflets 2-3 pairs, oblong, emarginate, villous beneath; panicles decompound, pubescent; petals with tomentose margins. ♄. S. Native of the East Indies. Fruit of 3 joined carpels, somewhat globular, and densely clothed with yellowish hairs.

Emarginate-leaved Soap-Berry. Clt. 1822. Tree 12 feet.

22 S. RA'RAK (D. C. prod. 1. p. 608.) leaflets 3-10 pairs, oblong, retuse, very smooth, membranaceous. ♄. S. Native of Java, Amboyna, and Cochin-china.—Rárak, Rumph. amb. 2. p. 134. S. saponària, Lour. coch. 238? S. pinnàtus, Mill. dict. no. 3.? Loureiro celebrates the berries of this tree, slightly bruised and steeped in water, as a very excellent soap, and remarks, that it is only required to use them with prudence, all abstergents being in some degree corrosive. He describes it as a very large tree, and as both wild and cultivated in Cochinchina. It has also been found in the South-sea Islands.

Rarak Soap-Berry. Tree 40 feet.

23 S. ABRU'PTUS (Lour. fl. coch. 238.) leaves abruptly-pinnate; leaflets lanceolate, smooth; flowers campanulate, of 4 sepals and 4 petals. ♄. G. Native of China about Canton. Racemes large, terminal. Flowers pale.

Abrupt-leaved Soap-Berry. Tree 30 feet.

24 S. MUKORÓSSI (Gært. fruct. 1. p. 342. t. 70.) leaflets 6 pairs, alternate, ovate-lanceolate, smooth, tender; berry ovate, acuminated at both ends. ♄. G. Native of Japan about Jeddo. Thunb. jap. 356. no. 37. Fruit of 3 carpels, 2 of them are abortive, the third very large. Thunberg informs us, that the fruit was reported by the Japanese physicians to be bitter and juicy. The tree is called *Mukorossi* in Japan.

Mukorossi or Japan Soap-Berry. Tree 20 feet.

† *Species not sufficiently known, with simple leaves.*

25 S.? I'NDICUS (Poir. dict. 6. p. 667.) leaves almost sessile, smooth, netted with veins, usually linear-lanceolate, undivided, but sometimes it is divided to the base into 2 opposite, ovate-lanceolate lobes. ♄. S. Native of the East Indies.

Indian Soap-Berry. Tree 20 feet.

26 S. SIMPLICIFÒLIUS; leaves simple, oblong, entire, coriaceous, oblique at the base; panicles axillary. ♄. S. Native of Guinea.

Simple-leaved Soap-Berry. Shrub 4 feet.

Cult. *Sapindus* is a genus of trees and shrubs possessing no beauty, therefore they are hardly worth cultivating except in general collections. They will thrive well in a mixture of loam, peat, and sand, and large cuttings will strike root in sand under a hand-glass, in heat. Seeds obtained from the places of their natural growth should be sown directly.

XII. ERIOGLO'SSUM (from *εριον*, *erion*, wool, and *γλωσσα*, *glossa*, a tongue; in allusion to the scales of the petals being villous). Blum. bijdr. p. 229. Cambess. in mem. mus. 18. p. 27.

LIN. SYST. *Octándria*, *Monogýnia*. Calyx 5-sépalled, 2 inner sepals smallest. Petals 4, concave, each furnished with a bifid, villous scale on the inside. Stamens 8, unequal, villous. Ovaries 3, 1-seeded, connate with the style, which is crowned by an obtuse stigma. Carpels elliptical, baccate, connate at the base, usually solitary from abortion.—A shrub with the habit of *Sapíndus*, bearing eatable fruit, and with pinnate leaves; leaflets 3-4 pairs, usually with an odd one.

1 E. E'DULE (Blum. l. c.) ♄. S. Native of Java. Sapíndus édulis, Blum. cat. hort. buitenz.

Eatable-fruited Erioglossum. Shrub 6 feet.

Cult. A mixture of loam, peat, and sand will suit this shrub, and ripe cuttings will root in sand under a hand-glass, in heat.

XIII. MOULI'NSIA (in honour of M. Charles des Moulins, of Bourdeaux, author of many interesting memoirs on various branches of natural history). Cambess. in mem. mus. 18. p. 27. t. 2.

LIN. SYST. *Octándria*, *Monogýnia*. Calyx 5-parted. Petals 4, the fifth deficient, and with its seat vacant, each furnished with a cucullate scale above the base, with the scales crested at the apex, and ending in an inflexed appendage beneath the apex.

Disk incomplete, 4-lobed, with the lobes opposite the petals. Stamens 8, excentral, connate around the ovary at the base. Pistil excentral. Style crowned by a somewhat 3-lobed stigma, seated between the lobes of the ovary. Ovary 3-lobed, 3-celled; cells 1-ovulate. Capsule 3, or from abortion only 2-lobed, 2-3-celled, opening at the cells into 2-3 valves.—Trees with exstipulate? abruptly-pinnate leaves; leaflets alternate or opposite. Flowers racemose, white.

1 M. Cupanoìdes (Cambess. in mem. mus. 18. p. 40. t. 2.) leaves with 5-7 pairs of oblong, somewhat acuminated, stalked, entire leaflets, which taper to both ends; racemes compound, terminal. ♄. S. Native of Timor and Java. Sapíndus fraxinifòlius? D. C. prod. 1. p. 608.

Cupania-like Moulinsia. Tree.

2 M. rubiginòsa; petioles villous; leaves with many pairs of opposite, nearly sessile, ovate-lanceolate, obtuse, mucronate, entire, nearly smooth leaflets; panicle terminal, composed of numerous simple racemes. ♄. S. Native of Pulo-Penang and Coromandel. Sapíndus rubiginòsus, Roxb. cor. 1. p. 44. t. 62. Calyx of 5 unequal sepals. Petals 4, white, appendiculate at the base; appendages furnished with 2 transverse lines of white hairs. Stamens villous, 8, unequal, incumbent. This tree is called *Ishyrashy* among the Telingas. The wood is very useful for various purposes, being large, straight, strong, and durable, towards the centre it is of a chocolate colour.

Rusted Moulinsia. Clt. 1821. Tree 20 feet.

Cult. A mixture of loam, peat, and sand will suit these trees, and ripened cuttings will root in sand under a hand-glass, in heat.

XIV. CUPA'NIA (in memory of Father Francis Cupani, an Italian monk, author of Hortus Catholicus and other botanical works, died in 1710). Plum. gen. p. 49. t. 19. Pers. ench. 1. p. 413. D. C. prod. 1. p. 612.—Trigònis, Jacq. amer. 100. Molinæ'a, Juss. gen. 245.—Guiòa, Cav. icon. 4. p. 49.—Dimerèza, Labill. nov. cal. t. 51.—Gelònium, Gærtn. fruct. 2. p. 271.—Tìna, Rœm. et Schult. syst. 5. p. 985.—Ratònia, D. C. prod. 1. p. 618.—Mischocárpus, Blum. bijdr. 238.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-cleft or 5-parted. Petals 5, each furnished with a small scale above the base (perhaps always) rarely wanting. Disk occupying the bottom of the calyx, regular, entire, or crenulated. Stamens 10, or from abortion 9-5, inserted between the margin of the disk and the ovary. Style trifid or undivided. Capsule pear-shaped, 2-3-sided, 2-3-valved, 2-3-celled. Seeds erect, arillate.—Trees or shrubs with exstipulate? abruptly-pinnate leaves, or from abortion simple; leaflets opposite and alternate. Flowers whitish, in racemose panicles or racemes.

Sect. I. Trigònis (from τρεις, *treis*, three, and γωνια, *gonia*, an angle; the petals are of the form of a triangle). Jacq. amer. 100. Petals convolutely cucullate at the apex.—American species.

1 C. tomentòsa (Swartz, fl. ind. occ. 2. p. 657.) leaflets 3-4-pairs, obovate, retuse, clothed with fine rusty tomentum beneath, serrate-toothed at the top of the lateral nerves; outer leaflets largest. ♄. S. Native of Hispaniola, Guadaloupe, and on the banks of the river Magdalena in woods. Trigònis tomentòsa, Jacq. amer. 102.—Plum. ed Burm. t. 110. C. Americàna, Lin. Petals yellowish, triangular, and hairy on the inside.

Tomentose-leaved Cupania. Clt. 1818. Tree 30 feet.

2 C. exce'lsa (H. B. et Kunth, nov. gen. amer. 5. p. 125.) leaflets usually 5 pairs, oblong, bluntish, remotely toothletted, coriaceous, smoothish above, but pubescent beneath. ♄. S. Native of Mexico on the mountains.

Tall Cupania. Clt. 1824. Tree 60 feet.

3 C. verna'lis (St. Hil. fl. bras. 1. p. 387.) leaves with 5-6 pairs of oblong, sharply-serrated leaflets, which taper to the base, smooth above and puberulous beneath; calyx tomentose. ♄. S. Native of Brazil in the province of Rio Grande do Sul, where it is called *Cambuata*. Ovary 3-lobed, 3-celled. Flowers decandrous; filaments pilose.

Spring Cupania. Tree 20 feet.

4 C. euphoriæfòlia (St. Hil. fl. bras. 1. p. 388.) leaves with 4-5 pairs of oblong, entire, smoothish leaflets, which are narrowed at the base; calyx permanent, puberulous; fruit pubescent. ♄. S. Native of Brazil. Capsule pear-shaped, 2-3-lobed, 2-3-celled.

Euphoria-leaved Cupania. Shrub.

5 C. panicula'ta (St. Hil. fl. bras. 1. p. 388. t. 80.) leaves with 5 pairs of elliptic, obtuse leaflets, rounded at the base, dentately serrated, shining above but tomentose beneath; calyx tomentose. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers octandrous. Filaments pilose.

Panicled-flowered Cupania. Shrub 3 to 4 feet.

6 C. latifòlia (H. B. et Kunth, nov. gen. amer. 5. p. 126.) leaflets 2 pairs, obovate-oblong, retuse, repandly toothed, smooth, but hairy on the veins beneath. ♄. S. Native of an island in the river Magdalena, called Isla de Brugas. Fruit unknown.

Broad-leaved Cupania. Tree 40 feet.

7 C. scrobicula'ta (H. B. et Kunth, nov. gen. amer. 5. p. 127.) leaflets 4 pairs, oblong, retuse, remotely and sharply toothed, somewhat membranaceous, smooth, scrobiculate at the origin of the veins beneath. ♄. S. Native of New Granada near Turbaco. This species comes very near *C. glàbra*.

Scrobiculate-leaved Cupania. Tree 20 feet.

8 C. reticula'ta (Cambess. in mem. mus. 18. p. 41.) leaves with 2-3 pairs of elliptical, short-acuminated or rounded at the apex, entire, stalked, reticulately veined, smooth leaflets; calyx permanent, 5-parted, tomentose; capsule obcordate, pear-shaped, 3-lobed, tomentose. ♄. S. Native of Guiana. Flowers disposed in large, spreading, racemose panicles.

Reticulated-leaved Cupania. Tree.

9 C. gla'bra (Swartz, fl. ind. occ. 2. p. 659.) leaflets 3-4 pairs, ovate, obtuse, crenated, smooth, acuminated at the base. ♄. S. Native of Jamaica, where it is called *Loblolly-tree*, and St. Domingo in the mountains.

Smooth Cupania. Fl. May, June. Clt. 1822. Tree 14 feet.

10 C. emargina'ta (St. Hil. fl. bras. 1. p. 386.) leaves with 2-3 pairs of obovate, subcuneated, emarginate, entire, smooth leaflets; calyx deciduous; fruit smooth. ♄. S. Native of Brazil in the province of Rio Janeiro. Capsule obcordate, 2-celled, 2-valved.

Emarginate-leaved Cupania. Tree 15 feet.

11 C. zanthoxyloìdes (St. Hil. fl. bras. 1. p. 386. t. 79.) leaves with 2-3 pairs of obovate-oblong, dentately-serrated, smooth leaflets, which are narrowed at the base, smooth above and tomentose beneath; calyx permanent, tomentose; fruit pubescent. ♄. S. Native of Brazil near the town of St. Paul. Capsule pear-shaped, 3-lobed, 3-valved.

Zanthoxylon-like Cupania. Shrub 6 to 7 feet.

12 C. sapona'ria (Pers. ench. 1. p. 413.) leaflets 5-6 pairs, oblong, tapering to both ends, entire, scabrous and pubescent beneath. ♄. S. Native of the West Indies. C. saponarioìdes, Swartz, fl. ind. occ. 2 p. 661.

Saponaria-like Cupania. Fl. May, Ju. Clt. 1810. Tr. 20 ft.

13 C. Poire'tii (Kunth, ann. des scienc. nat. 1. p. 457.) leaflets usually 4 pairs, oblong, acute, coriaceous, smoothish, shining above; branches and panicled racemes covered with rusty tomentum. ♄. S. Native of Trinidad and Guadaloupe. Robìnia rubiginòsa, Poir. syst. veg. 3. p. 247.

Poiret's Cupania. Tree 20 feet.

14 C. Vòua-ra'na (Cambess. in mem. mus. 18. p. 42.) leaves with 2-3 pairs of elliptic or oblong-obovate, obtuse, or shortly acuminated, obsoletely-sinuated, smooth, stalked leaflets; calyx 5-parted, tomentose, permanent, at length smooth; capsule obcordate, 2-lobed, smooth. ♄. S. Native of Guiana, where it is called *Voua-rana*. Vòua-ràna Guianénsis, Aubl. guian. suppl. p. 12. t. 374. Matàyba? Vòua-ràna, D. C. prod. 1. p. 609. Cupània lævigàta, Rich. ined. Racemes axillary, branched. Flowers in fascicles on the racemes.

Voua-rana Cupania. Tree.

15 C. puncta'ta (St. Hil. fl. bras. 1. p. 389.) leaves with 5-6 pairs of ovate, obtuse, usually somewhat emarginate, quite entire leaflets, which are smoothish above and pubescent beneath; calyx hairy. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers usually decandrous. Filaments pilose.

Dotted Cupania. Shrub 3 to 4 feet.

16 C. gemina'ta (Poir. suppl. 2. p. 419.) leaflets 2, oval, acuminated, entire, glaucous above, puberulous beneath; lateral nerves prominent, confluent at the apex. ♄. S. Native of Cayenne. C. diphýlla, Vahl.? Younger capsules velvety, bluntly trigonal.

Twin-leaved Cupania. Tree.

17 C.? nítida (D. C. prod. 1. p. 613.) leaflets 1-2 pairs, with an odd one, oval, acuminated, entire, coriaceous, very smooth on both surfaces. ♄. S. Native of French Guiana or Cayenne. Young capsules velvety, adult ones smooth, 3-winged at the apex. This is probably a species of *Paullínia*.

Shining-leaved Cupania. Tree?

Sect. II. Molinæ'a (in honour of John Des Moulins, a French physician). Juss. gen. 245. Lam. ill. t. 305. D. C. prod. 1. p. 613. Petals flattish, a little larger than the calyx. Filaments very short, villous. Mauritian or East Indian species.

18 C. læ'vis (Pers. ench. 1. p. 413.) leaflets 2-3 pairs, opposite, oblong, quite entire, very smooth, coriaceous; nerves hardly prominent. ♄. S. Native of the island of Bourbon. Molinæ'a, Lam. ill. t. 305. f. 1. Molinæ'a læ'vis, Willd. spec. 2. p. 329. Capsules obovate, triquetrous-winged. Corymbs of flowers panicled, terminal.

Smooth Cupania. Tree small.

19 C. Chapelieria'na (Cambess. in mem. mus. 18. p. 44.) leaves with 3-7 pairs of elliptical, oblong, smooth, toothed leaflets, which are shining above and narrowed at the base; calyx permanent, puberulous; capsule obovoid, smooth; racemes axillary, a little longer than the leaves. ♄. S. Native of Madagascar.

Chapelier's Cupania. Tree.

20 C. alternifòlia (Pers. ench. 1. p. 413.) leaflets 4-5 pairs, usually alternate, quite entire, very smooth, coriaceous; nerves hardly prominent. ♄. S. Native of the Island of Bourbon. This plant is probably nothing more than a slight variety of *C. læ'vis*. Molinæ'a, Lam. ill. t. 305. f. 2. M. alternifòlia, Willd. spec. 2. p. 329.

Alternate-leafletted Cupania. Tree.

21 C. Perrotte'tii (Cambess. in mem. mus. 18. p. 45.) leaves with 2-3 pairs of elliptical, acutish or obtuse, quite entire, stalked, smooth leaflets; calyx deciduous, 5-parted, hairy; capsule obovate, somewhat emarginate at the apex, somewhat 2-lobed, smooth. ♄. S. Native of the Philippine Islands. Racemes very short, axillary.

Perrottet's Cupania. Tree.

22 C. venulòsa (D. C. prod. 1. p. 613.) leaflets 1-2 pairs, opposite, oblong, quite entire, very smooth, netted with rather prominent nervules. ♄. S. Native of the island of Bourbon and the Mauritius. Leaflets very like the leaves of *Vaccínium vìtis-idèa*.

Veiny-leaved Cupania. Tree.

23 C. Thouarsia'na (Cambess. in mem. mus. 18. p. 45.) leaves with 2 pairs of obovate-oblong, cuneated, emarginate, quite entire, smooth leaflets; calyx permanent, puberulous; capsule obovate, smooth; racemes axillary, shorter than the leaves, densely puberulous. ♄. S. Native of Madagascar.

Petit Thouars's Cupania. Tree.

24 C. cane'scens (Pers. ench. 1. p. 413.) leaflets 2 pairs, opposite, elliptical-oblong, quite entire, shining, even, smooth. ♄. S. Native of Coromandel in the mountains. Molinæ'a canéscens, Roxb. hort. beng. p. 29. Panicles axillary. Capsules ovate, 3-furrowed, not winged.

Hoary Cupania. Clt. 1818. Tree 16 feet.

25 C. Tola'mbitou (Cambess. in mem. mus. 18. p. 43.) leaves with 2-3 pairs of oblong, subacuminated, quite entire, nearly sessile, quite smooth, leaflets, which are narrowed at the base; calyx deciduous; capsule obcordately 3-lobed, smooth; racemes axillary, shorter than the leaves. ♄. S. Native of Madagascar, where it is called *Tolambitou*.

Tolambitou Cupania. Tree.

Sect. III. Adonta'ria (from *οδους οδοντος, odous odontos*, a tooth; petals toothed). D. C. prod. 1. p. 614. Petals crenate-toothed at the apex, inserted in a 5-parted or 5-tubercled hypogynous disk. Filaments villous at the base.

26 C. denta'ta (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 614.) leaflets 6-7 pairs, alternate, oval-oblong, crenate-toothed. ♄. S. Native of Mexico. Panicle terminal. Petals white, equal in length with the pubescent calyx, cuneated, 3-toothed at the apex. Capsules red, ovate, 3-furrowed, wingless.

Toothed-leaved Cupania. Clt. 1824. Tree small.

Sect. IV. Guiòa (in honour of Joseph Guio, a botanical artist, mentioned by Cavanilles). Cav. icon. 4. p. 49. D. C. prod. 1. p. 412. Petals flat, smaller than the calyx. Filaments smooth. Capsules 3-winged, or perhaps of 3 distinct carpels. This section will probably form a distinct genus.

27 C. Ratònia (Cambess. in mem. mus. 18. p. 47.) leaves with 2-3 pairs of oblong-spatulate, somewhat cuneated, obtuse or a little emarginate, quite entire, smooth, stalked leaflets; calyx 5-parted, permanent; capsule obcordate, 2-lobed, smooth; racemes simple, axillary, solitary. ♄. S. Native of St. Domingo, where it is called *Raton*.

Raton Cupania. Tree.

28 C. lentiscifòlia (Pers. ench. 1. p. 413.) leaflets 3 pairs, alternate, lanceolate, quite entire, coriaceous. ♄. S. Native of the island of Babao, one of the Friendly Islands. Guiòa lentiscifòlia, Cav. icon. 4. p. 49. t. 373. Petals red. Panicle terminal.

Lentiscus-leaved Cupania. Shrub 6 feet.

Sect. V. Ape'tala. Flowers apetalous. Petals wanting.

29 C. ape'tala (Lab. nov. cal. p. 72. t. 73.) leaflets 5-13 pairs, ovate-lanceolate, smooth; racemes short, axillary; flowers polygamous, apetalous. ♄. S. Native of New Caledonia.

Apetalous Cupania. Tree 36 feet.

30 C. Lessertia'na (Cambess. in mem. mus. 18. p. 46.) leaves with 2-3 pairs of oblong-lanceolate, tapering to both ends, acuminated, entire, stalked, quite smooth leaflets; calyx permanent, 5-cleft, hairy; capsule pear-shaped, smooth. ♄. S. Native of Java. Mischocárpus Sundaìcus, Blum. bijdr. p. 238. Racemes axillary, solitary, or twin, spike-formed. Petals wanting.

De Lessert's Cupania. Tree.

Sect. VI. Dimere'za (from *διμερης, dimeres*, 2-parted; in

allusion to the 2-parted appendages of the petals). Labill. nov. cal. t. 51. Petals 5, orbicular, furnished each with a bifid appendage on the inside. Stamens 8. Capsules coriaceous, 3-valved, 3-seeded.

31 C. glau'ca (Cambess. in mem. mus. 18. p. 29.) hairy; leaflets 1-2 pairs, lanceolate, glaucous beneath; flowers panicled. ♄. G. Native of New Caledonia. Dimerèza glaúca, Labill. nov. caled. t. 51. Diplopétalum glaúcum, Spreng. syst. append. p. 150. Capsule triquetrous, 3-celled, 3-seeded.

Glaucous-leaved Cupania. Shrub 9 feet.

Sect. VI. Tína (from τις, τινος, *tis, tinos*, who, what; at the time the name was given it was uncertain to what genus the plants belonged). Corolla of 5 hairy scales. Stamens 5, inserted in the base of the pistil. Capsules 2-valved, narrowed at the base, pear-shaped.

32 C. cupanioìdes (Cambess. in mem. mus. 18. p. 28.) leaves impari-pinnate; panicles axillary; capsules obcordate. ♄. S. Native of the Mauritius? Gelònium cupanioìdes, Gært. fruct. 2. p. 271. t. 139. Tìna cupanioìdes, D. C. prod. 1. p. 614.

Cupania-like Cupania. Tree 20 feet.

33 C. Madagascarie'nsis (Pet. Th. gen. mad. no. 4. under *Tìna*,) capsules acuminated; leaves alternate, conjugate, or abruptly and impari-pinnate, with woody petioles; flowers panicled. ♄. S. Native of Madagascar.

Cult. The species of *Cupània* will thrive well in a mixture of sandy loam and peat; and ripened cuttings will root in sand under a hand-glass, in a moist heat.

XV. HARPU'LIA (*Harpula* is its vernacular name at Chittagong). Roxb. fl. ind. 2. p. 441.

Lin. syst. *Pentándria, Monogýnia.* Sepals 5. Petals 5, alternate with the stamina. Stamens 5. Style short. Stigma, 2-lobed; lobes reflexed. Capsule 2-celled; seeds solitary, arillate. Disk fleshy, villous. A small tree, with abruptly-pinnate leaves, with from 4-6 pairs of entire, ovate-lanceolate, opposite, or alternate leaflets, and axillary, solitary panicles of small pale-yellow flowers.

1 H. cupanioìdes (Roxb. l. c.). ♄. S. Native of the hills near Chittagong.

Cupania-like Harpulia. Fl. April. Tree 20 feet.

Cult. A mixture of loam and sand will answer this tree well, and ripened cuttings will root in sand under a hand-glass, in heat.

XVI. BLI'GHIA (in honour of Captain William Bligh, R.N. who first carried the bread-fruit trees to the West Indies). Kœnig, in ann. bot. 1806. 2. p. 571. D. C. prod. 1. p. 609.—Akeèsia. Tuss. antill. (1808) p. 66.—Bonánnia, Raf. specch. (1814) 15. p. 115.

Lin. syst. *Octándria, Monogýnia.* Calyx 5-parted. Petals 5, scarcely appendiculate on the inside? Stamens 8. Style very short. Stigmas 3. Carpels 3, connate, fleshy, opening at the apex. Seeds solitary, seated on a large fleshy aril.—A large tree, with habit of *Sapíndus* or *Cupània*.

1 B. sa'pida (Kœn. l. c. 2. t. 16. and 17.). ♄. S. Native of Guinea, from whence it has been introduced into the West Indies and South America. Akeèsia Africàna, Tuss. antil. p. 66. t. 3. Bonánnia nítida, Raf. specch. 15. p. 116. Akēe, Lunan. hort. jam. 2. p. 335. Rachis of leaves not winged, pubescent. Leaflets 3 or 4 pairs, ovate-lanceolate, veiny. This is an esteemed African fruit-tree, with reddish or yellowish berries, about the size of a hen's egg, with the aril of the seed of a grateful subacid flavour. In the West Indies it is considered wholesome.

Savoury Akee-tree. Fl. Mar. Clt. 1793. Tree 30 feet.

Cult. This tree is greatly esteemed for the excellence of its fruit, both in Guinea and the West Indies. It will thrive well in a mixture of loam and peat. Ripened cuttings, not deprived of any of their leaves, will strike root in sand under a hand-glass, in heat. The tree has never been brought to a flowering state in this country.

XVII. TALI'SIA (*Toulichi* is the name of *T. Guianénsis* in Guiana). Aubl. guian. 1. p. 349. D. C. prod. 1. p. 609.

Lin. syst. *Octándria, Monogýnia.* Calyx deeply 5-cleft. Petals 5, each furnished with a densely pilose scale above the base, nearly equalling the limb. Disk very fleshy, occupying the whole bottom of the calyx, regular, crenulated. Stamens 8, inserted between the margin of the disk and the ovary. Stigma sessile, obsoletely 3-toothed. Ovary 3-4-celled, with the ovulæ fixed to the bottom of the cells.—Trees or shrubs with exstipulate, abruptly pinnate leaves, with alternate leaflets. Flowers disposed in racemose panicles.

1 T. hexaphy'lla (Vahl. ecl. 2. p. 29.) racemes simple; calyx equal in length to the petals; leaflets 2-3 pairs, oblong-lanceolate, shining, smooth on both surfaces. ♄. S. Native of South America.

Six-leaved Talisia. Tree 20 feet.

2 T. móllis (Kunth, mss. Cambess. in mem. mus. 18. p. 48.) racemes decompound, panicled; calyx shorter than the petals; leaflets 5 pairs, oval-oblong, acuminated, with the nerves and nervelets hairy beneath. ♄. S. Native of South America. T. Guianénsis, D. C. prod. 1. p. 609. exclusive of the synonymes.

Soft Talisia. Clt. 1824. Shrub 4 feet.

3 T. Guiane'nsis (Aubl. guian. 1. p. 340. t. 136.) racemes decompound; calyx shorter than the petals; leaflets many pairs, ovate-lanceolate, acuminated, coriaceous, quite smooth on both surfaces. ♄. S. Native of Guiana and Cayenne. G. glàbra, D. C. prod. 1. p. 609. Flowers rose-coloured.

Guiana Talisia. Shrub 4 feet.

4 T.? acladòdea (D. C. prod. 1. p. 609.) trunk simple; racemes terminal; leaves abruptly pinnate; leaflets oblong-linear, acuminated. ♄. S. Native of Peru in groves. Acladòdea pinnàta, Ruiz et Pav. fl. per. prod. 133. t. 29. syst. p. 262. Tree with the habit of a palm. Female flowers unknown.

Unbranched Talisia. Tree 40 feet.

Cult. These trees will thrive well in a mixture of loam and peat, and large cuttings, not deprived of any of their leaves, will strike root in sand under a hand-glass, in heat.

XVIII. STADMA'NNIA (in honour of Stadmann, a German botanical traveller). Lam. ill. t. 312. D. C. prod. 1. p. 615.

Lin. syst. *Octándria, Monogýnia.* Calyx 5-toothed. Petals wanting. Stamens 8. Ovary oblong. Style very short. Stigma trigonal. Berry globose, 1-celled, 1-seeded from abortion.—Trees with impari-pinnate leaves, and elongated, spike-formed racemes of small whitish flowers.

1 S. sidero'xylon (D. C. prod. 1. p. 615.) leaves alternate, with 3 or 5 pairs of alternate, large, oval, oblong, coriaceous, emarginate, smooth, shining leaflets; racemes panicled, elongated, terminal. ♄. S. Native of the island of Bourbon, where it is called *Bois de fer*, as well as of Amboyna. Arbor palòrum alba, Rumph. amb. 3. t. 65. The wood of this tree is very hard and heavy, of a reddish colour. It is very knotty, and is therefore very difficult to cut. It is commonly used for stakes or pales. Cupània sideróxylon, Cambess.

Iron-wooded Stadmannia. Tree 66 feet.

2 S. austra'lis; leaves alternate, with 2 or 3 pairs of large, oblong, retuse, rather coriaceous, opposite leaflets, with an odd one; young leaves and branches covered with rusty down; racemes terminal? ♄. G. Native of New Holland.

Southern Stadmannia. Cult. 1820. Tree 60 feet.

Cult. Trees with very shewy, large, pinnate leaves. They will thrive well in a mixture of loam and peat, or a light, loamy

soil; and ripened cuttings will root in sand under a hand-glass, in a moist heat.

XIX. MATA'YBA (*Matabaiba* is the name of *M. Guianénsis* in Guiana). Aubl. guian. 1. p. 331. t. 128. Matàyba, D. C. prod. 1. p. 609.—Ernstíngia, Neck. elem.—Ephièlis, Schreb. gen. no. 647.

Lin. syst. *Octándria, Monogýnia.* Calyx 5-cleft. Petals 5, each furnished with a short appendage above the base on the inside. Disk filling the bottom of the calyx, 8-crenate. Stamens 8, with villous filaments inserted between the margin of the disk and ovary. Style none. Stigma subsessile, 3-toothed. Ovary 2-celled; cells 1-ovulate. Capsule oblong, 1-celled, 2-valved, one of which is empty, the other 2-seeded on the inside at the middle. Seeds arillate, reniform.—Trees with exstipulate, abruptly pinnate leaves, and racemose panicles of small white flowers.

1 M. Guiane'nsis (Aubl. guian. 1. p. 331. t. 128. Lam. ill. t. 298.) leaves smooth, abruptly pinnate, with 3 or 4 pairs of leaflets; petiole not winged; racemes panicled. ♄. S. Native of Guiana and St. Domingo in woods. Ephièlis fraxínea, Willd. spec. 2. p. 328. Ephièlis Guianénsis, Pers. ench. 1. p. 413. Panicle divaricate. The wood of this tree is considered useful for many purposes, being hard and durable.

Guiana Matayba. Fl. Oct. Clt. 1803. Tree 60 feet.

2 M. Patrisia'na (D. C. prod. 1. p. 609.) leaves impari-pinnate; leaflets 5, villous beneath; petioles slightly winged; racemes simple. ♄. S. Native of Guiana or Cayenne. Fruit very like that of the first species, but differs from it in the impari-pinnate leaves.

Patris's Matayba. Clt. 1825. Tree 50 feet.

Cult. These trees will thrive well in a mixture of loam and peat; and ripened cuttings, not deprived of any of their leaves, will root in sand under a hand-glass, in heat.

XX. NEPHE'LIUM (one of the names given to the *Burdock* by the ancients; the present genus has rough fruit, which has some resemblance to the *Burdock*). Lin. gen. no. 1425. Euphòria, Comm. in Juss. gen. 247.—Dimocárpus, Lour. fl. coch. 1. p. 286.—Scytàlia, Gært. fruct. 1. p. 197.—Aporètica, spec. D. C.—Pomètia, Forst. prod. 392.

Lin. syst. *Octo-Decándria, Monogýnia.* Calyx 5-6-toothed. Petals 5-6, rarely wanting, densely pilose inside. Disk annular, occupying the bottom of the calyx. Stamens 8-10, rarely 6, inserted between the margin of the disk and the ovary. Style crowned by a 2-lobed or bifid stigma. Ovary obcordate, didymous, 2-celled. Fruit indehiscent, usually 1-lobed from abortion, the other lobe being usually abortive, tubercled or muricated, rarely smooth. Seeds thick, covered by a fleshy aril. Embryo straight.—Trees with abruptly-pinnate, exstipulate leaves, rarely simple; leaflets opposite or alternate. Flowers disposed in racemose panicles or racemes. Fruit of all eatable.

1 N. Litchì (Cambess. in mem. mus. 18. p. 30.) leaflets 3-4 pairs, tapering to both ends, lanceolate, glaucous beneath; racemes loose, forming a panicle; berries cordate, scaly. ♄. G. Native of the East Indies and China. Euphòria punícea, Lam. dict. 3. p. 573. ill. t. 306. Euphòria Litchì, Desf. cat. 159. Litchì Chinénsis, Sonn. itin. t. 129. Scytàlia Chinénsis, Gært. fruct. t. 42. f. 3. Scytàlia Loacán, Roxb. hort. beng. p. 28. Dimocárpus Lychì, Lour. fl. coch. 233. Sapíndus édulis, Ait. hort. kew, ed. 1. vol. 2. p. 36. Dimocárpus Litchì, Willd. spec. 2. p. 346. La-tjì, Osb. itin. 192. english edition, 1. p. 308. Li-tchì, Du Halde, chin. 2. p. 144. t. 154. Lechèa, Rich. hist. de Tonquin, 1. p. 60.—Zann. hist. 147. t. 108. Flowers pale. The berries grow in loose racemes; they are heart-shaped, covered with a scaly, hardish rind, which is red on one side and green on the other, containing a delicious white, sweet, subacid pulp, and a large, somewhat obovate, brownish seed. This delicious fruit is about the size of a date; it is said to be dangerous when eaten to excess, occasioning an eruption over the whole body. The Chinese suffer it to dry till it becomes black and shrivelled like prunes. Thus it is preserved all the year, and they use it in tea, to which it communicates an acidity which they prefer to the sweetness of sugar. Loureiro says, the tree is cultivated in great abundance in the southern provinces of China and the northern provinces of Cochin-china, being equally abhorrent both of cold and heat in the extreme. To enjoy the fruit in its full perfection of flavour and smell, it must be eaten in the provinces of Fo-ki-en, Quan-tong, and Quan-si, where it grows. As it will not bear the climate of Pekin, the fruit is carried there for the emperor's use, inclosed in tin vessels, filled with spirits mixed with honey, &c., and thus preserves an appearance of freshness, but loses much of its flavour. The trees themselves are also transported by water from Quan-tong to Pekin for the emperor at considerable labour and expense to his subjects, and being embarked when they begin to flower, the fruit is commonly ripe by the time of their arrival at Pekin. The fruit is called *Li-tchì*, *Lichì*, or *La-tjì* by the Chinese.

Litchi Nephelium. Fl. May, June. Clt. 1786. Tree 15 ft.

2 N. longa'num (Cambess. in mem. mus. 18. p. 30.) leaflets 3 pairs, with strong pinnate nerves beneath; panicle loose; berries globose, almost smooth. ♄. G. Native of China and Cochin-china. Scytàlia Longán, Roxb. hort. beng. p. 29. Dimocárpus Longán, Lour. fl. coch. 233. Euphòria Longàna, Lam. dict. 3. p. 574.—Buchoz. icon. col. t. 99. This tree is also cultivated in China and Cochin-china for its fruit, which is in great esteem among the Chinese, and if not so agreeable to the taste as the *Litchì*, it is however said to be more wholesome. It is globular, has a yellowish, smooth skin, and its pulp is white, tart, and juicy. This fruit is called by the Chinese *Longan*, *Lang-an*, *Long-yen*, or *Laong-uhan*.

Longan Nephelium. Fl. May, June. Clt. 1786. Tree 20 ft.

3 N. infórme (Cambess. in mem. mus. 18. p. 30.) leaflets? panicles few-flowered; berries usually twin, irregular, tubercled. ♄. G. Native of Cochin-china in woods. Euphòria infórmis, D. C. prod. 1. p. 612. The leaves are almost like those of the *Longan*. The fruit of this tree is also eaten in China. It is not so good as those of the two preceding species, being much more sour. The wood is good, hard, and heavy, of a reddish-brown colour.

Unsightly-shaped-fruited Nephelium. Tree 20 feet?

4 N. lappa'ceum (Lin. syst. 4. p. 236.) leaflets 5-7, oblong; berries subovate, hairy. ♄. S. Native of the East Indies. Lam. ill. t. 764. Marsd. sum. with a figure. Euphòria Nephèlium, D. C. prod. 1. p. 612. Dimocárpus crinìta, Lour. fl. coch. 234. Scytàlia Ramboótan, Roxb. hort. beng. p. 29. Petals absent. Calyx 5-6-cleft. Stamens 5-8. The pulp of the fruit is eatable, of an agreeable sub-acid flavour, though not so good as the *Longan* or *Litchì*; it is usually twin. This is the Rambutan or Rampostan of Bont. jav. f. 109.

Burdock-fruited Nephelium or Rambootan. Tree.

5 N. pinna'tum (Cambess. in mem. mus. 18. p. 30.) leaves pinnate; racemes supra-decompound, terminal. ♄. S. Native of the Islands of Tanna and Namoka. Pomètia pinnàta, Forst. prod. p. 392.

Pinnate-leaved Nephelium. Tree.

6 N. Bengale'nse; leaves with 4-5 pairs of oblong-lanceolate leaflets, which are oblique at the base; panicle terminal, composed of many racemes. ♄. S. Native of Bengal. Scytàlia Bengalénsis, Roxb. in herb. Lamb.

Bengal Nephelium. Tree.

7 N. verticilla'tum (Lindl. bot. reg. 1059. under *Euphòria*,)

leaves simple, obovate-lanceolate, auricled at the base; ovary didymous, with 2 styles between; stamens 8, monadelphous at the base; sepals unequal; flowers in terminal, panicled racemes; ovary surrounded by 8 glands. ♄. S. Native of the Moluccas. Scytàlia verticillàta, Roxb. hort. beng. p. 29. Flowers small, white tinged with red.

Whorled-leaved Nephelium. Fl. June. Clt. 1821. Shrub 6 ft.

† *Species only known by name from Roxb. hort. beng. p. 29. and 88. under the genus Scytàlia.*

8 N. RIMÒSUM. Roxb. Silhet. p. 29.
9 N. DANU'RA. Roxb. Chittagong. p. 29.
10 N. RU'BRUM. Roxb. Silhet. p. 29.
11 N. PARVIFLÒRUM. Roxb. Moluccas. p. 88.
12 N. OPPOSITIFÒLIUM. Roxb. Moluccas, p. 88.

Cult. This is a genus of fine trees, for the most part bearing delicious fruit. They will grow well in a mixture of loam and peat. Cuttings taken off from ripened wood, planted in sand under a hand-glass, in a moderate heat, will root.

XXI. THOUI'NIA (in honour of Andre Thouin, professor of agriculture in the Jardin des Plantes of Paris, editor of the agricultural part of the Encyclopedie Methodique; died in 1820.) Poit. ann. mus. 3. p. 70. t. 6. D. C. prod. 1. p. 612. but not of Thunb. nor Smith.

LIN. SYST. *Octo-Decándria, Monogýnia.* Calyx 4-5-parted. Petals 4-5, naked inside. Disk occupying the bottom of the calyx, regular, crenulated. Stamens 8-10, inserted between the margin of the receptacle and the ovary. Style trifid, with the segments longitudinally stigmatose inside, immersed between the lobes of the ovary. Fruit constantly of 3 carpels, adnate to the central axis, drawn out into a membranous wing at the apex and back, 1-celled, 1-seeded at the base. Seeds destitute of aril.—Trees or shrubs, rarely furnished with tendrils, with exstipulate, abruptly-pinnate, trifoliate, rarely simple leaves. Flowers small, white.

* *Leaves simple.*

1 T. SIMPLICIFÒLIA (Poit. ann. mus. 3. p. 71. t. 6.) leaves coarsely serrate-toothed, rather tomentose beneath; racemes simple. ♄. S. Native of St. Domingo. Racemes axillary, a little shorter than the leaves. Leaves resembling those of the sweet chesnut, but narrower.

Simple-leaved Thouinia. Shrub 8 feet.

2 T. INTEGRIFÒLIA (Spreng. neue. entd. 2. p. 155.) leaves quite entire, smooth on both surfaces; racemes panicled. ♄. S. Native of Brazil. Leaves discoloured beneath. Panicle terminal, flaccid.

Entire-leaved Thouinia. Tree small.

* * *Leaves trifoliate.*

3 T. TRIFÒLIATA (Poir. ann. mus. 3. p. 72. 5. t. 27.) leaflets almost sessile, oval, tapering to the base, somewhat serrated, smooth, but pilose in the axils of the veins beneath; racemes simple, terminal. ♄. S. Native of St. Domingo about Fort Dauphin.

Trifoliate-leaved Thouinia. Shrub 8 feet.

4 T. TOMENTO'SA (D. C. prod. 1. p. 612.) leaflets elliptical-oblong, serrated, smooth above, but clothed with white velvety tomentum beneath; racemes simple. ♄. S. Native of St. Domingo. Leaves and carpels one-half smaller than those of the preceding species.

Tomentose-leaved Thouinia. Tree small.

5 T.? VILLO'SA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 612.) leaflets ovate, serrated at the apex, acute, villous; racemes panicled. ♄. S. Native of New Spain about Quaunahuaca. Carpels 3, distinct to the base, therefore it will probably form a distinct genus.

Villous-leaved Thouinia. Tree small.

6 T. SCA'NDENS (St. Hil. fl. bras. 1. p. 384.) leaves trifoliate; leaflets oblong, tapering to both ends, acuminated, smooth, furnished with 1 or 2 teeth on one side; racemes axillary, often converted into tendrils. ♄. ◡. S. Native of Brazil in the province of Rio Janeiro. Petals greenish-white.

Climbing Thouinia. Shrub cl.

* * * *Leaves pinnate.*

7 T. PINNA'TA (Turp. ann. mus. 5. p. 401. t. 26.) leaflets oblong, rather emarginate; flowers in terminal panicles, with 5 petals and 8 stamens. ♄. S. Native of St. Domingo between Monte-Christi and San-Yago.

Pinnate-leaved Thouinia. Clt. 1823. Shrub 8 feet.

8 T. POLY'GAMA (Meyer. prim. esseq. 156.) leaflets oblong-ovate; flowers polygamous, racemose, villous, with 4 petals and 8 stamens. ♄. S. Native of Guiana in sandy woods.

Polygamous-flowered Thouinia. Tree 14 feet.

9 T. DECA'NDRA (H. B. et Kunth, pl. equin. 1. p. 198. t. 56.) leaflets 6 pairs, lanceolate, toothed; flowers panicled, with 5 petals and 10 stamens. ♄. S. Native of Mexico about Acapulca.

Decandrous Thouinia. Tree 18 feet.

Cult. These trees will succeed well in a mixture of sandy loam and peat, and cuttings taken off from ripened wood will root in sand under a hand-glass, in heat.

XXII. HYPELA'TE (a name given by Pliny to *Ruscus;* it comes from *ὑπο, hypo,* under, and *ελατη, elate,* a fir-tree; habitat of original plant). Browne, jam. 208. Swartz, fl. ind. occ. 2. p. 653. t. 14. D. C. prod. 1. p. 614.—Melicócca species, Juss. in mem. mus. vol. 3.

LIN. SYST. *Octo-Decándria, Monogýnia.* Calyx 5-parted. Petals 5 or wanting, naked inside. Disk occupying the bottom of the calyx, nearly entire or lobed. Stamens 8-10, inserted between the margin of the disk and ovary. Style very short, crowned by a somewhat 2-3-lobed stigma. Ovary 2-3-celled; cells 2-3-ovulate. Fruit nearly dry, indehiscent, 1-2-celled from abortion. Seeds pendulous, destitute of aril?—Trees with exstipulate, trifoliate, or abruptly-pinnate leaves; leaflets opposite or alternate. Flowers small, white, glomerate, or disposed in short panicles.

1 H. TRIFOLIA'TA (Swartz, fl. ind. occ. 2. p. 655.) leaves trifoliate; leaflets coriaceous, obovate, with rather marginate petioles; panicles terminal, rather corymbose; petals 5. ♄. S. Native of the south of Jamaica on cretaceous hills. It is also said to be common in the low lands. A smooth shrub, with leaves like those of *Toddàlia* or *Lignum-vitæ*, but without dots. The stem is beset with leaves at intervals. This shrub is probably *Amýris lypelàla* of Rob. in Lunan. hort. jam. 1. p. 149.

Trifoliate Hypelate. Shrub 9 feet.

2 H. PANICULA'TA (Cambess. in mem. mus. 18. p. 32.) leaves with 2 pairs of leaflets; flowers decandrous, in terminal, corymbose panicles; petals 5. ♄. S. Native of St. Domingo. Melicócca paniculàta, Juss. mem. mus. 3. p. 187. t. 5. Fruit round, 1-seeded. Leaflets large, oblong-lanceolate, entire.

Panicled-flowered Hypelate. Clt. 1820. Tree 20 feet.

3 H. DENTA'TA (Cambess. in mem. mus. 18. p. 32.) leaves with 5 or 6 pairs of oboval leaflets, which are toothed at the apex; peduncles few-flowered, axillary; flowers octandrous; petals 5. ♄. S. Native of the Mauritian Islands. Melicócca dentàta, Juss. mem. mus. 3. p. 187. t. 6. Fruit round, 1-seeded. Leaflets small.

Toothed-leaved Hypelate. Tree 16 feet.

4 H. GENICULA'TA (Spreng. syst. 2. p. 220. under *Melicócca*,) leaves ternate or pinnate, with 2 pairs of oblong-lanceolate, acuminated leaflets; rachis knotted, jointed at the apex; panicles axillary, spreading. ♄. S. Native of Brazil. Flowers decandrous. Berry 1-seeded.

Jointed-petioled Hypelate. Tree small.

5 H. DIVERSIFO'LIA (Cambess. in mem. mus. 18. p. 32.) leaves with 1-9 pairs of oval, entire leaflets; flowers apetalous, octandrous, axillary, glomerate, 5-parted; drupe spherical, 2-seeded. ♄. S. Native of the Mauritius. Melicócca diversifòlia, Juss. mem. mus. 3. p. 187. t. 7. M. apétala, Poir. suppl. 3. p. 224. The leaves are probably sometimes simple and ovate. It is called in the Mauritius *Bois de Gaulette*.

Diverse-leaved Hypelate. Tree.

Cult. This is rather a handsome genus of shrubs. They will thrive well in a mixture of loam and peat, or any light loamy soil, and ripened cuttings will root if planted in sand under a hand-glass, in a moist heat.

XXIII. APHA'NIA (from *αφανες, aphanes*, obscure). Blum. bijdr. p. 236. Cambess. in mem. mus. 18. p. 37.

LIN. SYST. *Pentándria, Monogýnia*. Calyx 4-parted, unequal. Petals 4, ciliated, each furnished with 2 scales at the base. Disk hypogynous, girding the genitals. Stamens 5, approximating the pistil. Ovary ovate, compressed, 2-celled; cells 1-seeded. Style almost wanting, terminated by an emarginate stigma.—A tree with abruptly-pinnate leaves; leaflets nearly opposite. Panicle terminal, composed of many racemes.

1 A. MONTA'NA (Blum. l. c.) ♄. S. Native of Java.

Mountain Aphania. Tree.

Cult. A mixture of loam and sand will suit this tree, and ripe cuttings will root in sand under a hand-glass, in heat.

XXIV. MELICO'CCA (from *μελι, meli*, honey, and *κοκκος, coccos*, a berry; the taste of the fruit is very sweet). Juss. mem. mus. 3. p. 178. D. C. prod. 1. p. 614.

LIN. SYST. *Octo-Decándria, Monogýnia*. Calyx 4-5-parted. Petals 4-5, or wanting, naked inside. Disk occupying the bottom of the calyx, entire, or lobed. Stamens 8-10, inserted between the margin of the disk and the ovary. Style crowned by a 2-3-lobed stigma. Ovary 2-3-celled. Fruit baccate, 1-2-celled from abortion, 1-2-seeded. Seeds enwrapped in a fleshy substance. Embryo straight.—Trees with exstipulate, abruptly-pinnate leaves; leaflets nearly opposite. Flowers small, white, disposed in spike-formed racemes.

1 M. BI'JUGA (Lin. spec. 495.) leaves with 2 pairs of leaflets; rachis winged; racemes terminal and axillary, simple, spike-formed; flowers octandrous, of 4 petals; drupe 1-seeded from abortion. ♄. S. Native of the Antilles and of New Spain in the province of Caraccas, but is now cultivated throughout the West Indies for its fruit. M. bijugàtus, Jacq. amer. 108. t. 72. M. carpoìdea, Juss. mem. mus. 3. p. 187. t. 4. Leaflets large, yellowish-green. The male flowers are more yellow than the female. The fruit of this is as large as a bullace-plum, jet-black, with a very sweet pleasant taste. It is now known in Jamaica by the name of *bullace-plum*, but in the time of Patrick Browne the tree was called *Genip-tree*. At Curaçoa the Spaniards call it *Monos*; it is cultivated to a great extent there. It is also called *Honey-berry*.

Two-paired-leaved or Common Honey-berry. Clt. 1778. Tree 16 to 20 feet.

2 M. OLIVÆFO'RMIS (H. B. et Kunth, nov. gen. amer. 5. p. 150.) leaves with 2 pairs of large, elliptical, acute, coriaceous leaflets; rachis naked; peduncles terminal, branched; flowers octandrous, of 4 petals; drupe 1-seeded from abortion. ♄. S. Native of New Granada at Turbaco. Fruit the size and shape of an olive, jet-black, with a pleasant taste.

Olive-shaped-fruited Honey-berry. Clt. 1818. Tree 16 ft.

3 M. TRI'JUGA (Juss. in mem. mus. 3. p. 187. t. 8.) leaves with 3 pairs of oblong, obovate, obtuse leaflets; racemes axillary, elongated; flowers 6-parted, apetalous, octandrous; drupe spherical, 2-3-celled, 2-3-seeded. ♄. S. Native of the islands of Ceylon and Timor. Schleichèra trijuga, Willd. spec. 4. p. 1096. Scytàlia trijuga, Roxb. mss. Fruit black, eatable.

Three-paired-leaved Honey-berry. Clt. 1820. Tree 20 ft.

4 M.? PUBE'SCENS (Roth. nov. spec. 385.) leaves with 2 pairs of very blunt leaflets and an odd one; rachis tomentose. ♄. S. Native of the East Indies.

Pubescent-petioled Honey-berry. Tree.

Cult. Most of the species of this genus bear eatable fruits. They will thrive in a mixture of loam and peat, or a light loamy soil; and ripened cuttings will strike root in sand under a hand-glass, in heat.

Section II.

DODONÆA'CEÆ. (Cambess. in mem. mus. 18. p. 33.). Cells of ovary containing 2-3-ovulæ, rarely more (f. 112. g.). Embryo spirally twisted.

XXV. KOELREUTE'RIA (in honour of John Theophilus Koelreuter, once Professor of Natural History at Carlsrhue). Laxm. nov. comm. petrop. 16. p. 561. t. 18. but not of Murr. D. C. prod. 1. p. 616.

LIN. SYST. *Octándria, Monogýnia*. Calyx 5-parted. Petals 3-4 from abortion, each furnished at the claw inside with a 2-parted appendage. Disk very fleshy, occupying the whole bottom of the calyx, regular, 8-crenate. Stamens 8, rarely 5-6-7, inserted between the margin of the disk and the ovary. Style truncate or acutish at the apex. Ovary 3-celled; cells 2-ovulate. Capsule bladdery, 1-celled above, 3-celled at the bottom, 3-valved; valves seminiferous beneath the middle. Seeds without aril.—A deciduous tree, with exstipulate, impari-pinnate leaves; leaflets opposite or alternate, coarsely lobed or toothed. Flowers yellow, disposed in terminal, racemose, spreading panicles.

1 K. PANICULA'TA (Laxm. l. c.). ♄. H. Native of China. Sapíndus Chinénsis, Lin. fil. suppl. 228. K. Paullinoìdes, Lher. sert. 18. t. 19. K. paniculàta, Duh. ed. nov. t. 36. Ker. bot. reg. t. 320.

Panicled-flowered Koelreuteria. Fl. July, Aug. Clt. 1763. Tree 10 to 15 feet.

Cult. This beautiful tree deserves a place in every collection; when in flower it is extremely shewy. It will thrive in any common soil, but it should be planted in as sheltered a situation as possible, because it does not flower if too much exposed. If the summer prove cold, the wood seldom ripens, therefore the tops of the branches are generally killed the following winter by the frost. It may be either propagated by layers or cuttings from the root.

XXVI. COSSI'GNIA (in honour of M. Cossigny, a French naturalist, once resident at Pondicherry, who presented Commerson with an herbarium of the plants of Coromandel). Comm. in Juss. gen. 248. D. C. prod. 1. p. 614.

LIN. SYST. *Penta-Hexándria, Monogýnia*. Calyx 5-parted. Petals 4, naked inside. Disk irregular, occupying the bottom of the calyx. Stamens 5-6, inserted in the disk. Pistil excentral. Style longish, terminated by a capitellate stigma. Ovary 3-celled; cells 3-ovulate. Capsule 3-celled, 3-valved; cells 3, or from abortion only 2-seeded. Seeds destitute of aril, fixed to the permanent triangular centril axis.—A tree with exstipulate, impari-pinnate leaves. Flowers in panicles.

1 C. Borbo'nica (D. C. prod. 1. p. 614.). ♄. S. Native of Bourbon. Leaves impari-pinnate, sometimes with 2-3 or 1 pair of leaflets, the odd leaflet is always sessile. C. pinnàta, Lam. dict. 2. p. 132. ill. t. 256. when the leaves are pinnate. C. triphýlla, Lam. dict. 2. p. 132. when the leaves are trifoliate. Leaflets oblong, entire, somewhat scabrous above, pale tomentose beneath, with yellow veins. Flowers panicled, see Bory. voy. 2. p. 324. Ruízia aúrea, Hortul.

Bourbon Cossignia. Clt. 1811. Tree 20 feet.

Cult. This tree is known in our gardens by the name of *Ruízia aúrea*. It is generally admired on account of the orange-coloured nerves of the leaves, which give it an agreeable appearance. It will thrive in a mixture of loam and peat, or a light, loamy soil; and ripe cuttings will strike root in sand under a hand-glass, in a moist heat.

XXVII. LLAGUNO'A (in honour of Eugene de Llaguno, a Spanish amateur botanist). Ruiz et Pav. fl. per. prod. 126. t. 28. Pers. ench. 2. p. 565. D. C. prod. 1. p. 116.

Lin. syst. *Octándria, Monogýnia.* Calyx 5-cleft. Petals wanting. Disk fleshy, occupying the bottom of the calyx, 10-lobed at the apex. Stamens 8, rarely 9-10. Style incurved, terminated by a 3-lobed stigma. Capsule 3-valved, 3-celled, with a dissepiment in the middle of each valve; cells 1-2-seeded; seeds destitute of aril.—Trees with exstipulate, trifoliate leaves, or usually simple from abortion. Flowers disposed in short, few-flowered, axillary racemes.

1 L. nítida (Ruiz et Pav. fl. per. prod. 126. t. 28.) leaves smooth, serrated, acute, undivided, or furnished on each side with a lobe at the base, and they are therefore somewhat ternate. ♄. S. Native of Peru in woods. Amiròla nítida, Pers. ench. 2. p. 565. Peduncles trifid; lateral branches usually abortive. The seeds of this plant are black and shining, and are used for forming necklaces by the natives of Peru.

Shining-seeded Llagunoa. Shrub 9 feet.

2 L. prunifòlia (H. B. et Kunth, nov. gen. amer. 5. p. 131.) leaves ovate-elliptical, sharply toothed, smooth above, hairy beneath, with the nerves and veins tomentosely hairy. ♄. S. Native of Peru near Loxa. Amiròla prunifòlia, D. C. prod. This is probably only a variety of the preceding. Seeds perhaps used for the same purpose.

Plum-leaved Llagunoa. Shrub 8 feet.

3 L. mo'llis (H. B. et Kunth, l. c.) leaves elliptical, serrated, hairy above, but clothed with hoary tomentum beneath. ♄. S. Native of Peru near Loxa. Amiròla móllis, D. C. prod. 1. p. 616.

Soft-leaved Llagunoa. Shrub 10 feet.

4 L. glandulòsa; leaves stalked, trifoliate; leaflets elliptical, serrated, dotted with black glands on both surfaces. ♄. G. Native of Chili at Coquimbo. Amiròla glandulòsa, Hook, in bot. Beech. voy. p. 12. Calyx 5-cleft. Petals wanting. Stamens 8. Ovary ovate, trigonal. Stigma oblong, sessile.

Glandular Llagunoa. Shrub.

Cult. These shrubs will thrive in a mixture of loam and peat or sandy loam; and ripened cuttings will root in sand under a hand-glass, in a moderate heat.

XXVIII. DODONÆ'A (in honour of Rambert Dodoens, more generally known by the name of Dodonæus, physician to Maximilian II. and Rudolph II., author of Historia Plantarum, in 6 pemptades, that is to say, in 6-times 5 books. This work has been translated into French by L'Ecluse or Clusius; he died in 1585). Lin. gen. ed. 1. no. 855. D. C. prod. 1. p. 616. but not of Plum.

Lin. syst. *Octo-Decándria, Trigýnia.* Calyx 4-5, rarely 5-parted (f. 112. *a.*). Petals wanting. Disk hypogynous, usually vanished. Stamens 8, rarely 9-10, inserted in the disk or receptacle. Style 2-3 (f. 112. *d.*), rarely 4-cleft, with the segments longitudinally stigmatose inside. Capsule 2-3-4-sided, 2-3-4-celled, opening by 2-3-4 valves at the dissepiments, not as in the rest of the order at the cells; valves keeled, winged (f. 112. *f.*). on the back. Central axis 2-3-4-angled, 2-3-4-winged. Seeds destitute of aril.—Shrubs with exstipulate, simple or pinnate leaves. Flowers small, greenish-yellow.

* *Leaves lanceolate or spatulate.*

FIG. 112.

1 D. viscòsa (Lin. mant. 238. exclusive of many of the synonymes. Meyer. prim. essequeb. p. 157.) leaves obovate-oblong, cuneated at the base, clammy; flowers racemose; fruit 2-3-winged, on longer pedicels. ♄. G. Native of South America, and the Caribbee Islands, as well as of Guinea at Waree in sandy places.—Plum. ed. Burm. t. 247. f. 2.—Sloane, hist. 2. t. 162. f. 3. —Rumph. amb. 4. t. 50.—Pluk. phyt. t. 142. f. 1. There are varieties of this plant with acutish, blunt, and emarginate leaves; capsules at both ends profoundly emarginated, 7 or 9 lines long and 8 or 12 broad (see Kunth, nov. gen. amer. 5. p. 134.) There are probably many species confounded here. D. viscòsa, Forst. prod. 27. ex D. viscòsa, spatulàta and tríquetra, according to Sir James Smith are constantly confused together.—Ptèlea viscòsa, Lin. spec. 173. Mill. dict. no. 2. The taste of the whole plant is sour and bitterish, hence it is called in Jamaica *Switch-sorrel.*

Clammy Dodonæa. Fl. June, July. Clt. 1690. Shrub 6 ft.

2 D. spatula'ta (Smith, in Rees' cycl. vol. 12. no. 2.) leaves lanceolate-obovate, clammy; sepals ovate, acute, naked; flowers dioecious. ♄. G. Native of the Sandwich Islands. The plant is smaller than *D. viscòsa.*

Spatulate-leaved Dodonæa. Shrub 4 feet.

3 D. attenua'ta (Cung. in Field's New South Wales, p. 352.) leaves linear-spatulate, covered with scabrous dots, tapering to the base, with revolute, denticulated margins, rounded, acute, and quite entire at the apex; racemes lateral and terminal. ♄. G. Native of New Holland in the channel of Cox's River.

Attenuated-leaved Dodonæa. Clt. 1824. Shrub 2 to 3 feet.

4 D. Jamaice'nsis (D. C. prod. 1. p. 616.) leaves oblong-lanceolate, tapering to both ends, with the margins somewhat revolute, rather clammy; flowers disposed in short racemes; fruit shorter than the pedicel. ♄. G. Native of the colder parts of Jamaica.—Browne, jam. t. 18. f. 1. D. angustifòlia, Swartz, obs. 150. D. viscòsa, Cav. icon. t. 327. Carpels 3-winged. The whole plant is sour and bitterish, it is also called *Switch-sorrel* in Jamaica.

Jamaica Dodonæa. Fl. June, Jul. Clt. 1810. Shrub 6 ft.

5 D. biala'ta (H. B. et Kunth, nov. gen. amer. 5. p. 134. t. 442.) leaves lanceolate, tapering to both ends, clammy; racemes somewhat branched; fruit constantly 2-winged, length of pedicel. ♄. S. Native of South America in New Spain near Cumana, as well as of Guinea not far from the Gambia, in sandy places, particularly near Bathurst.

Two-winged-fruited Dodonæa. Fl. May, July. Clt. 1822. Shrub 4 feet.

6 D. Burmannia'na (D. C. prod. 1. p. 616.) leaves oblong, cuneated at the base, acutish, clammy; flowers racemose; fruit longer than the pedicels. ♄. S. Native of the East Indies,

particularly in the islands of Ceylon and Timor.—Burm. zeyl. t. 23. Ptèlea viscòsa, Burm. ind. 36. D. angustifòlia, Roxb. hort. beng. p. 28. Leaves sometimes obtuse, sometimes acutish. Capsules 6 lines long and 9 broad.

Burmann's Dodonæa. Fl. June, July. Clt. 1758. Sh. 5 ft.

7 D. microca'rpa (D. C. prod. 1. p. 617.) leaves oblong-linear, tapering to the base, but blunt at the apex or emarginate; flowers racemose; fruit shorter than the pedicel. ♄. S. Native of the Island of Bourbon. Lam. ill. t. 304. f. 2. Leaves 3 lines broad. Capsules 3 lines long and 4 broad.

Small-fruited Dodonæa. Fl. May, July. Clt. 1818. Sh. 4 ft.

8 D. salicifòlia (D. C. prod. 1. p. 617.) leaves oblong-linear, acuminated at both ends, clammy; flowers racemose; fruit? ♄. G. Native of New Holland? D. angustifòlia, Lam. dict. 3. p. 292. Cultivated in the gardens of France under the name of *Bois de Reinette*. Leaves sweet-scented, 4 lines broad.

Willow-leaved Dodonæa. Fl. May, Jul. Clt. 1820. Sh. 4 ft.

9 D. laurì'na (Sieb. in Spreng. syst. app. p. 152.) leaves oblong-lanceolate, smooth, tapering to both ends; branches round; branchlets 2-edged; flowers in axillary cymes. ♄. G. Native of New Holland.

Laurel-like Dodonæa. Fl. June, July. Clt. 1820. Sh. 4 ft.

10 D. dioíca (Roxb. hort. beng. p. 28. D. C. mem. soc. genev. 1. p. 445.) leaves obovate-oblong, cuneated at the base, acute at the apex, never clammy; young branches compressed, adult ones round; flowers dioecious, racemose. ♄. S. Native of the East Indies, particularly in Hindostan. D. oblongifòlia, Link, enum. 1. p. 381.? D. heterophýlla, Hortul. Very like the following species. Perhaps the figure in Rumph. amb. 4. t. 50. is referable to this or to *D. triquetra*.

Dioecious-flowered Dodonæa. Fl. June, July. Clt. 1819. Shrub 4 feet.

11 D. trí'quetra (Andr. bot. rep. t. 231.) leaves lanceolate, tapering to both ends; branchlets triquetrous; flowers dioecious, racemose; fruit with narrow wings, shorter than the pedicel. ♄. G. Native of New Holland.

Three-sided-branched Dodonæa. Fl. Ju. Jul. Clt. 1790. Sh. 4 ft.

12 D. cunea'ta (Smith, in Rees' cycl. no. 5. Rudge, Lin. trans. 11. p. 296. t. 19.) leaves oblong, wedge-shaped, 3-toothed at the apex; branchlets hardly angular; flowers in short panicles. ♄. G. Native of New Holland about Port Jackson. Fruit almost like that of *D. viscòsa*.

Wedge-leaved Dodonæa. Fl. June, July. Clt. 1816. Sh. 3 ft.

13 D. asplenifòlia (Rudge, in Lin. trans. vol. 11. p. 297. t. 20.) leaves oblanceolate, tapering to the base, 3-toothed at the apex, clammy; flowers somewhat racemose; branches triquetrous. ♄. G. Native of New Holland about Port Jackson.

Spleen-wort-leaved Dodonæa. Fl. June, July. Clt. 1816. Shrub 4 feet.

14 D. umbella'ta; leaves lanceolate, coriaceous, tapering to both ends; flowers terminal, umbellate. ♄. G. Native of New Holland (v. s. herb. Lamb.).

Umbellate-flowered Dodonæa. Shrub 2 to 4 feet.

15 D. Ki'ngii; leaves oblong-lanceolate, tapering to both ends, coriaceous; flowers in short, terminal racemes; fruit small, 3-winged. ♄. G. Native of New Holland (v. s. herb. Lamb.).

King's Dodonæa. Shrub 2 to 4 feet.

16 D. confe'rta; leaves obovate-lanceolate, mucronate, tapering to the base; racemes short, crowded. ♄. G. Native of Van Diemen's Land (v. s. herb. Lamb.).

Crowded-flowered Dodonæa. Shrub 1 to 4 feet.

17 D. lóngipes; leaves oblong-lanceolate, tapering to both ends, obtuse, mucronate; racemes short, axillary; pedicels long; fruit 3-winged. ♄. G. Native of New Holland. Fruit dark-purple, with greenish-yellow wings (v. s. herb. Lamb.).

Long-pedicelled Dodonæa. Shrub 2 to 4 feet.

18 D. erioca'rpa (Smith, in Rees' cycl. no. 6.) leaves elliptic-lanceolate, wavy; branches and fruit beset with long hairs; sepals elliptical, reflexed. ♄. G. Native of the Sandwich islands on the mountains.

Hairy-fruited Dodonæa. Shrub 4 feet.

19 D. elæagnoìdes (Rud. in Schrad. neu. journ. 2. p. 392.) leaves oblong-ovate, clothed with scaly scurf above. ♄. S. Native of St. Domingo.

Elæagnus-like Dodonæa. Fl. June, Jul. Clt. 1800. Sh. 4 ft.

20 D.? serrula'ta (D. C. prod. 1. p. 617.) leaves elliptical-oblong, stalked, serrulated, coriaceous, smooth; capsules coriaceous, 3-winged. ♄. G. Native of Monte Video.

Serrulated-leaved Dodonæa. Shrub 4 feet.

* * *Leaves linear, filiform.*

21 D. ericæfòlia; leaves crowded, linear, very narrow, short; flowers crowded, axillary, and terminal. ♄. G. Native of New Holland (v. s. herb. Lamb.).

Heath-leaved Dodonæa. Shrub 1 to 2 feet.

22 D. filifórmis (Link. enum. 381.) twiggy; leaves long, very narrow; pedicels axillary; fruit 3-winged. ♄. G. Native of New Holland. D. angustíssima, D. C. prod. 1. p. 617.

Filiform-leaved Dodonæa. Clt. 1820. Shrub 2 to 4 feet.

* * * *Leaves pinnate.*

23 D. multi'juga; leaflets 10-15 pairs, small, pubescent, 3-toothed at the apex; petioles interruptedly winged; panicles axillary and terminal. ♄. G. Native of New Holland (v. s. herb. Lamb.).

Many-paired-leafletted Dodonæa. Shrub 2 feet.

24 D. boroniæfòlia; leaflets 3-4 pairs, small, trifid at the apex, with the petioles winged, pubescent. ♄. G. Native of New Holland (v. s. herb. Lamb.).

Boronia-leaved Dodonæa. Shrub 1 to 2 feet.

25 D. Caleya'na; pilose; leaflets 3-4 pairs, small, ovate, with revolute edges; petioles winged. ♄. G. Native of New Holland (v. s. herb. Lamb.).

Caley's Dodonæa. Shrub 1 to 2 feet.

26 D. pinna'ta (Smith, in Rees' cycl.) leaflets 3-8 pairs, small, lanceolate, with revolute edges; fruit 3-winged; branches villous; petioles interruptedly winged. ♄. G. Native of New Holland.

Pinnate-leaved Dodonæa. Clt. 1824. Shrub 2 to 3 feet.

Cult. Dodonæ'a is a genus of trifling shrubs not worth cultivating, except in botanic gardens. They will thrive well in a mixture of loam and peat or any light soil, and cuttings will root readily in sand under a hand-glass, those of the stove species should be placed in a moderate heat.

XXIX. MAGONÆ'A (*Magon*, the name of some botanist known to St. Hilaire). St. Hil. fl. bras. 1. p. 394. Cambess. in mem. mus. 18. p. 35. Phæocárpus, Mart. fl. bras. 1. p. 62. t. 37-38.

Lin. syst. *Octándria, Monogýnia*. Calyx 5-parted, unequal. Petals 5, destitute of scales. Disk occupying the bottom of the calyx, irregular. Stamens 8, inserted in the disk. Pistil excentral. Style curved, terminated by a somewhat 3-lobed stigma. Ovary 3-celled; cells containing many ovulæ; ovulæ imbricate. Capsule large, woody, 3-valved, many-seeded. Seeds large, flat, girded by a wing. Embryo straight, very flat. Cotyledons large, suborbicular.—Trees with exstipulate, abruptly pinnate leaves, and racemose panicles of flowers.

1 M. pube'scens (St. Hil. fl. bras. 1. p. 394. pl. rem. bras. 1. p. 239. t. 23 and 24.) branches pubescent; leaflets ovate or oblong-elliptic, profoundly emarginate, pubescent; flowers racemose; ovaries egg-shaped. ♄. S. Native of Brazil in the

province of Minas Geraes, where it is called *Pao de Tinguy*. Phæocárpus campéstris, Mart. fl. bras. 1. p. 62. t. 37-38. Flowers yellowish-green.

Pubescent Magonæa. Tree 30 feet.

2 M. GLABRA'TA (St. Hil. fl. bras. 1. p. 395. pl. rem. bras. 1. p. 241.) branches smooth; leaflets oblong-elliptic, emarginate, mucronulate, smoothish; flowers panicled; ovaries egg-shaped. ♄. S. Native of Brazil with the last.

Smooth Magonæa. Tree 30 feet.

Cult. A mixture of loam and sand will answer the species; and ripe cuttings, not deprived of their leaves, will root readily in sand, under a hand-glass, in heat.

XXX. ALE'CTRYON (from *αλεκτρυων, alectryon*, a cock, in allusion to the wing of the fruit having a crest like a cock-comb). Gært. fruct. 1. p. 216. t. 46.

LIN. SYST. *Octándria, Monogýnia*? Flowers unknown. Berry coriaceous, globose, 1-celled, with the margin at the apex crested or winged. Receptacle a small tubercle above the base of the loculament at the crested side of the berry. Seed erect, without albumen, girded by an incomplete aril, fixed to the base of the cell. Cotyledons spirally convolute, and with the radicle pointing downwards as in *Dodonæ'a*.—Trees or shrubs with simple leaves.

1 A. EXCE'LSUM (Gært. l. c.) fruit with a crested wing at the apex. ♄. S. Native of? Euonymoìdes excélsa, Sol. in coll. Banks.

Tall Alectryon. Tree or shrub.

2 A.? CANE'SCENS (D. C. prod. 1. p. 617.) fruit edged around with a wing. ♄. G. Native of New Holland on the eastern coast. Leaves oblong, obtuse, clothed with very close-pressed pubescence. Racemes axillary, length of leaves. Fruit almost like that of *Samerària*. Style connected on both sides to the wing of the fruit. Seed oblong, thick.

Hoary Alectryon. Tree or shrub.

Cult. *Aléctryon* is a genus which is hardly known; but we should recommend the same culture and mode of propagation as that given to *Dodonæ'a*, should the plants ever be introduced to the gardens.

† *Genera not sufficiently known, but evidently belonging to Sapindàceæ.*

XXXI. EYSTATHE'S (from *ευσταθης, eystathes*, stable, durable; in allusion to the hardness and durability of the wood). Lour. fl. coch. p. 235. D. C. prod. 1. p. 618.

LIN. SYST. *Octándria, Monogýnia*. Calyx of 5 sepals. Petals 5, equal in length with the calyx. Stamens 8. Ovary roundish. Style filiform. Stigma blunt. Berry globose, fleshy, 1-celled, 4-seeded.—A large tree with simple leaves, and racemes of small, white flowers.

1 E. SYLVE'STRIS (Lour. l. c.). ♄. G. Native of Cochin-china on the mountains. Valentínia sylvéstris, Raeusch. Leaves ovate-oblong, acuminated, quite entire, smooth. Branches spreading. The wood is hard and durable, and is used for building in Cochin-china.

Wild Eystathes. Tree 60 feet.

Cult. This tree will no doubt thrive well in a mixture of loam and peat; and ripened cuttings will probably root in sand under a hand-glass, in a moderate heat.

XXXII.? RACA'RIA (*Racari*, the name of the tree in Guiana). Aubl. guian. suppl. t. 24. f. 382. D. C. prod. 1. p. 618.

LIN. SYST. *Octándria, Monogýnia?* Flowers unknown. Drupe ovate, 1-celled, containing 3 oblong, trigonal nuts, enwrapped in a brittle covering.—A tree with abruptly pinnate leaves and a spiny trunk.

1 R. SYLVA'TICA (Aubl. l. c.). ♄. S. Native of Guiana in woods at the bottom of Serpent Mountain. Trunk beset with large spines above the cicatrices of the leaves. The wood is hard and durable. Leaves with 3 pairs of entire leaflets.

Wood Racaria. Shrub 8 feet.

Cult. This tree is very little known, but if ever it should be introduced to the gardens we would recommend that it should be grown in a mixture of loam and peat; and ripened cuttings to be planted in sand and a hand-glass placed over them, in a moist heat.

XXXIII. VALENTI'NIA (in honour of Michael Berhard Valentini, a German botanist, author of Prodromus Historiæ Hessiæ, published in the year 1707.). Swartz, fl. ind. 687. t. 14. D. C. prod. 1. p. 618.

LIN. SYST. *Octándria, Monogýnia*. Calyx 5-parted, coloured, spreading, permanent. Petals wanting. Stamens 8. Ovary roundish. Style 1. Capsule baccate, pulpy inside, opening at length into 3 or 4 revolute valves. Seeds 3-4, oblong. This genus is referable to *Sapindàceæ*, from the analogy of the leaves, with *Thouínia simplicifòlia*, and deficient of petals as in *Schleichèra* and *Llagunòa*.

1 V. ILCIFÒLIA (Swartz, l. c.). ♄. S. Native of Hispaniola and Cuba, on the most sterile rocks towards the sea. Leaves alternate, like those of the *holly*, but are more oblong, but probably they are more like those of *Thouínia simplicifòlia*. Flowers scarlet, disposed in umbels.

Holly-leaved Valentinia. Shrub 3 feet.

Cult. This beautiful shrub will probably grow in a mixture of sand and loam; and ripened cuttings will perhaps root in sand under a hand-glass, in heat.

XXXIV. PEDICE'LLIA (from *pedicellus*, a pedicel; seeds seated on pedicels). Lour. fl. coch. p. 655. D. C. prod. 1. p. 618.

LIN. SYST. *Polygàmia, Dioècia*. Flowers polygamo-dioecious. Calyx 5-parted; lobes small, acute. Petals wanting. Stamens 8. Ovary roundish, stalked. Style almost wanting. Stigmas 3, somewhat reflexed. Capsules 3-valved. Seed 1, seated on a proper pedicel.—A small tree, with opposite, lanceolate, quite entire leaves, and terminal racemes of small, whitish flowers. The order to which this plant really belongs is extremely doubtful, on account of the opposite leaves.

1 P. OPPOSITIFÒLIA (Lour. l. c.). ♄. G. Native of Cochin-china in woods. The nectary or disk is 5-crenate.

Opposite-leaved Pedicellia. Tree 16 feet.

Cult. This tree will grow in a mixture of loam and peat; and ripened cuttings will root in sand under a hand-glass.

XXXV. PIERA'RDIA (in honour of Mr. Pierard, of Kew). Roxb. hort. beng. p. 28.

LIN. SYST. *Octándria, Monogýnia*. Flowers monoecious. Calyx 4-parted, tomentose. Petals wanting? Stamens 8. Style crowned by 3 stigmas. Berry globose, 3-celled, 3-seeded. —A tree with alternate, simple, ovate-lanceolate, coriaceous leaves, and racemes of yellow flowers. Fruit eatable.

1 P. DU'LCIS (Jack, mal. misc.). ♄. S. Native of Sumatra and Chittagong. P. sápida, Roxb. hort. beng. l. c.

Sweet Pierardia. Clt. 1820. Tree 30 feet.

Cult. A mixture of loam and sand will suit this tree well; and ripened cuttings will root in sand under a hand-glass, in heat.

ORDER L. HUMIRIA'CEÆ (plants agreeing with *Humìrium* in many important characters). St. Hil. fl. bras. 2. p. 87.

Calyx 5-cleft. Petals 5, alternating with the lobes of the calyx. Stamens hypogynous, double, quadruple, and multiple the number of the petals, monadelphous at the base, drawn out beyond the anthers, which are short and 2-celled. Style simple, crowned by a lobed stigma. Ovary free, for the most part girded by an annular disk at the base, 5-celled; cells 1-2-ovulate. Fruit drupe-formed, containing a 5-celled nut, or fewer from abortion; cells 1-2-seeded. Integument of seed membranous. Embryo straight, oblong, within a fleshy albumen.—Trees and shrubs, abounding in resinous juice, with alternate, simple, coriaceous, exstipulate leaves, and axillary corymbs of flowers.

Synopsis of the Genera.

1 Humi'rium. Stamens 20, joined into a tube, alternate ones shortest, ciliated above. Annular disk 20-lobed. Stigma 5-lobed. Fruit containing a 5-celled nut. Cells 2-seeded.

2 Helle'ria. Stamens numerous, disposed in 5 bundles, connected at the base into a ring. Annular disk toothed. Stigma 5-lobed. Fruit containing a 5-celled nut, or fewer celled from abortion.

3 Sacaglóttis. Stamens 10, with the filaments connate at the base; anthers ending in a ligula. Ovary girded by a ring. Stigma depressed, rather lobed. Ovary 5-celled, with 1 pendulous ovulæ in each cell.

I. HUMI'RIUM (*Houmiri* is the name of *H. balsamíferum* in Guiana). Mart. fl. bras. 1. p. 143. t. 198 and t. 199. St. Hil. fl. bras. 2. p. 88.—Houmìri, Aubl. guian. 1. p. 564. t. 215.—Houmìria, Juss.—Humìria, D. C. prod. 1. p. 619.—Myrodéndron, Schreb. gen. no. 901.

Lin. syst. *Monadélphia, Polyándria.* Stamens 20, with the filaments connected into a tube at the base; cells of anthers drawn out. Disk annular, 20-toothed, surrounding the ovary. Stigma 5-lobed. Fruit drupe-formed, containing a 5-celled putamen; cells 2-seeded from abortion, each separated by a bony dissepiment.—Trees flowing with balsam. Leaves entire, commonly margined by small gland-like dots, with the limb running down the petiole, and even down the stem, therefore sessile. Flowers axillary and terminal, corymbose, and irregularly cymose.

1 H. parvifo'rum (St. Hil. fl. bras. 2. p. 89.) leaves short, obovate, tapering into the petiole, emarginate and mucronulate at the apex; inflorescence longer than the leaves; peduncles and petals smooth. ♄. S. Native of Brazil in the province of Rio Janeiro. Petals green.

Small-flowered Humirium. Fl. Sept. Tree.

2 H. monta'num (St. Hil. fl. bras. 2. p. 90.) leaves sessile, obovate; inflorescence shorter than the leaves; peduncles hairy; petals smooth. ♄. S. Native of Brazil in the province of Minas Geraes. Petals green.

Mountain Humirium. Tree.

3 H. balsamíferum (Aubl. guian. 1. p. 564. t. 225.) leaves ovate-oblong, half stem-clasping, with a decurrent nerve on the back; inflorescence longer than the leaves; peduncles smooth as well as the petals. ♄. S. Native of Guiana and Cayenne. Myrodéndron amplexicaúle, Willd. spec. 2. p. 1171. Bark thick, abounding in red balsamic fluid, resembling styrax in smell; after it has exuded from the bark it becomes brittle and transparent, and when burnt affords a very agreeable odour. The negroes and the natives of Guiana use the bark for the purpose of slips to make flambeaus. They also use the wood in building their houses. The resin, according to Aublet, might be used medicinally in the same manner as balsam of Peru. The tree is called *Red-wood* by the Creoles on account of the wood being red.

Balsam-bearing Humirium. Tree 40 feet.

4 H. crassifòlium (Mart. fl. bras. 2. p. 143. t. 198.) leaves coriaceous, stalked, obovate-oblong, entire; petioles winged; petals pubescent on the back. ♄. S. Native of Brazil on mount Serra de Arara-coara, on the confines of Peru. Cymes axillary, trichotomous. Flowers small, white.

Thick-leaved Humirium. Tree 8 to 12 feet.

5 H. floribu'ndum (Mart. fl. bras. 2. p. 145. t. 199.) leaves obovate or oblong, with a short acumen at the tip, emarginate, quite entire, tapering into the short petiole; branches and pedicels 2-edged; petals smooth. ♄. S. Native of Brazil in the province of Bahia. Cymes trichotomous, axillary. Flowers small, white.

Bundle-flowered Humirium. Tree 20 to 30 feet.

Cult. These elegant trees will thrive well in a mixture of loam and sand, and ripened cuttings will root in sand under a hand-glass, in heat.

II. HELLE'RIA (in honour of George Heller, professor of botany at Wurzburg). Nees et Mart. nov. act. bonn. 12. p. 40. t. 7. St. Hil. fl. bras. 2. p. 90.

Lin. syst. *Polyadélphia, Polyándria.* Lobes of calyx impressed with glandular pores on the back. Petals reflexed. Stamens numerous, disposed in 5 fascicles, alternating with the petals; filaments connected into a ring at the base; cells of anthers smooth, ending in a gland. Stigma 5-lobed. Ovary villous, 5-celled. Fruit drupe-formed; cells of putamen excavated, usually fewer than in the ovary.—Trees and shrubs, with stalked, entire leaves. Flowers terminal on the branches, usually in dichotomous cymes or corymbs. Sometimes there is a 6th cell added to the ovary.

1 H. ovalifòlia (St. Hil. fl. bras. 2. p. 91.) leaves large, ovate; peduncles hispid; petals tomentose. ♄. S. Native of Brazil in the provinces of Minas Geraes and Minas Novas. Petals greenish-white.

Oval-leaved Helleria. Fl. Aug. Shrub 6 feet.

2 H. obova'ta (Nees et Mart. nov. act. bonn. 12. p. 40. t. 7.) leaves obovate, emarginate and mucronulate at the apex; peduncles and petals smooth. ♄. S. Native of Brazil in the province of Minas Geraes. Petals greenish-white.

Obovate-leaved Helleria. Fl. Sept. Shrub 5-6-12 feet.

Cult. A mixture of loam, peat, and sand will suit these shrubs, and ripened cuttings will root in sand under a hand-glass, in heat.

III. SACAGLO'TTIS (from σακος, *sakos*, a buckler or shield, and γλωττα, *glotta*, a tongue; in allusion to the anthers being terminated by a ligula, as well as in the ovary being surrounded by a buckler-like cupula). Mart. fl. bras. 2. p. 146. Act. bonn. 12. p. 39. with a figure.

Lin. syst. *Monadélphia, Decándria.* Calyx cup-shaped, quinquefid. Petals 5, revolute. Stamens 10, with the filaments connate at the base; cells of anthers connective, drawn out into a ligula. Ovary girded by a cupula, 5-celled, each cell containing one pendulous ovula. Stigma depressed, capitate, globose, somewhat lobed.—A tree with round branches. Leaves oblong, acuminated, shining above, and pale beneath. Flowers yellowish-green, in short axillary corymbs.

1 S. Amazónica (Mart. fl. bras. 2. p. 146.) ♄. S. Native on the banks of the river Amazon.

Amazonian Sacaglottis. Tree 20 feet.

Cult. A mixture of loam, peat, and sand will suit this tree, and ripened cuttings will root in sand under a hand-glass, in heat.

ORDER LI. MELIA'CEÆ (plants agreeing with *Mèlia* in important characters). Juss. gen. 263. mem. mus. 3. p. 436. D. C. prod. 1. p. 619.

Calyx of 4 or 5 (f. 113. *a.*) sepals, but usually 4-5-toothed or 4-5-cleft (f. 115. *a.*). Petals hypogynous, equal in number with the sepals (f. 113. *b.* f. 115. *b.*), and alternating with them, each with a broad claw, usually joined together at the base, and generally valvate in the bud. Stamens double the number of the petals, very rarely equal, triple or quadruple that number, with their filaments joined together into a long-toothed tube (f. 113. *c.* f. 114. *c.* f. 115. *d.*); anthers sessile in the throat of the tube, adnate to its inner side. Ovary 1 (f. 113. *d.*). Style 1 (f. 113. *e.*), with distinct (f. 113. *d.*) or joined (f. 114. *d.*) stigmas. Fruit various, baccate (f. 114.), drupaceous (f. 113. *f.*), or capsular, many-celled, but from abortion often 1-celled, with a dissepiment in the middle of each valve. Seeds without albumen, with various-formed dicotyledonous embryos.—Tropical trees or shrubs, with alternate, exstipulate, simple or compound leaves. This order is particularly distinguished by the stamens being united into a tube, which is toothed at the apex, bearing the anthers in its throat, rarely only monadelphous at the base (f. 115. *d.*).

Synopsis of the Genera.

TRIBE I.

MELIE'Æ. *Cells of fruit 1-2-seeded. Embryo inverted. Cotyledons flat, leafy. Leaves simple or compound.*

1 GERU'MA. Calyx 5-toothed, flat. Petals 5. Stamens 5, connected into a ring at the base. Style crowned by 3 stigmas. Capsule 4-5-celled, 4-5-valved; cells 2-seeded. Seeds inserted in pulp. Leaves simple.

2 TURRÆ'A. Calyx 5-cleft. Petals 5. Stamens 10, joined into a long tube, which is 10-cleft at the apex, with the anthers inserted between the lobes. Style crowned by a thickish stigma. Capsule 5-celled, 5-valved, with a dissepiment in the middle of each valve; cells 2-seeded. Leaves simple, rarely pinnate.

3 QUIVÍSIA. Calyx 4-5-toothed. Petals 4-5, short, silky outside. Stamens 8-10, in a short tube. Stigma capitate. Capsule coriaceous, 4-5-celled, opening by 4-5 valves at the apex, with a dissepiment in the middle of each valve; cells 2-seeded. Leaves simple.

4 STRIGÍLIA. Calyx 5-toothed. Petals 5, joined at the base, silky outside. Stamens 10, joined into a tube. Drupe obovate, 3-celled, but only 1-seeded from abortion (R. et P.), 6 celled; cells 1-seeded (Cav.). Leaves simple.

5 CANE'LLA. Calyx 5-cleft (f. 113. *a.*). Petals 5 (f. 113. *b.*). Stamens 10-15 (f. 113. *c.*), joined into a tube. Stigmas 3. Drupe 3-celled, or only 1-celled from abortion; cells 1-2-seeded. Leaves simple.

6 CIPADE'SSA. Calyx 5-toothed. Petals 5. Stamens 10, connected into a tube at the base; anthers adnate inside. Capsule globose, 5-furrowed, containing a 5-celled, 5-seeded nucleus.

7 SANDO'RICUM. Calyx 5-toothed. Petals 5. Stamens 10, joined into a tube, which is 10-toothed, bearing the anthers inside. Stigmas 5, bifid. Drupe containing 5 ovate, compressed nuts, which are 2-valved at the base and 1-seeded. Leaves trifoliate.

8 ME'LIA. Calyx 5-cleft (f. 114. *a.*). Petals 5 (f. 114. *b.*). Stamens 10 (f. 114. *c.*), connected into a tube, which has 20 teeth at the apex, bearing the anthers on the inside at the throat. Ovary seated on an elevated torus. Drupe containing a 5-furrowed, 5-celled nut; cells 1-seeded. Leaves pinnate or bipinnate.

TRIBE II.

TRICHILIE'Æ. *Cells of fruit 1-2-seeded. Embryo inverted. Cotyledons thick. Leaves pinnate, trifoliate, rarely simple.*

9 TRICHI'LIA. Calyx 4-5-toothed (f. 115. *a.*). Petals 4-5 (f. 115. *b.*). Stamens 8-10 (f. 115. *d.*), sometimes distinct (f. 115. *d.*), sometimes connected into a tube, bearing the anthers at the throat inside. Capsule 2-3-valved, 2-3-celled; valves with a dissepiment in the middle of each; cells 1-2-seeded. Seeds arillate. Leaves pinnate, trifoliate or simple.

10 MI'LNEA. Calyx 5-parted. Petals 5. Urceolus with 5 anthers round its inside at the throat. Ovary 3-celled, each cell containing 1-2 ovulæ. Berry large, 3-celled, usually 1-seeded. Seed arillate.

11 GONIOSCHE'TON. Calyx 5-toothed. Petals 5. Stamens 10, joined into a tube, which is toothed at the apex, and bearing the anthers at the throat. Capsule globose, 3-4-valved, 3-4-celled. Seed solitary from abortion, without aril. Leaves impari-pinnate.

12 DYSO'XYLUM. Calyx 4-5-cleft. Petals 4-5. Stamens 8-10, connected into a tube, bearing the anthers at the throat. Capsule coriaceous, 3-4-valved, 3-4-celled; cells 1-seeded, with a dissepiment in the middle of each valve. Seed without aril. Leaves abruptly-pinnate.

13 EKEBE'RGIA. Calyx 4-cleft. Petals 4. Stamens 10, connected into a short tube, which is entire at the apex, bearing sessile anthers on the inside of the tube. Berry globose, 5-seeded. Leaves impari-pinnate.

14 GUA'REA. Calyx 4-toothed. Petals 4. Stamens 8, connected into a tube, which is toothed at the apex, bearing the anthers at the throat on the inside. Stigma capitate. Capsule 4-celled, 4-valved. Seeds solitary in the cells, arillate. Leaves abruptly-pinnate.

15 EPICHA'RIS. Calyx urceolate, irregularly 5-6-cleft. Petals 4, rarely 5. Anthers 8-10, adnate to the throat of the toothed tube. Capsule subglobose, coriaceous, 2-4-valved, 2-4-celled, with a dissepiment in the middle of each valve. Seed solitary, incompletely covered by a fleshy aril. Leaves abruptly-pinnate.

16 DIDYMOCHE'TON. Calyx of 5 sepals. Petals 5, connate with the tube of the stamens at the base. Stamens 10, with the tube elongated and 10-toothed at the apex, bearing the anthers in the throat. Capsule ovate, 2-3-celled from abortion. Seeds solitary, axarillate. Leaves impari-pinnate.

17 APHANAMI'XIS. Calyx of 5 roundish sepals. Petals 3. Stamens 6, connate into a globose tube. Capsule 2-3-valved,

2-3-celled, with a dissepiment in the middle of each valve. Seed solitary, covered with lobed aril. Leaves impari-pinnate.

18 HE'YNEA. Calyx 5-toothed. Petals 5. Stamens 10, connected into a tube, bearing the anthers at the apex. Ovary 2-celled; cells 2-ovulate. Capsule 2-valved, 1-celled, 1-seeded from abortion. Leaves impari-pinnate.

19 CHISOCHE'TON. Calyx urceolate, nearly entire. Petals 4, linear. Anthers 6, rarely 7-8, inserted in the throat of the 6-cleft tube. Capsule 2-3-celled, rarely 1-celled, 2-3-valved, with a dissepiment in the middle of each valve. Seeds covered by an incomplete, fleshy aril. Leaves impari-pinnate.

20 CARA'PA. Calyx 4-5-cleft. Petals 4-5. Stamens 8-10, connected into a tube, which is toothed at the apex, bearing the anthers at the throat on the inside. Style short, crowned by a broad stigma. Drupe 4-5, furrowed or lobed, 4-5-valved, 4-5-seeded. Seeds very large, resembling those of the Mammee apple. Leaves abruptly-pinnate.

21 CALPA'NDRIA. Calyx of 4 permanent, unequal sepals. Petals 4. Stamens 25-40; filaments distinct at the base, but joined into a cylindrical tube at the apex, bearing the anthers in its throat. Capsule woody, subglobose, 3-valved, 3-celled, with a dissepiment in the middle of each valve, each cell containing 1-2 1-seeded nuts. Seeds without aril. Leaves simple.

22 ODONTA'NDRIA. Calyx 5-toothed. Petals 5, ovate. Filaments 10, connate at the base, the 5 opposite the petals sterile. Disk none. Style short, crowned by an obtuse stigma.

Tribe I.

MELIE'Æ (plants agreeing with *Mèlia* in many important characters). D. C. prod. 1. p. 619. Cells of fruit 1 or 2-seeded (f. 113. *f.*), destitute of albumen. Embryo inverted. Cotyledons flat, leafy.—Trees or shrubs, with alternate leaves; they are simple in the 5 first genera, and compound in the 2 last.

I. GERU'MA (*djerrum* is the Arabic name of this shrub). Forsk. descr. 62. D. C. prod. 1. p. 619.

LIN. SYST. *Monadélphia, Pentándria.* Calyx flat, 5-toothed. Petals 5, lanceolate, spreading. Stamens 5, erect, joined in a thick ring at the base. Anthers trigonal. Style 1. Stigmas 3. Capsules oval, 4-5-celled, 4-5-valved. Seeds 2 in each cell, inserted in trigonal pulp. (Forsk.)

1 G. A'LBA (Forsk. l. c.) ♄ ? G. Native of Arabia about Hadie. Leaves alternate, oval-oblong, somewhat serrated. Flowers white.

White Geruma. Shrub.

Cult. This shrub will grow freely in a mixture of loam and peat, and large cuttings will strike root freely in sand under a hand-glass.

II. TURRÆ'A (in honour of George Turra, an Italian botanist, and professor of botany in the university of Padua, author of several botanical works; died in 1607). Lin. mant. no. 1306. D. C. prod. 1. p. 620.

LIN. SYST. *Monadélphia, Decándria.* Calyx 5-cleft. Petals 5, very long, strap-formed. Stamens 10, joined into a very long tube, which is 10-cleft at the apex, with the anthers at the base of the lobes, or inserted between them. Style 1. Stigma thickish. Capsules 5-celled; cells 2-seeded; valves with a dissepiment in the middle of each. Leaves simple, rarely pinnate.

1 T. VI'RENS (Lin. mant. 237.) leaves elliptical-lanceolate, acuminated, emarginate, quite smooth; calyxes and fruit silky-villous. ♄. S. Native of the East Indies among heaps of Scoria on worn out volcanoes. Smith, icon. ined. 1. t. 10. Flowers white, disposed in small axillary spikes.

Var. β? Billardièrii (D. C. prod. 1. p. 620.) leaves ovate, lanceolate, acuminated, young ones pubescent, at length becoming smooth; calyx pubescent; stigma protruding much. ♄. S. Native of the East Indian Islands. Perhaps a proper species.

Green Turræa. Clt. 1820. Tree 20 feet.

2 T. PUBE'SCENS (Willd. spec. 2. p. 555.) leaves ovate, emarginate, pubescent beneath; calyxes villous. ♄. S. Native of the Island of Hainan. Hellen, in act. holm. 1788. p. 296. t. 10. f. 3. Flowers reddish, disposed in umbels.

Pubescent Turræa. Tree 20 feet.

3 T. MACULA'TA (Smith, icon. ined. 1. t. 11.) leaves ovate, acute, smooth; calyxes ciliated; petals smooth. ♄. S. Native of Madagascar. T. glàbra, Cav. diss. 7. p. 360. t. 204. Flowers 2 or 3 inches long, disposed in lateral bundles, with pale-red petals. Leaves with pale spots, especially at the nerves beneath, deciduous.

Spotted-leaved Turræa. Tree 20 feet?

4 T. SERI'CEA (Smith, icon. ined. 1. t. 12.) leaves ovate, bluntish, downy on both surfaces; calyxes, peduncles, and petals villous. ♄. S. Native of Madagascar. T. tomentòsa, Cav. l. c. p. 361. t. 205. f. 2. Petals linear, 4 inches long, longer than the staminiferous tube. Flowers red, large, rising from the lateral buds, usually solitary, seldom 3-4 together. Leaves deciduous.

Silky-calyxed Turræa. Tree 20 feet.

5 T. LANCEOLA'TA (Cav. diss. 7. p. 361. t. 205. f. 1.) leaves lanceolate, bluntish at both ends, smooth; segments of calyx lanceolate, longer than its tube; petals linear, shorter than the staminiferous tube. ♄. S. Native of Madagascar. Peduncles axillary, 1-2-flowered. Flowers an inch long. Petals yellow, with scarlet bases. Capsules clothed with a rufous down.

Lanceolate-leaved Turræa. Shrub.

6 T. RI'GIDA (Vent. choix. t. 48.) leaves elliptical, acuminated, with revolute margins, stiff, shining; calyxes and petals smoothish; branches straight. ♄. S. Native of the Mauritius. Petals yellow, rather pilose, an inch long, a little longer than the staminiferous tube.

Stiff-leaved Turræa. Clt. 1816. Tree 50 feet.

7 T. HETEROPHY'LLA (Smith in Rees' cycl. 36. no. 6.) leaves ovate, undivided or 3-lobed, with villous veins; calyxes hairy, with short teeth; petals reddish, somewhat spatulate, longer than the staminiferous tube. ♄. S. Native of Guinea at Cape Coast.

Variable-leaved Turræa. Tree 20 feet?

8 T. QUERCIFÒLIA; leaves cuneated at the base, triangularly 3-lobed at the top, somewhat 5-lobed; pedicels solitary, axillary, 1-flowered. ♄. S. Native of Sierra Leone. Flowers apparently red.

Oak-leaved Turræa. Tree.

9 T. PINNA'TA (Wall. pl. asiat. rar. 2. t. 119.) leaves impari-pinnate, with 2-3 pairs of stalked, cordate-lanceolate, acute, quite entire, pubescent leaflets; calyx pubescent, with ligulate, obtuse segments; claws of petals connate. ♄. S. Native of the East Indies. Corolla pink.

Pinnate-leaved Turræa. Tree.

10 T.? HERBA'CEA (Poir. dict. 8. p. 187.) leaves elliptic-lanceolate, obtuse, smooth; flowers solitary; calyxes striated, smooth. ⊙? S. Native of Rio Janeiro. Petals jagged at the apex. Filaments shorter than the corolla. This is probably a distinct genus, and not belonging to *Meliàceæ*.

Herbaceous Turræa. Pl.

Cult. The species of this genus will grow well in a mixture of loam, peat, and sand, and ripened cuttings will strike root in

sand under a hand-glass, in heat. The last species can only be raised from seeds.

III. QUIVI'SIA (one of the species is called *Bois de quivi* in the Isle of France). Comm. in Juss. gen. 264. D. C. prod. 1. p. 620.—Gilibértia, Gmel. syst. 682.

Lin. syst. *Monadélphia, Octo-Decándria.* Calyx urceolate, 4-5-toothed. Petals 4-5, short, silky on the outside. Anthers 8-10, seated on the top of a short tube. Stigma capitate. Capsule coriaceous, 4-5-celled, opening by 4-5 valves at the apex; valves with a dissepiment in the middle of each; cells 2-seeded. Leaves simple.

1 Q. deca'ndra (Cav. diss. 7. p. 367. t. 211.) leaves alternate, oblong, entire, tapering to both ends; peduncles axillary, racemose. ♄. S. Native of the Mauritius. Q. racemòsa, Pers. ench. 1. p. 468. Gilibértia decándra, Willd. spec. 2. p. 551. Flowers white.

Decandrous Quivisia. Tree 20 feet.

2 Q. oppositifòlia (Cav. diss. 7. p. 368. t. 214.) leaves opposite, ovate, quite entire, smooth; peduncles axillary, 3-5-flowered. ♄. S. Native of the Mauritius. Gilibértia oppositifòlia, Willd. l. c. Flowers white.

Opposite-leaved Quivisia. Tree 15 feet.

3 Q. ova'ta (Cav. diss. 7. p. 368. t. 212.) leaves alternate, obovate, obtuse, entire; pedicels tern, axillary, 1-flowered; fruit downy. ♄. S. Native of the Island of Bourbon. Gilibértia ovàta, Willd. spec. 2. p. 552.—Gilibértia rùtilans, Smith in Rees' cycl. 16. no. 4. is hardly distinct from this, unless that the flowers are somewhat racemose. Flowers white.

Ovate-leaved Quivisia. Shrub 6 feet.

4 Q. heterophy'lla (Cav. l. c. t. 213.) leaves alternate, oval or obovate, entire, sinuately-toothed and pinnatifid; pedicels in pairs, axillary, 1-flowered. ♄. S. Native of the Mauritius. Bory. voy. 1. p. 196. Flowers white?

Variable-leaved Quivisia. Clt. 1822. Shrub 6 feet.

Cult. These trees will succeed well in a mixture of loam and peat. Ripened cuttings will root freely in sand under a hand-glass, in heat.

IV. STRIGI'LIA (from *strigilis*, a comb; resemblance in the denticulations of the anthers). Cav. diss. 7. p. 358. D. C. prod. 1. p. 621.—Foveolària, Ruiz et Pav. syst. fl. per. 99.—Tremánthus, Pers. ench. 1. p. 467.

Lin. syst. *Monadélphia, Decándria.* Calyx campanulate, 5-toothed. Petals 5, somewhat joined at the base, with linear segments, which are silky on the outside. Stamens 10; filaments joined into a tube; anthers rough from stellate-setaceous dots. Drupe ovate, somewhat trilocular, 1-seeded from abortion (Ruiz et Pav.), but according to Cavanilles 6-celled; cells 1-seeded. This genus comes very near to *Styrax*, but differs in the anthers being sessile at the top of the tube, not with the filaments free at the apex as in that genus. The leaves in all the species are furnished with gland-bearing hollows.

1 S. racemòsa (Cav. diss. 7. p. 358. t. 201.) plant clothed with rufous hairs; leaves oblong, with a short acumen, with revolute edges, glandless beneath, velvety from rusty hairs; racemes solitary, erect; flowers secund. ♄. S. Native of Peru. Tremánthus ferrugíneus, Pers. ench. 1. p. 467. Foveolària ferrugínea, Ruiz et Pav. fl. per. 4. t. 392. Calyx 5-toothed. Flowers probably white. Fruit hairy.

Racemose-flowered Strigilia. Tree 80 feet.

2 S. oblónga (Ruiz et Pav. l. c. and fl. per. 4. t. 391. under *Foveolària*,) leaves oblong, acuminated, smooth; racemes panicled, erect, solitary or in pairs. ♄. S. Native of Peru. Calyx 5-toothed. Flowers white? Fruit large, obovate.

Oblong-leaved Strigilia. Tree 90 feet.

3 S. ova'ta (Ruiz et Pav. l. c. and fl. per. 4. t. 390. under *Foveolària*,) leaves ovate-oblong, acuminated, smooth; furnished with very small glanduliferous hollows; panicles axillary, usually 2-3 together. ♄. S. Native of Peru. Flowers white.

Ovate-leaved Strigilia. Tree 60 feet.

4 S. cròcea (Ruiz et Pav. fl. per. 4. t. 392. under *Foveolària*,) leaves oblong, broad, acuminated; panicles axillary, usually twin; anthers beset with stellate bristles; calyx entire or nearly so. ♄. S. Native of Peru.

Copper-coloured Strigilia. Tree.

5 S. corda'ta (Ruiz et Pav. l. c. and fl. per. 4. t. 389. under *Foveolària*,) leaves cordate, ovate, acute, furnished with glanduliferous hollows; racemes panicled, axillary, usually 3 together. ♄. S. Native of Peru in groves. Flowers probably white.

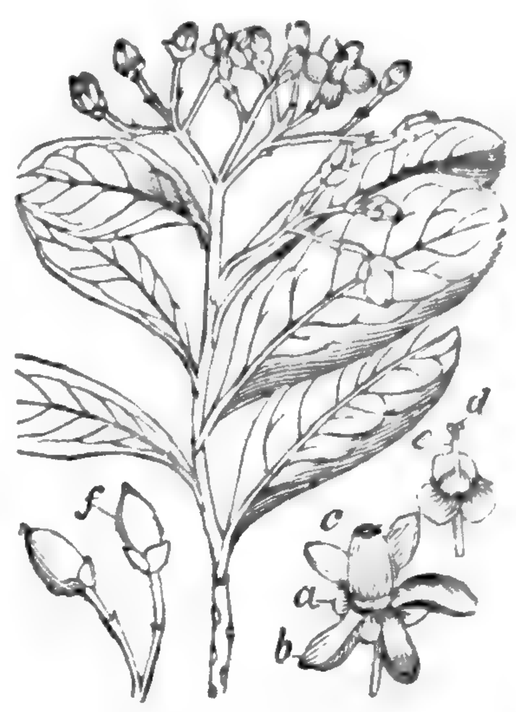
Cordate-leaved Strigilia. Tree 60 feet.

Cult. These trees will succeed in a mixture of loam and peat, and ripened cuttings will strike root in sand under a hand-glass, in heat.

V. CANE'LLA (from *canna*, a reed; in allusion to the rolled bark like cinnamon). Browne, jam. 215. D. C. prod. 1. p. 563. —Winteràna, Lin. gen. 598.

Lin. syst. *Monadélphia, Deca-Icosándria.* Calyx of 5 sepals (f. 113. *a*.). Petals 5 (f. 113. *b*.), somewhat coriaceous, of a bluish-glaucous colour, twisted in the bud. Stamens joined into a tube (f. 113. *c*.); anthers 10-15 (f. 113. *c*.), fixed to the inside of the tube. Stigmas 3. Berry 3-celled, but sometimes only 1-celled from abortion; cells 1-2-seeded. Embryo curved (according to Gært.), enwrapped in a fleshy seed-cover, with linear cotyledons. Leaves simple.

FIG. 113.



1 C. a'lba (Murr. syst. 4. p. 443.) leaves alternate, obovate, cuneated at the base, white or glaucous beneath, somewhat coriaceous, sometimes full of pellucid dots; flowers terminal, cymose; anthers 15. ♄. S. Native of the Caribbee Islands and the mainland of South America in woods. Winteràna canélla, Lin. spec. 636. C. álba, Swartz in Lin. trans. lond. 1. p. 96. t. 8.—Browne, jam. p. 215. t. 37. f. 3. C. Winteràna, Gært. fruct. 1. p. 373. Laúrus Winteràna, Lin. spec. ed. 1. p. 371. Córtex Winteràna, Blackw. herb. t. 206.—Pluk. phyt. t. 160. f. 7.—Sloan. jam. 2. p. 87. t. 191. f. 2.

This is a tree from 10 to 15 feet high, branched only at the top. The bark is whitish, by which it is known at first sight in the woods. The leaves are entire, glaucous beneath, and are very like those of the laurel, shining above. The flowers grow at the tops of the branches in clusters, but upon divided peduncles; they are small and seldom open, of a violet colour; the calyx is permanent; the petals are coriaceous and deciduous. The berry is fleshy, smooth, black; the receptacle is the central angle of the cells. The seeds are usually globular and beaked, always very smooth, black, and shining, the outer skin is crustaceous, thin, and brittle; the inner of a bay-brown colour. The whole tree is very aromatic, and when in blossom perfumes the whole neighbourhood. The flowers dried, and softened again in warm water, have a fragrant odour, nearly approaching to that of musk. The leaves have a strong smell of laurel. The white-bellied and bald-pate pigeons feed greedily upon the berries, and thence acquire their peculiar flavour. The bark of this tree is brought

to Europe in long quills, which are about three quarters of an inch in diameter, somewhat thicker than cinnamon, it is of a whitish or light-brown colour, with a yellowish hue. In taste it is moderately warm, aromatic, and bitterish; its smell is agreeable, and resembles that of cloves. Its virtues are extracted most perfectly by proof spirits. This bark has now superseded that of *Drỳmis Winteri*. It has been supposed to possess considerable virtues, and is said to be useful in scorbutic and many other complaints. It is now, however, considered merely in the light of an aromatic, and like many other spices is employed for the purpose of correcting disagreeable drugs.

White-barked Canella. Clt. 1735. Tree 15 feet.

2 C. axilla'ris (Nees. et Mart. in nov. act. bonn. 12. p. 18. t. 3.) flowers axillary, nodding, decandrous. ♄. S. Native of Brazil. Bark white, smooth. Leaves elliptic, obtuse, quite entire, smooth, paler beneath, coriaceous. Calyx of 3 rounded lobes. Petals 5, sessile, ovate-orbicular. Crown of 5 obovate, ciliated segments, alternating with the petals. Tube short, girding the germen, bearing 10 sessile anthers; anthers 2-celled. Ovary ovate. The bark of this tree has the same properties as that of *C. álba*.

Axillary-flowered Canella. Tree 20 feet.

3 C. laurifòlia (Lodd. cat. Sweet, hort. brit. p. 65.) leaves obovate, lanceolate, narrower, green beneath; flowers terminal. ♄. S. Native of the West Indies.

Laurel-leaved Canella. Clt. 1817. Tree 15 feet.

Cult. These valuable trees will thrive well in a mixture of loam, peat, and sand; and well-ripened cuttings, taken off at a joint, will root in sand under a hand-glass. in a moist heat, but care should be taken not to deprive them of any of their leaves. Mr. Sweet says that large old cuttings are best.

VI. CIPADE'SSA (meaning unknown). Blum. bijdr. 4th number.

Lin. syst. *Decándria, Monogýnia.* Calyx small, obsoletely 5-toothed. Petals 5; filaments 10, nearly the length of the petals, emarginate, connected into a tube at the base; anthers adnate inside. Ovary girded by a ring, 5-celled; cells containing 2 ovulæ. Style short, crowned by a capitate, 5-toothed stigma. Capsule globose, 5-furrowed, containing a 5-celled, 5-seeded nucleus. A shrub with pinnate leaves.

1 C. fruticòsa (Blum. l. c.). ♄. S. Native of Java. Lánsium domésticum, Jack, mal. mis. ex Spreng. syst. append. p. 252.

Shrubby Cipadessa. Shrub.

Cult. A mixture of loam and sand will suit this shrub well, and ripened cuttings will root in sand under a hand-glass, in heat.

VII. SANDO'RICUM (altered from *Santoor*, the Malay name of the tree). Cav. diss. 7. p. 359. D. C. prod. 1. p. 621.

Lin. syst. *Monadélphia, Decándria.* Calyx short, bluntly 5-toothed. Petals 5, linear. Stamens joined into a 10-toothed tube, and bearing the anthers within the tube. Stigmas 5, bifid. Berry in the shape of an apple, containing 5 ovate-compressed nuts, which are 2-valved and 1-seeded at the base. Seeds arched at the hilum.—Trees with trifoliate leaves, that is to say, impari-pinnate, with an odd leaflet. Flowers yellow.

1 S. I'ndicum (Cav. diss. 7. p. 359. t. 202. and 203. Roxb. cor. 3. t. 261.) leaflets ovate, oblong, entire, pubescent. ♄. S. Native of the Philippine and Molucca islands and other parts of the East Indies. Sandóricum, Rumph. amb. 1. t. 61. Lam. ill. t. 350. Hantol, Lam. dict. This last is its name in the Philippine islands. Racemes axillary, somewhat panicled. Flowers yellow. Fruit fleshy, agreeably acid.

Indian Sandal-tree. Clt. 1820. Tree 40 feet.

2 S. serra'tum; leaflets ovate-elliptic, acuminated, repandly-crenated. ♄. S. Native of the East Indies. Differs from *S. I'ndicum* in the leaves being crenate, not entire.

Serrate-leaved Sandal-wood. Tree.

Cult. These trees will thrive in a mixture of loam and peat, and ripened cuttings will root in sand under a hand-glass, in heat.

VIII. ME'LIA (μελια the Greek name for the ash; resemblance in leaves). Lin. gen. no. 576. D. C. prod. 1. p. 621.

Lin. syst. *Monadélphia, Decándria.* Calyx small, 5-cleft (f. 114. *a.*). Petals 5 (f. 114. *b.*), oblong-linear, spreading. Stamens 10, with the filaments joined into a 20-toothed tube (f. 114. *c.*), bearing the anthers on the inside at the throat. Ovary seated on a somewhat stipitate torus. Style filiform. Stigma capitate, 5-angled. Drupe ovate, containing a 5-furrowed, 5-celled nucleus, each cell containing 1 seed. Albumen fleshy, with flat leafy cotyledons and a superior radicle.—Trees with impari-pinnate or bipinnate leaves, and axillary panicles of white or blue flowers, with reddish or purplish tube, and yellow anthers.

1 M. azedara'ch (Lin. spec. 550.) leaves bipinnate; leaflets deeply serrated, somewhat quinate. ♄. G. Native of Ceylon and Syria. Cav. diss. 7. p. 363. t. 207. Lam. ill. 372. Comm. hort. 1. t. 70. Leaves deciduous in autumn, remaining so all the winter in Europe, but within the tropics they are evergreen. Petals violet; tube of stamens reddish. Fruit the size of a cherry, pale-yellow when ripe. The pulp surrounding the nucleus is poisonous, and when mixed with grease is said to kill dogs. The seeds are bored and strung for beads by the Roman Catholics. *Azadaracht* is a name under which Avicennes speaks of a poisonous tree.

Azedarach Bead-tree. Fl. Jul. Aug. Clt. 1659. Tree 40 ft.

2 M. robu'sta (Roxb. hort. beng. p. 33.) leaves bipinnate, especially with the leaflets either pinnate or ternate, membranous, roundish or oblong-lanceolate, acuminated, toothed; young leaves, branches, and petioles covered with a kind of scurfy pubescence; panicles axillary. ♄. S. Native of Malabar. Flowers probably bluish.

Robust Bead-tree. Clt. 1820. Tree 40 feet.

3 M. austra'lis (Sweet, hort. brit. ed. 2. p. 85.) leaves bipinnate; leaflets ovate, acuminated, crenate-toothed; panicles axillary. ♄. G. Native of New Holland. Leaves sometimes pinnate.

Southern Bead-tree. Clt. 1810. Tree 20 feet.

4 M. Japónica; leaves pinnate; leaflets ovate, acuminated, slightly crenate; panicles axillary, divaricated. ♄. G. Native of Japan. Differs from *M. Azedarách*, in the leaves being slightly crenated, not deeply toothed, and in the panicles being divaricate, not racemose. Flowers the colour of those of *M. Azedarách*.

Japan Bead-tree. Tree 30 feet.

5 M. sempervírens (Swartz, fl. ind. occ. 2. p. 737.) leaves bipinnate; leaflets deeply toothed, usually 7 in number, when young shining; petioles roundish at the base. ♄. G. Native of Jamaica in hedges. Ker. bot. reg. 643. M. Azédarach β, Lin. spec. 550. Smaller than the *M. Azédarach*, usually flowering the second year from seed, and the leaves are later of falling off in the autumn. This tree is known in the West Indies by the name of *Indian lilac*. Flowers bluish.

Ever-green Bead-tree. Fl. Jul. Aug. Clt. 1656. Tr. 25 ft.

6 M. compósita (Willd. spec. 3. p. 559.) leaves somewhat bipinnate, but at the apex of the petioles they are simply pinnate; leaflets almost entire, lower ones ternate; peduncles, calyxes, and petals rather velvety. ♄. S. Native of the East Indies, the Island of Timor, and is now cultivated in the Canary Islands.—M. dùbia, Cav. diss. 7. 364. is probably distinct from this, but is not sufficiently known.—Burm. ind. t. 24. Flowers with whitish or pinkish petals, and the tube of the stamens purple. Leaves falling off in winter.

Compound-leaved Bead-tree. Fl. Jul. Aug. Clt. 1810. Tr. 30 ft.

7 M. argu'ta (D. C. prod. 1. p. 622.) leaves bipinnate; leaflets oblong-lanceolate, acuminated, sharply and awnedly serrated; calyxes and pedicels rather velvety. ♄. S. Native of the Moluccas. Flowers unknown.

Sharp-serrated-leaved Bead-tree. Tree 20 feet.

8 M. Azadira'chta (Lin. spec. 550.) leaves pinnate; petioles terete; leaflets ovate-lanceolate, unequal at the base, acuminated, dentately-serrated. ♄. S. Native of the East Indies. Cav. diss. 7. p. 364. t. 208.—Burm. zeyl. t. 15.—Rheed. mal. 4. t. 52. Flowers bluish. Fruit when ripe of a purplish colour, about the size of a small olive, the pulp is oily, acrid, and bitter as well as the bark. *Azadarachta* is a name under which Avicennes speaks of a poisonous tree.

FIG. 114.

Azadirachta Bead-tree. Fl. July, Aug. Clt. 1759. Tr. 20 ft.

9 M. baccífera (Roth. nov. spec. p. 218.) leaves pinnate; petioles round; leaflets ovate, coarsely and bluntly serrated above the middle, equal at the base. ♄. S. Native of the East Indies. Flower with pinkish petals, and a purple staminiferous tube.

Berry-bearing Bead-tree. Tree 20 feet.

10 M. exce'lsa (Jack, mal. misc. vol. 1. no. 1. p. 12.) leaves pinnate; leaflets quite entire; panicles crowded, axillary, a little longer than the leaves. ♄. S. Native of Pulo-Penang. Trichília excélsa, Spreng. syst. app. p. 252. Flowers white. Anthers 10, in the throat of a 10-toothed tube.

Lofty Bead-tree. Clt. 1819. Tree 50 feet.

11 M. Guinee'nsis (G. Don, in Loud. hort. brit. p. 168.) leaves bipinnate; leaflets deeply and coarsely serrated; flowers in terminal, divaricate panicles. ♄. S. Native of Guinea, where it is called by the English settlers lilac. Flowers with white or pinkish petals, and a purplish tube of stamens. Fruit small, pale-yellow when ripe; the pulp is poisonous.

Guinea Bead-tree or Lilac. Fl. Ju. Aug. Clt. 1824. Tr. 30 ft.

† *Species only known by name.*

12 M. supe'rba (Roxb. hort. beng. p. 33.). ♄. S. Native of the East Indies at Soonda.

Superb Bead-tree. Clt. 1810. Tree 30 feet.

13 M. tomentòsa (Roxb. l. c. p. 90.). ♄. S. Native of Prince of Wales Island.

Downy Bead-tree. Tree 30 feet.

Cult. These fine trees will thrive well in a mixture of loam, peat, and sand; and large ripened cuttings will strike root in sand under a hand-glass, but those of the stove species require to be placed in a moderate heat. It must be observed that the leaves should not be shortened. Seeds, if they can be procured, is the best mode of increasing the species.

Tribe II.

TRICHILIE'Æ (plants agreeing with *Trichília* in important characters). D. C. prod. 1. p. 622. Cells of fruit 1-2-seeded. Seeds without albumen. Embryo inverted. Cotyledons very thick.

IX. TRICHI'LIA (from τριχα, *tricha*, by threes, which comes from τρεις; the stigma is 3-lobed, and the capsule is usually 3-valved and 3-celled). Lin. gen. no. 528. D. C. prod. 1. p. 622.—Trichília, Elcàja, and Portèsia of Juss.

Lin. syst. *Octo-Decándria*, *Monogýnia*, or *Monadélphia*, *Octo-Decándria*. Calyx 4-5-toothed or lobed (f. 115. *a.*). Petals 4-5 (f. 115. *b.*) -ovate or rather oblong, connected at the base. Stamens 8 or 10 (f. 115. *d.*), filaments flat, sometimes distinct (f. 115. *d.*), sometimes closely joined into a tube, bearing the anthers at the throat or between the teeth of the tube. Style simple, crowned by a capitate 3-lobed stigma. Capsules 3-valved, 3-celled (rarely 2-valved, 2-celled); valves bearing a dissepiment in the middle of each; cells 1-2-seeded. Seeds baccate, arillate. Embryo inverted, with very thick cotyledons. Trees and shrubs, with alternate, impari-pinnate, or trifoliate leaves, and axillary racemes or panicles of white flowers, sometimes disposed into a crowded, sessile head.

* *Leaves pinnate.*

1 T. hírta (Lin. spec. 550.) leaves impari-pinnate, with 3 or 4 pairs of elliptical, acuminated, smooth leaflets; racemes crowded; filaments of stamens truly joined into a tube. ♄. S. Native of Jamaica, plentiful between Passage Fort and St. Jago de la Vega. Flowers greenish-white, with purple-headed stamens.

Hairy Trichilia. Fl. June, July. Clt. 1800. Tree 20 feet.

FIG. 115.

2 T. spondioìdes (Swartz, fl. ind. occ. 730.) leaves impari-pinnate, with 5 or 10 pairs of ovate-lanceolate leaflets, which are somewhat hairy on the margins; racemes panicled, axillary; filaments of stamens almost distinct. ♄. S. Native of Jamaica and St. Domingo on the mountains. Jacq. hort. schoenbr. 1. t. 102.—Sloane, hist. 2. t. 210. f. 2-3. Flowers small, whitish, odorous. The French in the West Indies called it *Bastard Monbin*.

Spondias-like Trichilia. Fl. Sept. Dec. Clt. 1800. Tr. 20 ft.

3 T. affìnis (St. Hil. fl. bras. 2. p. 78.) leaflets 9, rarely 8 or fewer, lanceolate-ovate, obscurely acuminated, puberulous on the nerves beneath; panicles not half so long as the leaves, usually twin; petals connected at the base, hardly puberulous; filaments connate into an 8-10-toothed tube, bearing the anthers between the teeth. ♄. S. Native of Brazil in the province of the Missions. Petals yellowish.

Allied Trichilia. Fl. Mar. Shrub 8 feet.

4 T. Richardia'na (St. Hil. fl. bras. 2. p. 78.) leaves impari-pinnate, with 3 pairs of lanceolate, bluntly acuminated leaflets, which are pilose in the axils of the veins beneath; panicles loose and few-flowered, rather longer than the petioles; petals distinct, smooth; filaments connate into an 8-toothed tube, bearing the anthers between the teeth. ♄. S. Native of Brazil near Rio Janeiro.

Richard's Trichilia. Tree.

5 T. tomentòsa (H. B. et Kunth, nov. gen. amer. 5. p. 215.) leaves impari-pinnate, with 12-15 pairs of oblong, somewhat acuminated leaflets, which are smoothish above and clothed with short, hoary down beneath; panicles axillary, longer than the petioles. ♄. S. Native of Peru on the western declivities of the Andes. Flowers whitish. Filaments connate into a tube.

Tomentose Trichilia. Tree 30 feet.

6 T. quadri'juga (H. B. et Kunth, nov. gen. amer. 5. p. 215.) leaves impari-pinnate with usually 4 pairs of oblong, acuminated, smooth leaflets; panicles axillary, longer than the petioles; filaments of stamens hairy on the inside; capsules somewhat pear-shaped. ♄. S. Native of South America on the banks of the river Magdalena. Flowers whitish.

Four-paired-leafletted Trichilia. Tree 30 feet.

7 T. eme'tica (Vahl. symb. 1. p. 31.) leaves impari-pinnate, with 4 pairs of elliptical leaflets, which are villous on the under surface; flowers decandrous, crowded; filaments of stamens joined to the middle. ♄. G. Native of Arabia on the Yemen mountains. Elcàja, Forsk. descr. 127. Flowers whitish. The fruit of this tree, mixed with perfumes, is used by the Arabian women for washing their hair. The fresh seeds are made into an ointment with those of *Sésamum* against the itch. Forsköl found mention of this tree in an Arabian book by the name of *Djouz-Elcai*, whence his generic name *Elcàja*.

Emetic Trichilia. Tree 30 feet.

8 T. Havanne'nsis (Jacq. amer. 129. t. 175. f. 38. pict. p. 65. t. 260. f. 35.) leaves impari-pinnate, with 2 or 3 pairs of obovate, smooth leaflets, outer ones largest; racemes cymose, axillary, crowded, shorter than the petioles. ♄. S. Native of Cuba in mountain woods, and near Xalapa in Mexico. H. B. et Kunth, nov. gen. amer. 5. p. 216. T. glàbra, Lin. syst. nat. 13. p. 294. Flowers white. Stamens distinct at apex. All parts of the tree have an unpleasant smell when bruised.

Havannah Trichilia. Clt. 1794. Tree 30 feet.

9 T. Cati'gua (St. Hil. fl. bras. 2. p. 77.) leaves pinnate; leaflets 9-12, lanceolate, or lanceolate-ovate, smooth; panicles much shorter than the leaves, 2-3-ternate; petals connected at the base, spreading, densely pubescent; filaments connate into an 8-10-toothed tube, and bearing the anthers between the teeth. ♄. S. Native of Brazil in the province of Minas Geraes, where it is called *Catigua*. Wood hard.

Var. β, parviflòra (St. Hil. l. c.) leaflets 11-15; panicles shorter; flowers not half the size. In the province of Goyaz.

Catigua Trichilia. Fl. April, June. Tree 40 feet.

10 T. odora'ta (Andr. bot. rep. t. 637.) leaves impari-pinnate, with 3-4 pairs of smooth, ovate-oblong, wavy leaflets; racemes axillary, glomerate; stamens bifid, distinct. ♄. S. Native of St. Vincent? Hook, exot. fl. t. 128. Flowers greenish-white, sweet-scented, 4-petalled, and with a 4-toothed calyx.

Sweet-scented Trichilia. Clt. 1801. Tree 20 feet.

11 T. pa'llida (Swartz, fl. ind. occ. 733.) leaves pinnate, with 3 pairs of ovate-lanceolate, acute, smooth, membranaceous leaflets; racemes axillary, and somewhat terminal; flowers octandrous; capsules 2-valved. ♄. S. Native of Hispaniola and Mexico in bushy places on the mountains. Portèsia ovàta, Cav. diss. 7. p. 369. t. 215.? Lam. ill. t. 302. f. 1. Flowers white. Filaments distinct almost to the base.

Pale Trichilia. Fl. Feb. Mar. Tree 16 feet.

12 T. moscha'ta (Swartz, fl. ind. occ. p. 735.) leaves pinnate, with alternate, ovate, acuminated, smooth leaflets; racemes axillary; anthers sessile on the top of the tube; capsules usually 1-seeded. ♄. S. Native on the north side of Jamaica in woods, where it is called *musk-wood*, on account of the smell of every part of the tree when rubbed. Flowers whitish.

Musk Trichilia. Fl. May. Tree 20 feet.

13 T. termina'lis (Jacq. amer. 130.) leaves pinnate, with 3 pairs of lanceolate, blunt, shining leaflets; racemes panicled; lobes of calyx profoundly cut, much spreading; filaments of stamens distinct. ♄. S. Native of Jamaica near Kingston. Flowers white.

Terminal Trichilia. Tree 20 feet.

14 T. glandulòsa (Smith, in Rees' cycl. p. 36. no. 10.) leaves pinnate, with 5 or 7 elliptical-lanceolate, bluntly acuminated leaflets, hairy at the origin of the veins beneath; flowers octandrous; tube of stamens entire; stigma depressed. ♄. G. Native of New Holland at Port Jackson. T. octándra, Sol. mss. Flowers whitish.

Glandular Trichilia. Fl. Jul. Aug. Clt. 1821. Tree 20 ft.

15 T. bi'juga (Labill. nov. cal. t. 54.) leaves abruptly pinnate, with 2 pairs of oblong, waved, smooth leaflets; panicle loose, shorter than the leaves; anthers 10, in the throat of a toothed tube. ♄. G. Native of New Caledonia. Petals yellow.

Two-paired-leafletted Trichilia. Tree 30 feet.

16 T. specta'bilis (Forst. prod. no. 188.) leaves pinnate, with obovate leaflets; racemes axillary, supra-decompound. ♄. G. Native of New Zealand. Flowers white.

Shewy Trichilia. Tree 20 feet?

17 T. allia'cea (Forst. prod. no. 189.) leaves pinnate, with lanceolate, acute leaflets; racemes axillary, supra-decompound. ♄. G. Native of the island of Namoka in the South Seas. Dysóxylum alliàceum and longifòlium, Blum. bijdr. 4th number. Flowers white. All parts of the tree smells of garlic when bruised.

Garlic-scented Trichilia. Tree 20 feet.

18 T. e'legans (St. Hil. fl. bras. 2. p. 79. t. 98.) leaves impari-pinnate, with 1-2-3 pairs of lanceolate, bluntish leaflets, which are pilose in the axils of the veins beneath; panicles raceme-formed, about equal in length to the petioles; petals distinct, smooth; filaments connate into an 8-10-toothed tube, bearing the anthers between the teeth. ♄. S. Native of Brazil in woods not far from the town of St. Paul. Petals whitish.

Elegant Trichilia. Fl. Nov. Tree 15 feet.

19 T. heterophy'lla (Willd. spec. 2. p. 554.) leaves pinnate and ternate, with ovate, acuminated, smooth leaflets; racemes axillary; flowers octandrous. ♄. S. Native of Madagascar. Portèsia mucronàta, Cav. diss. 7. p. 370. t. 216. Lam. ill. t. 302. f. 2. Flowers yellowish. Anthers sessile between the teeth of the tube.

Variable-leaved Trichilia. Tree 20 feet.

20 T. monta'na (H. B. et Kunth, nov. gen. 7. p. 226.) leaves impari-pinnate, with 1-2 pairs of oblong, acuminated, smooth leaflets, which are netted beneath; panicles axillary, solitary, or twin almost simple, longer than the petioles. ♄. S. Native of New Granada on Mount Quindiu. Flowers whitish.

Mountain Trichilia. Tree 20 feet.

* * *Leaves trifoliate.*

21 T. trifolia'ta (Lin. spec. 551.) leaves trifoliate; leaflets obovate, shining. ♄. S. Native of Curaçoa in dry grassy places.—Jacq. amer. 129. t. 82. pict. 65. t. 123. T. Halèsia, Læfl. itin. 188. Flowers white. All parts of the tree have an unpleasant smell. The negresses use a decoction of the roots to procure abortion. In Curaçoa the tree is called *Kerse-boom* or Cherry-tree. The Spaniards also call it *Cerasso-macho* or Male-cherry.

Trifoliate Trichilia. Shrub 6-10 feet.

22 T. pteleæfòlia (St. Hil. fl. bras. 2. p. 80. t. 99.) leaves ternate; leaflets obovate, shortly and bluntly acuminated, membranous, puberulous; panicles shorter than the petioles; petals distinct, smooth; filaments joined into a tube at the base, distinct above, bidentate at the top; cells of ovary only containing 1 ovula. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers small, white.

Ptelea-leaved Trichilia. Fl. Oct. Shrub.

23 T. nervòsa (Vahl. symb. 1. p. 31.) leaves trifoliate; leaflets ovate. ♄. S. Native of Java. Mèlia Koatjápa, Burm. ind. 101. exclusive of the synonymes. Flowers whitish.

Nerved-leaved Trichilia. Tree 20 feet.

24 T. venòsa (Spreng. syst. 3. p. 68.) leaves ternate; leaflets ovate-roundish, obtuse, with parallel veins, smooth; flowers panicled, smooth. ♄. S. Native of the island of Mascarin.

Veiny-leaved Trichilia. Shrub.

25 T. Portorice'nsis (Spreng. syst. 3. p. 68.) leaves ternate; leaflets oblong, acutish, repand, smooth on both surfaces, shining; petioles channelled; racemes corymbose, few-flowered. ♄. S. Native of Porto-Rico.

Porto-Rico Trichilia. Tree.

* * * *Leaves simple. Doubtful species, probably referable to a separate genus.*

26 T.? spinòsa (Willd. spec. 2. p. 554.) leaves simple, ovate, emarginate; branches spinose; berry 3-celled. ♄. S. Native of the East Indies. Turræ'a vìrens, Hell. act. holm. 1788. p. 294. t. 10. f. 1. Flowers white? Probably a species of *Limònia?*

Spiny Trichilia. Shrub?

27 T.? ine'rmis (Spreng. neue. entd. 1. p. 285.) leaves simple, obovate, retuse, coriaceous, shining, quite entire; branches unarmed; capsules 3-celled. ♄. S. Native of Brazil. This is probably a species of *Turræ'a*. Flowers white?

Unarmed Trichilia. Tree?

28 T.? sca'ndens (Lunan. hort. jam. 2. p. 319.) leaves simple, lanceolate, ovate, with revolute margins; flowers spiked, each with 4 styles. ♄. ◡. S. Native of Jamaica. Flowers whitish.

Climbing Trichilia. Shrub cl.

29 T. simplicifòlia (Spreng. syst. 3. p. 69.) leaves oblong, acuminated, smooth; petioles thickened at the apex; flowers panicled, octandrous. ♄. S. Native of Martinico. Hedwígia simplicifòlia, N. E.

Simple-leaved Trichilia. Shrub.

Cult. These trees will thrive well in a mixture of loam and peat, and ripened cuttings, without shortening their leaves, will strike root in sand under a hand-glass, in heat.

X. MI'LNEA (in honour of Colin Milne, LL.D. author of a kind of Botanical Dictionary, Institutes of Botany, and numerous other works). Roxb. fl. ind. 2. p. 430

Lin. syst. *Monadélphia, Pentándria.* Calyx 5-parted. Petals 5. Urceolus with 5 anthers round its inside at the throat. Ovary 3-celled, containing 1-2 ovulæ in each cell, which are attached to the central column, without albumen. Berry round-oval, large, 3-celled, usually 1-seeded.—A middle-sized tree, with unequally-pinnate leaves, with about 3 or 6 pairs of nearly opposite, entire, smooth leaflets, without stipulas, and axillary panicles of white flowers. Seeds solitary, inserted in a complete, thick, lucid, edible aril, like that of the *Litchi* of the Chinese.

1 M. edu'lis (Roxb. l. c.) ♄. S. Native of the East Indies on the Garrow Hills, and of the Silhet district, where it is called *Gumi* by the natives, who eat the aril which surrounds the seed.

Eatable Milnea. Tree 20 feet.

Cult. A mixture of loam and sand will answer this tree; and ripened cuttings will root in sand under a hand-glass, in heat.

XI. GONIOSCHE'TON (from *γωνια, gonia,* an angle, and *χιτων, chiton,* an inner coat; in allusion to the staminiferous tube being angular). Blum. bijdr. 4th number.

Lin. syst. *Monadélphia, Decándria.* Calyx small, obsoletely 5-toothed. Petals 5, oblong, spreading. Stamens 10, joined into a short, angular, toothed, conic tube, bearing the anthers in its throat. Ovary girded by a membranous urceolus, 5-celled; cells 2-ovulate. Style filiform, crowned by a peltate, angular stigma. Capsule globose, coriaceous, 3-4-valved, 3-4-celled from abortion. Seed solitary, exarillate, exalbuminose, fixed to the inner angle. Cotyledons large.—A tree with impari-pinnate leaves, and compound axillary racemes of flowers.

1 G. arbore'scens (Blum. l. c.) leaflets oblong, tapering to both ends. ♄. S. Native of Java. Trichília arboréscens, Spreng. syst. append. 252.

Arborescent Gonioscheton. Tree 20 feet.

Cult. A mixture of loam and sand will suit this tree, and ripe cuttings will root in sand under a hand-glass, in heat.

XII. DYSO'XYLUM (from *δυσωδης, dusodes,* fetid, and *ξυλον, xylon,* wood; the wood is fetid). Blum. bijdr. 4th number.

Lin. syst. *Monadélphia, Octo-Decándria.* Calyx small, 4-5-cleft. Petals 4-5, oval-oblong. Anthers 8-10, inserted in the throat of the denticulated tube. Ovary girded by a short ring, 3-4-celled; cells 2-ovulate. Style filiform, crowned by a sub-peltate stigma. Capsule coriaceous, 3-4-valved, 3-4-celled, or from abortion 2-valved, 1-2-celled, with a dissepiment in the middle of each valve. Seeds solitary, exarillate, exalbuminose, fixed to the middle of the inner angle of the cells. Trees with impari-pinnate leaves, and axillary and terminal panicles of flowers.

1 D. exce'lsum (Blum. l. c.) leaves impari-pinnate, with 4 pairs of leaflets, which are ovate-oblong, acuminated and oblique at the base; panicles axillary, crowded; flowers octandrous; capsule globose. ♄. S. Native of Java and the Straits of Malacca. Trichília excélsa, Spreng. syst. append. p. 252.

Tall Dysoxylum. Tree 50 feet.

2 D. macroca'rpum (Blum. l. c.) leaves pinnate; leaflets oblong, alternate; flowers decandrous, panicled; capsule large, globose. ♄. S. Native of Java. Trichília macrocárpa, Spreng. syst. append. p. 252.

Large-fruited Dysoxylum. Tree.

3 D. laxiflòrum (Blum. l. c.) leaves pinnate; leaflets alternate, oblong-lanceolate; flowers decandrous, in loose panicles. ♄. S. Native of Java.

Lax-flowered Dysoxylum. Tree.

4 D. si'mile (Blum. l. c.) leaves pinnate; leaflets alternate, opposite, oblong, bluntish, unequal; flowers decandrous, panicled; capsule globose. ♄. S. Native of Java. Trichília símilis, Spreng. syst. append. p. 252.

Similar Dysoxylum. Tree.

5 D. molli'ssimum (Blum. l. c.) leaves pinnate; leaflets subopposite, ovate-oblong, bluntish, villous beneath, as well as the panicles, which are divaricate; flowers octandrous. ♄. S. Native of Java. Trichília mollíssima, Spreng. syst. append. p. 252.

Very-soft Dysoxylum. Tree.

Cult. These trees will thrive in a mixture of loam, peat, and sand, and ripened cuttings will root in sand under a hand-glass, in heat.

XIII. EKEBE'RGIA (in honour of Charles Gustavus Ekeberg, Captain a Swedish East Indiaman, who took Sparmann to China for the purpose of making inquiries in natural history). Sparm. act. holm. 1779. p. 282. t. 9. D. C. prod. 1. p. 623.

Lin. syst. *Monadélphia, Decándria.* Calyx 4-cleft. Petals 4. Stamens 10? with a very short, entire tube; anthers almost sessile on the inside of the tube. Stigma capitate. Berry globose, 5-seeded. Seeds unknown.—A tree with impari-pinnate leaves.

1 E. Cape'nsis (Sparm. l. c.) ♄. G. Native of the Cape of Good Hope in the woods of Hautenequas and Essenboch, where it is called by the Dutch colonists *Essen* or *Esschenboom,* and *Hautenequas Essen,* from its resemblance to the common ash. Leaves impari-pinnate, with 5 pairs of elliptical, acuminated, smooth leaflets. Flowers white. Trichília Capénsis, Pers. ench. 1. p. 468.

Cape Ekebergia. Fl. July, Aug. Clt. 1789. Tree 20 ft.

Cult. This tree will succeed well in a mixture of loam and peat, and ripened cuttings, not deprived of their leaves, will root in sand under a hand-glass.

XIV. GUA'REA (*Guara* is a name given to one of the species

by the natives of Cuba). Lin. mant. no. 1305. D. C. prod. 1. p. 623.

Lin. syst. *Monadélphia, Octándria.* Calyx small, 4-toothed. Petals 4, distinct, oblong, obtuse. Stamens 8, joined into an entire or crenulate tube bearing the anthers on the inside at the throat. Anthers 2-celled, bursting inwards. Style simple, crowned by a discoid stigma. Capsule somewhat globose, 4-celled, 4-valved, bearing a dissepiment in the middle of each valve, smooth or tubercled. Seeds solitary or twin in the cells, without albumen, but covered with red aril.—Trees or shrubs, with abruptly seldom with impari-pinnate leaves, and axillary panicles, racemes, or spikes of white or reddish flowers.

1 G. grandifòlia (D. C. prod. 1. p. 624.) leaflets many pairs, oval-oblong, feather-nerved, with 10 or 12 lateral, very prominent nerves beneath; racemes elongated. ♄. S. Native of French Guiana, as well as the Caribbee Islands.—Plum. icon. t. 147. f. 2. Mèlia Guàra, Jacq. amer. 126. t. 176. f. 37. Trichília Guàra, Lin. spec. 551. G. trichilioìdes, Lin. mant. 228. exclusive of the synonymes of Browne and Marcgrave. G. macrophýlla, Vahl.? Leaves large; leaflets 8 or 9 inches long, lower ones smallest. Petals silky on the outside, 4 or 5 lines long. Tube of stamens entire, not toothed at the apex. Fruit roundish, according to Jacquin. All parts of this tree, but especially the bark, smell strong of musk, and may be used instead of that perfume for many purposes. The wood is full of a bitter, resinous substance, which renders it unfit for rum hogsheads, being observed to communicate both its smell and taste to all spiritous liquors; but it is often cut for staves and heading when there is a scarcity of other timber. The powder of the bark is said to be a good emetic, and is sometimes used among the negroes for that purpose. The English call it *Musk-wood* and *Alligator-wood;* the French *Bois-rouge.*

Great-leaved Guarea. Fl. Feb. Mar. Clt. 1752. Tr. 30 ft.

2 G. spicæflòra (St. Hil. fl. bras. 2. p. 81.) bark of branches grey, scabrous; leaflets 9-13, lanceolate-ovate, shortly acuminated; panicles spike-formed, oblong; capsule smooth. ♄. S. Native of Brazil in the province of Rio Janeiro. Petals reddish.

Spike-flowered Guarea. Fl. Oct. Tree 20 feet.

3 G. multi'juga (St. Hil. fl. bras. 2. p. 82.) bark of branches dark-red; leaflets 32, opposite, middle one half a foot long, all oblong-lanceolate or obovate-lanceolate, acuminated, smooth; panicle rather pyramidal, very long; capsule smooth. ♄. S. Native of Brazil in the province of Minas Geraes. Petals rose-coloured.

Many-paired-leaved Guarea. Fl. Dec. Tree 30 feet.

4 G. pu'rgans (St. Hil. pl. usu. bras. no. 71. and fl. bras. 2. p. 83.) bark of branches red; leaflets 10-18, oblong-lanceolate, shortly and bluntly acuminated, smooth; panicle raceme-formed; capsule pear-shaped, smooth, and even. ♄. S. Native of Brazil.—Jíto, Marcg. bras. 120. with a figure. The bark of this tree is bitter, and is employed as a purgative by the inhabitants of Brazil.

Cathartic Guarea. Fl. Sept. Tree 30 feet.

5 G. Swa'rtzii (D. C. prod. 1. p. 624.) leaflets 2 to 4 pairs, lanceolate-ovate, acuminated, feather-nerved, with 6 or 7 prominent, lateral nerves beneath; racemes elongated. ♄. S. Native of the Caribbee Islands. Eluthèria, Browne, jam. 369. no. 7.—Sloan. hist. 2. t. 170. f. 1. Guàrea trichilioìdes, Swartz, obs. 146. Flowers white. This tree possesses the same qualities as the preceding.

Swartz's Guarea. Fl. June, July. Clt. 1822. Tree 20 feet.

6 G. brachysta'chya (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 624.) leaflets 4 or 5 pairs, oval, acute; racemes axillary, solitary, 4 times shorter than the leaves; fruit globose, and are, as well as branchlets, tubercled. ♄. S. Native of New Spain. Flowers whitish.

Short-spiked Guarea. Tree 20 feet.

7 G. hu'milis (Bert. in litt. D. C. prod. 1. p. 624.) leaflets 2 or 3 pairs, oval, acuminated; racemes axillary, solitary, 4 times shorter than the leaves; branchlets smooth. ♄. S. Native of Porto-Rico. G. glàbra, Vahl.? Flowers whitish.

Humble Guarea. Tree 10 feet.

8 G. tuberculata (St. Hil. fl. bras. 2. p. 83. t. 100.) bark grey, scabrous; leaflets 3-12, alternate, lanceolate-ovate, shortly and obtusely-acuminated, smooth; panicle raceme-formed; capsule smooth, tubercled, or puberulous. ♄. S. Native of Brazil in the province of Rio Janeiro. Petals white.

Tubercled-fruited Guarea. Tree 30 feet.

9 G. Lessonia'na (St. Hil. fl. bras. 2. p. 84.) bark grey, wrinkled; leaflets 6-10, opposite, lanceolate-ovate, shortly-acuminated, pubescent beneath; panicles raceme-formed; capsule pear-shaped, tubercled, velvety-pubescent. ♄. S. Native of Brazil in the Island of St. Catharine.

Lesson's Guarea. Tree.

10 G. ramiflòra (Vent. choix. t. 41.) leaflets 2 pairs, ovate-lanceolate; racemes lateral, very short, rising from the sides of the branches; capsules globose. ♄. S. Native of Porto-Rico. Flowers whitish.

Branch-flowered Guarea. Clt. 1822. Tree 20 feet.

11 G. exce'lsa (Bonpl. H. B. et Kunth, nov. gen. 7. p. 227.) leaflets 2 or 3 pairs, elliptic-oblong, obtuse, coriaceous, smooth above, villous beneath at the origin of the veins; panicles axillary, almost simple, hardly exceeding the petioles. ♄. S. Native of New Spain between Acapulca and Zumpanga. Flowers white.

Lofty Guarea. Tree 50 feet.

Cult. All the species of *Guàrea* will thrive well in loam mixed with a little sand, and ripened cuttings, with their leaves not shortened, will strike root in sand under a hand-glass, in heat.

XV. EPICHA'RIS (from επιχαρις, *epicharis*, beautiful; elegance of trees). Blum. bijdr. 4th number.

Lin. syst. *Monodélphia, Octo-Decándria.* Calyx urceolate, irregularly 5-6-cleft. Petals 4, rarely 5. Anthers 8-10, adnate to the throat of a toothed tube. Ovary inclosed in the tube, 4-celled; cells 2-ovulate. Style filiform, crowned by a capitate, depressed stigma. Capsule subglobose, coriaceous, 2-4-valved, 2-4-celled, with the valves bearing a dissepiment in the middle of each. Seeds solitary, incompletely covered by a fleshy aril, exalbuminous. Cotyledons very thick.—Trees with abruptly-pinnate leaves.

1 E. densiflòra (Blum. l. c.) leaves with 5-8 pairs of alternate, oblong, acuminated leaflets, which are oblique at the base, and pubescent beneath; racemes crowded, axillary. ♄. S. Native of Java. Guàrea densiflòra, Spreng. syst. append. p. 251.

Dense-flowered Epicharis. Tree 50 feet.

2 E. cauliflòra (Blum. l. c.) leaves with many pairs of opposite, oblong, acuminated leaflets, which are villous beneath; racemes crowded, lateral. ♄. S. Native of Java. Guàrea cauliflòra, Spreng. syst. append. p. 251.

Stem-flowered Epicharis. Tree 50 feet.

3 S. seri'cea (Blum. l. c.) leaves with many pairs of oblong, acuminated leaflets, which are covered with silky pubescence beneath; racemes crowded, lateral. ♄. S. Native of Java. Guàrea sericea, Spreng. syst. append. p. 251.

Silky Epicharis. Tree 60 feet.

4 E. alti'ssima (Blum. l. c.) leaves with many pairs of oblong, acuminated leaflets, which are pubescent at the ribs beneath. ♄. S. Native of Java.

Tallest Epicharis. Tree 140 feet.

Cult. These trees will succeed in a mixture of loam and

peat, and ripened cuttings will root in sand under a hand-glass, in heat.

XVI. DIDYMOCHE'TON (from *διδυμος, didymos*, double, and *χιτων, chiton*, a coat; in allusion to the petals being connected with the staminiferous tube at the base). Blum. bijdr. 4th number.

Lin. syst. *Monadélphia, Decándria.* Calyx small, 5-sepalled, imbricate. Petals 5, connate with the tube of the stamens at the base, but free at the apex, spreading. Stamens 10, with the tube elongated and 10-toothed at the apex, bearing the anthers in the throat. Ovary inclosed in the membranous tube, 5-celled; cells 2-ovulate. Style filiform, terminated by a capitate stigma. Berry corticate, ovate, 2-3-celled from abortion. Seeds solitary, axarillate, exalbuminous, fixed to the inner angle of the cells. Cotyledons thick.—A shrub with impari-pinnate leaves.

1 D. nu'tans (Blum. l. c.) leaflets oblong-lanceolate, pubescent on the ribs beneath; spikes panicled, axillary, nodding; flowers glomerate. ♄. S. Native of Java.

Nodding-flowered Didymocheton. Shrub 6 feet.

Cult. A mixture of loam and sand will answer this shrub, and ripened cuttings will root in sand under a hand-glass, in heat.

XVII. APHANAMI'XIS (from *a* priv. *φαναι, phanai*, to appear, and *μιξις, mixis*, mixed; in allusion to not being joined at the base, but free and mixed). Blum. bijdr. 4th number.

Lin. syst. *Monadélphia, Hexándria.* Calyx small, of 5 roundish, imbricate sepals. Petals 3, oval, concave, spreading. Stamens 6, connate into a globe. Anthers oblong, trigonal. Ovary girded by a narrow ring, 3-celled; cells 2-seeded. Style pyramidal, triquetrous, terminated by a simple stigma. Capsule obovate, 2-3-valved, 2-3-celled; valves with a dissepiment in the middle of each. Seeds solitary, covered by a fleshy-lobed aril, umbilicate at the base, exalbuminous, fixed to the central receptacle. Cotyledons thick. Radicle superior.—A tall tree with impari-pinnate leaves; leaflets opposite, oblong. Panicles elongated, axillary.

1 A. grandifòlia (Blum. l. c.) ♄. S. Native of Java.

Great-leaved Aphanamixis. Tree 40 feet.

Cult. This tree will grow in a mixture of loam and sand; and ripened cuttings will root in sand under a hand-glass, in heat.

XVIII. HE'YNEA (in honour of B. Heyne, M.D. a German botanist, and traveller in the East Indies). Roxb. hort. beng. p. 33. and in bot. mag. t. 1738. D. C. prod. 1. p. 624.

Lin. syst. *Monadélphia, Decándria.* Calyx 5-toothed. Petals 5. Filaments 10, joined into a cylindrical tube, bearing the anthers at the apex. Style 1. Ovary 2-celled; cells containing 2 ovulæ, which are fixed to the inner angle. Capsules 2-valved 1-celled, 1-seeded from abortion. Seed arillate. Embryo inverted, free of albumen, with very thick cotyledons.—Trees with impari-pinnate leaves, and panicles or racemes of small, white flowers.

1 H. tri'juga (Roxb. hort. beng. 33. cor. 3. t. 260. and in Sims, bot. mag. t. 1738.) leaves impari-pinnate; leaflets 3 pairs; panicles axillary, on long peduncles, corymbose. ♄. G. Native of Nipaul. Flowers white. Every part of the tree is bitter.

Three-paired-leaved Heynea. Fl. Sept. Clt. 1812. Tree 20 feet.

2 H. quinque'juga (Roxb. hort. beng. p. 90.) leaves abruptly-pinnate, with 5-7 pairs of oval, oblong leaflets, which are clothed at the origin of the veins beneath with rusty down, as well as the twiggy panicle. ♄. S. Native of Java and the Moluccas. Trichília rufinérvia, Blum. bijdr. 4th number.

Five-paired-leaved Heynea. Clt. 1816. Tree 20 feet.

3 H. multi'juga (Blum. bijdr. 4th number,) leaves impari-pinnate, with usually 6 pairs of oblong leaflets, tapering unequally on both sides to the base; racemes axillary, solitary. ♄. S. Native of Java.

Many-paired-leaved Heynea. Tree 20 feet.

Cult. These trees will succeed well in a mixture of loam and peat, and ripened cuttings, with their leaves not shortened, will root in sand under a hand-glass, in a moderate heat.

XIX. CHISOCHE'TON (from *σχιζω, schizo*, to cut, and *χιτων, chiton*, a coat; in allusion to the staminiferous tube being 6-cleft). Blum. bijdr. 4th number.

Lin. syst. *Monadélphia, Hexándria.* Calyx urceolate, nearly entire. Petals 4, linear. Anthers 6, rarely 7 or 8, inserted in the throat of a 6-cleft, conical tube. Ovary girded by a short ring, 3-celled; cells 1-seeded. Style clavate, crowned by an obtuse stigma. Capsule 2-3-celled, or only 1-celled from abortion, 2-3-valved, with a dissepiment in the middle of each valve. Seeds arillate; aril incomplete, fleshy. Embryo exalbuminous. Cotyledons large, peltate.—Trees with impari-pinnate leaves, and with branched panicles of flowers.

1 C. pa'tens (Blum. l. c.) leaflets oblong; panicles spreading, much branched. ♄. S. Native of Java. Schizochìton, Spreng. syst. append. p. 251.

Spreading-panicled Chisocheton. Tree.

2 C. dive'rgens (Blum. l. c.) leaflets oblong; panicle divaricate, twiggy. ♄. S. Native of Java. Schizochìton, Spreng. l. c.

Diverging-panicled Chisocheton. Tree.

Cult. A mixture of loam, peat, and sand will suit the species of this genus, and ripened cuttings will root in sand under a hand-glass, in heat.

XX. CARA'PA (*Carapa* is the name of *C. Guianénsis* in Guiana). Aubl. guian. suppl. p. 33. t. 387. D. C. prod. 1. p. 626.—Xylocárpus, Schreb. gen. no. 646.—Persoònia, Willd. spec. 2. p. 331.

Lin. syst. *Monadélphia, Octo-Decándria.* Calyx coriaceous, 4-5-lobed. Petals 4 or 5, coriaceous. Stamens 8-10; filaments joined into a tube, which is toothed at the apex, and bearing the anthers on the inside at the throat. Style short. Stigma broad, truncate, with a furrowed margin. Drupe dry, globose, woody inside, 4-5-furrowed, 4-5-valved, 4-5-seeded. Seeds thick, free of albumen.—Trees with abruptly-pinnate, coriaceous leaves, and panicled racemes of small, dirty-yellowish flowers. Stamens and habit of trees agreeing with *Meliàceæ*, but the seeds come closer to those of *Guttíferæ*.

1 C. Guiane'nsis (Aubl. l. c.) leaflets 8 or 10 pairs, alternate or opposite, elliptical, oblong, acuminated, coriaceous, shining. ♄. S. Native of Guiana in forests. Lam. ill. t. 301. Persoònia Guareoìdes, Willd. spec. 331. The inhabitants of Guiana extract an oil from the seeds of this tree by boiling them in water, which they call oil of carapa, and is used by them for rubbing their hair and all parts of their body; it preserves them against the bites of insects and the humidity of the atmosphere. This oil is thick and bitter. The trunk of the tree furnishes masts for small vessels. The tree is called *Carapa* by the Caribbees, and *Y-Andiroba* by the Caripous. Fruit the size of an apple.

Guiana Carapa. Fl. Nov. Clt. 1824. Tree 60 feet.

2 C. obova'ta (Blum. bijdr. 4th number,) leaves with 2 pairs of obovate, coriaceous leaflets. ♄. S. Native of Java. Xylocárpum obovàtum, Spreng. syst. append. 147.

Obovate-leaved Carapa. Tree 20 feet.

3 C. Guinee'nsis (G. Don, in Loud. hort. brit. p. 168.) leaflets 8 or 10 pairs, oblong, acuminated, shining, coriaceous; racemes

panicled, axillary; fruit tetragonal, 4-valved, 4-seeded. ♄. S. Native of Sierra Leone on the mountains. Afzèlia spléndens, Hortul. Fruit about the size of an apple, containing 3 or 4 large, angular nuts. There is an oil extracted from the nuts, which is used by some of the natives in place of soap, as well as for the purpose of anointing their bodies.

Guinea Carapa. Fl. Feb. May. Clt. 1793. Tree 30 feet.

4 C.? prócera (D. C. prod. 1. p. 626.) leaflets 4-5 pairs, obtuse, cuneated at the base; flowers of 5 petals, decandrous. ♄. S. Native of the Caribbee Islands. Trichília prócera, Forsyth, ined. in herb. Lher. Fruit unknown.

Lofty Carapa. Tree 66 feet.

5 C. Molucce'nsis (Lam. dict. 1. p. 621.) leaflets usually 3 pairs, opposite, ovate, acute. ♄. S. Native of the Moluccas in muddy places among the mangroves. Granàtum littòreum, Rumph. amb. 3. p. 92. t. 61. C. I'ndica, Juss. dict. sc. nat. 7. p. 31. Xylocárpus Granàtum, Kœn. naturf. 20. p. 2. The tree is called *Cadul Gaha* by the Cingalese, and *Candalanga* by the Tamuls.

Molucca Carapa. Clt. 1820. Tree 50 feet.

Cult. These trees will succeed well in a mixture of loam and sand, and ripe cuttings will strike root in sand under a hand-glass, in a moist heat.

XXI. CALPA'NDRIA (from καλπη, *calpe*, an urn, and ανηρ ανδρος, *aner andros*, a male; in allusion to the stamens being situated in the throat of the urn-shaped tube). Blum. bijdr. 4th number.

Lin. syst. *Monadélphia, Polyándria.* Calyx of 4 permanent, unequal sepals. Petals 4. Stamens 25-40, filaments distinct at the base, but joined into a cylindrical tube at the top, bearing the anthers at its throat. Ovary 3-4-celled; cells 3-ovulate. Stigma somewhat trifid. Capsule woody, subglobose, 3-valved, 3-celled, with a dissepiment in the middle of each valve; cells containing 1-2 nuts from abortion. Nuts of 2 forms, 1-seeded. Seeds exalbuminous, exarillate.—A shrub with simple, lanceolate, serrated leaves, and solitary, or twin lateral flowers.

1 A. lanceola'ta (Blum. l. c.) ♄. S. Native of Java.

Lanceolate-leaved Calpandria. Shrub 6 feet.

Cult. This shrub will probably grow in a mixture of loam and peat, and ripened cuttings will root in sand under a hand-glass, in heat.

XXII. ODONTA'NDRIA (from οδους οδοντος, *odous odontos*, a tooth, and ανηρ ανδρος, *aner andros*, a male; sterile stamens appearing like teeth). H. B. et Kunth, 7. p. 228.

Lin. syst. *Monadélphia, Decándria.* Calyx hemispherical, 5-toothed. Petals 5, sessile, ovate, acute, equal, valvate in the bud. Filaments 10, connate at the base, the 5 opposite the petals sterile. Anthers ovate-cordate, 2-celled, bursting lengthwise on the inside. Disk none. Style short, crowned by an obtuse stigma.—An unarmed tree, with alternate, simple, entire, membranous, exstipulate leaves, and axillary, many-flowered panicles. Flowers conglomerate.

1 O. acumina'ta (Willd. herb. in Röm et Schult, syst. 5. p. 511.) ♄. S. Native of New Granada.

Acuminated-leaved Odontandria. Tree 30 feet.

Cult. A mixture of loam and sand will suit this tree well, and ripened cuttings will root in sand under a hand-glass, in heat.

Order LII. CEDRELEA'CEÆ (plants agreeing with *Cedrèla* in important characters). Cedrèleæ, R. Br. gen. rem. 64.

Calyx short, 5-cleft (f. 116. *a.*). Petals 5 (f. 116. *b.*), alternating with the segments of the calyx, and longer, erect, with a longitudinal plait on the inside of each in the middle. Genitals stipitate; stipe furnished with 5 adnate glands, 5-angled, and between the glands the plaits of the petals interpose. Stamens 5, inserted in the stipe, and appear as if they were a continuation of the glands; filaments awl-shaped; anthers cordate, 2-celled, at length versatile. Style prismatically pentagonal, crowned by a peltate stigma (f. 116. *c.*), which is obsoletely pentagonal. Ovary seated on the stipe, 5-celled; cells alternating with the stamens, containing 8 or 12 ovulæ. Dissepiments connected with the central axis, with imbricate ovulæ inserted on both sides of it. Fruit capsular (f. 116. *e.*), 5-valved; valves separable from the axis, and sometimes also the dissepiments, which alternate with the valves. Seeds suspended from the central placenta, with 2 rows in each cell imbricate, drawn out into a wing at the base or apex (f. 116. *f.*) or at both ends. Albumen fleshy, sparing. Integument thin, spongy. Embryo nearly erect, with leafy cotyledons, and a short, exserted, superior radicle.—Trees with dense, beautifully grained, coloured, sweet-scented wood. Leaves alternate, pinnate, with many pairs of opposite or sub-opposite, unequal-sided leaflets. Panicle large, spreading, pyramidal, composed of numerous little cymes of flowers, with the lateral ones usually male, the terminal ones fertile. This order differs principally in the stamens being inserted in the torus or protruding from the back of the urceolus, rarely fixed to the throat of the tube, as in *Swietènia*. It also differs from the last order in the seeds being winged. The trees are of great value for their wood, of which mahogany will give a good idea.

Synopsis of the Genera.

1 Cedre'la. Calyx 5-toothed. Petals adnate to the torus. Stamens 5, distinct. Capsule 5-celled, 5-valved. Seeds numerous, on each side of the dissepiment, ending in a wing.

2 Swiete'nia. Calyx 4-5-cleft (f. 116. *a.*). Stamens 8-10, joined into a tube. Capsule 5-celled (f. 116. *e.*), 5-valved. Seeds numerous, each drawn out into a wing (f. 116. *f.*).

3 Chloro'xylon. Calyx 5-cleft. Stamens 10, connected at the base. Capsule 3-valved, 3-celled. Seeds 4 in each side of the dissepiment, drawn out into a wing.

4 Flinde'rsia. Calyx 5-cleft. Stamens 10, alternate ones sterile. Capsule 5-valved, 5-celled. Seeds 2 in each side of the dissepiment, ending in a wing at the top.

5 Oxle'ya. Capsule 5-valved, 5-celled. Seeds 3, on each side of the dissepiment, ending in a wing at both ends.

I. CEDRE'LA (from *cedrus*, the cedar-tree; the wood has an aromatic scent like it). Lin. gen. no. 277. D. C. prod. 1. p. 624. Cèdrus, Mill.

Lin. syst. *Pentándria, Monogýnia.* Calyx small, 5-toothed. Torus elevated, stipe-formed. Petals 5, broad at the base, approximate, adnate to the torus. Stamens 5; filaments short, distinct, inserted in the torus; anthers oblong. Style 1. Stigma capitate. Capsule woody, 5-celled, 5-valved. Seeds numerous, compressed, imbricated downwards, ending in a membranous wing. Albumen fleshy. Embryo inverted. Cotyledons flat, leafy (Gært. fr. 2. p. 84. t. 95.). Trees with abruptly pinnate, many-paired leaves, and axillary and terminal panicles of small whitish flowers.

1 C. odora'ta (Lin. spec. 289.) leaflets ovate-lanceolate, entire, on short stalks. ♄. S. Native of the Caribbee Islands and Barbadoes.—Sloan. hist. 2. t. 220. f. 2.—Browne, jam. 159. t. 10. f. 1.—Lam. ill. t. 137. Corollas whitish flesh-coloured, resembling those of *hyacinth*. Fruit about the size of a partridge's egg. The bark of the tree is rough, marked with longitudinal fissures. This as well as the berries and leaves has a smell like *Assa-fœtida*, when fresh. The timber, however, has a pleasant smell. The tree is commonly known under the name of *Cedar* in the British West India islands. The trunk is so large as to be hollowed out into canoes and pariaguas, for which purpose it is extremely well adapted; the wood being soft, it may be cut out with great facility, and being light it will carry a great weight on the water. There are canoes in the West Indies, which have been formed out of these trunks, 40 feet long and 6 feet broad; the wood is of a brown colour, and has a fragrant odour, whence the name of *Cedar* has been given to it; it is frequently cut into shingles for covering houses, and is found very durable, but as the worms are apt to eat this wood, it is not proper for building ships, though it is often used for that purpose, as also for sheathing of ships. It is also used for wainscoting of rooms, and to make chests, because vermin do not so frequently breed in it as in many other sorts of wood, this having a very bitter taste, which is communicated to whatever is put into the chests, especially when the wood is fresh, for which reason it is never made into casks, because spiritous liquors will dissolve part of the resin, and thereby acquire a very bitter taste.

Sweet-scented Bastard-cedar. Clt. 1739. Tree 80 feet.

2 C. angustifòlia (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 624.) leaflets oblong, acuminated, entire, on long footstalks. ♄. S. Native of New Spain. The wood is good for many purposes, especially for making furniture.

Narrow-leaved Bastard-cedar. Tree 50 feet.

3 C. Brasilie'nsis (St. Hil. fl. bras. 2. p. 86. t. 101.) leaves abruptly-pinnate, with 14-20 oblong, obliquely ovate, acuminated, entire leaflets, which are smooth above but puberulous beneath; petals clothed with white tomentum. ♄. S. Native of Brazil in the province of Minas Geraes. Panicle terminal, large, pyramidal.

Var. β, austràlis (St. Hil. l. c.) leaflets with the nerves and margins puberulous; branches, petioles, and peduncles short, and densely pubescent.

Brazilian Bastard-cedar. Tree 40 feet.

4 C. Toóna (Roxb. cor. 3. t. 238.) leaflets lanceolate, acuminated, entire, pale-glaucous beneath. ♄. S. Native of the East Indies, where it is called *Toon* (Roxb.). Nipaul (Wall.). Willd. act. nat. cur. berl. 4. p. 198. Anthers inserted in 5 nectarial glands. Flowers small, white, smelling like fresh honey. Leaves deciduous. The wood of this tree is very like mahogany, but lighter and not so close in the grain. It is much used for furniture and various other purposes. The bark is powerfully astringent, and though not bitter, it has been found a good medicine in the cure of remitting and intermitting fevers, particularly when joined with a small portion of the powdered seed of *Guilandìna Bonducélla*, which is a very powerful bitter.

Toon Bastard-cedar. Fl. Feb. May. Clt. 1823. Tr. 60 ft.

5 C. febri'fuga (Blum. bijdr. 4th number) leaflets ovate-oblong, acuminated, quite entire. ♄. S. Native of Java. Flowers small, white. The bark is powerfully astringent, and is used in Java as a febrifuge. The wood is excellent for many purposes.

Febrifuge Bastard-cedar. Tree 60 feet.

6 C. velutìna (D. C. prod. 1. p. 625.) leaflets ovate-lanceolate, entire, smooth, petioles and branches velvety from very short down. ♄. S. Native of the East Indies at Tipperah. This is perhaps the *C. villòsa* of Roxb. hort. beng. p. 18. This tree has been cultivated a long time in Kew Gardens, under the name of *Cedrèla odoràta*.

Velvety Bastard-cedar. Clt. 1793. Tree 50 feet.

† *Species not sufficiently known.*

7 C. alternifòlia (Steud. nom. 170.) leaves alternate, simple, cordate-ovate, acute, fruit pentagonal, mucronated. ♄. S. Native of Campechy. Cèdrus alternifòlia, Mill. dict. no. 3. This probably belongs to a distinct genus, not belonging to the present order.

Alternate-leaved Bastard-cedar. Clt. ? Tree.

8 C. rosmarìnus (Lour. coch. p. 160.) leaves simple, linear; peduncles 1-flowered; seeds not winged. ♄. G. Native of Cochin-china and about Macao in China. This shrub yields an essential oil, and a spirit, not inferior to that which is drawn from rosemary. It probably belongs to a distinct genus, not belonging to this order.

Rosemary Bastard-cedar. Shrub 4 feet.

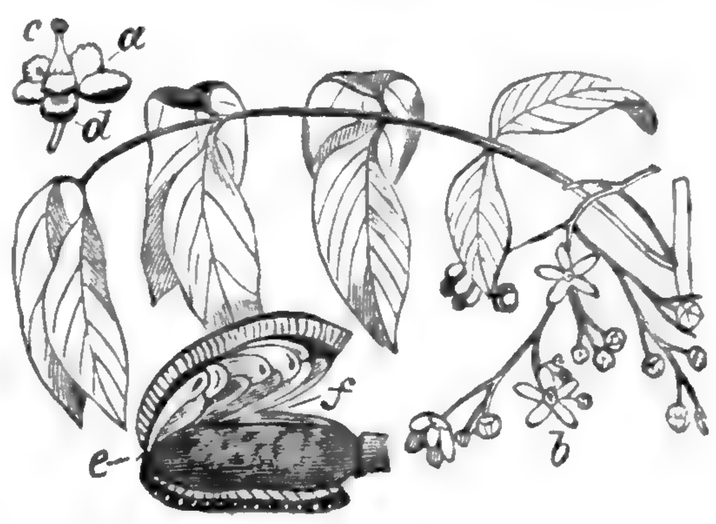
Cult. These trees will thrive well in a mixture of loam and peat; and large ripened cuttings will strike root in sand under a hand-glass, in heat.

II. SWIETE'NIA (in honour of Gerard Van Swieten, a Dutch botanist, author of several botanical works; died in 1772. He was physician to the Empress Maria Theresa). Lin. gen. no. 575. D. C. prod. 1. p. 625.

Lin. syst. *Monadélphia, Octo-Decándria.* Calyx small, 4 or 5-cleft (f. 116. *a.*), deciduous. Petals 4-5 (f. 116. *b.*). Stamens 8 or 10; filaments joined together into a toothed tube, bearing the anthers on the inside of the tube. Style 1. Stigma capitate (f. 116. *c.*). Capsules prickly, egg-shaped, woody, 5-celled, many-seeded (f. 116. *f.*). Valves opening from the base (f. 116. *e.*) or apex; margins opposite to the angles of the pentagonal central placenta. Seeds imbricating downwards, expanded into a wing, fixed to the placenta. Albumen fleshy. Embryo straight. Cotyledons flat, leafy. (Gært. fruct. 2. p. 89. t. 96.)—Trees with alternate, abruptly-pinnate leaves, and axillary panicles or racemes of small, white flowers.

1 S. Mahógoni (Lin. spec. 271.) leaflets usually 4 pairs, ovate-lanceolate, unequal at the base, acuminated at the apex; panicles axillary. ♄. S. Native of South America, Cuba, Jamaica, St. Domingo, but particularly Honduras Bay. Cav. diss. 7. p. 365. t. 209. Hook. bot. misc. pt. 1. t. 16 and 17.

FIG. 116.



—Cèdrus Mahógoni, Mill. dict. no. 2.—Cat. carol. 2. t. 81. The figure given by Gærtner, and that given in the Fl. mex. shew the capsule opening from the top, not from the base, therefore there are probably two species, varying in the dehiscence of the capsule. *Mahogoni* is the American name of the tree. The excellence of mahogany for all domestic purposes has been long known in England, and it is a matter of surprise that for a long time the only author who mentioned this tree was Catesby. Browne informs us, that mahogany was formerly very common in Jamaica, and while it could be had in the low lands, and brought to market at an easy rate, furnished a very considerable branch of the exports from that island, that it thrives in most soils, and varies both in grain and texture with each, that which grows among rocks being smaller, but very hard and weighty, of a close grain and beautifully shaded, while

the produce of the low and richer lands is observed to be more light and porous, of a paler colour and open grain. The tree grows very tall, with a straight trunk, sometimes 4 or 6 feet in diameter, and usually bears a great number of capsules. The flowers are of a whitish or saffron colour, and the fruit is about the size of a turkey's egg.

The first discovery of the beauty of mahogany wood is attributed to the carpenter on board Sir Walter Raleigh's ship at the time that vessel lay off the harbour of Trinidad in 1595. At Honduras 200 years is considered to be necessary from the time of the plant being reared by seed to that of its perfection and fitness for cutting, which commences about the month of August; at this time the leaves assume a yellowish hue. The Honduras mahogany is not so good as the Jamaica and St. Domingo mahogany, and is probably a distinct species. The bark of mahogany is astringent and bitter, and in its action on the human frame has been said to coincide nearly with Peruvian bark.

Common *Mahogany*. Clt. 1734. Tree 80 feet.

2 S. FEBRI'FUGA (Roxb. cor. 1. p. 18. t. 17.) leaflets usually 4 pairs, oval, obtuse or emarginate, and oblique at the base; racemes rising from the axils of the upper abortive leaves, therefore constituting a terminal panicle. ♄. S. Native of the East Indies in the mountainous parts of the Rajahmundry Circar, north of Samulcotah and Peddapore. S. Sóymida, Dunc. tent. edin.1794. Valves of fruit smooth, opening from the top. Flowers small, cream-coloured. The wood of this tree is of a dull-red colour, remarkably hard and heavy; it is reckoned by the natives the most durable wood they know, and on that account it is used for all the wood-work in their temples; it is also very serviceable for various other purposes. The bark is internally of a light-red colour; a decoction of it dyes brown of various shades, according as the cloth has been prepared. Its taste is a bitter and astringent united, and very strong, particularly the bitter, but is not in any way nauseous or disagreeable, and may be used in the same way as Peruvian bark. *Soymida* is its name among the Telingas.

Febrifuge Mahogany. Clt. 1796. Tree 60 feet.

3 S. Senegale'nsis (Desr. in Lam. dict. 3. p. 679.) leaflets usually 3 pairs, oval-oblong, coriaceous, bluntish; panicle terminal; flowers octandrous; fruit globose, 4-valved. ♄. S. Native of Senegal. Flowers small, whitish. The wood of this tree is very hard, and of a beautiful grain. It is brought to this country from Sierra Leone.

Senegal or African Mahogany. Tree 60 feet.

4 S. trilocula'ris (Roxb. mss. in herb. Lamb.) leaves pinnate; leaflets alternate, ovate, smooth, acuminated, rather unequal at the base; panicle terminal, composed of racemes; capsule 3-celled, 6-valved, opening from the apex, not prickly. ♄. S. Native of the East Indies.

Three-celled-capsuled Mahogany Tree. Tree 100 feet.

Cult. These trees will thrive well in a mixture of loam and peat, and ripe cuttings with their leaves not shortened will strike root in sand, in a moist heat.

III. CHLORO'XYLON (from χλωρος, *chloros*, yellow, ξυλον, *xylon*, wood; colour of wood). D. C. prod. 1. p. 625.

Lin. syst. *Monadélphia*, *Decándria*. Calyx small, 5-cleft. Petals 5. Stamens 10; filaments protruding from the back of the urceolus, the rest awl-shaped, free, radiately spreading. Capsules opening from the top, 3-valved, 3-celled; valves bearing a dissepiment in the middle. Seeds 4 in each cell, ending in a wing fixed to the dissepiments on the valves.—A tree with abruptly-pinnate leaves, and terminal panicles of small, whitish flowers.

1 C. Swiete'nia (D. C. prod. 1. p. 625.) ♄. S. Native of the East Indies on the mountainous parts of the Circars. Swietènia chloróxylon, Roxb. cor. 1. p. 46. t. 64. Leaves abruptly-pinnate, with many pairs of small, unequal, ovate, somewhat rhomboid, obtuse leaflets. The wood of this tree is of a deep-yellow colour, remarkably close grained, heavy, and durable; it is used for various purposes, and comes nearer to boxwood than any other in its native country. It is called *Billoo* by the Telingas.

Mahogany-like Chloroxylon. Clt. 1820. Tree 50 feet.

Cult. This tree will succeed in a mixture of loam and peat, and ripe cuttings, with their leaves not shortened, will strike root in sand under a hand-glass, in a moist heat.

IV. FLINDE'RSIA (Captain Michael Flinders, R.N. a celebrated circumnavigator, who explored the coast of New Holland in the beginning of the present century; he was accompanied by Mr. R. Browne, as naturalist, whose works on the botany of New Holland are well known). R. Br. gen. rem. p. 63. t. 1. D. C. prod. 1. p. 625.

Lin. syst. *Monadélphia*, *Decándria*. Calyx 5-cleft, short. Petals 5. Stamens 10, protruding from the back of the urceolus, with their bases dilated; filaments awl-shaped, spreading, alternate ones sterile. Capsule 5-valved, 5-celled, partible into 5 single segments, which are divided each by a longitudinal dissepiment, at length free, with 2 seeds on each side. Seeds erect, winged at the apex. Albumen absent. Cotyledons transverse, thick, leafy.—Trees with impari-pinnate leaves, small white flowers, and echinated capsules.

1 F. austra'lis (R. Br. l. c.) leaflets 1 to 3 pairs; flowers panicled; fruit ovate, very blunt at both ends. ♄. G. Native of New Holland on the eastern coast. Leaves full of pellucid dots, as in the orange. The wood is useful for various domestic purposes, and is said not to be much inferior to mahogany.

Southern Flindersia. Clt. 1823. Tree 66 feet.

2 F. Amboine'nsis (Poir. suppl. 4. p. 650.) leaflets 3 or 7 pairs; flowers almost solitary; fruit ovate-oblong, tapering to both ends. ♄. S. Native of the islands of Hitoe and Ceram. —Rumph. amb. 3. p. 201. t. 129. The trunk of the tree is used for pales. The spiny part of the fruit is formed into rasps by the natives of Amboyna; it is therefore called *Arbor radulifera* by Rumphius.

Amboyna Flindersia. Tree 60 feet.

Cult. These fine trees will thrive well in a mixture of loam and peat, and ripened cuttings, with their leaves not shortened, will strike root in sand under a hand-glass, those of the last species in heat.

V. OXLE'YA (in honour of Mr. Oxley of New South Wales). Cung. mss. in Hook. bot. misc. pt. 3. p. 286. t. 54.

Lin. syst. *Decándria*, *Monogýnia?* Flowers unknown. Capsule 5-celled, dividing even to the base into 5 valves, with a dissepiment in the middle of each, at length separating from the central receptacle, with 3 seeds on each side of the dissepiment. Seeds fixed by their middle, edged all round and extended into a wing at both ends. Albumen wanting. Radicle towards the hylum. This genus differs from *Flindérsia* in the valves separating from the base, in having 3 seeds on each side of the dissepiment, and in the seeds being winged at both ends.

1 O. xanthóxyla (Cung. mss. l. c.). ♄. G. Native of the eastern coast of New Holland. This is a tree 100 feet high, and 4 or 5 feet in diameter at the base. Leaves impari-pinnate, sometimes ternate, but usually with 4-5 pairs of opposite, lanceolate, quite entire, acuminated, bluntish, coriaceous leaflets, full of minute dots, on short stalks. The wood is very yellow. It is found to be useful in various kinds of carpentering, and in building boats.

Yellow-wooded Oxleya. Clt. 1829. Tree 100 feet.

Cult. A mixture of loam and peat with a little sand, will suit this tree. Ripened cuttings, with their leaves not shortened, will root in sand under a hand-glass.

Order LIII. AMPELI'DEÆ (from αμπελος, *ampelos*, a vine, and ειδος, *eidos*, form; plants like the grape-vine). H. B. et Kunth, nov. gen. amer. 5. p. 223. D. C. prod. 1. p. 627.—Vites, Juss. gen. 267.—Sarmentàceæ, Vent. tabl. 3. p. 167.—Viníferæ, Juss. mem. mus. 3. p. 144.

Calyx small, with an entire or toothed (f. 118. *a.*) margin. Petals 4-5, alternating with the teeth of the calyx, round the base of the ovary, and inserted on the outside; they are therefore between hypogynous and perigynous, broadest at the base, rarely connected into a lobed, monapetalous corolla (f. 118. *b.*), somewhat valvate and inflexed at the apex in æstivation. Stamens equal in number with the petals, inserted in the disk in front of the petals, sometimes sterile from abortion; filaments free or joined at the base (f. 118. *f.*); anthers ovate, birimose, inserted by their back, oscillatory. Ovary globose, free. Style 1, short or almost wanting, crowned by a simple stigma. Berries globose (f. 117.), younger ones 2-celled; cells 2-seeded. Adult berries usually with the dissepiments vanished, therefore 1-celled, watery or fleshy, not separating from the epicarp. Seeds 4-5, or fewer from abortion, sometimes wanting, erect, bony, fixed to the central axis by short funicles (f. 118. *c.*). Albumen fleshy, hard. Embryo erect, one-half shorter than the albumen, with a terete inferior radicle, and lanceolate cotyledons, which are keeled on one side and flat on the other.

This order is composed of sarmentose and climbing shrubs, with the lower leaves opposite, and the upper ones alternate, stalked, simple, lobed or compound, furnished with stipulas at the base. Peduncles racemose, thyrsoid, corymbose, cymose or umbellate, opposite the leaves; sometimes these peduncles are changed into tendrils. Flowers small, insignificant, greenish or greenish-yellow, rarely purple. The vine is the type and representative of this order, the other genera differ but little from it in botanical character, and not at all in habit. The common grape is the only species that bears really good fruit, the American kinds, with large fleshy berries, being spoiled by a disagreeable foxy flavour, which is not found to be removed by cultivation.

Synopsis of the Genera.

Tribe I.

Vini'feræ. *Corolla polypetalous. Stamens opposite the petals. Peduncles often changed into tendrils.*

1 Ci'ssus. Calyx nearly entire. Petals 4. Stamens 4. Ovary 4-celled. Berry 1-4-seeded.

2 Pterisa'nthes. Perigone leafy, lobately-winged. Calyx urceolate, entire. Petals 4. Stamens 4. Stigma sessile, bluntish. Ovary immersed in the disk. Berry 1-2-seeded.

3 Ampelo'psis. Calyx nearly entire. Petals 5. Stamens 5. Style 1, crowned by a capitate stigma. Ovary not immersed in the disk.

4 Vi'tis. Calyx 5-toothed. Petals 5, cohering. Stamens 5. Style wanting. Berry 2-celled, 4-seeded (f. 117.).

Tribe II.

Leea'ceæ. *Corolla monopetalous* (f. 118. *b.*). *Stamens alternating with the lobes of the corolla, usually monadelphous* (f. 118. *f.*). *Peduncles never changed into tendrils.*

5 Lee'a. Calyx 5-toothed (f. 118. *a.*). Corolla 5-cleft (f. 118. *b.*). Urceolus of stamens 5-lobed (f. 118. *f.*); filaments adnate to the urceolus between the segments. Style simple (f. 118. *d.*). Capsule 4-6-lobed, 4-6-celled; cells 1-seeded.

6 Lasianthe'ra. Calyx 5-toothed, bracteate on the outside. Corolla 5-cleft. Stamens 5, inserted in the bottom of the corolla, and alternating with its lobes; anthers hairy. Style short.

Tribe I.

VINI'FERÆ (from *vinum*, wine, *fero*, to bear; produce wine,) or SARMENTA'CEÆ (from *sarmentum*, a twig; plants twiggy). D. C. prod. 1. p. 627. Corolla polypetalous. Stamens opposite the petals. Fruit and seeds as in the character of the order. Peduncles usually changed into tendrils.

I. CI'SSUS (from κισσος, *kissus*, ivy, said to come from the Arabic *qissos*, signifying ivy). Lin. gen. no. 147. D. C. prod. 1. p. 627.

Lin. syst. *Tetrándria, Monogýnia.* Calyx almost entire. Petals 4, separating from each other to the base. Stamens 4. Ovary 4-celled. Berry 1-4-seeded.—Climbing plants, with simple, trifoliate or palmate leaves, and cymes or corymbs of small, greenish, yellow, or purplish flowers.

* *Leaves simple, cordate, entire, and sometimes rather lobed.*

1 C. vitigínea (Lin. spec. 170.) leaves cordate, roundish, serrated, smoothish, or clothed with rusty pubescence beneath; stipulas cordate. ♄. ◡. S. Native of the East Indies.—Pluk. mant. 27. t. 337. f. 4. Vahl. symb. 3. p. 18. Berries pear-shaped, 1 or 2-seeded, black, clothed with a bluish-glaucous pollen. Plant with the habit of the grape-vine. Flowers red.

Var. β, Cochinchinénsis (D. C. prod. 1. p. 627.) leaves smooth, toothletted, 3-lobed; berries roundish. ♄. ◡. S. Native of Cochin-china. C. vitigínea, Lour. cochin. 83.

Vine-like Cissus. Fl. July, Aug. Clt. 1772. Shrub cl.

2 C. repa'nda (Vahl. symb. 3. p. 18.) leaves cordate, entire, somewhat lobed, repand, adult ones smooth on both surfaces. ♄. ◡. S. Native of the East Indies. Young branches downy, adult ones smooth. Berries pear-shaped, about the size of peas, mucronate.

Repand-leaved Cissus. Shrub cl.

3 C. adna'ta (Roxb. fl. ind. 1. p. 423.) leaves roundish, cordate, acuminated, bristle-toothed, smooth above, velvety beneath, as well as the round branches; stipulas ovate-orbicular, adnate, with a gibbous centre, and scarious margins; flowers nodding. ♄. ◡. S. Native of the East Indies near Dacca. C. aristàta, Blum. bijdr. 4th number. Berries black, size of peas.

Adnate-stipuled Cissus. Fl. July, Aug. Clt. 1818. Shrub cl.

4 C. latifòlia (Vahl. symb. 3. p. 18. exclusive of the synonyme of Lam.) leaves cordate, ovate, acuminated, bristly-serrated, smooth above, but clothed with rusty hairs beneath; branches tetragonal; stipulas oblong. ♄. ◡. S. Native of the East Indies in woods.—Rumph. amb. 5. t. 164. f. 1. Berries pear-shaped.

Broad-leaved Cissus. Fl. July, Aug. Clt. 1824. Shrub cl.

5 C. glau'ca (Roxb. fl. ind. 1. p. 425.) leaves cordate, acuminate, sometimes somewhat lobed, bristly-serrated, smooth on both surfaces, as well as the petioles and peduncles; stipulas

broad, furrowed, blunt; cymes decompound; berries 1-seeded. ♄. ◡. S. Native of Madagascar and the East Indies.—Rheed. mal. 7. t. 11. C. latifòlia, Lam. dict. 1. p. 30. but not of Vahl. C. compréssa, Blum. bijdr. 4th number. Berries round, about the size of peas, purple.

Glaucous Cissus. Fl. July, Aug. Clt. 1818. Shrub cl.

6 C. I'NDICA (Rottl. et Willd. nov. act. nat. cur. 4. p. 183.) leaves roundish-cordate, acuminated, with bristly serratures, pubescent beneath; branches roundish, and are, as well as the petioles clothed with short down. ♄. ◡. S. Native of the East Indies.

Indian Cissus. Shrub cl.

7 C. CORDIFÒLIA (Lin. spec. 170.) leaves cordate, quite entire, pubescent beneath; peduncles trifid, dichotomous. ♄. ◡. S. Native of South America.—Plum. icon. t. 259. f. 3. Berries blue, 1-seeded.

Heart-leaved Cissus. Shrub cl.

8 C. ROTUNDIFÒLIA (Vahl. symb. 3. p. 19.) leaves cordate, roundish, smooth, serrated; umbels simple; branches pruinose, with swollen joints. ♄. ◡. S. Native of Java. Sælánthus rotundifòlius, Forsk. descr. icon. t. 4. Berry 1-seeded, large, oblong.

Round-leaved Cissus. Shrub cl.

9 C. RE'PENS (Lam. dict. 1. p. 31.) leaves cordate, ovate, somewhat toothed, and are, as well as the branches, smooth; flowers umbellate; stems creeping. ♃. ◡. S. Native of Malabar.—Rheed. mal. 7. t. 48. C. cordàta, Roxb. fl. ind. 1. p. 425. Stems succulent. Berries red, 1-seeded. Stipulas oval. Flowers dull-purple. Taste of leaves very acrid.

Creeping Cissus. Clt. 1821. Pl. cl.

10 C. PUNCTICULÒSA (Rich. act. soc. hist. nat. par. 106.) leaves broad-cordate, very blunt, with an abrupt, blunt point, and remote, bristle-like serratures; branches dotted. ♄. ◡. S. Native of Cayenne.

Dotted-branched Cissus. Clt. 1818. Shrub cl.

11 C. TAMOÌDES (St. Hil. fl. bras. 1. p. 342.) branches unarmed, terete, scabrous; leaves simple, cordate, acuminate, sharply-denticulated, full of pellucid dots, scabrous; pedicels and flowers smooth. ♄. ◡. S. Native of Brazil in the province of Minas Geraes. Flowers umbellate at the tops of the branches. Petals yellow.

Tamus-like Cissus. Shrub sarmentose.

12 C. UVÍFERA (Afz. rem. guin. 69. ex Spreng. neue. entd. 3. p. 235.) leaves somewhat peltately-cordate, quite entire, smooth, spotted at the base; shoots round, smooth. ♄. ◡. S. Native of Sierra Leone. Berries black, pulpy, with an austere, acid taste, but are eaten by the natives.

Grape-bearing Cissus. Shrub cl.

13 C. TILIA'CEA (H. B. et Kunth, nov. gen. et spec. amer. 5. p. 222.) smooth; leaves roundish, ovate, cordate, sharply-toothed, somewhat coriaceous; branches tetragonal; cymes dichotomous. ♄. ◡. S. Native near the city of Mexico.

Lime-tree-leaved Cissus. Shrub cl.

14 C. QUADRANGULA'RIS (Lin. mant. 39.) leaves cordate, kidney-shaped, serrated, smooth, fleshy; stem tetragonal, winged. ♃. ◡. G. Native from Arabia to Cochin-china. Root tuberous.—Rumph. amb. 5. t. 44. Sælánthus quadragònus, Forsk. descr. 33. icon. t. 2. Roxb. fl. ind. 1. p. 426. Berries red, 1-seeded, about the size of peas.

Quadrangular-stemmed Cissus. Clt. 1790. Pl. cl.

15 C. COMPRESSICAU'LIS (Ruiz et Pav. fl. per. 1. p. 64. t. 100.) leaves cordate, acutely-serrated, pubescent; flowers umbellate; partial peduncles dichotomous; stem tetragonal, compressed. ♄. ◡. S. Native of Peru among rubbish near Chancay. Berries dark-purple.

Compressed-stemmed Cissus. Shrub cl.

16 C. DI'SCOLOR (Blum. bijdr. 4th number.) leaves cordate-oblong, acuminated, discoloured, with bristly-serratures, and are, as well as the angular branches, smooth; cymes somewhat quinquefid, shorter than the leaves. ♄. ◡. S. Native of Java.

Discoloured-leaved Cissus. Shrub cl.

17 C. NODÒSA (Blum. bijdr. 1. c.) leaves somewhat cordate, oblong, pointed, with bristly serratures, smooth; corymbs dichotomous; pedicels umbellate; stem round, herbaceous, knotted. ♃. ◡. S. Native of Java.

Knotted-stemmed Cissus. Pl. cl.

18 C. JAVA'NA (D. C. prod. 1. p. 628.) leaves somewhat cordate, ovate-lanceolate, acuminated, smooth, somewhat serrated; serratures bristly; branches roundish, furrowed; peduncles trifid, rather corymbose. ♄. ◡. S. Native of Java.

Java Cissus. Shrub cl.

19 C. PENTAGO'NA (Roxb. fl. ind. 1. p. 426.) leaves cordate, rarely somewhat lobed, serrulated, acuminated, smooth; branches shining, pentagonal, with roundish angles and furrowed sides. ♃. ◡. S. Native of the East Indies in the forests of Chittagong.

Pentagonal-branched Cissus. Pl. cl.

20 C. SICYOÌDES (Lin. spec. 170.) leaves cordate, ovate, smooth, thickish, with adpressed, bristly serratures; branches round. ♃. ◡. S. Native of Jamaica and Guadaloupe in waste places, and by the sides of walls.—Sloan. hist. 1. t. 144. f. 1.—Brown. jam. t. 2. f. 1 and 2. Lam. ill. t. 84. f. 1. Jacq. amer. 22. t. 15. pict. 16. t. 20. The berries are black and oblong, and are eaten by the natives, as well as several other of the species, but are chiefly food for birds.

Choco-like Cissus. Fl. July, Aug. Clt. 1768. Pl. cl.

21 C. FULIGI'NEA (H. B. et Kunth, nov. gen. amer. 5. p. 224.) the whole plant of a rusty-black; leaves roundish-ovate, deeply-cordate, remotely-toothletted, hairy above, and clothed with soft down beneath; lower leaves 3-5-lobed, upper ones entire; branches round, and are, as well as the peduncles, clothed with hairy down. ♄. ◡. S. Native of South America on the banks of the river Magdalena.

Blackish Cissus. Shrub cl.

22 C. ANTA'RCTICA (Vent. choix. t. 21.) leaves ovate, somewhat cordate, loosely serrated, smoothish; nerves glandular at the base; petioles and branches clothed with rusty-pubescence. ♄. ◡. G. Native of New Holland. Sims, bot. mag. 2488. C. glandulòsa, Poir. suppl. 105. Vìtis Kánguruh, Hortul. C. Baudiniàna, Brouss.

Antarctic Cissus or Kanguruh Vine. Clt. 1790. Shrub cl.

23 C. CAPE'NSIS (Willd. spec. 1. p. 655.) leaves somewhat cordate, 5-angled, toothed, clothed with rusty down beneath; flowers somewhat capitate. ♄. ◡. G. Native of the Cape of Good Hope. Vìtis Capénsis, Thunb. fl. cap. 2. p. 105.

Cape Cissus. Clt. 1792. Shrub cl.

24 C. RUGÒSA (D. C. prod. 1. p. 629.) leaves cordate, trifid or quinquefid, wrinkled; flowers racemose. ♄. ◡. S. Native of Jamaica on the mountains. C. nov. sp. Lunan, hort. jam. 2. p. 216. Berry black, large, 4-seeded. Leaves almost like those of the common vine.

Wrinkled-leaved Cissus. Shrub cl.

25 C. CANE'SCENS (Lam. ill. no. 1620.) leaves ovate, oblong, unequally-cordate at the base, toothed, clothed with short, hoary down; branches angular; peduncles and cymes villously-tomentose. ♄. ◡. S. Native of Peru. H. B. et Kunth, nov. gen. amer. 5. p. 223.

Hoary Cissus. Shrub cl.

26 C. UMBRÒSA (H. B. et Kunth, nov. gen. amer. 5. p. 223.) leaves ovate, unequal-sided, obliquely-cordate, sharply-toothletted, hairy above, but clothed with hoary, downy pubescence beneath; branches rather tetragonal, hairy; peduncles and cymes smoothish. ♄. ◡. S. Native of South America on the shady banks of the river Magdalena.

Shaded Cissus. Shrub cl.

** *Leaves simple, not cordate, entire or toothed, sometimes lobed.*

27 C. SMILA'CINA (H. B. et Kunth, nov. gen. amer. 5. p. 224.) leaves ovate-oblong, somewhat acuminated, obliquely truncate at the base, smooth above, hairy beneath, as well as the furrowed branches; cymes and peduncles smooth. ♄. ◡. S. Native of South America on the banks of the river Magdalena in shady places. C. sicyoìdes, Poir. dict. suppl. 1. p. 104. ex H. et B.

Smilax-like Cissus. Clt. 1820. Shrub cl.

28 C. OVA'TA (Lam. ill. no. 1619. St. Hil. fl. bras. 1. p. 343.) leaves ovate-oblong, acuminated, smooth, rather scabrous, with sharply-toothletted serratures; branches unarmed, channelled, smooth; pedicels and flowers smooth. ♄. ◡. S. Native of Guadaloupe, Jamaica, and Brazil in the province of Rio Janeiro. Irsiòla, Brown. jam. t. 4. f. 1 and 2. Very like *C. sicyoìdes*, but the leaves are ovate, not cordate. It is perhaps the C. smilácina of Willd. enum. 163.? The berries are oblong and black, and are eaten by the natives. Flowers yellowish-green.

Ovate-leaved Cissus. Clt. 1822. Shrub cl.

29 C. ELLÍPTICA (Schlecht. et Cham. in Linnæa. 5. p. 221.) leaves elliptical-ovate or obovate, truncate at the base; branches obscurely quadrangular. ♄. ◡. S. Native of Mexico. This species differs from *C. sicyoìdes* in the leaves neither being cordate, nor acuminated, nor smooth beneath.

Elliptical-leaved Cissus. Shrub cl.

30 C. OBSCU'RA (D. C. prod. 1. p. 629.) leaves ovate-lanceolate, acuminated, smooth, with a few awn-like, pressed serratures. ♄.? ◡. S. Native of South America? Large panicles, much branched, sterile, small ones fertile. This is perhaps the C. ovàta of Rich. act. soc. hist. nat. par. p. 105. a native of Cayenne, but not of Lam.

Obscure Cissus. Shrub cl.

31 C. UMBELLA'TA (Lour. fl. coch. 84.) leaves ovate, smooth, quite entire; umbels compound; corollas woolly inside. ♄. ◡. S. Native of China about Canton. Calyx truncate, surrounding the berry, which is 1-seeded.

Umbellate-flowered Cissus. Shrub cl.

32 C. GLANDULÒSA (Gmel. syst. 256.) leaves ovate, acute, serrate-toothed, fleshy; pedicels and calyxes glandular at the base. ↾. ◡. G. Native of Arabia. Sælánthus glandulòsus, Forsk. descr. 34. Root tuberous. Stems round. Perhaps this is the same as C. glandulòsa of Horn. hort. hafn. 1. p. 143. which is said to have hispid pedicels and calyx.

Glandular-calyxed Cissus. Clt. 1819. Pl. cl.

33 C. PRODU'CTA (Afz. rem. guin. 63. ex Spreng. neue. entd. 3. p. 234.) leaves ovate-oblong, acuminated, with rather bristly teeth; flowers panicled; shoots very long, striated, compressed. ↾. ◡. S. Native of Guinea.

Produced Cissus. Shrub cl.

34 C. TUBERÒSA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 629.) leaves obovate, smooth, coarsely-serrated or trifid, with cut lobes; root tuberous. ↾. ◡. S. Native of New Spain. Very like *C. sicyoìdes* and *C. ovàta*, and is probably only a variety of one of them.

Tuberous-rooted Cissus. Pl. cl.

35 C. MICRA'NTHA (Poir. suppl. 1. p. 105.) leaves smooth, ovate, somewhat 3-lobed, with acute-serrated lobes, middle lobe longest; peduncles quinquefid at the apex, umbellate, length of petiole. ↾? ◡. S. Native of St. Domingo.

Small-flowered Cissus. Pl. cl.

36 C. TOMENTÒSA (Lam. ill. no. 1613.) leaves somewhat pentagonal, bluntly-toothed, smooth above, and clothed with rusty down beneath; petioles compressed. ♄. ◡. S. Native of Bourbon. Flowers and fruit unknown.

Tomentose Cissus. Shrub cl.

37 C. ANGULA'TA (Lam. ill. no. 1614.) leaves ovate, somewhat pentagonal, and angularly lobed, downy beneath; peduncles flat, longer than the leaves. ↾. ◡. S. Native of the East Indies. Berry dark-purple.

Angular-leaved Cissus. Pl. cl.

38 C. DUARTEA'NA (St. Hil. fl. bras. 1. p. 343. t. 71.) hairy; branches unarmed, furrowed; leaves trisected or profoundly 3-lobed, obtuse, sinuated. ♄. ◡. S. Native of Brazil in the province of Minas Geraes. Flowers umbellate at the tops of the branches.

Duarte's Cissus. Shrub cl.

39 C. TRILOBA'TA (Lam. dict. 1. p. 31.) leaves 3-lobed or trisected; lobes ovate, acute, toothed, rather fleshy; branches round. ♄. ◡. S. Native of Malabar.—Rheed. mal. 5. t. 45.

Three-lobed-leaved Cissus. Clt. 1822. Shrub cl.

*** *Leaves trifoliate.*

40 C. A'CIDA (Lin. spec. 170.) leaflets obovately-cuneated, fleshy, smooth, toothed at the apex, but almost entire at the base. ♄. ◡. S. Native of South America and the West Indies. Jacq. schœnbr. 1. t. 33.—Plum. ed. Burm. t. 259. f. 3. Sícyos angulàta, Lin. spec. ed. 1. p. 1013. Berries black, surrounded by the calyx. The whole plant has an acid taste.

Acid Cissus. Fl. June, Aug. Clt. 1692. Shrub cl.

41 C. SETÒSA (Roxb. fl. ind. 1. p. 428.) leaves sessile; leaflets 3, rarely 5, fleshy, smooth, oval, wavy, coarsely and unequally bristly-toothed; stipulas cordate; stems round, beset with glandular bristles. ↾. ◡. S. Native of the East Indies in hedges and forests in the Rajamundree Circar. Berries 1-seeded. Root fusiform. Every part of the plant is exceedingly acrid. The leaves toasted and oiled are applied to indolent tumours to bring them to suppuration.

Bristly-toothed-leaved Cissus. Pl. cl.

42 C. CARNÒSA (Lam. dict. 1. p. 31.) leaflets oval, obtuse, serrated, fleshy, smooth; branches and petioles round. ↾. ◡. S. Native of the East Indies. C. pergamàcea, Blum. bijdr. 4th number.—Rumph. amb. 5. t. 166. f. 2.—Rheed. mal. 7. t. 9. Roxb. fl. ind. 1. p. 427. Berries black, 4-seeded. Flowers small, white. Branches rather flattened.

Fleshy-leaved Cissus. Clt. 1818. Pl. cl.

43 C. TRIFOLIA'TA (Jacq. amer. 23.) leaflets obovate, deeply serrated, acute, fleshy, smooth; branches subalate. ♄. ◡. S. Native of Jamaica and Surinam in hedges. Swartz, obs. p. 50. —Sloan. jam. t. 142. f. 5-6.? Sícyos trifoliàta, Lin. spec. ed. 1. p. 1013. Berries small, black. This is probably distinct from *C. ácida*. C. trifoliàta of Lour. is most probably a very distinct species. Every part of the plant is acid.

Trifoliate Cissus. Fl. June, Aug. Clt. 1739. Shrub cl.

44 C. CAU'STICA (Tuss. ant. t. 16.) leaflets ovate, obtuse; branches round, jointed, succulent; petioles channelled. ♄. ◡. S. Native of the Caribbee Islands. Flowers corymbose, blood-coloured. The plant is very caustic.

Caustic Cissus. Shrub cl.

45 C. SALUTA'RIS (H. B. et Kunth, nov. gen. amer. 5. p. 225.) leaflets oblong, sharply serrated, full of pellucid dots, hairy above, and clothed with rusty hairs beneath; branches round, and are as well as the peduncles hairy and striated. ♄. ◡. S. Native of New Andalusia near Quetepe and Cumana in arid places. The root of this species is useful against dropsy.

Salutary Cissus. Shrub cl.

46 C. SPINÒSA (St. Hil. fl. bras. 1. p. 345.) branches spinose, angular, young ones tomentose; leaves ternate; leaflets unequal, lanceolate, dentately serrated, covered with white tomentum beneath; pedicels pilose; flowers puberulous. ♄. ◡. S. Native of Brazil in the province of Minas Geraes. Flowers umbellate at the tops of the branches. Petals violet?

Spinose-stemmed Cissus. Shrub sarmentose.

47 C. SYLVA'TICA (St. Hil. fl. bras. 1. p. 345.) branches unarmed, angular, smoothish; leaves ternate; leaflets unequal, lanceolate, sharply serrated, smooth, full of pellucid dots; pedicels pilose; flowers smoothish. ♄. ◡. S. Native of Brazil in the province of Minas Geraes. Flowers umbellate at the tops of the branches.

Wood Cissus. Shrub sarmentose.

48 C. A'LBIDA (St. Hil. fl. bras. 1. p. 344.) branches terete, tomentose; leaves ternate; leaflets unequal, acute, unequally-toothed, tomentose beneath; pedicels tomentose; flowers hairy. ♄. ◡. S. Native of Brazil in the province of Minas Geraes. Flowers in umbels at the tops of the branches. Petals green.

White Cissus. Shrub cl.

49 C. OBOVA'TA (Vahl. symb. 3. p. 19.) leaflets smooth, membranaceous, obovate, quite entire, mucronated; peduncles trichotomous, longer than the leaves. ♃? ◡. S. Native of Santa Cruz.

Obovate-leaved Cissus. Pl. cl.

50 C. PAUCIFLÒRA (D. C. prod. 1. p. 630.) leaflets obovate, almost entire, cuneated at the base, blunt at the apex, smooth, stiff; peduncles few-flowered, shorter than the leaves. ♄. ◡. G. Native of the Cape of Good Hope. Burch, cat. no. 3009.

Few-flowered Cissus. Shrub cl.

51 C. TERNA'TA (Gmel. syst. 1. p. 256.) leaflets smooth, stiff, ovate, cordate, acute, serrated; branches round. ♄. ◡. G. Native of Arabia in corn-fields. Sælánthus ternàtus, Forsk. descr. 35. Common petioles wanting.

Ternate-leaved Cissus. Shrub cl.

52 C. LU'CIDA (Poir. suppl. 1. p. 106.) leaflets smooth, shining, ovate, setaceously-toothletted; branches compressed, tetragonal, somewhat winged, glandular. ♄. ◡. S. Native of Cayenne. Allied to *C. alàta*.

Shining-leaved Cissus. Shrub cl.

53 C. QUADRIALA'TA (H. B. et Kunth, l. c.) leaflets smooth, obtuse, crenate-toothletted, and full of pellucid dots, middle ones ovate and acuminated at the base, lateral ones unequal-sided; branches tetragonal, 4-winged; peduncles and cymes hairy. ♄. ◡. S. Native of the Isle of Panumana in the mission of the Orinoco.

Four-winged-stemmed Cissus. Shrub cl.

54 C. MICROCA'RPA (Vahl. ecl. 1. p. 16.) leaflets oblong, serrated, mucronulate, smooth, membranaceous; branches angular. ♄. ◡. S. Native of the Caribbee Islands.—Plum. icon. ed. Burm. t. 259. f. 4. Berries oblong, black.

Small-fruited Cissus. Fl. June, Aug. Clt. 1820. Sh. cl.

55 C. ACUTIFÒLIA (Poir. suppl. 1. p. 106.) leaflets ovate, toothed, somewhat lobed, smooth, membranaceous; lobes acute; branches angular, somewhat compressed. ♄. ◡. S. Native of the East Indies.

Acute-leaved Cissus. Shrub cl.

56 C. ERÒSA (Rich. act. soc. hist. nat. par. 106.) leaflets membranaceous, smooth, oblong-ovate, rather acute at the base, erosely-toothed; petioles rather marginate; cymes on long peduncles. ♄. ◡. S. Native of Cayenne.

Erose-toothed Cissus. Shrub cl.

57 C. TIMORIE'NSIS (D. C. prod. 1. p. 630.) leaflets membranous, smooth, stalked, acute, broadly toothed; panicles loose, trichotomous. ♄. ◡. S. Native of Timor.

Timor Cissus. Shrub cl.

58 C. EMARGINE'LLA (Swartz. in act. holm. 1825. p. 427.) leaflets obovate, emarginate, remotely crenated, smooth; branches and petioles quadragonal. ♄. ◡. S. Native of the Caribbee Islands.

Emarginate-leaved Cissus. Shrub cl.

59 C. PAPILLÒSA (Blum. bijdr. 4th number,) leaflets ovate-oblong, acuminated, coarsely and sharply toothed, smooth, coriaceous; corymbs axillary, divaricating; stem woody, papillose, much branched. ♄. ◡. S. Native of Java.

Papillose-stemmed Cissus. Shrub cl.

60 C. GENICULA'TA (Blum. bijdr. l. c.) leaflets oblong, acuminated, bluntly toothletted, membranaceous, pubescent on the rib on both surfaces, lateral leaflets half-cordate; corymbs dichotomous, jointed; stem suffruticose, roundish. ♄. ◡. S. Native of Java.

Jointed-stemmed Cissus. Shrub cl.

61 C. RHODOCA'RPA (Blum. bijdr. l. c.) leaflets ovate-elliptical, acuminated, membranaceous, smooth, coarsely and unequally toothed, lateral leaflets cordate; corymbs dichotomous, shorter than the leaves; stem somewhat tetragonal. ♄. ◡. S. Native of Java. Fruit red, eatable.

Red-fruited Cissus. Shrub cl.

62 C. HIRTE'LLA (Blum. bijdr. l. c.) leaflets ovate-oblong, membranous, unequally serrated, downy beneath as well as the petioles; corymbs dichotomous, axillary. ♄. ◡. S. Native of Java.

Hairy Cissus. Shrub cl.

63 C. ALA'TA (Jacq. amer. 23. t. 182. f. 10.) leaves hairy; leaflets ovate, cordate, acute, serrated; branches with membranous angles. ♄. ◡. S. Native of Jamaica and Carthagena, climbing among trees and shrubs.—Sloan. hist. 1. p. 233. t. 144. C. trifoliàta, Lin. spec. 170.? Petals red; nectary yellow.

Winged-stemmed Cissus. Clt. 1822. Shrub cl.

64 C. PUBE'SCENS (H. B. et Kunth, nov. gen. amer. 5. p. 226.) leaflets acute, sharply toothletted, puberulous above, hoary-pubescent beneath, middle one largest, stalked, ovate-oblong, narrow-cuneated at the base; branches quadrangular, striated, hairy. ♄. ◡. S. Native of South America, plentiful on the banks of the river Magdalena between Mompox and Buenavista. Flowers and fruit unknown.

Pubescent Cissus. Shrub cl.

65 C. RHOMBIFÒLIA (Vahl. ecl. 2. p. 10.) leaflets pubescent, serrulated, lateral ones semicordate; middle one ovate-rhomboid; branches angular. ♄. ◡. S. Native of the Island of Trinidad.

Rhomb-leaved Cissus. Shrub cl.

66 C. CINE'REA (Lam. ill. no. 1624.) leaflets thickish, pubescent, ovate, toothed, lateral ones somewhat cordate; branches angular; petioles round. ♄. ◡. S. Native of the East Indies, particularly Java. C. pubinérvis, Blum. bijdr. 4th number.

Grey Cissus. Shrub cl.

67 C. CIRRHÒSA (Pers. ench. 1. p. 142.) leaflets fleshy, villous, ovate, serrated; branches and petioles compressed; berries hairy. ♄. ◡. S. Native of the Cape of Good Hope. Vìtis cirrhòsa, Thunb. fl. cap. 2. p. 106. There is a variety of this totally smooth according to Thunberg, it may probably prove a distinct species.

Tendrilled Cissus. Shrub cl.

68 C. CRENA'TA (Vahl. symb. 3. p. 19.) leaflets roundish, crenated, young ones villous. ♄. ◡. S. Native of the East Indies. Vìtis trifòlia, Lin. spec. 293.—Rumph. amb. 5. t. 166. f. 2. C. obtusifòlia, Lam. dict. 1. p. 31.?

Crenate-leaflëtted Cissus. Shrub cl.

69 C. ANGUSTIFÒLIA (Roxb. fl. ind. 1. p. 427.) flowers dioecious; leaflets smooth on both surfaces, lanceolate, serrated; stipulas ovate, acute; cymes shorter than the petioles; stem much compressed. ♄. ◡. S. Native of Sumatra. Berries white, round, 1-2-seeded, about the size of peas.

Narrow-leaved Cissus. Fl. Feb. Clt. 1818. Shrub cl.

* * * * *Leaves palmate, with 5 leaflets.*

70 C. QUINA'TA (Ait. hort. kew. ed. 2. vol. 1. p. 260.) leaflets

obovate, wedge-shaped, serrated above. ♄ . ◡. G. Native of the Cape of Good Hope.

Quinate-leaved Cissus. Fl. July. Clt. 1790. Shrub cl.

71 C. PENTAPHY'LLA (Willd. spec. 1. p. 659.) leaflets smooth, ovate, serrated, acuminated. ♃. ◡. G. Native of Japan. Vitis pentaphýlla, Thunb. fl. jap. 106.

Five-leaved Cissus. Fl. April, Sept. Clt. 1790. Pl. cl.

72 C. STRIA'TA (Ruiz et Pav. fl. per. 1. p. 64. t. 100.) leaflets smooth, sessile, oblong-lanceolate, serrated; stem striated, flexuous; cymes arched. ♄ . ◡. S. Native of Peru.

Striated-branched Cissus. Shrub cl.

73 C. MEXICA'NA (Moc. et Sesse, fl. mex. icon. ined. and D. C. prod. 1. p. 631.) leaflets smooth, stalked, oblong-lanceolate, serrated; stem somewhat tetragonal. ♄ . ◡. S. Native of Mexico.

Mexican Cissus. Shrub cl.

74 C. PALMA'TA (Poir. suppl. 1. p. 107.) leaflets 5-7, smooth, sessile, linear-lanceolate, sinuated, with bristle-like teeth; branches tetragonal. ♄ . ◡. S. Native of the Isle of France. Flowers umbellate.

Palmate-leaved Cissus. Shrub cl.

75 C. GRANULÒSA (Ruiz et Pav. fl. per. 1. t. 101.) leaflets smooth, obovate, toothed; stem angular, granular; cymes spreading. ♄ . ◡. S. Native of Peru among broken rocks.

Granular-stemmed Cissus. Shrub cl.

76 C. DIGITA'TA (Lam. ill. no. 1627.) leaves smooth, upper ones trifoliate; leaflets ovate, serrated; branches round. ♄? ◡. G. Native of Arabia. Sælánthus digitàtus, Forsk. descr. 35. icon. t. 3.

Digitate-leaved Cissus. Shrub cl.

77 C. DIVERSIFÒLIA (D. C. prod. 1. p. 631.) leaves smooth, radical ones simple, middle ones trifoliate, upper ones with 5 leaflets; leaflets acuminated, tapering to the base, acutely-crenated; petioles with a pubescent line. ♄ . ◡. S. Native of? C. heterophýlla, Link. enum. 1. p. 143. but not of Poir.

Diverse-leaved Cissus, Clt. 1822. Shrub cl.

78 C. FEMÍNEA (Roxb. fl. ind. 1. p. 428.) leaves digitate, shining, with stalked, broad-lanceolate, entire, or somewhat crenulate leaflets; style wanting; petals and stigmas 4 or 5. ♄ . ◡. S. Native of the East Indies on wooded mountains. Flowers small, green, or greenish-yellow.

Female Cissus. Shrub cl.

79 C. ELONGA'TA (Roxb. fl. ind. 1. p. 429.) leaves digitate, smooth, with stalked, oblong, acute, remotely serrated leaflets; stipulas and bracteas cordate; cymes trichotomous; branchlets fleshy, polished, a little compressed. ♄ . ◡. S. Native among the mountains on the coast of Coromandel and Bengal. Plant climbing over trees to a considerable extent. Berries round-turbinate, the size of a cherry, when ripe black, 1-seeded.

Elongated Cissus. Clt. 1818. Shrub cl.

80 C. AURICULA'TA (Roxb. fl. ind. 1. p. 630.) leaflets stalked, oblong, acute, bluntly serrated, smooth above, villous beneath; stipulas ear-shaped; branches round, villous. ♄ . ◡. S. Native of Mysore. Shoots climbing over trees to a great extent. Berries size, shape, and appearance of a common cherry, 1-seeded.

Eared-stipuled Cissus. Fl. year. Clt. 1820. Shrub cl.

81 C. TUBERCULA'TA (Blum. bijdr. 5th number,) leaflets oblong, acuminated, serrated, smooth, coriaceous; corymbs shorter than the petioles; stem compressed, tubercled. ♄ . ◡. S. Native of Java.

Tubercled-stemmed Cissus. Shrub cl.

82 C. MUTA'BILIS (Blum. bijdr. 1. c.) leaflets oblong, acuminated, lateral ones bluntish, remotely serrated; serratures scarious; cymes axillary; stem woody; berries 3-4-seeded. ♄ . ◡. S. Native of Java.

Changeable Cissus. Shrub cl.

83 C. SCARIÒSA (Blum. bijdr. 1. c.) leaflets oval, bluntish, coriaceous, coarsely serrated at the apex; serratures scarious at the top; stem chinky. ♄ . ◡. S. Native of Java.

Scarious Cissus. Shrub cl.

84 C. LÆVIGA'TA (Blum. bijdr. 1. c.) leaflets ovate, acute, with glandular serratures, smooth, coriaceous; corymbs axillary; stem round, warted. ♄ . ◡. S. Native of Java.

Smooth-leaved Cissus. Shrub cl.

85 C. DICHÓTOMA (Blum. bijdr. 1. c.) leaflets coriaceous, smooth, ovate-lanceolate, acuminated, with glandular serratures; corymbs dichotomous, shorter than the leaves. ♄ . ◡. S. Native of Java.

Dichotomous Cissus. Shrub cl.

86 C. THYRSIFLÒRA (Blum. bijdr. 1. c.) leaflets ovate-oblong, acute, serrulated, clothed beneath with rusty down as well as the branches; thyrse tendrilled. ♄ . ◡. S. Native of Java.

Thyrse-flowered Cissus. Shrub cl.

87 C. QUINQUEFÒLIA (Sol. mss. bot. mag. t. 2443.) leaflets 5, oblong-lanceolate, tapering to both ends, deeply serrated, smoothish; branches round, knotted, smooth; branches of panicle divaricating; pedicels puberulous; flowers smooth, umbellate. ♄ . ◡. S. Native of Brazil. C. Simsiàna, Schult. 3. p. 545. Flowers green.

Five-leaved Cissus. Fl. Jul. Clt. 1800. Sh. cl.

* * * * * *Leaves pedate, with 5-7-9 leaflets; middle leaflet solitary, lateral ones in twos, threes, or fours.*

88 C. JAPÓNICA (Willd. spec. 1. p. 659.) leaflets 5, smooth, oval, with awned serratures, lateral ones obtuse; peduncles longer than the leaves. ♃. ◡. G. Native of Japan.

Japan Cissus. Pl. cl.

89 C. NIPAULE'NSIS (D. C. prod. 1. p. 632.) leaflets 5, smooth, oval, acute, tapering to the base, with awned serratures; peduncles shorter than the leaves. ♃ . ◡. G. Native of Nipaul.

Nipaul Cissus. Pl. cl.

90 C. CORIA'CEA (D. C. prod. 1. p. 632.) leaflets 5, smooth, rather coriaceous, oval, tapering a little to both ends, broadly and distantly crenated; peduncles shorter than the leaves. ♄ . ◡. S. Native of the island of Timor. There are 2 varieties of this plant, one with broader and the other with narrower leaflets.

Leathery-leaved Cissus. Shrub cl.

91 C. LANCEOLA'RIA (Roxb. fl. ind. 1. p. 430.) leaflets 5, smoothish, rather coriaceous, lanceolate, acuminated, irregularly somewhat serrated; cymes stalked, almost the length of the petioles. ♄ . ◡. S. Native of the East Indies. C. dioíca, Roxb. in herb. Lamb.—Rheed. mal. 7. p. 15. t. 8. Flowers dioecious, female ones unknown.

Lanceolate-leafletted Cissus. Fl. Feb. Mar. Shrub cl.

92 C. SERRULA'TA (Roxb. fl. ind. 1. p. 432.) leaflets 5, oblong, serrulated; stem polished. ♃ . ◡. S. Native of Chittagong. C. glabràta, Blum. bijdr. no. 4.

Serrulated-leafletted Cissus. Fl. April, May. Pl. cl.

93 C. HETEROPHY'LLA (Poir. suppl. 1. p. 107.) leaflets 5, smooth, upper ones somewhat rhomboid, crenated, lower ones oblique, obtuse; stem fistular, striated. ♄ . ◡. S. Native of Java. C. leucocárpa, Blum. bijdr. no. 4. Berries white.

Variable-leaved Cissus. Shrub cl.

94 C. PEDA'TA (Lam. dict. 1. p. 31.) leaflets 7-9, lanceolate, acuminated, serrated, clothed with downy pubescence beneath; branches and petioles hoary. ♄ . ◡. S. Native of the East Indies.—Rheed. mal. 7. t. 10.? but the flowers are said to be 5-cleft. Roxb. fl. ind. 1. p. 431. C. heptaphýlla, Retz. obs. v. 22. Berries white, 4-lobed, depressed, 4-seeded.

Pedate-leaved Cissus. Shrub cl.

* * * * * * *Leaves pinnate or bipinnate, with opposite leaflets.*

95 C. PINNA'TA (Russ. besch. alep. ex Rœm. et Schult. syst. 3. p. 317.) leaves pinnate and trifoliate, smooth, membranaceous, with ovate, cut leaflets. ♄? ◡. S. Native of Aleppo.

Pinnate-leaved Cissus. Shrub cl.

96 C. OBLÍQUA (Ruiz et Pav. fl. per. 1. p. 65. t. 101. f. 6.) leaves pinnate, pubescent, with 2 or 3 oblique, cordate leaflets. ♄? ◡. S. Native of Peru.

Oblique-leafletted Cissus. Shrub cl.

97 C. MA'PPIA (Lam. ill. no. 1631.) leaves somewhat bipinnate, smooth, rather fleshy; leaflets ovate, quite entire. ♄. ◡. S. Native of the Isle of France, where it is called *Mappia*.

Mappia Cissus. Shrub cl.

98 C. ORIENTA'LIS (Lam. ill. p. 332. t. 84. f. 2.) leaves bipinnate, smooth; leaflets ovate, serrated. ♄. ◡. S. Native of the Levant.

Eastern Cissus. Shrub cl.

99 C. CONNI'VENS (Lam. ill. no. 1630.) leaves somewhat bipinnate, smooth; leaflets ovate, bluntish, a little toothed; petals conniving. ♄. ◡. S. Native of Madagascar. Differing from *C. orientàlis*, in having smaller and fewer leaflets.

Conniving-petalled Cissus. Shrub cl.

Cult. *Cissus* is a climbing genus of plants, hardly distinguishable from *Vìtis*. They are hardly worth cultivating, except in general collections; they will grow freely in any light soil, and cuttings will root readily under hand-glasses; those of the stove species should be placed in a moist heat.

II. PTERISA'NTHES (from πτερον, *pteron*, a wing, and ανθος, *anthos*, a flower; winged perigone). Blum. bijdr. no. 4.

LIN. SYST. *Polygàmia, Dioècia.* Perigone leafy, lobately-winged, coriaceous, deformed. Flowers polygamous, marginal ones male, pedicellate, hermaphrodite ones in the disk sessile. Male flowers with an urceolate, entire calyx, 4 rhomboid, erectish petals, 4 stamens which are opposite the petals, and with a tumid disk in the centre. Hermaphrodite flowers, with a short entire calyx, spreading petals, and with the stamens as in the male. Ovary immersed in the disk, crowned by a sessile, bluntish stigma. Berries obovate, 1 rarely 2-seeded. Seeds gibbous on the back, compressed on the other side, and with a longitudinal furrow. Albumen cartilaginous, 2-lobed. Embryo straight.

1 P. INVOLUCRA'TA (Blum. l. c.) leaves digitate; leaflets oblong, acuminated, repandly-toothed; flowers disposed in involucrated fascicles, outer ones on pedicels, inner ones sessile. ♄. ◡. S. Native of Java. Cissus involucràta, Spreng. syst. append. p. 44.

Involucrated-flowered Pterisanthes. Shrub cl.

Cult. Any light soil will suit this shrub, and cuttings will root readily under a hand-glass, in heat. Not worth cultivating unless in general collections.

III. AMPELO'PSIS (from αμπελος, *ampelos*, a vine, and οψις, *opsis*, resemblance; resembling the vine in every respect). Mich. fl. bor. amer. 1. p. 159. D. C. prod. 1. p. 632.

LIN. SYST. *Pentándria, Monogýnia.* Calyx almost entire. Petals 5 (as in *Vìtis*) but separating from each other from the apex to the bottom (as in *Cissus*). Stamens 5. Style 1, crowned by a capitate stigma. Ovary not immersed in the disk, 2-4-seeded (Kunth, nov. gen. amer. 5. p. 222.). This is an intermediate genus between *Cissus* and *Vìtis*.

* *Leaves simple.*

1 A. CORDA'TA (Mich. fl. bor. amer. 1. p. 159.) leaves cordate, acute, toothed, somewhat 3-lobed; nerves villous beneath; racemes doubly bifid. ♄. ◡. H. Native of North America from Pennsylvania to Carolina on river sides and among hedges. Císsus ampelópsis, Pers. ench. 1. p. 142. Vìtis indivìsa, Willd. baumz. 538. Flowers reddish. Berries pale-red.

Cordate-leaved Ampelopsis. Fl. June, July. Clt. 1803. Shrub cl.

2 A. BÓTRIA (D. C. prod. 1. p. 633.) leaves cordate, crenated, 3-5-lobed, downy; racemes subdivided. ♄. ◡. S. Native of the eastern coast of Africa on the shores of Zanquebar. Bótria Africàna, Lour. coch. 154. Flowers reddish. Berries black and eatable.

Grape Ampelopsis. Shrub cl.

* * *Leaves palmate, with 3 or 5 leaflets.*

3 A. HETEROPHY'LLA (Blum. bijdr. 4th number,) leaves simple or ternate, cordate, crenate-serrated, smooth; corymbs dichotomous. ♄. ◡. S. Native of Java. Vìtis Javánica, Spreng. syst. app. p. 90.

Variable-leaved Ampelopsis. Shrub cl.

4 A. HEDERA'CEA (Mich. fl. bor. amer. 1. p. 160.) leaves palmate, with 3 and 5 leaflets, smooth on both surfaces; leaflets stalked, oblong-acuminated, mucronately toothed; racemes corymbose, dichotomous. ♄. ◡. H. Native of North America from Pennsylvania to Carolina on the Alleghany mountains. Hédera quinquefòlia, Lin. spec. 292. Vìtis quinquefòlia, Lam. ill. no. 2815. Císsus hederàcea, Pursh, fl. amer. sept. 1. p. 170. Vìtis hederàcea, Willd. spec. 1. p. 1182,—Corn. can. t. 100. Stems climbing and rooting. Flowers greenish-purple. Fruit small, black. This shrub is used for covering walls like ivy. The leaves turn red in autumn.

Five-leaved *Ivy*, Virginian Creeper, or *Ivy-like* Ampelopsis. Fl. June, July. Clt. 1629. Shrub cl.

5 A. HIRSU'TA (Donn, hort. cant. 166.) leaves palmate, with 3 or 5 ovate, acuminated, coarsely toothed leaflets, which are pubescent on both surfaces. ♄. ◡. H. Native of the Alleghany mountains. Císsus hederàcea, var. β, hirsùta, Pursh, fl. amer. sept. 1. p. 170.

Hairy Ampelopsis. Fl. April, May. Clt. 1806. Shrub cl.

6 A. CAPREOLA'TA (D. Don, prod. fl. nep. p. 188. under *Vìtis*) leaflets 5, elliptical, acuminated, bristly-toothed, coriaceous, pubescent beneath; umbels axillary, 4-rayed, shorter than the leaves. ♄. ◡. H. Native of Nipaul. Resembles *A. hederàcea*, but is one half smaller. Flowers axillary, umbellate.

Climbing Ampelopsis. Shrub cl.

7 A.? TERNA'TA (D. C. prod. 1. p. 633.) leaves trifoliate, clothed with cinereous down beneath; leaflets oblong-oval, mucronate, doubly serrated, lateral ones oblique; stems and tendrils downy. ♄. ◡. S. Native of the East Indies. Vìtis ternàta, Roth. in Rœm. and Schult. syst. 5. p. 319.

Ternate-leaved Ampelopsis. Shrub cl.

* * * *Leaves pinnate or bipinnate.*

8 A. PINNA'TA (Rœm. et Schult. syst. 3. p. 322.) leaves pinnate, smooth, with 5 toothed leaflets. ♄. ◡. S. Native? Vìtis pinnàta, Vahl. symb. 3. p. 43. Branches purplish. Flowers small.

Pinnate-leaved Ampelopsis. Shrub cl.

9 A. BIPINNA'TA (Mich. fl. bor. amer. 1. p. 160.) leaves bipinnate, smooth; leaflets deeply lobed; racemes stalked, twice bifid. ♄. H. Native of Virginia and Carolina, in shady woods on river sides. Vìtis arbòrea, Willd. spec. 1. p. 1183. Císsus stáns, Pursh, fl. amer. sept. 1. p. 170.—Pluk. mant. t. 412. f. 2. Stem upright. Flowers small, green. Berries globose, cream-coloured.

Bipinnate-leaved Ampelopsis. Fl. June, Aug. Clt. 1700. Shrub 10 feet.

Cult. The hardy species of this genus are well adapted for covering walls, or planting with other climbing plants over bowers or trellis-work; they are easily increased by layers or cuttings in the autumn. The stove species are not worth growing, except in general collections; cuttings of these will strike root readily in a pot of sand under a hand-glass, in a moist heat.

IV. VI'TIS (from the Celtic word *guid*, which signifies a tree or shrub, that is to say, the best of trees; in Spanish it is called *vid*; in French *vigne*; in English *vine*. Wine comes from the celtic word *gwin*). Lin. gen. no. 284. D. C. prod. 1. p. 633.

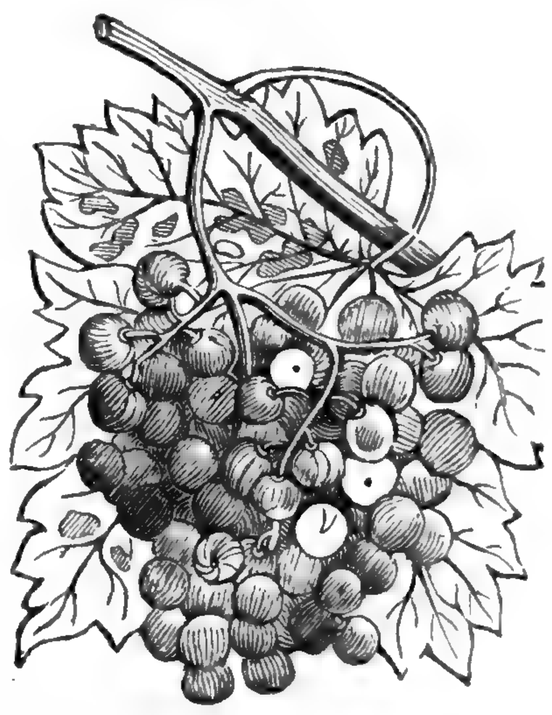
Lin. syst. *Pentándria, Monogýnia.* Calyx usually 5-toothed. Petals 5, cohering at the top, with a likeness to a calyptra, separating at the base, and deciduous. Stamens 5. Style none. Berry 2-celled, 4-seeded; cells and seeds often abortive. Climbing shrubs, with simple, lobed, cut or toothed, rarely compound leaves, and thyrsoid racemes of small, greenish-yellow flowers. The grape-vine belongs to this genus.

† *Hermaphrodite species, natives of the old world.*

* *Leaves entire, toothed, or lobed, seldom jagged.*

1 V. vinífera (Lin. spec. 293.) leaves lobed, sinuately toothed, naked, or downy. ♄. ◡. H. Native, indigenous, in the southern parts of Asia, but now cultivated every where.—Blackw. herb. t. 154. There are varieties with the leaves more or less lobed, smooth, pubescent, or downy, flat or curled, pale or deep-green. Branches prostrate, climbing, or erect, tender or firm. Racemes loose or crowded, ovate, or cylindrical. Berries red, black, pale-white, or green, watery or fleshy, sweet, musky, or sour. Seeds variable in number, often without. See the great number of varieties enumerated by Duhamel in abr. fr. 2. t. 16. Rox. Clem. var. vid. 1 vol. 8vo. madrid 1807. Chapt. vign. 2 vol. 8vo. Paris 1801. Rœm. et Schult. syst. 5. p. 300. See also the catalogue of the Luxemburg Garden at Paris, which includes 1400 varieties, gathered from various fruit catalogues. There are about 600 varieties in the gardens about Geneva.

FIG. 117.



The vine attains a great age in warm climates. Pliny speaks of a vine which had existed 600 years, and Bosc says that there are vines in Burgundy 400 years old. In Italy there are vineyards which have been in a flourishing state upwards of 300 years, and Miller says that a vineyard 100 years old is reckoned young. The extent of the branches of a vine in certain situations is commensurate with its produce and age. In the hedges of Italy they are found overtopping the highest trees, and in England one plant trained against a row of houses in Northallerton covered a space of 137 square yards, then about 100 years old, in the year 1785. There is one at Hampton Court nearly the same age, occupying 116 square yards. The vine sometimes attains a girth of 4 feet in circumference, and will afford planks 15 inches broad. The timber is of great durability. The vine is generally considered of Persian origin, and Dr. Sickler has given a curious account of its migration to Egypt, Greece, and Sicily. From Sicily it is supposed to have found its way to Italy, Spain, and France, and in the latter country it is believed to have been cultivated in the time of Antoninus. In the old world the culture of the vine forms a branch of rural economy from the 21st to 51st degree of north latitude, or from Schiraz in Persia to Coblentz on the Rhine. Some vineyards are even to be found near Dresden and in Moravia, and by means of garden-culture it is made to produce fruit for the table still farther north, being grown to a considerable degree of perfection in the hothouses of St. Petersburgh and Stockholm. The vine is supposed to have been introduced to Britain by the first Roman governors, though from Tacitus it appears to have been wanting in Agricola's time. There is evidence, however, to prove that vineyards were planted here in the year 280 A. D. and Bede, writing in 731, says there are vineyards growing in several places. Harte observes that the religious fraternities of the dark ages spread out from Italy in all directions, carrying with them the knowledge of agriculture and gardening, and from the celebrated nursery of the wealthy fathers of the Chartreuse of France, which contained 24 acres, all sorts of fruit-trees were sold and distributed in Europe and in Asia and Africa, during several centuries previous to the French Revolution, and there is little doubt, Professor Martyn observes, that orchards and vineyards were common appendages to abbeys and monasteries from their first establishment to the time of the Reformation. From this period they have disappeared in part, perhaps from the culture of the vine being little understood by those to whom the lands of religious houses were sold or granted; and in part because a better article could be introduced from our French provinces in the time of the Henries, and continued to be imported when we lost these. In modern times vineyards have been planted and wine produced nearly, if not entirely equal to that of France. It is stated in the Museum Rusticum, that at Arundel Castle in Sussex the Duke of Norfolk had a vineyard, of which there were in his Grace's cellar in 1763, about 60 pipes of excellent Burgundy. In Miller's time the hon. Charles Hamilton of Painshill had a vineyard which succeeded for many years and produced excellent champaigne. There are also accounts of several other individuals who have succeeded in the culture of vineyards. There can be no hesitation therefore in agreeing with these authors, and with Miller, Martyn, and Speechley, that vineyards would succeed in various parts of England, and particularly of Ireland, and produce wine equal to much of that imported from France. Whether this branch of rural economy would be profitable is doubtful to say. It may, however, afford much satisfaction to individuals in favourable situations to form vineyards and drink their own wine.

Grapes appear to have been in demand for the table as early as the 16th century, for Tusser includes "grapes white and red" in his list of fruits published about the year 1560, but as far as appears the vine has only been cultivated as dwarf standards, or trained against walls or buildings till the beginning of the 18th century. Stoves for preserving curious exotics had been introduced soon after the middle of the 17th century, but no mention is to be found of artificial heat to the vine till 1718, when Laurence informs us in his Fruit Garden, published that year, that the Duke of Rutland at Belvoir Castle, has done so much justice to the vine, as to have fires constantly burning behind his sloped walls from Lady-day to Michaelmas, whereby he is rewarded with the largest grapes and even the best Frontignacs in July. These sloped walls were afterwards covered with glass as we are informed. Switzer (Pract. fruit gard. 2d ed. 1763.) appears to be the first author who gives a regular plan of a vinery, with directions for forcing the grape. He advises making fires as early as the middle of December, so as to make vines push by the middle of January. However, since his time the art of forcing has made such rapid progress, that no kitchen-garden worth notice is now without them; the fruit is produced in some vineries during every month of the year; and in the

London market is to be had in the highest degree of perfection from March to January. Vines are grown at the same time on walls, unaided by fire-heat, and in favorable seasons the more hardy sorts attain a tolerable degree of maturity, but they are of little value compared with those grown in vineries and hot-houses. The uses of the grape in Britain are well known, in the dessert it ranks next to the pine-apple, and is by some preferred to it. The leaves form an excellent garnish to other table-fruits. Wine is sometimes made in England by expressing and fermenting the juice, either alone or with that of other fruits; and it has even been made from a decoction of the leaves, as well as from a decoction of the young shoots. In warmer climates it is not only used in the dessert, but eaten with bread, either newly gathered or dried as raisins; and in these countries from the fermented juice a wine is made superior to all others for stimulating the stomach and exhilarating the spirits. The medical products of the vine are verjuice, used as the juice of lemons; tartar, a gentle cathartic; vinegar, used as a condiment; for extracting the virtues of other medicines; for counteracting the effects of vegetable poisons. Even wine itself is given as a medicine in typhus fevers, in nervous disorders, in putrid sore-throat, and even in the plague. Martyn says wine is the most grateful and efficacious cordial that can be furnished from the whole class of aromatics.

The varieties of the vine are exceedingly numerous, partly from its antiquity, it having, as Professor Martyn remarks, been cultivated since the time of Noah, and partly from the influence of the soils and climates in changing the qualities of grapes, there being hardly two vineyards in France or Italy where the sorts, though originally the same, remain long precisely alike, but chiefly, as far as respects this country, from the facility with which new sorts are produced from seed. Parkinson, in 1627, enumerates 23 varieties. Ray, in 1688, enumerates 12 sorts as then much in request. Rea, in 1702, adds 5 sorts to Ray's list. Switzer, in 1717, says, "It is to Lord Capel and Sir William Temple that we are owing that collection of good grapes now so plenty in England; the latter," he says, "brought over the *Chasselas*, *Parsley* and *Frontignac;* and also the *Amboyna*, *Burgundy*, *Black Muscat*, and *Grisly Frontignac;* all highly approved varieties. The most valuable additions to the varieties have been procured by sowing the seeds of sorts ripened in this country. Many varieties have been sent from Spain, France, and Italy, so that the list of some British nurserymen exceed 250 names. No successful attempt has been made to class the numerous varieties of the vine either in France or England, as Duhamel did those of other fruits. M. Bosc was employed to compare and class those collected at the Luxemburg, but in 1809 he had only succeeded in figuring and describing 50 distinct sorts. In the catalogue published of the Luxemburg collection by Hervey in 1802, the arrangement is, 1st, vines with black oval fruits 37 sorts; 2nd, black round fruits 98 sorts; 3rd, white oval fruits 44 sorts; 4th, white round fruits 73 sorts; 5th, grey or violet oval fruits 5 sorts; and 6th, grey or violet round fruits 10 sorts, making 267 in all.

A list of British grapes cultivated in nurseries, arranged according to the colour and shape of their berries.

* *Grapes with round black berries.*

1 *Early Black* or *July Grape. Morillon noir hatif*, or *Raisin de la Madaleine* (Fr.). An old variety from France, principally esteemed for being early ripe, berries small.—Lang. P. t. 47. f. 3.

2 *Black Muscadine* or *Black Frankindale. Muscat noir* (Fr.). An approved variety, common on dwelling-houses about London. It is a good bearer; the leaves change to a fine scarlet and yellow colour in autumn.—Lang. p. t. 36. Excellent for a vinery.

3 *Black Grape from Tripoli.* This is a free growing kind. The berries are nearly all of a size, and are slightly undulated, some are without seeds, but when they are present small, compared to any other kind; they do not possess that fine, rich bloom that the Black Damascus does. It is, however, a month earlier, and is an excellent, tender, rich grape.

4 *Black Damascus* or *Worksop Manor Grape.* A large, excellent, late grape, full of rich, vinous juice, but is not a good bearer. Imported from Damascus by Edward the ninth duke of Norfolk.

5 *Black Lisbon, Black Spanish* or *Alicant, Black Portugal, Black Valentia* or *Black Prince.* A large, juicy berried variety, received from Portugal.

6 *Black* or *Purple Frontignac*, or *Purple Constantia. Muscat noir de Frontignac* (Fr.). A large, mealy, rich, and vinous-berried variety, which is much esteemed. It must be kept a long time before it becomes black, and then its rich flavour is gone. Lang. p. t. 38. Excellent for a vinery.

7 *Blue* or *Violet Frontignac. Noir Précoce* (Fr.). This is the true old Frontignac. No grape will stand early forcing better. The bunches are small, and separate easily.

8 *Black Sweet-water.* A small-berried variety, apt to crack, and not much in repute on that account. It is an improper kind for a Pine stove. Lang. p. t. 51.

9 *Black Morocco. Le cœur raisin d'Afrique, Raisin de Maroc* (Fr.). Berries tawny-coloured, of a high musky flavour. It is not worth growing unless in large collections. The bunches are short and stinted.

10 *Claret. Clarette rose* (Fr.). Wine from white berries may be coloured with the leaves of this sort. The berries are small and black, and the juice of a blood-colour and harsh tasted. The leaves are beautifully veined in autumn. Lang. p. t. 47.

11 *Black Prince.* The bunch and berries are large. It well deserves a place in a vinery, and ripens well on the open wall.—Hook. p. 45.

12 *Turner's Hardy, Black Esper*, and *Hardy Blue.* A very prolific, hardy grape. Aiton considers it one of the best we have for a wall.—Hort. trans. 3. 93.

13 *Black Corinth, Zante, Ascalon Currant.* Berries small and sweet, generally without seeds, and is the sort which produces the dried corinths or currants of the shops. From Ascalon in Palestine.—Lang. p. 46.

* * *Grapes with long black berries.*

14 *Black Muscadel.* An old variety from France. The berries are large, and have a pleasant taste. It is a shewy, good grape, and forms a handsome contrast, grafted on the white muscat of Alexandria, their habits of growth being in unison.

15 *Black Hamburg* or *Warner's Grape.* An old variety. The berries are large, pleasant, and vinous. It is one of the best grapes we have, and a plentiful bearer. Excellent for a vinery.

16 *Purple Hamburgh. Muscat violet* (Fr.). The berries are large, pleasant, and vinous, of a very dark colour. It is a good bearer.

17 *Small Black Cluster, Auvernat*, or *Black Burgundy.* An old variety, originally from Burgundy, with hoary leaves. It is a good wall fruit. The berries are small and pleasant.—Lang. p. t. 41.

18 *Miller's Burgundy, Miller's Cluster, Meunier Grape*, or *Miller's Grape.* This variety was originated from seed by Miller about 1720. It is a hardy grape, and was used for making wine at Painshill vineyard in 1750. The berries are middle-sized and pleasant.

19 *Large Black Cluster.* This variety was sent to Speechly from Portugal in 1740. The berries are middle-sized, rough, and harsh.—Lang. p. t. 42.

20 *Black Raisin. Augibert noir* (Fr.). This variety came from Languedoc. The berries are large and thick skinned. The same as the black Muscadel. Excellent for a late crop in a vinery.

21 *Black* or *West's St. Peter's*, or *Black Lombardy, Black Palestine.* The berries are large and juicy. It is an approved late grape. Excellent for a late crop in a vinery, only requiring more heat than other varieties.

22 *Black Cornichon. Cornichon noir, Dedos de Damas* (Fr.). *Pitzotella* (Port.). A curious finger-shaped fruit. It is a worthless grape.

23 *Damson Grape.* The succulent character of the leaves of this variety is very remarkable. This grape, even when well ripened, has an austere medlar-like flavour, which to some palates may be agreeable.

* * * *Grapes with round, white, or green berries.*

24 *Royal Muscadine*, or *White Portugal, Amber Muscadine, Chasselas blanc, D'Arboyce* (Fr.). This variety is said to have been introduced by Sir W. Temple in 1660. The bunch is large, the berries are middle-sized, rich, and vinous. It is one of the best hardy grapes, and an excellent bearer, but is not so good in flavour as the white Muscadine.

25 *Malmsey Muscadine* or *Parsley-leaved. Malvoisie musqué Ciotat, Raisin d'Austriche* (Fr.). *Vìtis laciniòsa*, species no. 2. p. 709. It is an old variety from France. The clusters are large, the berries middle-sized, rich, and musky. It is a good bearer, with fine leaves and fine fruit. Hort. trans. 4. t. 1.

26 *Common White Muscadine*, or *Chasselas*, or *Early White Teneriffe Grape, Amber Muscadine, Chasselas musquée* (Fr.). This variety was introduced by Sir W. Temple in 1660. Both bunch and berries are middle-sized and sugary. It is the best grape we have for a wall, and a great bearer. Not good for early forcing.—Lang. p. t. 35.

27 *White Frontignac* or *White Constantia. Muscat blanc* (Fr.). The bunch is large, with exquisite berries. It is a much esteemed hot-house and vinery grape.—Lang. p. t. 37.

28 *White Sweet-water* or *Pearl-drop. Pareyl druyf* (Dutch). This is a favourite Dutch grape. The clusters are middle-sized, and the berries are large and sugary. Esteemed an excellent grape.—Lang. p. t. 50. The kind called *Stillward's Sweet-water* is better than the old Dutch kind, as the bunches and berries are both larger. It is an improper kind for a pine stove, as its berries crack in a high humid atmosphere.

29 *White Corinth, White Ascalon, Yellow Stoneless*, or *Sultana raisin. Corinthe blanc* (Fr.). This variety is from Ascalon in Palestine. The berries are small, often without seeds, with a fine flesh, and an agreeable flavour. It is subject to decomposition immediately after maturity.—Duh. monc. fr. p. 273. t. 7.

30 *Pitmaston new white cluster.* Raised by Williams of Pitmaston from seeds of the black cluster. The bunches are crowded, and berries middle-sized. It is very hardy, and a great bearer.—Hort. trans. 3. p. 249. t. 8.

31 *Pitmaston Mignon white cluster.* Originated at Pitmaston, described in Hort. trans. The bunch is close, the berries small, juicy, and sweet. It is very hardy, and a great bearer.

32 *Scotch white cluster.* This variety was raised from seed by a blacksmith at Edinburgh about 1812. The bunch is middle-sized and close, the berries are small, juicy, and sweet. It is a very hardy kind, and a great bearer.

33 *Scarlet-leaved black cluster.* Originated from seed by Williams of Pitmaston in 1816. The bunch is small, as well as the berries, which are sugary. A hardy grape, remarkable for the beauty of its leaves in autumn.

34 *Kismush Grape.* Bunches small and well shouldered; berries small, sweet, and juicy, of a pleasant flavour, free from seeds.—Hort. trans. 4. t. 4.

* * * * *Grapes with long, white, or green berries.*

35 *White Muscat of Alexandria, Alexandria Frontignac, Muscat d'Alexandrie* or *Passe longue musquée* (Fr.), sometimes called *White Tokay* in the northern counties. Bunch large, as well as berries, which are vinous, musky, and rich. It is one of the richest grapes we have, and particularly well adapted for vineries.—Duh. monc. fr. p. 270. t. 5.

36 *Tottenham Park Muscat Grape.* (Hort. trans. vol. 6. p. 123). This variety was obtained from seeds of the Muscat of Alexandria by Mr. Henry Burn, for which he received the silver medal of the Horticultural Society. It is a free grower, abundant bearer, and its produce both in size of bunch and berry is equal to the old Muscat, but of superior flavour.

37 *White Muscat of Lunel.* Bunch middle-sized. Berries large, rich, and vinous, a good bearer, and highly esteemed grape.

38 *White Morillon* or *Genuine Tokay.* The berries are large and juicy. A good grape; the bunches are much larger than that of blue Tokay. It is an abundant bearer, and of very rich flavour; it has a thin, delicate skin, which renders it a bad packing grape, which is the only fault it has. Leaves downy underneath.

39 *Golden Galician.* Berries large, and of tolerable flavour.

40 *White Raisin*, or *White Hamburgh* or *Portugal.* The berries are large, with a thick skin and firm flesh.—Lang. p. t. 43.

41 *White Syrian.* Bunch very large. Berries very large, with a thick skin and firm flesh. It is a good bearer, and the largest of all both for bunches and berries. For a late grape no moderate collection should be without it.

42 *White Cornichon. Cornichon blanc, Doigt de Donzelle, Zeta de Voca* (Fr.). A curious pudding-shaped like berry, but not otherwise remarkable.—Duh. monc. fr. p. 271. t. 6.

43 *Verdelho.* Bunch small. Berries small, with a rich saccharine flavour. A hardy fruit, and fit for a common wall, but the stones eaten with the fruit prove deleterious. This is the kind from which Madeira wine is made.—Hort. trans. 1. p. 260.

44 *Amiens* or *Leon Native.* A very hardy grape, and ripens at Amiens in July.

45 *Greek Grape.* This is a good grape, but it does not keep many days after maturity. It is called in Durham and Northumberland *Green chee.*

46 *Cat's Grape.* A more worthless grape cannot be imagined.

47 *White Grape from Alcobaca.* It is much like the white Lombardy.

* * * * * *Grapes with red, rose-coloured, blue, greyish, or striped berries.*

48 *Red Muscat of Alexandria. Muscat rouge* (Fr.). This resembles the white Muscat except in colour. Bunch large and long. Berries rich, musky, and vinous. A rich hot-house grape like the white Muscat of Alexandria. Excellent for a vinery.—Duh. monc. fr. p. 268. t. 4.

49 *Red Muscadel.* Bunch large. Berries large, with a pleasant juice. It is a shewy, good fruit, but does not keep well. The flavour is rather better than that of red Syracuse.

50 *Red Frontignac. Muscat rouge de Frontignac* (Fr.). Bunch middle-sized. Berries large, oval, and brick-coloured. It is an excellent keeping fruit, but not so good as the following kind. Excellent for a vinery.

51 *Grizzly Frontignac. Muscat gris* (Fr.). Bunch small. Berries round, brownish, red, and yellow-coloured, with an excellent flavour, and keeps well. Excellent for a vinery.

52 *Red Hamburgh*, or *Hampton Court Vine*, or *Gibraltar.* Originated by Warner of Rotherhithe about 1730. Bunch large.

Berries large, globose, thin-skinned, rich, and vinous. Reckoned the best of the Hamburgh grapes.

53 *Giles's Seedling Hamburgh.* A new variety raised from Warner's Hamburgh. The leaves are elegant, both as to form and colour.

54 *Red Parsley-leaved Muscadine. Ciotat rouge* (Fr.). Berries middle-sized, red.

55 *Aleppo, Striped Aleppo,* or *Party-coloured Grape.* Berries middle-sized, with juicy flesh, of a very fine flavour. It is a curious grape, the berries frequently striped with black and white. The berries are liable to decomposition soon after maturity.

56 *Red Syracuse.* Bunch large. Berries large and oval, with a thick skin. A coarse fruit as to flavour, but very shewy and durable. It is a very vigorous kind.

57 *Blue Tokay. Malvoisie* (Fr.). Berries small and vinous, powdered with a blue bloom; the bunches about the size of those of the black cluster. It is not good if kept after maturity. It is a free bearer.

58 *Red Smyrna.* A very good grape, with a fine flavour.

59 *Brick Grape, Lombardy, Flesh-coloured Tokay,* or *Red Rhenish.* Berries small, sweet, of a brick-colour, but very inferior in flavour to the other Tokay kinds. The brick grape is probably a distinct variety. Lang. p. t. 39.

60 *Red Chasselas* or *Red Muscadine coral. Chasselas rouge* (Fr.). Berries red, small, and round.

61 *New Muscat of Jerusalem.* Originated by Miller about 1738. Bunch large. Berries very large, highly musky, vinous, and rich. Forsyth has seen the berries of this as large as a gooseberry.

62 *Variegated Chasselas.* This variety was originated from the Aleppo and Muscadine by Knight about 1811. Beautifully variegated berries and leaves.—Hort. trans. 1. p. 258. t. 15.

63 *Chasselas Panaché* or *Striped Muscadine. Chasselas doré's* or *Bar sur Aube blanc* (Fr.). This is a French ornamental grape, variegated both in the leaves and fruit.

64 *Elford's Seedling.* Is a tolerable grape.

The most elaborate descriptions of the varieties of the vine which have yet appeared are contained in a Spanish work by Don de Roxas Clemente, Librarian to the botanical garden of Madrid, which we shall give an outline of, more that it may assist some individual in the classification of English grapes, than for the description of the varieties he gives.

Spanish varieties of the vine grape, extracted from Ensayo sobre las variedades de la vid comun que vegetan en Andalucia, con un Indice etimologico y tres listas de plantas en que se caracterizan varias especias nuevas, by Don de Roxas Clemente y Rubio, Librarian to the royal botanic garden of Madrid. *8vo. Madrid.* 1807.

Sect. 1. *Leaves tomentose.*

Tribe 1. *Forénses. Listanes* (Span.). *Branches prostrate, long, and tender. Leaves palmate, with the recesses cordate or subcordate. Berries round, firm, sweet, and early.*

1 *ubérrima;* branches smooth; recesses of leaves cordate; racemes numerous; berries crowded, white, with a thin skin. Listan, comun. p. 131. f. 5.—2 *hyacínthina;* berries of a hyacinth-red. Listan Morado, p. 136.—3 *Antiliàna;* branches tomentose at the base; racemes very few; berries crowded, yellowish. Listan Landrenado, p. 136.—4 *Ligèri;* recesses of leaves subcordate; peduncles slender; berries much crowded, middle-sized, white. Colgadera, p. 137.—5 *Fuenteduénnæ;* recesses of leaves subcordate; peduncles hard; berries very much crowded, middle-sized, white, with thickish skin. De Fuenteduenna, p. 138.—6 *Capàni;* berries very black. Tempranillo, p. 138.

Tribe 2. *Fissiles. Polominos* (Span.). *Branches prostrate, long, and tender. Leaves palmate, with cordate recesses. Berries black, soft, and sweetish.*

7 *fissiles;* berries rather pellucid. Polomino, comun. p. 140.—8 *Venatòrum;* berries very pellucid. Polomino bravio, p. 140.

Tribe 3. *Pénsiles. Mantuos* (Span.). *Branches firm, white, with long internodes. Leaves lobed or palmate. Berries firm and sapid.*

9 *fállax;* leaves yellowish; berries roundish, of a deep green. Mantuo Castellano, p. 141.—10 *sylvática;* branches slender; leaves deep-green, lower ones very large; berries green, late. Mantuo bravio, p. 143.—11 *rubélla;* berries red. Mantuo morado, p. 143.—12 *pénsilis;* leaves greenish-yellow; berries large, very round, and very late. Mantuo de Pillas, p. 144.—13 *confertíssima;* leaves very downy, yellowish-green; berries crowded, yellowish, late, with conspicuous veins. Mantuo Laeren, p. 145.—14 *pellùcida;* leaves yellowish-green; berries large, yellow, pellucid, with very conspicuous veins. Cordovi, p. 145.—15 *Merlèti;* leaves yellowish-green; berries round, green, late, never abortive. Fray Cusano de Miraflores, p. 146.—16 *issophýlla;* leaves deep-green; racemes cylindrical; berries much crowded, round, and yellow. Torrontes, p. 146.

Tribe 4. *Durácinæ. Jaenes* (Span.). *Branches rather erect, brittle. Peduncles woody. Berries crowded, firm, with very thick skin.*

17 *Stephàni;* berries blackish. Jaen negro de Sevilla, p. 147.—18 *Crescéncii;* berries very black. Jaen negro de Grenada, p. 148.—19 *Varrònis;* berries white. Jaen blanco, p. 149.

Tribe 5. *Helvòlæ, Mollares* (Span.). *Branches tender. Leaves large, roundish, nearly entire, or a little toothed, soft. Berries large, round, very soft, and sapid.*

20 *móllis;* berries black, sapid. Mollar negro, p. 151.—21 *versícolor;* berries party-coloured. Mollar cano, p. 153.—22 *Duhamèli;* berries black, rather acid. Mollar negro bravio, p. 153.

Tribe 6. *Dápsiles. Albillos* (Span.). *Branches prostrate, long, tender. Leaves small, dark-green. Racemes rather cylindrical. Berries crowded, soft.*

23 *racemosíssima;* peduncles woody; berries much crowded, obovate, green, and very juicy. Albillo castellano, p. 154.—24 *succòsa;* berries black. Albillo negro, p. 155.—25 *Lalénnæ;* peduncles tender; berries crowded, green. De Lalenna, p. 556.—26 *Beguillèti;* racemes small; berries much crowded, green, and juicy. De Beguillet, p. 156.—27 *Héppe;* leaves tomentose; racemes middle-sized; berries much crowded, roundish, pale greenish-yellow, with conspicuous veins. Albillo pardo, p. 157.—28 *Herrèræ;* racemes large; berries much crowded, roundish, pale greenish-yellow. Albillo de Huelba, p. 157.

† *Singular varieties of the same tribe.*

29 *válida;* branches firm; leaves large, tomentose; berries round, much crowded, green, soft. Albillo loco, p. 158.—30 *Lienwebèri;* branches brittle; leaves middle-sized, tomentose; berries crowded, middle-sized, rather oblong, white, and soft. Albillo de Granada, p. 159.—31 *acérba;* branches firm; leaves large, tomentose; berries much crowded, roundish, green, and acid. Verdaguilla, p. 160.—32 *Millèri;* branches firm; leaves deep-green; berries oblong, green, soft, austere. Verdal,

p. 161.—33 *impàtiens;* branches erectish; leaves large, green; berries much crowded, obovate, green, very juicy, with conspicuous veins. Abejera, p. 162.—34 *lacrymòsa;* leaves palmate, greenish-yellow; racemes small; berries much crowded, rather oblong, green, and very juicy. Lorona, p. 163.—35 *anómala;* tendrils opposite. Gallega, p. 163.—36 *mollíssima;* branches spotted with black at the base; leaves nearly entire, when the fruit is mature they change to a red; berries black, middle-sized, very juicy, and very crowded. Mollor de Cadiz, p. 164.—37 *dulcíssima;* branches erect; leaves middle-sized, greenish-yellow; berries middle-sized, very round, white, and juicy. Malvasia, p. 165.—38 *Ximenezioìdes;* branches brittle; leaves palmate, greenish-yellow; berries few, middle-sized, rather oblong, white, soft, and very sweet. Ximenez Zumbon, p. 166.—39 *Liebáulti;* branches erect, reddish-brown, brittle; berries small, round, black. Tintilla, p. 167.—40 *maculàta;* branches brittle; leaves palmate; berries middle-sized, round, black, and very soft. Tinto, p. 169.—41 *Bretonnèria;* branches brittle; leaves middle-sized, palmate; berries middle-sized, round, black, rather soft, of an austere-sweetish taste, and with a thick skin. Romé, p. 170.—42 *diversifòlia;* branches tender; leaves palmate, and nearly entire; racemes small; berries much crowded, small, round, black. Garabatona, p. 171.—43 *Valcarcèlia;* branches short, tender; leaves middle-sized, palmate; berries few, small, round, black, soft, very sweet, and late. Morrastell, p. 172.—44 *Virgiliàna;* leaves greenish-yellow; racemes small; berries obovate, black, and very soft. Virgiliana, p. 173.—45 *bullàta;* branches tender; leaves large, blistered; berries crowded, large, roundish, white. Beva, p. 174.—46 *Galàna;* leaves large; berries rather crowded, middle-sized, roundish, white, and firm. Galana, p. 175.—47 *Dussieux;* branches tender; berries middle-sized, white, firm, very sapid, with a thin skin. Montuo Castellano, p. 175.—48 *pícta;* branches tender; leaves large; berries crowded, middle-sized, obovate, hard, and very fleshy. Pecho de Perdiz, p. 176.—49 *bipartìta;* branches tender; leaves middle-sized, greenish-yellow; berries few, middle-sized, rather oblong, white, rather firm, very sapid, and late, with a thin skin. Zurumi, p. 177.—50 *Columéllæ;* branches long, tender; leaves obscurely green; racemes large; berries rather crowded, large, roundish, white, and firm. De Columela, p. 178.—51 *prolífera;* branches thick; leaves acutely-sinuated, toothed; racemes small; berries crowded, round, white, and soft. Sepa canasta, p. 179.—52 *Colònia;* berries few, large, roundish, white, soft, subacid, early. Colona, p. 179.—53 *rotundifòlia;* leaves somewhat orbicular, nearly entire, soft, greenish-yellow; racemes small; berries obovate, very soft. Fray Cusana de Mayna, p. 180.—54 *subcompréssa;* branches tender, compressed at the base; leaves large, cordately-sinuated, greenish-yellow; racemes small; berries very round, white, soft, and very sweet. Cienfuentes, p. 181.—55 *aurántia;* branches very brittle; berries middle-sized, much crowded, rather obovate, firm, austere, yellow. Doradilla, p. 181.—56 *canìna;* branches brittle; leaves middle-sized, greenish-yellow; berries much crowded, middle-sized, round, yellow, firm, and austere. Montuo Perruno, p. 183.—57 *paupérrima;* branches brittle, spotted at the base, with short internodes; leaves small, acuminately-toothed, yellow; berries, few, middle-sized, round, white, firm, fleshy, and sweet. Listan de Paxarete, p. 184.—58 *frágilis;* branches erect, shining, firm; leaves acutely-sinuated, greenish-yellow; racemes long; peduncles very brittle; berries very few, unequal, round, yellow, fleshy, austere, late. Heben, p. 184.—59 *macrophýlla;* leaves large, with the tomentum deciduous; berries few, fleshy, yellow, austere. Rabo de Baca, p. 185.—60 *ignóbilis;* branches tender; leaves large, tomentose or pilose; berries round, dirty-yellow, firm, austere. Rebazo, p. 186.

Sect. 2. *Leaves pilose or nearly smooth.*

Tribe 7. *Ximenèciæ. Ximenecias* (Span.). *Branches erect and horizontal. Leaves acutely-sinuated, greenish-yellow, rather pilose. Berries rather crowded, middle-sized, white.*

61 *Forsỳthii;* branches horizontal. Ximenez loco, p. 183.—62 *Ximenecia;* branches erect. Ximenez, p. 188.

Tribe 8. *Flavéntes. Perrunos* (Span.). *Branches firm and brittle. Leaves yellowish. Berries crowded, middle-sized, roundish.*

63 *flàva:* branches very brittle; peduncles brittle; berries firm, yellow. Perruno comun. p. 192.—64 *Rozièri;* branches very brittle; peduncles brittle; berries firm, black. Perruno negro, p. 193.—65 *Quintìnea;* branches brittle; peduncles firm; berries black, rather firm. Quintinea, p. 194.—66 *Bernàla;* branches brittle; berries black, soft. Bernala, p. 194.—67 *firmissima;* branches firm; leaves very hairy; berries white, firm. Perruno duro, p. 195. f. 3.

Tribe 9. *Prostràtæ. Vigiriegos* (Span.). *Branches prostrate, very tender. Leaves yellowish. Berries large, soft.*

68 *prostràta;* berries roundish, greenish-white. Vigiriega comun, p. 196.—69 *Catònis;* berries black. Vigiriega negra, p. 197.—70 *Bidèti;* berries oblong, greenish-white. De Bidet, p. 197.

Tribe 10. *Oxicárpæ. Agraceras* (Span.). *Leaves deep-green. Berries middle-sized, round, and large oblong, rather acid.*

71 *álbicans;* branches white, firm; racemes middle-sized; berries middle-sized, black, late. Blanquecina, p. 198.—72 *Sòti;* branches white, firm; racemes oblongish, large; berries middle-sized, black, late. De Soto, p. 198.—73 *vittàta;* berries black or greyish-black. Melonera, p. 199.—74 *florentìna;* peduncles very tender; berries large, black. Agracera, p. 200.—75 *Langlèya;* peduncles black, very flexile; berries large, black. Langleya, p. 201.

Tribe 11. *Pergulànæ. Ferrares* (Span.). *Branches prostrate. Leaves greenish-yellow. Berries rather crowded, round, firm, and sapid.*

76 *autumnàlis;* branches tender; berries large, blackish. Ferrar comun. p. 202.—77 *speciòsa;* branches tender; berries large, white. Ferrar blanco, p. 202.—78 *Jonèsia;* branches firm; berries large, blackish. Jetubi loco. p. 203.—79 *exquisìta;* berries middle-sized, obtuse, black. Colona negra, p. 204.—80 *saccharàta;* berries middle-sized, umbilicate, black. Zucari, p. 204.—81 *mellìta;* berries large, yellow. Melcecha, p. 206.

Tribe 12. *Bumásti. Tetas de vaca* (Span.). *Berries large, ovately-conical.*

82 *sulcàta;* berries umbilicate, rather furrowed, red. Leonada, p. 207. f. 10, 11. 22.—83 *exsúcca;* leaves rather pilose; berries black. Corazon de Cabrito, p. 209.—84 *Martinècii;* berries rather yellow. Martinecia, p. 210.—85 *longíssima;* berries tapering to both ends, white. Santa Paula de Granada, p. 211.—86 *macrobótrys;* leaves pilose, rather tomentose; berries black. Caco de Tinaja, p. 213.

Tribe 13. *Oleagíneæ. Cabrieles* (Span.). *Leaves deep-green. Berries middle-sized and large, oblong, firm, austere, or very sapid.*

87 *rùbra;* branches whitish, striped longitudinally with red, tender; berries black, middle-sized, and large. Cabriel, p. 214.—

88 *Pliniàna;* branches whitish, firm; berries middle-sized, black. Jetubi bueno, p. 216.—89 *prædùra;* berries large, green. Ataubi, p. 216.—90 *prægrándis;* peduncles red; berries large, red. Santa Paula de Xerez, p. 218.—91 *Garidèli;* peduncles green; berries large, black. Moravita, p. 218.—92 *ovàta;* berries middle-sized, red. Arrobal, p. 219.

Tribe 15. *Dactylìdes. Datileras* (Span.). *Branches prostrate. Berries oblong, firm, and sweet.*

93 *Dáctylus;* berries red. De Ragol, p. 220.—94 *ténera;* leaves obscurely-green; berries middle-sized, black. Teta de vaca negra, p. 220.—95 *teretiúscula;* berries large, black. Teta de negra, p. 221.—96 *grácilis;* branches very short; racemes short; berries few, white. Teta de vaca blanco, p. 221.—97 *exímia;* branches long; racemes large; berries crowded, white. De Loxa, p. 222. f. 2.—98 *lónga;* racemes slender; berries very few, oblong, slender, white. Almunnecar, p. 223.—99 *orchídea;* branches long; racemes small; berries crowded, yellow, very sweet. Boton de Gallo, p. 225.—100 *jucúnda;* leaves greenish-yellow; berries black, very sweet. Boton de Gallo negra, p. 225.

Tribe 15. *Apiàna. Moscatelles* (Span.). *Berries musky.*

101 *generòsa;* berries round, yellow. Muscatel melnudo blanco, p. 226.—102 *moschàta;* berries round, red. Muscatel melnudo morado, p. 227.—103 *obovàta;* berries obovate, violet. Moscate gordo Morado, p. 228. f. 1.—104 *Isodòri;* berries obovate, rather yellow. Moscatelon, p. 229.

† *Singular varieties of the same tribe.*

105 *Boutelòui;* berries large, subobovate, yellowish, rather sweet. De Boutelou, p. 230.—106 *Sáchsi;* branches prostrate, brittle; leaves greenish-yellow; berries middle-sized, round, greenish-white, sweet. Vigiriego de Motril, p. 231.—107 *vìvax;* branches erect; leaves yellowish-green; berries middle-sized, very round, dark-violet, sapid. Jami, p. 231.—108 *Teràna;* branches rather firm; leaves small, yellowish-green; berries very crowded, middle-sized, very round, firm, and yellow. Terana, p. 233.—109 *sphærocárpa;* branches rather firm; leaves green, hardly pilose; berries large, very round, white, and sapid. Alban real, p. 234.—110 *pseudoapiàna;* leaves greenish-yellow, hardly pilose; berries large, very round, green. Muscatel de Flandes, p. 235.—111 *Elisabeth;* branches firm; leaves rather pilose; berries large, round, white, soft, insipid. Santa Isabel, p. 236.—112 *Vaòa;* berries few, minute, oblong-ovate, blackish, firm, and acid. Vaoa, p. 236.—113 *Ruízia;* leaves palmate; berries few, middle-sized, roundish, black, and fleshy. Ruizia, p. 237.—114 *Zèæ;* branches very brittle; leaves yellowish-green; berries middle-sized, party-coloured, soft, and sapid. Molar de Granada, p. 237.—115 *hirsùta;* branches rather erect, brittle; leaves very hairy, yellowish; berries very round, yellow, soft. Cannocazo, p. 238.—116 *regàlis;* leaves yellowish-green; berries few, large, cylindrically subovate, white, rather firm. Uva de Rey, p. 239.—117 *Pallàdii;* branches prostrate; leaves yellowish; berries much crowded, middle-sized, rather oblong, yellowish, firm, and rather acid. Ciuti, p. 240.—118 *Búcci;* leaves yellowish; berries crowded, middle-sized, subcylindrical, yellowish, firm, and subacid. Casta de Oñanez, p. 242.—119 *Nievàsea;* berries few, large, oblong, red, subacid, sapid. Nievasea, p. 243.

Descriptive List of the varieties of Vìtis Vinífera or Grapevine, cultivated in the regions on the Rhine, by Professor Dierbach in Heidelberg, extracted from Schlecht. Linnæa. vol. 3. p. 142 to 152.

§ 1. *Humilìores. Stem shrubby, usually dwarf, with the nodes of the branches approximate. Berries usually small and dense.*

* *Sphærocárpæ. Berries globose.*

α *Nóbiles. Grapes from which a generous wine is obtained.*

1 *pusílla;* leaves 3-5-lobed, villous beneath; bunches small, dense; berries small, pellucid, with a thin, yellowish-green skin which is dotted, and operculated, and with a juicy aromatic sweet flesh. There are varieties of this with green, cream-coloured, red, and black berries. Riesling, p. 144.—2 *peregrìna;* leaves 3-5-lobed, pubescent beneath; bunches middle-sized, pyramidal, and rather dense; berries greenish-yellow, covered with a greyish bloom with a thin skin, and aromatic sweet flesh. Walsch-Riesling, p. 145.—3 *xanthocárpa;* leaves 3-lobed, villous beneath; bunches small, dense; berries yellowish, pellucid, covered with white, pruinose dots, with a thin skin and a sweet juicy flesh. There is a variety of this with greenish fruit. Gelber-Riesling, Ortlieber, Knakkerle, p. 145.—4 *nàna;* leaves 5-lobed, covered with white pubescence beneath; bunches rather dense, branched; berries green, covered with pruinose dots, with a thick skin and sweet flesh. Kleiner Gutedel, p. 145.—5 *Campàna;* leaves slightly 3-lobed, flat, pubescent beneath; bunches small, dense; berries whitish-green, with a thin dotted skin, and sweet juicy pulp. This is the grape from which champaigne is made. Champagner, Kleiner-Heinsch, p. 145.—6 *Burgundìaca;* leaves 3-5-lobed, villous beneath; bunches small, dense; berries greenish-yellow, dotted, with a thin skin, covered with a grey bloom, and with juicy, aromatic, sweet pulp. Weisser Burgunder, p. 145.—7 *nicarìna;* leaves 5-lobed, scabrous beneath; bunches middle-sized, dense, oblong; berries greenish-yellow, covered with a white bloom; the skin is thin and dotted, and the pulp is green, juicy, and sweet. Futterling, p. 145.—8 *péndula;* leaves 3-lobed or entire, pubescent beneath; bunches on long peduncles, dense; berries unequal-sized, green, with a thick skin, covered with a white bloom, and with succulent sweet flesh. There is a variety of this with black berries. Hangling, p. 145.

β *Plebèiæ. Grapes which produce bad and cheap wines.*

9 *crépitans;* leaves 3-5-lobed, covered with white villi beneath; bunches loose, branched, oblong; berries on long pedicels, white, dotted, covered with a grey bloom; skin thin and pulp pellucid, watery, and sweet. Weisser Rauschling, p. 146.—10 *xanthóxylon;* leaves 3-5-lobed, villous beneath; bunches dense; berries on short pedicels, dotted, covered with a grey bloom; skin rather thick, and pulp red and sweet. Schwarzer Rauschling, Gelbholzer, p. 146.—11 *pulverulénta;* leaves slightly 3-lobed, blistered, clothed beneath with white villi; bunches dense, oblong, middle-sized, nearly simple; berries blue, covered with a grey bloom; the skin is thin and the pulp is red. Blaue Mullertraube, p. 146.—12 *Austrìaca;* leaves 3-lobed or nearly entire, hairy beneath; bunches crowded; berries green, dotted, covered with a grey bloom; skin thin; pulp watery, usually containing only 1 seed. Oesterreicher sylvaner, p. 146. There are varieties of this with red and black berries.—13 *acérba;* leaves 5-lobed, smooth; bunches ovate, middle-sized, dense, simple; berries without dots, greyish-red, with a thin skin, and red, juicy, acid, astringent pulp. Schlehentraube, p. 146.—14 *tinctòria;* leaves 5-lobed, hairy beneath; bunches crowded; berries blue, with a thick skin and firm, acid, purple pulp, which stains the hands. Farbertraube, p. 146.

* * *Dactylìdes. Berries more or less oblong.*

α Nóbiles. Grapes from which good wines are obtained.

15 *Clavennénsis;* leaves on long petioles, slightly 3-lobed, with red teeth, pilose beneath; bunches small, dense; berries red, covered with brownish bloom; skin rather thick, and the pulp juicy, aromatic, and sweet. There is a variety of this with black berries and red pulp. Clavner, Rulander, Burgunder, p. 147.—16 *Tyrolénsis;* leaves on short petioles, slightly 3-lobed; bunches small, broad, branched, dense; berries pruinose, red, with a thin skin, and juicy, aromatic, sweet pulp. Traminer, p. 147.

β Plebèiæ. Grapes from which cheap wines are obtained.

17 *præ̀cox;* leaves on long petioles, 3-lobed, or entire, rather pubescent beneath; bunches small, crowded; berries blue, covered with a grey frosted bloom; skin thick; pulp firm and acid. Jacobstraube, p. 146.—18 *Omphacìna;* leaves 5-lobed, smooth; bunches elongated, flaccid; berries cream-coloured, dotted, covered with a white bloom, with a thick skin, and firm acid pulp. Sauertraube, Verjus, p. 147.

γ Apyrènæ. Berries without seeds.

19 *Corinthìaca;* leaves slightly 3-lobed, villous beneath; bunches middle-sized, rather flaccid; berries cream-coloured, covered with white bloom; skin thin, pulp succulent and sweet. Rosinentraube, Corinthe, p. 147.

§ 2. *Elatiòres. Trunk shrubby, tall and climbing, or arboreous and erect, with the internodes of the branches elongated. Bunches usually large, and flaccid.*

1 *Fruticòsæ. Stems tall.*

* *Sphærocárpæ. Berries globose.*

α Nóbiles. Grapes from which excellent wines are obtained.

20 *Aminea;* leaves 5-lobed, smooth, or pubescent beneath; bunches large, flaccid; berries greenish-yellow, dotted with brown, and covered with white bloom; skin thin; pulp pellucid, juicy, sweet, and very savoury. There are varieties of this with smaller white and red berries. Gruner oder weisser Gutedel, p. 148.—21 *æstivàlis;* leaves 5-lobed, pubescent on the nerves beneath; bunches early, large, flaccid; branches thin; berries large, dotted, whitish-green, covered with grey bloom; skin thin; pulp juicy and savoury. Fruher Gutedel, Perltraube, p. 148.—22 *rùbra;* leaves 5-lobed, coloured; bunches large, flaccid; berries purple, covered with a grey bloom; skin thin, pulp red and savoury. Rother Gutedel, Konigs-gutedel, p. 148.—23 *durácina;* leaves 5-lobed, smoothish; bunches large, flaccid; berries greenish-yellow, dotted with brown, covered with white bloom; skin thick; pulp firm, fragile, and very savoury. There is a variety of this with deeply jagged leaves, and loose bunches. Krachgutedel, p. 148.—24 *Lugiàna;* leaves 5-lobed, smooth; bunches large, rather dense; berries green, dotted, covered with grey bloom; skin thin; pulp juicy and savoury. Lugiane, p. 149.

β Plebèiæ. Grapes from which bad and cheap wines are obtained.

25 *mìsera;* leaves on long petioles, slightly 3-lobed, clothed with white villi; bunches large, pyramidal, flaccid, branched; berries large, greenish-yellow, dotted, covered with white bloom; skin thin; pulp yellow, watery. Elender, Putzcheere, Tokayer, p. 149.—26 *caudàta;* leaves on long petioles, 5-lobed, woolly beneath; bunches large, tapering into a tail, flaccid; berries cream-coloured, dotted, covered with a white bloom; skin thin; pulp juicy. Hammelchewanz, Lamberttraube, p. 149.—27 *leucophýlla;* leaves 5-lobed, covered with white hairs beneath; bunches large, flaccid; berries red, covered with grey bloom; skin thick; pulp firm, acid. Weislauber, Hudler, p. 149.—28 *cathártica;* leaves 3-lobed, pubescent beneath; bunches large, rather dense; berries greenish-white, pellucid, with a thin skin and juicy, watery, acid pulp. There are varieties of this with cream-coloured and red berries. The wine obtained from this grape is cathartic in a strong degree as well as the berries, Heinisch, p. 149.—29 *albuèlis;* leaves 3-lobed, on short petioles; bunches large, dense, pyramidal; berries white, dotted, pruinose, with a thin skin and juicy watery pulp. There are varieties of this with larger and smaller berries, cream-coloured, red, and black. Alben, Elbling, p. 149.

* * *Dactylìdes. Berries more or less oblong.*

α Nóbiles. Grapes from which pleasant wines are obtained.

30 *Malvática;* leaves rather hairy beneath; bunches large, rather dense, berries green, dotted, pruinose, with a thin skin, and juicy, savoury pulp. There are varieties of this with white and black berries. Malvasier, Seidentraube, p. 150.—31 *Rhæ̀tica;* leaves on long petioles, 5-lobed, villous beneath; bunches dense, large; berries unequal, flesh-coloured, covered with grey bloom; skin thick; pulp firm, sweet, and savoury. There are varieties of this with white and green berries. Fleischtraube, Valteliner, p. 150.

β Plebèiæ. Grapes from which bad wines are obtained.

32 *Francónica;* leaves on long petioles, 3-lobed, pubescent beneath; bunches large, flaccid, on long peduncles; berries green, dotted, pruinose, with a thick skin, and juicy, sweetish pulp. Franken, p. 150.—33 *callòsa;* leaves slightly 3-lobed, on long stalks, rough beneath; berries green, pruinose, with a callose skin, and firm, sweetish pulp. There is a variety of this with red berries. Hartheinsch, p. 150.—34 *rostràta;* leaves 3-5-lobed, on long stalks, pubescent beneath; berries acuminated, very long, green, pruinose, with a thick skin and acid pulp. There is a variety of this with blue berries. Spitzwalscher, Vogelschnabel, p. 150.

2 *Arborescéntes. Stems gigantic.*

* *Sphærocárpæ. Berries globose.*

α Nóbilis. Grapes from which excellent wines are obtained.

35 *Apiàna;* leaves 3-5-lobed, rather pilose beneath; bunches large, dense; berries cream-coloured, dotted, pruinose, with a thick skin, and a peculiar musky firm pulp, resembling the berries of the black-currant. There are varieties of this with red, blue, and black berries. Muscateller, p. 151.

β Plebèia. Grapes from which bad wines are obtained.

36 *microcárpa;* leaves 5-lobed, on long petioles, smoothish; bunches large, pyramidal, branched, flaccid; berries large, black, covered with grey bloom; skin thick; pulp firm and sweet. There is a variety of this with red berries. Trollinger, Schwarzer-gutedel, Malvasier, p. 151.—37 *Chenopòdea;* leaves 5-lobed, smooth; bunches large, rather dense, pyramidal, on long peduncles, much branched; berries middle-sized, blue, covered with grey bloom; skin thick; pulp reddish, of a sweetish-acid flavour. Gansfussler, p. 151.

* * *Dactylìdes. Berries more or less oblong.*

38 *Aureliàna;* leaves 3-lobed, on long stalks, hispid beneath; bunches early, very dense; berries cream-coloured, pellucid,

pruinose, with a thick skin, and firm, sweet, savoury pulp. There are varieties of this with white and green berries. Orleans, Seidentraube, p. 151.—39 *Africàna;* leaves 5-lobed, tomentose beneath; bunches large, flaccid; berries very long, blue, covered with a grey bloom; skin thick; pulp rather acid. Marokkaner, p. 151.—40 *Damascèna;* leaves 3-lobed, pubescent beneath; bunches large, branched, flaccid; berries large, blue, covered with grey bloom, with a thick skin, and sweet, savoury pulp at maturity. There are varieties of this with cream-coloured and white berries. Damascenertraube, Zibebe, p. 151.—41 *Alexandrìna;* leaves 5-lobed, smoothish; bunches large, flaccid, branched; berries unequal, greenish-yellow, covered with white bloom; skin thin; pulp very savoury and aromatic. Zibeben-Muskateller, p. 152.

Propagation.—The vine is propagated from seeds, layers, cuttings, grafting, and budding. By seeds for the sake of obtaining new varieties, by layers to obtain strong shewy plants the first year; by cuttings for economy in management, and to get plants with tops proportioned to their roots; and by grafting and budding for various useful and curious purposes.

By seed.—Select seed from the finest and best ripened berries, of approved sorts, if the object be to propagate an esteemed variety, or to procure a subvariety of an esteemed sort. But if the object be to procure an entirely new variety, the first object is to bring two or more sorts close together when in flower, so as that the pollen may effect a promiscuous impregnation, or by cutting out with small scissors the stamens from the flowers intended for the female parent before the anthers burst, and introducing the pollen of the variety intended for the male parent by dusting the stigma with the ripe anthers. This last is the most certain and effectual method, because the pollen of the stranger plant, operating alone, must have more influence on the progeny than when operating in conjunction with that of the blossoms to be crossed. The object of this should be to obtain a superior variety in every particular, therefore particular attention should be paid both to the kind impregnated and to the kind impregnating. Were the *Red Frontignac* and *White Sweet-water* wedded together, their union would probably produce a very valuable sort, as there would be a good chance of the berries being both large and delicate. Grapes for seed should be permitted to remain on the plant until they are perfectly mature, and until the seeds become of a dark brown. The seeds should be separated from the pulp and preserved till February or March. They should then be sown in pots filled with light earth, plunged in a moderate hot-bed, and the plants will come up in about a month; and when the plants are about 6 inches high, they should be planted singly into 48-sized pots, and shifted into larger pots from time to time as they grow. Water gently as circumstances require, give plenty of light and air, and in the following autumn cut the plants down to within two buds of the ground, and suffer only one of these to extend itself in the spring. They will produce fruit in 4 or 5 years, when the approved sorts should be selected and the others destroyed, or be kept for stocks to graft or inarch good sorts upon. Forsyth and some other authors recommend planting seedling vines the second year of their growth against a wall in the open air. Where there is abundance of walling to spare and no great haste requisite to prove the fruit, this is a good mode, as the fruit is sure of growing larger, and give a better opportunity of judging of their merits; but keeping the plants under glass in pots is the most eligible method, as the plants will produce fruit much sooner, and of better flavour. It would not, however, be prudent to plant out seedlings in a vinery in their untried state. The fruit of seedlings is not even always such as would be advisable to introduce into a vineyard; for although it may not have the sweetness, flavour, bulk, or precocity desired in an eating grape, it may be of that insipid large-berried kind, which is fit only to make the most inferior wines. In most vine countries, a small black berry, with an austere taste and aromatic flavour, and in a close bunch like that of our black cluster, is preferred to all others. It may be observed that vines raised from the seeds of black-berried kinds do not produce always black berries, nor the white-berried white berries.

By layers.—The advantage of layers is generally stated to be that of procuring large plants, that come immediately into bearing. A deep incision is made at a joint, or a ring of bark is taken off, and the shoot pegged down and covered with earth. However, vine plants raised from layers are supposed to be shorter lived and far inferior to those raised from cuttings.

By cuttings.—The advantage of propagating by cuttings is economy in labour. There are three kinds of cuttings used: 1 Long cuttings, from a foot to a foot and a half in length, consisting of new or young wood, with a joint or two of that of the preceding year. This is the sort recommended by Miller, adopted in forming vineyards on the Continent, and formerly used in this country for planting walls and vineries. They are inserted in the earth so as only to leave two eyes above ground, with the earth firmly pressed round them, they are mulched, and water is supplied regularly in dry weather. They strike freely in this way, either with or without bottom heat. In France they will even produce bunches of grapes the first year. 2 Short cuttings are formed with only one eye on the young wood, and 2 inches of that of the preceding year attached, plant in pots, one cutting in each, at first in 48-sized pots, and as soon as these pots are full of roots shift them into 32-sized pots. 3 Single-eyed cuttings; for this last method ripened wood should always be chosen at the pruning season, and preserve the shoot till wanted in spring by covering their lower ends with earth. The upper part of the cutting should be cut in a sloping direction with a sharp knife about a quarter of an inch above the eye, and cut about 3 inches below the eye horizontally, or they may be cut horizontally or slopingly at both ends at equal distances from the bud. Plant in pots, and bury the whole cutting in the soil, with the eye uppermost; apply bottom heat as in propagating short cuttings.

By grafting.—The advantages of this mode of propagation is when a wall or vinery is planted with inferior sorts of vines, the nature of the vines may be changed without loss of time and without expence; or in small vineries where it would be inconvenient to have a number of sorts from different roots, they may be procured by grafting different kinds on one and the same plant. But the most important advantage, Speechly considers, is by grafting the weak and delicate growing vines, as the *Blue Frontignac* upon robust and vigorous kinds, as the *Syrian.* The *Syrian*, raised from seed, is greatly preferable to all others for stocks. If the seedlings degenerate to a kind of wildness, so much the greater will be the vigour of the plants and the higher the flavour of the sorts grafted on them. At the pruning season select cuttings for grafts, preferring the bottom part of the last year's shoots, preserve them by inserting three parts of their length in pots filled with earth till wanted. The season for grafting in stoves is the beginning of January, in the open air the beginning of March. On small stocks, not more than an inch in diameter, cleft-grafting will be found the most proper, but upon larger stocks whip-grafting is to be preferred. Vine grafts do not take so freely as those of most other fruits; the operation must be performed with the greatest care. But the most eligible manner of grafting vines is that by approach, in which case either the stock or scion must be growing in a pot. Strong plants, 2 years potted, are to be preferred for the open air, but for a vinery or hot-house, plants from the nursery may be potted or shifted and inarched the same season. Here the clay and bandage should remain 2 or 3 months after the grafts have

formed a union, lest the grafted part spring from the stock. But in whip or cleft-grafting the clay may be taken off when the scion has made shoots 5 or 6 inches long.

Culture of the vinery.—On the culture of so important a fruit as the vine, it is not surprising that there should be a great variety of opinions. We shall only give those of modern British gardeners.

Soil.—Speechly, late gardener at Welbeck, made use of the following compost. One-fourth part of garden mould (strong loam); one-fourth of the turf from a pasture where the soil is sandy loam; one-fourth of the sweepings and scrapings of pavements and hard roads; one eighth of rotten cow and stable-yard dung mixed, and one eighth of vegetable mould from decayed leaves, turned over and broken with the spade; then put it to the other materials and work the whole well together.—Treat. on the vine, p. 25. He also covers his vine beds with a coat of gravel 2 inches thick. Abercrombie recommends "of top spit sandy loam from an upland pasture, one-third part; unexhausted brown loam from the garden one-third part; scrapings of roads free from clay one sixth part; vegetable mould or old tan reduced to earth, or rotten stable-dung, one-eighth part." The borders he recommends "to be from 3 to 5 feet in depth, and where practicable, not less than 4 feet wide in surface within the house, communicating with a border outside the building of not less than 10 feet wide." M'Phail gives the following directions: "To make a suitable border where it is required for the grape-vine, provide a large quantity of earth of a loamy nature, that from arable land or from a ridge, in which a hedge-row, or hazel, maple, &c. have grown many years and have been grubbed; or a spit deep from the surface of a common, long pastured, or from the head or end lands of a corn-field. For forcing vines do best in a strong deep loam, not destitute of a mixture of sand and well manured with rotten dung, on a dry bottom of hard clay." Nicol says, "the average depth of a border should not be less than a yard, if 4 feet so much the better. The border should not be narrower outside and inside of the house than 30 feet. The soil should be thus composed: one half strong hazelly loam, one fourth light sandy earth, an eighth part of vegetable mould or decayed tree-leaves, and an eighth part of rotten dung; to which may be added a moderate quantity of lime or shell marl. These articles should be well mixed before planting." Wm. Griffin, who has received the medal of the Horticultural Society for his skill in cultivating vines at Woodhall in Hertfordshire, forms his vine borders as follows. After being completely drained, the whole bottom is covered with brick, stone, or lime rubbish about 6 inches thick, and on this is laid a compost of "half good loamy soil with its turf, one quarter of rich solid old dung, and one quarter of brick and lime-rubbish, the turf well rotted, and the whole well incorporated." Hort. trans. vol. 4. p. 100. D. Judd (Hort. trans. vol. 4. p. 4.) uses the following compost: half of rich gritty loam from a common; a quarter of rich old dung; and a quarter of lime-rubbish and leaf-mould mixed together. These materials were kept separate and frequently turned during winter, and when afterwards mixed, were not sifted, but laid on a prepared bottom to a depth of 3 feet. He says he does not use so much dung as is usually done, because though the vine will bear an extraordinary quantity of manure, yet its growth is thereby retarded, especially when young. He recommends the addition of old tan, from having experienced (with Speechly, Mitchell, and others) that the vine will root in that more freely than in any other substance.

Choice of plants.—Those raised from eyes and have been properly trained to a single shoot the second year after having been struck are preferred; but where plants have to be sent from a great distance, Justice prefers cuttings to plants containing an inch or two of the old wood and 12 of the new; these he plants at once where they are to remain, as practised in France. Mr. Neill, Edinb. encyc. art. hort. details a speedy mode of storing a new grape-house. However, this mode can only be practised where a vinery exists previously, or where there is a friend's vinery in the neighbourhood. In the end of June or the beginning of July, when the vines have made shoots 10 or 12 feet long, and about the time of the fruit setting, select any supernumerary shoots, bend them down so as to make them a double or flexure, into a pot filled with earth, taking care that a portion of last year's wood, containing a joint, pass into the soil in the pot; keep them each in a wet state, and at the same time maintain a moist warm air in the house, and in a week or 10 days roots will be seen proceeding from the joint. The layer may now be safely detached. Very frequently it contains 1 or 2 bunches of grapes, which continue to grow and come to perfection. A new grape-house may be furnished in this way with plants in 3 months as by the usual method in 3 years; for in the second year they will yield a good crop of grapes, but they should be allowed only to bear a moderate crop the first year, for if allowed to bear a full crop the first year, the plants would necessarily show their exhausted state by barrenness the following year. A mode of more general utility is to select the plants in the nursery a year before wanted, and to order them to be potted into rather large pots, baskets, or tubs, filled with richish earth and plunged into a tan bed. They will thus make shoots, which, the first year after their final destination will, under ordinary circumstances, produce fruit.

Planting.—Vines are commonly trained against a back wall or a trellis under the glass roof. In the first case, the plants are always planted in the inside of the house; but in the latter, there are two opinions among practical men, one in favour of planting outside, and the other inside the parapet wall. Where the vines are to be drawn out when in a dormant state, as is generally the case with those trained under the rafters in pineries, outside planting must be adopted; but for vineries, where this practice is not requisite, it seems preferable to plant them inside. Abercrombie says, "let them be carefully turned out of the pots, reducing the ball a little, and singling out the matted roots. Then place them in the pits, just as deep in the earth as they were before, carefully spreading the roots, and filling them up with vegetable mould or light earth. Settle all with a little water, and let them have plenty of free air every day, defending them from severe frost and wet till they begin to push young shoots." D. Judd (hort. trans. 4. p. 4.). The vines being reared from eyes in March, cut them down to one eye the following March, put them into bottom heat, there to stand until they produce shoots 2 feet long, afterwards harden them in the green-house, where a temperature of 60 degrees is kept; there to remain until they grow 2 feet longer. Holes are made in the border in the beginning of May, and about a barrowfull of old rotten tan put in each hole, in the middle of which the balls are placed, after having been treated as follows: the leaves are cut from the lower part of the stem 2½ feet of its length; the end of the shoot is then drawn through the hole in the wall, the ball is placed 2 feet distant from the wall on its side, so that the stem will lie in a horizontal position, about 6 inches below the level of the surface of the border, and that part of the stem which is to be covered with earth is slit or tongued at every eye, to the centre of the joint. This being done, the stem is covered with old tan, and abundance of roots will be produced from every eye so slit. After the roots had issued from the slits, it was surprising the progress the shoots made, under Judd's management they were from 25 to 30 feet long, and proportionate in strength.

Season of planting.—Plants that are in pots may be planted at any time of the year, but the autumn and spring months are preferred.

Distance.—This must depend entirely on the kind of vine planted. Speechly recommends 6 feet between each plant for the weak and delicate kinds, and 12 for the more robust, on a wall or trellis 12 feet high. At first temporary plants may be introduced between them; these should have been grown in large pots 2 or 3 years previous, so as to come immediately into bearing, and to be trained so as to occupy the upper part of the wall, while the permanent plants are furnishing it below.

Pruning and training.—Each author lays much stress on his own mode of pruning and training; but as M'Phail observes, good crops depend more upon management, soil, and climate, than upon any method of pruning or training that ever can be adopted. The long or new method of pruning has been adopted, and reduced to a regular system by J. Mearns of Shobben-court, Hertfordshire. The vines are planted in the inside of the house at $2\frac{1}{2}$ feet apart, nearly close to the front wall, and are headed down to within a foot of the soil, one shoot only is allowed to proceed from each plant, which at the end of the first season is cut down to the second or third eye; next year two leading shoots are encouraged, the strongest of which is stopped when it has grown three or four joints beyond the middle of the roof, and the weaker after having grown 3 or 4 feet, for the purpose of strengthening the eyes. At the fall of the leaf, the leading shoots are reduced, the main one to the length of the middle of the roof, and the lower one to the third eye. In the third season, one leading shoot is trained from each shoot, and fruit-bearing side shoots are produced, and no side shoot is allowed to proceed from the spur. The leading shoot from which is to become the bearing shoot next year. Thus in the autumn of the third season, the lower part of the house is furnished with a crop of grapes from a shoot proceeding from the wood of the preceding year; and parallel to this bearing shoot, is a young shoot for next year's crop. In winter, the shoot from the extremity of the bearing branch is cut off at the top of the roof, or within a few inches of it, and the shoot from the stem is cut down to the middle of the root, and all the spurs which had borne grapes are cut out. Each vine is now furnished with 2 shoots of bearing wood, a part of old barren wood, and a spur for producing a young shoot the following year. In the fourth summer a full crop is produced both in the upper and lower part of the house, the longer shoot bearing on the upper part of its length, and the shorter one its whole length; a leading shoot is produced from the short shoot and another from the spur. In the pruning season of the fourth year the centre shoot is entirely removed and replaced by the side shoot, and this side shoot is supplanted by a shoot from the spur in its turn, while a spur is prepared to succeed it. J. Mearns has followed this system since 1806, and has had abundant crops and large bunches, and he considers that it may be continued for any length of time.

M'Phail describes three modes of pruning. The first he calls the old method, the general shape of the plant when pruned being that of a trained peach. The second is what is called spur pruning, which is to head down the natural leader, so as to cause it to throw out 2 or 3 or more principal shoots; these are trained as leading branches; laterals from these are cultivated about 12 inches apart, as mother bearers, those in fruit are stopped, and after the fall of the leaf are cut into one or two eyes. The third is the long or new method described above. J. Seton, of Stamford-hill, plants his vines at the front and ends of the house, and trains the leading branches horizontally along long rods, and spurs are left annually on the old wood to produce fruit, and when these leading branches have reached the end of the house, they are then returned to the end from which they proceeded.

Mr. W. Smith (Hort. trans. 6. p. 522.) gives a description of arched hanging trellises in certain vineries of Scotland, which he considers a superior plan to training vines on the rafter, or to one or more wires, that while it admits air to the house it increases the space for training considerably. He thinks the plan capable of further improvement, and that the principle might be extended to peach-houses, in which case the trellis would require to be somewhat differently constructed.

Mr. Beattie (Hort. trans. vol. 5. p. 495.) gives an account of training his vine-trees in a vinery at Scone in Perthshire. To enlarge the surface to the utmost he has erected a trellis under each rafter, and from these the vines are trained along the back wall horizontally, not exactly to the top of the house, but so as to allow the free admission of air and sun to the trellis, as well as to the back wall, this method gives a great extent of surface. The vines are planted in the inside of the house, and the glasses are never taken off, but are ventilated by means of a ventilator at the top of each sash, and he has always had large crops of grapes.

Summer pruning depends generally on the necessity of admitting light and air to the fruit and young wood; and particularly on the sort of winter pruning to be adopted. The gardener must therefore have a predestinating eye to the following season. "Whatever methods of pruning are used," M'Phail remarks, "the grape-vine, through the whole course of the growing season, requires constant attendance, so as not to suffer the plant to be crowded in any part with superfluous branches or leaves, and no more fruit ought to be suffered to dwell on the plant than it is well able to bring to perfection. The berries also on each bunch should be thinned, so that they may have room to swell, without pressing too hard upon each other." M'Phail and Abercrombie agree in directing, that "as the shoots advance on newly planted vines, they must be kept regularly fastened to the rafters. Divest them of their tendrils, and also take off their lateral shoots as they appear. Vines may in general be allowed to extend 25 or 30 feet before they are stopped. Stop the shoots by pinching off their tops, after this 2 or 3 lateral shoots will come out near the top, let these extend 12 inches, then pinch off their tops; these again will send out lateral shoots, which should be stopped at the second joint. In the second season, as soon as the shoots are half a span long, the rudiments of the flower-bunches will be perceptible. Having thus ascertained the most promising shoots, divest the vines of supernumerary branches as they rise. On the leading shoots preserve the best laterals 3, 4 or 5 feet distance, according to the strength of the plant. Train the shoots retained on each side the rafter, tying them with matting to the trellis. Pinch off the bearing laterals at the second joint above the fruit, leaving only one or two bunches of fruit on each. Rub off water-shoots from the older wood. Pinch off inferior laterals and tendrils. After selecting the shoots to be trained for the production of a crop next season, and others necessary for filling the trellis from the bottom, which shoots should generally be laid in at the distance of 1 foot or 15 inches from each other; rub off all the others that have no clusters. For this purpose go over the plants every 3 or 4 days, till all the shoots in fruit have shown their clusters, and shorten those one joint above the uppermost cluster, at the same time rub off all water-shoots that may rise from the old wood. Train in the shoots to be retained, using fresh matting, and allowing sufficient room for the shoots to swell. The spurs or short shoots on which the clusters are placed will probably push again after being stopped, if so stop them again and again."

Hayward (Hort. trans. 1. p. 172.) takes off all collaterals as they arise, and any shoots, although laid in for fruit, that turn out unproductive, that the whole strength of the tree may be properly applied.

J. Mearns (Hort. trans. 4. p. 225.) stops the bearing

branches at the bunch instead of the next joint, the usual practice. He also blinds all the eyes on each fruit-spur as soon as they push, except the uppermost, which he retains to draw up the sap to nourish the fruit, however he never suffers eyes to push above a joint or two, he pinches them back, and he is always particularly cautious not to injure the leaf accompanying the bunch, for if that is lost the fruit of course will come to nothing.

Thinning the leaves and fruit.—The fruit clusters should be regularly thinned out with narrow-pointed scissars, in order to allow those berries left room to swell. This must entirely depend upon the kind so thinned. Cutting off the clusters, to a certain extent, of plants overloaded, and pushing weak wood, is the only means to cause them to produce shoots fit to bear fruit next year, and this should be duly attended to so long as the future plants are a matter of importance. The leaves should be thinned in order to admit air and light among the berries, always however taking care the leaf accompanying the bunch of fruit be retained uninjured.

Remedies for bleeding.—If pruning has been timely, the vine is not liable to bleed. But if the sap rises before the wound is healed bleeding ensues, and is not easily stopped. This of course retards the plant; but the consequences are not so disastrous as many seem to apprehend. The following remedies rank among the best: Sear and cover the wound with melted wax, or with warm pitch spread over a piece of bladder; or peel off the outside bark to some distance from the place, and then press into the pores of the wood a composition of pounded chalk and tar, mixed to the consistence of putty.—Abercrombie. However the best preventative is not to prune till the wood is thoroughly ripe in autumn, for plants pruned too late in spring, and forced too soon afterwards, will bleed. But when the vine is in full leaf it is not liable to bleed; therefore the largest branches may be cut off during the growing season with perfect safety. Mr. Knight (Hort. trans. vol. 1.) recommends four parts of scraped cheese to be added to one-part of calcined oyster-shells or other pure calcareous earth, and this composition pressed strongly into the pores of the wood. This done, he says, the sap will instantly cease to flow.

Stirring the soil and culture of the borders.—The surface of an open border should be turned with a three-pronged fork, not digging so deep as to injure the roots. This design is merely to revive the surface. When it is necessary to recruit the soil, dig the exhausted part up, and work in such a compost as has been described under soil. The dung out of the cow-house, perfectly rotted, is a fine manure for the vine. From the time the buds rise till the fruit is set, manure the border once in 10 days with the drainings of dung-hills poured over the roots of the plants.—Abercrombie. A week or two previous to commencing to force, the border should be forked over carefully, and let it be watered all over with drainings of the dung-hill, which repeat at the end of 4 or 5 days, giving as much as will sink down to the deepest roots and fibres. The border on the outside should already have been covered to a good thickness with stable-yard dung, the juice of which may be washed down to the roots. The intention of this covering is to answer as a manure, and also to keep severe frost from the roots, from the time the sap is put in motion till the spring is so advanced, as that the plants will sustain no injury. Previous to laying on the dung the border should be pointed, in order that the juices of the dung may descend the more readily.—M'Phail. Speechly covered the vine borders in front of his hot-house with gravel. The best gardeners do not crop them, or only with the most temporary crops of vegetables.

Time of beginning to force.—The best time to begin to force is the beginning of March, if the object be simply to obtain grapes in perfection moderately early. Those who begin earlier have a great number of obstacles and discouraging contingencies to intercept final success, from the adverse state of the weather. Gardeners, however, who work a number of houses, and who have to provide as well as they can against demands for grapes in early succession, begin to force about the 21st of December, and successively, in other houses, the 1st of January, the 1st of February, and so on. Attempts are made to lay forward for a crop in March by beginning to force in August; ripe grapes may be cut in 5 months or less, but when short days compose the third part of the course in about 6 months.—Abercrombie. M'Phail considers the month of February to be the best time to begin to force, if grapes be not wanted very early. To begin to force in August, M'Phail says, it would not be adviseable, unless you have several vineries, for there are many things which might reasonably be urged against the probability of success; however, by custom, vines may be brought, as it were naturally, to shoot in the autumn, and their fruit may be set before the shortest days; the greatest art will then be to preserve them through the dead of winter in a lively growing state. This can be done only by much attention in making gentle fires, and admitting an easy circulation of fresh air into the house every favourable opportunity. On the supposition that the earliest crop of grapes were over by the end of June, and the glasses laid aside, and if it is desirable to have grapes early, prune your vines in August, and put your house in order; and if it is necessary, dig and manure your border, and if dry give it a good watering with dung-water. When this is done, draw on the lights, and keep the air in the house to a moderate degree of heat, and they will shoot out and shew fruit; treat them as before directed. Speechly begins to force in November to have grapes in April. Griffin (Hort. trans. 4. p. 106.) begins early in January; no fire is used the first week, in the second a little fire is given every other night, the third week the heat is kept up to 50 or 52 degrees, but never allowed to exceed 55 till the vines begin to break; from that time until they flower the heat is kept between 52 and 57 degrees, and while they are in bloom the heat is raised to 57 and 65 degrees. Air is given regularly and plentifully through all these stages until the blossom appears, when the house is kept close, unless the sun be very powerful. When the bloom is past, attention is paid to thinning the grapes, a regular heat is kept up, and air given in due quantity when the weather permits, giving a larger proportion when the heat of the sun is strong, and shutting up early in the afternoon. The crop so treated generally ripens in July.

James Acon (Hort. trans. vol. 7. p. 1.) is enabled to furnish a regular supply of grapes throughout the year. He commences forcing on the 1st of September, and the fruit begins to ripen about the beginning of March, and continues to be gathered to the middle of May. The vines are trained horizontally on an arched trellis, a considerable distance from the glass, some on the walls and some on the rafters; but these last are introduced six weeks after the forcing of those on the trellis has begun, and they yield a succession of crops, which begin to ripen early in May. The fires of the house are directly under the trellis. The vines are planted within the house, but so as the earth is not heated by the fire. In pruning these vines, he leaves as little wood as possible. He prefers stopping them one joint above, having no joint without a cluster. When the crop is over, the branches should be laid near the ground and shaded, until the time of again beginning to force. This shade will have some affinity to the gloom of winter, which never fails to give vegetation increased energy. In May he shuts up his late vinery as soon as the bunches become visible. The vines are trained on a trellis near the glass. Till they are out of blossom the air is kept very warm. By this means the wood grows more compact, for if the house be kept cold the wood will become soft and

long jointed, and subsequently barren. As much air as possible is given during the summer, but as the autumn advances more caution on this point is observed. He endeavours to have the fruit perfectly coloured before the approach of the dark season, for if the colouring be deferred too long the berries will never acquire their proper flavour. The first object is to ripen the fruit well, after that to maintain a more passive vegetation; if this be managed well the bunches will remain for months without any apparent alteration. Great care must be observed to remove any berries inclining to damp, otherwise the crop will soon be spoiled. The *Muscat of Alexandria, St. Peter's,* and *Black Damascus* are best adapted for late crops. The gathering begins about the middle of January, and continues till the end of March, when the early house is in bearing. The pruning is the same as that adopted for the early house; no wood is suffered to remain without fruit. It will sometimes happen that the plants will bleed at the spring pruning; the best way to stop this is by keeping the house warmer for a few days, which seldom fails. After the crop is gathered the house is unroofed, to restore the elastic power of the wood. Vines in pineries should always be turned out of doors for a few weeks, for it has been observed that vines always push vigorously after having been exposed to frosty weather for a few weeks.

Care of outside stems.—The stems on the outside of the house should be guarded against the stagnating effects of cold, by a bandage of hay or moss, and a mulching of dry litter over the roots. The excluded stems must be protected in the same way at the beginning of the forcing season. It will also be adviseable, while the vines are young, to cover the outside border in winter with strawy dung taken from the outside of the hot-beds. Abercrombie. J. Griffin keeps the stems of the vines inside moist, from the time of beginning to force till the bunches show themselves, by daily watering them with a syringe. Some gardeners lap the stems round with moss, which they keep moist for two or three months. These two methods contribute to the production of vigorous shoots.

Temperature.—Abercrombie says, begin at 50° min. to 55° max., in a week raise the min. to 55°, the max. to 60°. Till the time of budding it should not exceed 60° by artificial means, and 64° by collected sun heat. After the buds are in full motion, it may be raised to 60° min. 64° max. from fire, and 68° from sun heat. By the time the bloom expands it should be 66° min. and 72° max. by fire, and when the sun's influence is strong, let it be accumulated by confining the interchange of air to the ventilators till the heat rises to 80°. After the fruit is set, the min. should be 75°, and fresh air plentifully admitted. M'Phail observes, nature should be imitated by increasing the heat as the days lengthen, but it should be remembered that to ripen the best sort of grapes they require as great a heat as the pine-apple does to ripen it in summer; for the vine has no artificial heat to its root. Nicol observes, that forcing must begin slowly by not allowing the heat to pass 50° or 55° mornings and evenings. For if forcing is begun with a dash, as many fast-going gardeners term it, the chance is that the fourth part of the buds will not push; therefore there will be a great falling off in the expected crop. When the whole of the buds are in an evident state of vegetation, the temperature may be gradually raised to 60°, 65°, and 70°, at which it may continue till the bloom begins to open. This rise should not be effected in less time than a fortnight, but three weeks is better. When the plants come into bloom, it should be raised to 75°. When the fruit is ripening let it be raised from 75° to 85° with sun heat, and plenty of air. Mearns (Hort. trans. 4. p. 254.) considers it of the utmost importance to the bold breaking of the buds, and to the strength of the wood, not to force vines hard until the first leaves arrive nearly at their full size. After that period, he gives them a much less portion of air, suffering the sun to raise the thermometer to 90° or 100° before he gives any air. He says there is no danger of drawing the wood after that stage of growth, and if the thermometer sinks to 60° at night, the vines will do better in a higher temperature in the day.

Air.—Abercrombie directs to give air pretty freely by the sashes until the leaves unfold. Before the foliage is fully made out, begin to keep the house close, admitting air only at the ventilators, and particularly observe to have a sultry moist climate while the blossom is coming out, and until it is off and the fruit set. While the fruit is swelling and ripening the plants will require abundance of light and air. M'Phail recommends a little air to be given during a part of the day, while the thermometer is above 65°, and when the sun shines in the winter months, and abundance in the summer season when the heat exceeds 75° or 80°. Nicol observes, in beginning to force air should be admitted freely every day until the foliage begins to expand, to the extent that the thermometer may not rise above 5° above the fire heat, by opening the sashes in the usual way. But after the foliage begins to expand, except in fine weather, the house should be chiefly aired by ventilators until the blossom is over, and the berries begin to set, or at least until the season becomes mild. When grapes are setting, air need not be admitted so freely as before, grapes being found to set best in a high moist temperature. A moderate circulation by the ventilators will be sufficient for this purpose, except when the sun shines strong, when it may be necessary to open a few of the sashes at the top, in order to let the rarified air escape, and to keep the temperature within due bounds. Air is to be increased as the season of the growth of the plants and fruit advance. When the fruit is ripening, it should be admitted more freely than before, in order to give the fruit a flavour, for on this, and the withholding of water, that matter entirely depends. Williams (Hort. trans. vol. 1.) strongly recommends a dry atmosphere for vines, in which, he says, the wood, although of slower growth, is more compact, and the fruit more saccharine. Hence vines growing on the sides of mountains in the province of La Mancha in Spain, yield richer grapes and make stronger wine than when cultivated in the neighbouring valleys, where, however, they experience greater warmth, and the fruit arrives sooner at maturity. Impressed with the importance of ventilation, from the beginning of July until the middle of October, he generally leaves several of the upper lights of his vinery open about 2 or 3 inches all night.

Watering and steaming.—Abercrombie says, vines require a plentiful supply of water from the time the fruit is well set till it begins to colour, particularly if the berries become transparent at the last swelling. Withhold water entirely when the grapes approach maturity. M'Phail recommends a plentiful supply of water to those planted inside, and in dry weather to those planted outside; let the plants be washed occasionally with clean water, with a syringe or engine; but if there is any chance of the paint being washed down from the rafters, it will answer the purpose fully as well by filling the house full of steam now and then, by throwing water on the flues when they are warm. The border, if in the inside of the house, should be watered and sprinkled now and then to keep it moist. Let the flues be watered now and then when they are hot, which is very beneficial to the plants, in promoting their growth, and in preventing them from being infested with the red spider. Steam, however, should not be used too copiously. If the vine borders be in the house, or if there are plenty of plants in pots of earth in it, the evaporation arising from the moist earth is generally sufficient to moisten the air properly. When the fruit is set, until the time of changing colour, the borders should be plentifully supplied, and the flues sprinkled now and then with clean water. Increase

the supplies of water with the advancement of the season. But when the fruit has begun to change colour, and swell off for ripening, the quantity of water hitherto liberally given must be lessened by degrees, and towards the coming to full maturity must be entirely withheld, that it may not be insipid. The operation of engine cleaning must also cease: but previously be particularly severe, and be careful to wash the plants well, that no vestige of the red spider may be left.

Ripening of wood.—Abercrombie says, if the fruit be not off by the middle of August, the continuation of fine dry weather, or the heat dependent on the natural climate, will hardly be sufficient to ripen the wood; and therefore, as soon as the external air declines to 68°, resume gentle fires morning and evening, so as to keep the min. temperature to 70°. Give plenty of air in favourable weather, and if it continues mild after the fruit is cut, take off the glass frames altogether; but in October the glasses should be put on again if the wood is not completely ripe. Nicol says, if the lower parts of the shoots be not by the beginning of August turning brownish, then it is adviseable to apply a little fire heat, in order to further the growth of the plants, and the perfection of the wood. Less trouble and expence for fuel will attend the process of ripening the shoots in September than in October. When the growth of the plants is over, expose the house day and night, except in rain.

Exposure and resting of the wood.—Vines which have been exposed to the weather, or freely to the dry air in a state of rest, when forced, after a proper interval, generally break at almost every eye. But if the plants are in the pinery, the branches must be withdrawn from the house after the fall of the leaf, to remain outside till the proper time of again beginning to force the plants. M'Phail says, "I advise that the glass frames of grape-houses be suffered to remain on all the year excepting in July and August, and the grape-vines in pineries should not be taken out to remain for any length of time at any season of the year. It is natural for the grape-vine to produce only one crop in the year, and when it is accustomed to grow in a hot-house appropriated for the pine-apple, its nature is not changed, nor will it offer to put forth its buds before January in hot-houses kept to a heat sufficient to grow the pine-apple, when the pine plants are plunged in a bed of warm tan." T. A. Knight is highly favourable to putting the vine into a state of repose as early as possible in the autumn preceding the season in which it is to be forced. Nicol exposes the house day and night, except in rain. After the autumn pruning he shuts up the house for 10 days, particularly if there be any appearance of frost, admitting air freely during the day. The object in this is in order that the pores may contract and their wounds heal gradually, or otherwise they are apt to bleed.

Forcing vines in a pinery.—Speechly considers that vines and pines may be grown advantageously together; but most gardeners prefer growing them separately. Abercrombie says, if any gardener gets a good fine-flavoured crop of grapes in a pinery, it is sufficient to confer very great credit on the manager. M'Phail says, in the month of November or December cut down all the old wood to about the height of the pit, leaving only two young shoots, the one to bear the crop, the other to be cut short, to grow long shoots to bear the fruit the succeeding year. As soon as they begin to shoot, let them down from the glass about a foot, so that they may receive the benefit of warm air round about them; if the stem miss shewing fruit on the fourth or fifth joint they will shew none at all, and therefore these ought to be cut out, as they would only take the nourishment from others that have shown fruit. T. A. Knight (Hort. trans. 6. p. 232.) had a Verdelho vine growing in a pot in the stove early in the spring of 1823, where its wood became perfectly ripened in August. It was then taken from the stove and placed under a north-wall, where it remained till the end of November, when it was replaced in the stove, and it ripened its fruit early in the following spring. In May it was again transferred to the north wall, where it remained in a quiescent state till the end of August. It then vegetated strongly and shewed abundant blossoms, which, upon being transferred to the stove, set freely, and the fruit having been subjected to a very high temperature, ripened early in February. The plant will retain its foliage till April, and will not be prepared to vegetate again till late in the spring. The experiment will probably succeed well with those varieties of the vine which produce blossoms somewhat freely and are of hardy habits; abundant crops of these may be obtained at all times of the winter and spring, by proper previous management of the plants, and by the application of a higher or lower degree of temperature.

Forcing vines by dung heat.—Justice, Lawrence, and Switzer state instances of this being done on wooden walls in their time. Fletcher, a market gardener near Edinburgh, has practised it with great success in a glass-case, keeping constantly, till the fruit is about to ripen, a heap of dung or dung and weeds in a state of fermentation in the area of the house. J. French, about the beginning of March, commences to force by introducing a quantity of new long dung, taken from under the cow-cribs, which is laid upon the floor of his house, extending from end to end, leaving a path next the wall. The dung being new, at the beginning a profuse steam arises, which is beneficial in destroying the ova of insects, but which would prove injurious if permitted to rise in so great a quantity when the leaves have pushed forth. In a few days the violence of the steam abates, and the buds open, and in the course of a fortnight the heat begins to diminish, and then it becomes necessary to carry a small addition of fresh dung, laying it in the bottom and covering it over with the old. The quantity of new dung to be introduced at each turning must be regulated by the degree of heat in the house. The temperature kept up is pretty regular, being from 65° to 70°.—Anderson, in hort. trans. vol. ii. J. Mearns (Hort. trans. 4. p. 256.) approves greatly of applying the steam and heat of dung to the forcing of grapes, and uses it in the earliest part of forcing with great advantage, forming a large ridge of it in the back part of his vinery, and introducing the recent litter always under the old dung. Dung heat is always highly noxious to insects. A method of forcing vines in beds raised above dung is described in Hort. trans. which does not appear to us worth trying.

Forcing the vine in hotbed-frames and other glass-cases.—T. A. Knight says (Hort. trans.) I have often used with great success a frame and hotbed thus formed for forcing grapes, by placing the bed at 3 feet distance from the wall, to which the vines are trained, and introducing their branches into the frame through holes made on the north end of it, as soon as the first violent heat of the bed had subsided, the vines having been trained to a south wall. The *White Chasselas* grape thus ripens in July if the branches of the vine be introduced in April; but the branches that have been forced, having been so closely pruned, renders them unproductive next season, therefore others must be substituted from the wall. Small holes should be made through the sides of the frame, through which the young shoots of the vines can extend themselves in the open air; for this purpose the frames should not be more than 8 or 10 feet long and 5 or 6 wide. The holes should of course be closed till wanted. When the grapes are nearly full grown, and begin to ripen, it will be advantageous to draw off the glasses altogether during the day in fine weather, by which means the fruit will obtain a degree of perfection that it rarely acquires in the vinery or hothouse. J. Mean (Hort. trans. 2. p. 330.) has practised a mode similar to that of Mr. Knight's. This method is parti-

cularly applicable to cases where vines are trained to walls and do not ripen their fruit nor bear well. The frame must be high enough on the sides to admit of the vines being trained horizontally on a trellis, to keep the pendant branches clear of the dung, and to give free room between the vine branches and the glass for the leaves. In the first or second week of April, just before the vines begin to move, you make up a common dung hotbed at a convenient distance from the wall, or from the place where the shoots of the vines are, the branches must then be introduced into the frame, the back board of the frame being so constructed as to slide off; these you train along the trellis already mentioned, with their points directed downwards towards the front of the frame. Vines produce an abundant crop in this way, and it is found that the ripening of the fruit is accelerated by laying slates on the dung; the wall always yielding a supply of young shoots for next year's crop. Various gardeners, as well foreign as British, construct temporary frames or glass-cases against vines on walls. Sometimes a temporary furnace and flue is built, and excellent crops are obtained. Small vine plants will produce fruit under a common hand-glass.

Forcing vines in pots.—This method is occasionally attempted by gardeners, in pits and stoves, and several bunches are obtained from each plant. The soil must be very rich and frequently supplied with water and liquid manure. Marsland (Hort. trans. 3. p. 363.) had a succession of grapes during eleven months in the year by forcing in pots. The pots were placed on stages, and as the fruit is cut they are replaced by others; at the age of 4 years they bear abundantly and produce large bunches. In a temporary vinery or glass-case, placed against a wall on which grapes were trained, T. Thorborn has ripened a late crop, and kept the fruit on the trees in a state fit for use till February. Mr. Ninian Niven (Loud. gard. mag. 3. p. 311.) forces grapes in pots in flued pits, and trains the shoots along the trellis under the glass. The pots are plunged in leaves or tan. After the vines have fruited 2 or 3 times they may be thrown away and their place supplied by others: by this means large fruit will always be produced.

Diseases and insects.—Nicol considers the red spider the grand enemy of the vine. After every winter pruning he recommends the branches, shoots, and trellis to be anointed with the following composition to destroy their larvæ: soft soap 2 pounds; flower of sulphur 2 pounds; nux vomica 4 ounces; turpentine a gill, boiled in 8 gallons of soft water. The composition to be laid on milk-warm with a hair brush, then with a sponge carefully anoint every part of the plant, walls, flues, rafters, &c. Abercrombie recommends all the shoots to be washed with soap and water, and it may be mixed with sulphur, the stems being previously stripped of loose bark. For the destruction of the turtle-bug, syringing the stems and shoots with a strong infusion of tobacco-stem-water. Watering is the best preventative of the red spider and green fly. To prevent birds, wasps, and flies, several gardeners direct them to be excluded by gauze frames, some recommend putting bags of gauze on each bunch. M'Phail recommends nets with meshes an inch square.

Gathering and keeping the fruit.—Grapes should be allowed to hang till fully matured and ripened, especially the thick-skinned and fleshy sorts. Even the thin-skinned and juicy kinds, which are cut usually before they are perfectly ripe, are much improved in flavour by being allowed to remain till they are ripe, particularly the *White Frontignac*, *White Sweetwater*, and *White Muscadine*. The vinery, when the fruit is ripe, ought to be kept dry and cool, in order to preserve the fruit as long as possible on the branches, and thus to prolong the grape season. The leaves round the bunches are to be picked off, and a fire to be made in the day-time in gloomy weather. J. Thomson (Hort. trans. 4. p. 132.) preserves grapes in the vinery till February, by lighting fires in the day-time to dry the air and dispel damp, and at the same time giving plenty of air, and shutting the house close up at night. Fires at night, with the house close shut, occasions a vapour, and causes the fruit to become mouldy and to decay. Some kinds will keep on the trees a long time by keeping the house dry and cool. Covering the floor of the vinery with dry coal-ashes, 3 inches thick, prevents damp. Forsyth (Treat. on fruit trees) preserves grapes by removal from the tree, cutting off the branch when there are 2 or 3 bunches on one, sealing both ends of the branch with common wax, then hanging them across a line in a dry room, cutting out with a pair of scissors any of the berries which begin to decay. He has kept grapes till February in this way. He says grapes may also be kept in packing jars, by wrapping every bunch in soft paper, with a layer of grapes and one of bran alternately, till you have filled the jar, covering the top with a bladder closely. These jars may be kept in a room where you can have a fire in damp weather.

Culture of the vine in the open air.—Vines require soil that has a dry bottom; in such as are rich and deep it will grow luxuriantly and produce abundance of large fruit; but on a dry, gravelly, chalky, or schistous soil, it will produce less fruit, but of better flavour. The greater part of the French vineyards, Bosc observes, are on a argil-calcareous soil. Argillaceous gravel is frequent near Nismes and Montpelier, and is that which produces the *vins des graves* of Bordeaux. Both good and bad wines are produced from the debris of granites, such as the *hermitage* of the Rhone. The excellent wines of Anjou are made from vines growing among schistous rocks. Wines made from vines on chalky soils, are weak, colourless, and do not keep, as those of Champagne. Retentive clays are the worst soils for the vine; in such a soil the shoots do not ripen, and the flowers prove abortive. Switzer (Fr. gard. 149.) observes that the soil for the vine should be light, with a chalky or gravelly bottom, free from springs. Hitt (Treat. on fruit trees, 12.) advises a mixture of lime-rubbish, brick-bats, &c. for a foot deep in the bottom of wall borders destined for the vine. The soil and situation, Laurence observes, (Fruit gard.) can never be too dry for the vine.

Manures.—Dung, Speechly says, should never be allowed to approach the roots of vines till it is reduced to a kind of black earth. The dust and dirt of roads he esteems as a manure for vines. He says vines are greatly injured by the common practice of laying lime-rubbish for the bottom floor in the preparation of the ground. Cow-dung is generally preferred for the vine in France, but all kinds are used by vine growers; the more careful use composts of leaves, cleaning of ditches, ponds, &c. which they turn over a year before using. Vines are allowed by all gardeners to be rich feeders; the fertility of both the Hampton Court and Valentines vines are attributed to their roots having found their way, the former into a large sewer, and the latter into a pond of stagnated water (Hort. trans. 3. p. 337.). The cause of the fertility of the vines in the hothouses at Earl's Court is attributed to the nature of the soil, which is composed of equal parts of garden earth and blood mixed together, and repeatedly turned over one year before using. Grapes are sometimes manured in Italy by digging in the pruned shoots.

Vine walls.—A south wall is always preferred; low walls 5-6 feet high, Speechly says, are best, as the plants grow stronger and afford larger grapes; at this height they enjoy both the reflected heat of the wall and the earth. English gardeners do not approve of flued walls for the vine.

Planting.—Where a wall is to be entirely covered with vines, 3 plants of a kind may be planted, weak growing kinds 3 feet distance, and the strong growing kinds 4 feet, the 2 outer plants of the 3 to be considered temporary, the middle one permanent,

which in 5 years will be in a state to cover the wall itself. When vines are planted in the intervals between other fruit-trees, or on piers, then one plant to each is sufficient.

Pruning of vines in the open air.—Any of the modes described above will do; the spur method and the fruit-tree method seem to deserve the preference; but this must entirely depend upon the pruner, for it is almost useless to describe methods of pruning. Horizontal training is considered the preferable mode for the vine. Training the shoots of vines along the ground like those of melons and cucumbers has been proposed and practised by Vispre (Dissert. on the growth of vine, Bath, 1786) and succeeded. Vines in some places are allowed to grow like herbs, spreading upon the ground, and the grapes of these vines are very large. The *Black Hamburgh* is an excellent grape for a wall. The only secret in ripening grapes in the open air is timely summer pruning, this assists ripening the wood. By fixing the bunches close to the wall by a thread they ripen a month earlier.

Growing the vine as espaliers or as standards.—The direction given for walls is sufficient for espaliers; but this practice is not to be considered worth following. As standards they may be grown in extensive plantations as in vineyards, and the plants may be trained either like currants or raspberries; in this case the stems will require to be tied to stakes. The pruning is nearly the same as that for raspberries. Switzer recommends the side or declivity of a hill lying to the south or south-east, which is favored with other hills somewhat higher, clothed with wood, on the north, north-east and north-west, to break the severity of those perishing quarters. Speechly observes that the hills in the counties bordering the English Channel, have in general declivities tending to the south, and are therefore highly favourable for vineyards. Steeps of poor, gravelly, and rocky soils, in warm situations, would produce more under vines than any other crop.

Forming vineyards.—They must be planted in rows at a distance from each other according to the height and mode of training proposed, and according as the soil may be rich or poor, deep or shallow. A square yard may be considered a desirable medium. Where vineyards are formed on the sides and steeps of hills, it may be best to form them into terraces or horizontal beds, rising one above another like steps of stairs, supported each by a wall, if the declivity is very steep, against which the vines may be trained; but in vine countries the terraces are usually wide and the walls so rude, that it is impossible to train the vines against them; in this case the standard or espalier mode is adopted. At Thonning, near Fontainebleau, mud walls are made, and the vines are trained to low trellises, at first horizontal along the bottom of the trellis, then erect upon the trellis.

Sorts proper for a vineyard.—On the Continent vines used for making wine are by no means agreeable to eat, and there is always a distinction made between fruits to eat and fruits to press by nurserymen. The names of vineyard grapes vary in every district. In this country it would be best to select such sorts as are already in the country, such as the *Clusters, Sweet-waters, Burgundy, Large Black Cluster, Miller's Grape*, &c.

Making wine from grapes.—This can hardly be considered as coming under gardening. We shall only suggest that it requires a person who has a knowledge of the general principles of fermentation and chemistry, or who has been concerned in the manufacture of British wines, to succeed properly. An excellent paper on the processes of wine-making will be found in the second volume of the memoirs of the Caledonian Horticultural Society, by Dr. Macculloch of Woolwich. H. S. Mathews (Hort. trans. vol. 2.) has given a receipt for making a tolerable sort of red wine from the leaves of the claret grape; these leaves, it is suggested, might be employed to give a colour to wines made from white grapes or green gooseberries, &c. The numerous varieties of wine depend principally on the proportion of sugar contained in the must, and the manner of its fermentation. When the proportion of sugar is sufficient and the fermentation complete, the wine is perfect and generous, if the quantity of sugar be too large, part of it remains undecomposed, and the fermentation is languid, and the wine is sweet and luscious; if, on the contrary, it be too small, the wine is thin and weak, and if it be bottled before the fermentation be completed, it will proceed slowly in the bottle, and, on drawing the cork, the wine will sparkle in the glass, as for example Champagne. When the must is separated from the husk of the grape before it is fermented, the wine has little or no colour; these are called white wines. If, on the contrary, the husks are allowed to remain in the must while the fermentation is going on, the alcohol dissolves the colouring matter of the husks, and the wine is coloured; such are called red wines. Besides in these principal circumstances wines vary much in flavour.

Qualities.—Grapes, before they are ripe, are extremely harsh and acid, and by expression furnish a liquor which is called verjuice. It contains malic acid, super-tartrate of potass, and may be made to furnish wine by addition of sugar. As the grape advances to maturity, the quantity of sugar in it increases, while that of the malic acid diminishes. It, however, never disappears entirely. The grape, when ripe, is cooling, antiseptic, and when eaten in considerable quantities is diuretic and gently laxative. In inflammatory diseases, and all others where acids are indicated, grapes form an excellent article of diet. Dried grapes or raisins are more saccharine, mucilaginous, and laxative than the recent grapes, but are less cooling. Wine, when taken in moderate quantities, acts as a beneficial stimulant to the whole system. It promotes digestion, increases the action of the heart and arteries, raises the heat of the body, and exhilarates the spirits. Taken to excess, it produces inebriety, which is often succeeded by headache, stupor, nausea, and diarrhœa, which last for several days. Habitual excess in wine debilitates the stomach, produces inflammation of the liver, weakens the nervous system, gives rise to dropsy, gout, apoplexy, tremors, and cutaneous affections. To convalescents and in all diseases of general debility and deficiency of vital powers, wine is the remedy on which medical men must place their chief dependence. It is contraindicated in all inflammatory complaints, and when it sours upon the stomach.

Insects and diseases are the same in the open air as in the vinery, and the modes for their destruction and prevention the same, which see under that head.

Common Vine or Grape, or *Wine-bearing* Vine. Fl., June, July. Clt? Shrub cl.

2 V. LACINIÒSA (Lin. spec. 293.) leaves 5-cut, with stalked, multifid segments. ♄. ⏑. S. Native of? This is perhaps only a variety of the preceding. It is called in France *Ciotat.* —Corn. can. t. 182. Vitis vinifera, var. 24. Rœm. et Schult. syst. 5. p. 314. Berries black. This is usually cultivated as a curiosity, and is called *Parsley-leaved vine.*

Jagged or Parsley-leaved Vine. Fl. June, July. Clt. 1648. Shrub cl.

3 V. DENTA'TA (Link. enum. 1. p. 236.) leaves cordate, usually 5-lobed, unequally and mucronately serrated, roughish. usually 5-lobed, unequally and mucronately serrated, roughish. ♄. ⏑. H. Native of? Flowers and fruit unknown. Petioles rough from indurated glands.

Toothed-leaved Vine. Clt. 1820. Shrub cl.

4 V. FLEXUÒSA (Thunb. Lin. trans. 2. p. 332.) leaves cordate, toothed, villous beneath; stem flexuous; panicles elongated. ♄. ⏑. H. Native of Japan. V. I'ndica, Thunb. fl. jap. 103. Berries of a brownish-green with an austere, acid taste.

Flexuous-branched Vine. Shrub cl.

5 V. WALLI'CHII (D. C. prod. 1. p. 634.) leaves cordately

truncate at the base, acuminated at the apex, acutely toothed, glossy on both surfaces; racemes shorter than the leaves. ♄. ◡. S. Native of Nipaul. Leaves shining, 2 or 3-times smaller than those of *V. vinífera*. Racemes with the peduncle hardly an inch long. Fruit unknown.

Wallich's Vine. Clt. 1822. Shrub cl.

6 V. GLABRÀ'TA (Roth. nov. spec. 156. Rœm. et Schult. syst. 5. p. 318.) leaves cordate, somewhat 3-lobed, serrated, smooth; serratures equal, with blunt lobes; tendrils bearing panicles. ♄. ◡. S. Native of the East Indies. Very like *V. vulpìna*, but the serratures of the leaves are shorter.

Smooth Vine. Clt. 1819. Shrub cl.

7 V. HEYNEA'NA (Rœm. et Schult. syst. 5. p. 318.) leaves cordate, acuminated, undivided, toothed, smooth above, but covered with rusty down beneath; panicles elongated. ♄. ◡. S. Native of the East Indies. V. cordifòlia, Roth. but not of Michx.

Heyne's Vine. Shrub cl.

8 V. I'NDICA (Lin. spec. 293.) leaves cordate, often more or less angled, finely serrated, pubescent beneath. ♄. ◡. S. Native of the East Indies.—Rheed. mal. 7. p. 11. t. 6. Panicles dense, rising solitary from the middle of the tendrils. Ovary embraced by a 5-lobed cup. Berries round, black, 1-2-seeded. Flowers greenish-purple. According to Lour. fl. cochin. 155. the berries are of a brownish-green; this is perhaps a distinct species. V. sylvéstris, Blum. bijdr. is a variety.

Indian Vine. Fl. April. Clt. 1692. Shrub cl.

9 V. LANA'TA (Roxb. fl. ind. 2. p. 474.) leaves cordate, serrated, woolly beneath; racemes panicled, opposite the leaves; petals cohering at the apex. ♄. ◡. S. Native of the East Indies in the forests in the Circar mountains. Flowers numerous, green. Berries round, purple, size of a pea, 1-2-seeded.

Woolly-leaved Vine. Shrub cl.

10 V. TRUNCA'TA (Blum. bijdr. 4th number,) leaves truncate at the base, ovate, acuminated, obtusely and glandularly-serrated; veins pubescent beneath; panicles opposite the leaves. ♄. ◡. S. Native of Java.

Truncate-leaved Vine. Shrub cl.

11 V. CYMÒSA (Blum. bijdr. l. c.) leaves cordate, acuminated, bristly-serrated, downy beneath; cymes stalked, trifid, shorter than the leaves. ♄. ◡. S. Native of Java.

Cymose Vine. Shrub cl.

12 V. CÆ'SIA (Hort. trans. vol. 5. p. 447.) leaves cordate, angularly-sinuated, with distant, bristle-like serratures, wrinkled on both surfaces, clothed with short, white down beneath; shoots terete, glaucous, pruinose. ♄. ◡. S. Native of Sierra Leone in the low lands. Cissus cæ'sia, Afz. rem. guin. ex Spreng. neue. entd. 3. p. 234. Berries black, round, with an austere, acid taste, not very agreeable to Europeans, and are chiefly eaten by the negroes, who are rather fond of them. The leaves are delicately toothed, having the appearance of being edged with fine hairs. The plant is called country grapes by the settlers at Sierra Leone.

Grey Vine. Fl. Feb. Mar. Clt. 1822. Shrub cl.

13 V. GLABE'RRIMA (Wall. fl. ind. 2. p. 476.) fleshy; leaves ovate-oblong, a little cordate, rather obtuse, remotely bristle-crenated; corymbs equal in length to the leaves, almost simple, consisting of many umbellets; flowers nectariferous; petals oblong-linear; berries 2-celled; stipulas fleshy, oval glands; stem 4-cornered. ♄. ◡. S. Native of Penang in the East Indies. Flowers rather large, tetrandrous, greenish. Ripe berries not observed.

Very-smooth Vine. Fl. Dec. Shrub cl.

14 V. GRA'CILIS (Wall. fl. ind. 2. p. 477.) leaves ovate-cordate, tapering to the apex, acuminated, with pointed teeth, pubescent above; nerves villous beneath; stipulas half-cordate, villous; clusters formed of many small, short, villous spikes, cirrhiferous; berries 3-seeded; stem filiform, villous when quite young. ♄. ◡. S. Native of the East Indies at Singapore. Flowers small, tetrandrous, brown, villous.

Slender Vine. Fl. Sept. Shrub cl.

15 V. BARBA'TA (Wall. fl. ind. 2. p. 478.) leaves round, cordate, sinuately-toothed, very slightly 3-lobed, smoothish; clusters disposed in oval bunches, bearing a dichotomous tendril; stem, branches, petioles, and peduncles covered with long capitate bristles. ♄. ◡. S. Native of Silhet in the East Indies. Flowers tetrandrous.

Bearded Vine. Fl. Aug. Shrub cl.

16 V. TRÍFIDA (Roth. nov. spec. 158.) leaves cordate, roundish, trifid at the apex, grey above and covered with rusty down beneath, repandly serrate-toothed; corymbs bifid, glomerate. ♄. ◡. S. Native of the East Indies.

Trifid-leaved Vine. Shrub cl.

17 V. TRÍLOBA (Roth. nov. spec. 156.) leaves cordate, 3-lobed, pubescent above, but clothed with rusty down beneath, deeply serrate-toothed, acuminated; lobes unequal; racemes ovate, downy. ♄. ◡. S. Native of the East Indies. Perhaps this is the same as *V. Labrúsca* of Lour. coch. 1. p. 193.

Three-lobed-leaved Vine. Shrub cl.

18 V. TOMENTÒSA (Roth. nov. spec. 156.) leaves cordate, 3-lobed, downy, serrated, middle-lobe ovate, lateral ones half-moon-shaped; racemes ovate, dense, downy. ♄. ◡. S. Native of the East Indies. Very like *V. tríloba*, but with the leaves simply serrated, and with the peduncles 2 or 3-times longer.

Downy Vine. Shrub cl.

19 V. HETEROPHY'LLA (Thunb. fl. jap. 103.) leaves 3 or 5-lobed, or the upper ones undivided, serrated, smooth; panicles somewhat dichotomous, smooth. ♄. ◡. G. Native of Japan. Teeth of calyx blunt. Style filiform, permanent. Berries globose, green, size of a pea.

Variable-leaved Vine. Shrub cl.

20 V. LATIFÒLIA (Roxb. fl. ind. 2. p. 474.) leaves cordate, 3-lobed, crenate-serrated, smooth; tendrils panicle-bearing; petals oblong; ovaries embracing a nectarial cup. ♃. ◡. S. Native of the East Indies in the warmer maritime parts.—Rheed. mal. 7. p. 13. t. 7. Flowers numerous, of a deep reddish-brown. Berries the size, shape, and appearance of a black currant, containing rarely more than 2 seeds. Root tuberous.

Broad-leaved Vine. Fl. May. Pl. cl.

21 V. PARVIFÒLIA (Roxb. fl. ind. 2. p. 475.) leaves angled, cordate, 3-lobed, crenate-serrated, smooth; stipulas oval; thyrse few-flowered. ♃. ◡. S. Native of the East Indies in the eastern parts of Bengal and Nipaul. Old branches woody, considerably flattened. Flowers very small, green. This plant has the appearance of the common vine.

Small-leaved Vine. Fl. Feb. Pl. cl.

22 V. GLANDULÒSA (Wall. fl. ind. 2. p. 479.) stem dotted, roughish; branches villous; leaves broad, cordate, ovate, 3-lobed, villous, bearing glands in the axils of the nerves beneath; tendrils dichotomous; corymbs short, dichotomous. ♃. S. Natives of the East Indies. Berries small, round, deep-purple, smooth, 4-seeded.

Glandular-leaved Vine. Fl. May, June. Shrub cl.

23 V. RUGÒSA (Wall. fl. ind. 2. p. 480.) all parts of the plant densely clothed with rusty down; leaves broad, cordate, acuminated, unequally 3-lobed, toothed, villous, and wrinkled above but woolly beneath; corymbs ovate, dense, consisting of many umbellets; petals linear, spreading. ♄. ◡. G. Native of Nipaul every where in the mountains and forests. Branches long, obscurely 4-cornered. Flowers small, with a yellow, crenulated disk and purplish stamens. This species resembles *V. lanàta*, Roxb. *tomentòsa* and *tríloba* of Roth., but differs in its far greater size, and its not cohering petals.

Wrinkled-leaved Vine. Shrub cl.

24 V. Pura'ni (Hamilt. mss. in D. Don, prod. fl. nep. p. 188.) leaves cordate, serrate-toothed, acuminated, coriaceous, pubescent above, villous beneath, as well as the petioles, sometimes 3-lobed; thyrse spicate, short, opposite the leaves. ♄. ◡. S. Native of Nipaul in the vicinity of the town, called Thankot. Shrub slender. Leaves small.

Purani Vine. Fl. April. Clt. 1820. Shrub cl.

** *Leaves ternate or quinate, rarely pinnate.*

25 V. semicorda'ta (Wall. fl. ind. 2. p. 481.) leaves ternate; leaflets villous on the under surface, acuminated, bristly-serrated, lateral ones half-cordate, gibbous, intermediate one ovate, tapering to the base; cymes oblong; young branches villous. ♃. ◡. S. Native of Nipaul on the Sheopore mountain. Flowers small, greenish.

Half-cordate-leafletted Vine. Fl. Sept. Pl. cl.

26 V. mollíssima (Wall. fl. ind. 2. p. 482.) leaves ternate; leaflets covered with very dense, white hairs, lateral ones acuminated, unequally crenated, half ovate, intermediate one elliptical, with a narrow, rather retuse base; cymes divaricating, dichotomous, villous; berries round, smooth, 4-seeded. ♄. ◡. S. Flowers tetrandrous. Berries almost the size of a common cherry.

Very soft Vine. Shrub cl.

27 V. bracteola'ta (Wall. fl. ind. 2. p. 483.) smoothish, slender; leaves ternate; leaflets with bristly-serratures, lateral ones half ovate; cymes on long peduncles, much divided, with oblong, deciduous bracteas. ♄. ◡. S. Native of the East Indies on the Juyuntija mountains. Flowers small, tetrandrous.

Bracteated Vine. Fl. Sept. Shrub cl.

28 V. cinnamòmea (Wall. fl. ind. 2. p. 483.) every part clothed with dense, rusty down; leaves from simple, ovate-cordate, a little 3-lobed, to ternate and quinate, with half-cordate, lateral leaflets; corymbs long, pendulous, bearing tendrils, consisting of very approximate, divaricate spikes. ♄. ◡. S. Native of the islands in the Straits of Malacca, Penang, Singapore, Pulo Dingding. Berries roundish, smooth, purple, 3-4-cornered. This is a charming species, remarkable on account of the varying form of its leaves.

Cinnamon-coloured Vine. Shrub cl.

29 V. rubifòlia (Wall. fl. ind. 2. p. 481.) leaves pinnate, with 5 pairs of oblong, acuminated, coarsely and sharply serrated, rather cordate leaflets, terminal one rather ovate, all glaucous beneath, and a little hairy. ♄. ◡. S. Native of Bengal on the Juyuntija mountains. Flowers fragrant, of a yellowish-green colour. Berries esculent.

Rubus-leaved Vine. Shrub cl.

*** *Dioecious or polygamous species, natives of America.*

30 V. Caribbæ'a (D. C. prod. 1. p. 634.) leaves cordate, acuminated, with long acute teeth, smoothish above, but downy beneath, as well as the peduncles. ♄. ◡. S. Native of Jamaica on the lower hills among bushes. Vìtis I'ndica, Swartz, obs. 95. Poir. dict. 8. p. 607.—Sloan. hist. 2. p. 104. t. 210. f. 4. Flowers small, white. Berries small, brownish-green, watery, acid, but eatable. This plant produces a great quantity of clusters of small black grapes of an austere taste, but they would doubtless make a good red wine. When it grows luxuriant, as it generally does on the higher woody lands of Jamaica, it is so full of juice that a piece about 3 feet long will yield near a pint of clear, tasteless water, which has saved the lives of many who have wandered long in the woods without any other refreshment of a liquid sort; therefore the plant is called in Jamaica *Water Withe*. According to Sloane, the fruit is red or deep-purple, the size of currants, and agreeably acid, as well as astringent.

Caribbean Vine. Clt. 1800. Shrub cl.

31 V. Labru'sca (Lin. spec. 293.) leaves cordate, a little 3-lobed, acutely-toothed, downy beneath, as well as the peduncles. ♄. ◡. H. Native of North America from Canada to Florida, in shady woods. Jacq. schœnbr. t. 426. Vìtis taurìna, Walt. fl. car. 242.—Plum. icon. t. 259. f. 1. Old leaves smooth beneath. Fertile racemes small. Berries black, large, of a disagreeable foxy smell, commonly called *Fox Grape*. They have a rough acid flavour, but are eatable.

Var. β, blánda; berries white. This variety is called in North America *Bland's Grape*. There are other varieties raised of this grape. From the fermented berries of all these very pleasant wine is made.

Wild Vine or Fox Grape. Fl. June, July. Clt. 1656. Sh. cl.

32 V. æstiva'lis (Michx. fl. bor. amer. 2. p. 230.) leaves broad-cordate, 3-5-lobed, young ones clothed beneath with cobweb-like down, adult ones smooth. ♄. ◡. H. Native of North America from Virginia to Carolina, in fields and woods. V. vulpìna, Willd. spec. 1. p. 1181. Jacq. schœnbr. t. 425. V. Labrúsca, Walt. fl. car. 242. Fertile racemes oblong. Berries small, dark-blue, very agreeable, and frequently converted into a very good home-made wine. It is known by the name of *Summer Grape*.

Summer Grape or Vine. Fl. May. Clt. 1656. Shrub cl.

33 V. sinua'ta; leaves sinuately-palmate, coarsely-toothed, with rhomboid recesses, young ones covered beneath with cobwebbed rusty down, adult ones smooth. ♄. ◡. H. Native of North America from Virginia to Carolina, in fields and woods. V. æstivàlis var. β, sinuàta, Pursh. fl. amer. sept. 1. p. 169. Fertile racemes oblong. Berries dark-blue, very agreeable to eat, and are, as well as those of the preceding species, converted into very good home-made wine. This is probably the V. Labruscoìdes of Muhl. cat. 27.

Scolloped-leaved Summer Grape-vine. Fl. May, June. Clt. 1656. Shrub cl.

N.B. The three preceding species have been greatly improved by cultivation, and many new varieties have been raised within the last few years.

34 V. cordifòlia (Michx. fl. bor. amer. 2. p. 231.) leaves cordate, acuminated, deeply-toothed, smooth on both surfaces. ♄. ◡. S. Native of North America from Canada to Florida, on the edges of rivers and in woods, where it is called *Winter Grape* or *Chicken Grape*. V. incìsa, Jacq. schœnbr. t. 427. V. vulpìna, Walt. fl. car. 243. Racemes loose, many-flowered. Berries green or amber-coloured, small, and ripen extremely late, of a very tart taste.

Heart-leaved Vine or Chicken Grape. Fl. June, July. Clt. 1806. Shrub cl.

35 V. ripa'ria (Michx. fl. bor. amer. 2. p. 231.) leaves cordate, a little trifid, unequally and deeply-toothed; petioles, margins, and nerves pubescent. ♄. ◡. H. Native of North America from Pennsylvania to Carolina, on the gravelly shores and islands of rivers. V. odoratíssima, Donn, hort. cant. 66. The flowers have an exquisitely fine smell, somewhat resembling that of mignonette. Female plants are very seldom found north of the Potowmac river, though the male extends very far beyond it. It is vulgarly called the *Vigne des Battures*.

River-side or Sweet-scented Vine. Fl. May, July. Clt. 1806. Shrub cl.

36 V. rotundifòlia (Michx. fl. bor. amer. 2. p. 231.) leaves shining on both surfaces, rather equally toothed, cordately kidney-shaped; racemes composed of many small umbellets or heads. ♄. ◡. H. Native of North America from Virginia to Florida, on river sides and in islands. Berries very large, dark-blue, agreeable to eat. It is commonly called *Bull* or *Bullet*

Grape, from the size and form of the fruit, sometimes *Muscadine Grape*.

Round-leaved Vine or Bullet Grape. Fl. June, July. Clt. 1806. Shrub cl.

† *American species not sufficiently known.*

37 V. PALMA'TA (Vahl. symb. 3. p. 42.) leaves cordate, palmate, smooth, with lanceolate, cut segments; umbels racemose. ♄. ◡. H. Native of Virginia. Vahl had his specimen from the Paris garden, where it was said to be a native of Virginia, but Mr. Pursh met with nothing answering the description in North America. Sir James Smith supposes this to be only a variety of *Vìtis vinífera*.

Palmate-leaved Vine. Shrub cl.

38 V. VIRGINIA'NA (Hort. par. ex Poir. dict. 8. p. 608.) leaves ovate-cordate, smooth, profoundly 5-lobed; lobes unequally and broadly crenated; racemes usually simple. ♄. ◡. H. Native of Virginia.

Virginian Vine. Shrub cl.

39 V. TILIÆFÒLIA (Humb. et Bonpl. ex Willd. in Rœm. et Schult. syst. 5. p. 320.) leaves cordate, serrated, hoary beneath. ♄. ◡. S. Native of South America on the banks of the river Magdalena, near Nares. V. I'ndica, H. B. et Kunth. 5. p. 227.

Lime-tree-leaved Vine. Shrub cl.

40 V. ACAPULCE'NSIS (H. B. et Kunth, nov. gen. amer. 7. p. 230.) leaves unknown; tendrils very long, branched; lower branches cymiferous; cymes much branched, clothed with rusty wool. ♄. ◡. S. Native of New Spain near Acapulca. Stamens 5.

Acapulca Vine. Shrub cl.

Cult. The cultivation of *Vìtis vinífera*, or common grape-vine, is given under its proper species. The American hardy species which bear eatable fruit, require the same treatment. The other hardy species are not worth cultivating; they will grow in any common soil, and ripe cuttings of them will root freely in earth. The stove species, or those from tropical countries, are not worth cultivating unless in botanic gardens; they are easily increased by ripened cuttings under a hand-glass in mould. They will grow in any common soil.

Tribe II.

LEEA'CEÆ (plants agreeing with *Leèa* in important characters). D. C. prod. 1. p. 635. Corolla monopetalous. Stamens alternating with the petals? usually monadelphous. Fruit and seeds scarcely known. Peduncles not converted into tendrils. The fruit, according to our own observations, is a dry capsule, with 4 to 6 lobes, which are separable, each lobe containing 1 seed.

V. LEE'A (in honour of James Lee, founder of the extensive nursery at Hammersmith hamlet, whose grandson is the present proprietor; author of an introduction to the Linnæan system of botany). Lin. mant. 124. D. C. prod. 1. p. 635.—Aquilícia, Lin. mant. 211.

LIN. SYST. *Monadélphia, Pentándria.* Calyx 4-5 toothed. Corolla 5-cleft, with revolute segments. Urceolus of stamens 5-lobed, with the filaments adnate to the outside between the lobes; anthers ovate, smooth. Style simple. Capsule 4-6-celled; cells 1-seeded, but both cells and seeds are often abortive. The seeds, according to Gærtner, are solitary in each cell, erect, with a 5 or 6-lobed cartilaginous albumen, with a terete, acuminated, arched or straight, somewhat excentral embryo, and awl-shaped cotyledons. Radicle inferior.—Large, rough shrubs, with cymes of small, greenish or yellowish, insignificant flowers. Leaves pinnate or bipinnate, resembling those of the *Elder*.

* *Leaves bi or tripinnate.*

1 L. SAMBU'CINA (Willd. spec. 1. p. 1177.) stem furrowed, angular; leaves somewhat bipinnate; leaflets ovate or ovate-lanceolate, serrated. ♄. S. Native of the East Indies and the Mauritian Islands, where it is called *Bois de source*. Aquilícia sambùcina, Lin. mant. 211. Cav. diss. 7. t. 218.—Rheed. mal. 2. p. 43. t. 26.—Rumph. amb. 4. t. 45. Leaves from simple to decompound. Flowers small, yellow, in terminal, supra-decompound, trichotomous corymbs. Berries round, pulpy, smooth, glaucous, black, size of a marrow-fat pea, 6-seeded, when dry torose. (f. 118.)

FIG. 118.

Elder-leaved Leea. Fl. Oct. Jan. Clt. 1790. Shrub 8 ft.

2 L. ROBU'STA (Roxb. fl. ind. 2. p. 468.) stem jointed, pubescent; leaves bi and tripinnate, with ovate-lanceolate, serrated, cuspidate leaflets; urceolus of stamens rather globose, white. ♄. S. Native of the East Indies in the Northern Circars. Stem flexuous. Leaves from 1 to 3 feet long, but usually greater in breadth; lateral leaflets with a broad cordate base, hairy beneath. Cymes supra-decompound, villous. Flowers numerous, small, green. Berries much flattened, size of a small cherry, smooth, black, and rather succulent, 6-lobed, 6-celled.

Robust Leea. Fl. Nov. Dec. Clt. 1823. Shrub 6 feet.

3 L. STAPHY'LEA (Roxb. fl. ind. 2. p. 471.) leaves compound or supra-decompound, with linear-oblong, finely taper-pointed, serrated, smooth leaflets; cymes loose. ♄. S. Native of the East Indies. Aquilícia Otíllis, Otíllis Zeylánica, Gært. fruct. 1. p. 275. t. 57. Staphýlea? I'ndica, Burm. ind. 75. t. 24. f. 2. Leaflets 4-7 inches long, and from 2-3 broad. Stipulas large. Calyx 5-toothed. Flowers small, greenish-white, very numerous. Urceolus of stamens a yellow, 5-cleft, fleshy ring. Berries dry, size of a small cherry, flattened, 5-6-grooved, 5-6-celled, with a single seed in each cell. Branches flexuous.

Staphylea-like Leea. Shrub 10 feet.

4 L. INTEGRIFÒLIA (Roxb. fl. ind. 2. p. 427.) somewhat arboreous; leaves supra-decompound, with lanceolate, entire, acuminated leaflets; corymbs supra-decompound. ♄. S. Native of the East Indies, in moist valleys among the Circar mountains. Leaves about $2\frac{1}{2}$ feet long, with the lower two pairs of pinnæ always bipinnate, as in the last species. Flowers greenish-white. Urceolus of stamens of 5 emarginate scales. Capsule usually 6-seeded.

Entire-leaved Leea. Shrub 8 feet.

5 L. RU'BRA (Blum. bijdr. 4th number,) stem round, furrowed; leaves bipinnate, rough on the veins beneath, with ovate-lanceolate, bluntly-serrated leaflets, lower ones ternate; corymbs decompound. ♄. S. Native of Java. Berries red.

Red Leea. Shrub 8 feet.

6 L. JAVA'NICA (Blum. bijdr. 1. c.) stem round, dotted, rough; leaves bipinnate, smooth, with sharply-serrated leaflets; corymbs decompound. ♄. S. Native of Java.

Java Leea. Shrub.

7 L. GUINEE'NSE; leaves pinnate, lower pair ternate; leaflets broad-lanceolate, acuminated, serrated; corymbs axillary, twin; fruit 4-celled, 4-seeded. ♄. ◡. S. Native of Guinea. (v. s. in herb. Lamb.)

Guinea Leea. Shrub straggling.

* * *Leaves usually pinnate, very seldom bipinnate.*

8 L. ACULEA'TA (Blum. bijdr. l. c.) stem roundish, furrowed, prickly; leaves pinnate, quite smooth, with coarsely-serrated leaflets; corymbs decompound. ♄. S. Native of Java.

Prickly-stemmed Leea. Shrub 8 feet.

9 L. HI'RTA (Herb. Banks, Horn. hort. hafn. 1. p. 231.) leaves pinnate, and sometimes bipinnate, with lanceolate-serrated hairy leaflets; anthers connected. ♄. S. Native of the East Indies in the lower parts of Bengal and Nipaul. L. scàbra, Roxb. mss. Stems many, flexuous, jointed. Leaflets from 2 to 8 inches long, and from 1 to 3 broad. Cymes terminal, 3-parted. Nectary inserted in the edge of the projecting ring, which surrounds the ovary. Berry black, resembling a black currant, 6-seeded, when dry 6-lobed.

Hairy Leea. Fl. Oct. Nov. Clt. 1823. Shrub 6 feet.

10 L. CRÍSPA (Lin. mant. 124.) herbaceous; stem and branches fringed at the angles; leaves pinnate, with oblong, serrated leaflets; anthers free. ♃. S. Native of the East Indies, common among bushes near Calcutta; and of the Cape of Good Hope. L. pinnàta, Andr. bot. rep. t. 355.—Rheed. mal. 2. p. 43. t. 26. Stems swelled above the joints. Leaflets usually 5, but in very luxuriant plants they are sometimes compound. Cymes small, a little hairy, 5-flowered. Flowers small, white. Urceolus of stamens with entire divisions, with the anthers lodged within its mouth. Berries round, size of a small cherry, when ripe smooth and black.

Curled-stemmed Leea. Fl. Oct. Nov. Clt. 1767. Sh. 5 ft.

11 L. A'SPERA (Wall. fl. nep. mss.) leaves pinnate, with oblong, lanceolate, serrated, villous, rather scabrous leaflets; stem and branches rather curled at the angles; anthers free. ♄. S. Native of Nipaul.

Rough-leaved Leea. Shrub 6 feet.

12 L. ÆQUA'TA (Lin. mant. 124.) stem round, pubescent; leaves pinnate, with lanceolate, acuminated, serrated leaflets, pubescent when young. ♄. S. Native of the East Indies. Leèa hirsùta, Blum. bijdr. Corymbs trichotomous. Flowers small, greenish.

Even Leea. Fl. Oct. Nov. Clt. 1777. Shrub 6 feet.

* * * *Leaves simple.*

13 L. MACROPHY'LLA (Roxb. hort. beng. p. 18. fl. ind. 2. p. 465.) herbaceous; leaves simple, stalked, broad-cordate or lobed, posterior lobes overlapping each other; cyme trichotomous; root tuberous. ♃. S. Native of the East Indies. Leaves from 1-2 feet long, and nearly as broad. Flowers numerous, small, white. Urceolus of stamens with entire divisions. Anthers inverted within the mouth of the urceolus. Berries much depressed, size of a small cherry, obscurely 6 or more lobed, with an equal number of cells, when ripe black and succulent. The root of this plant promises to yield a colour fit for dying; its taste is astringent, and it is mucilaginous.

Long-leaved Leea. Clt. 1806. Pl. 4 feet.

Cult. These plants are scarcely worth cultivating, except in general collections. They will all thrive well in a mixture of loam and peat, or any light, rich soil, and large cuttings root readily in sand under a hand-glass, in heat.

VI. LASIANTHE'RA (from λασιος, *lasios*, woolly, and ανθηρα, *anthera*, an anther; anthers hairy). Beauv. fl. d'ow. 1. p. 85. t. 51. D. C. prod. 1. p. 636.

LIN. SYST. *Pentándria*, *Monogýnia*. Calyx 5-toothed. bracteolate on the outside. Corolla 5-cleft. Stamens 5, inserted in the bottom of the corolla; filaments broad, alternating with the lobes of the corolla. Anthers oblong, hairy. Style short.—A small climbing shrub with simple leaves.

1 L. AFRICA'NA (Beauv. fl. d'ow. l. c.). ♄. ᴗ. S. Native of Africa near Chama, on the banks of the river St. Yago. A suffruticose climber, with ovate-oblong, entire, cuspidate leaves. Peduncles leaf-opposed, umbellately branched at the apex. Flowers capitate, as in *Aràlia*.

African Lasianthera. Shrub cl.

Cult. This plant will thrive in any light loamy soil, and large cuttings will strike root in sand under a hand-glass, in heat.

ORDER LIV. GERANIA'CEÆ (plants agreeing with *Gerànium* in important characters). D. C. fl. fr. 4. p. 838. prod. 1. p. 637. Sweet, Ger.—Gerània, Juss. gen. 268.

Calyx permanent, of 5 sepals (f. 119. *a.*); sepals more or less unequal, imbricate in æstivation, sometimes one of them is drawn out into a hollow spur at the base, which is closely connate to the peduncle. Petals 5 (f. 119. *b.*), (rarely 4, one of which being abortive very rarely absent altogether) unguiculate, alternating with the sepals, equal or unequal; in the first they are hypogynous, in the second they are usually inserted in the calyx or connected together. Stamens with the filaments rarely free, but almost always monadelphous at the base, disposed in a simple series, hypogynous or perigynous, equal or double in number to the petals, rarely triple that number as in *Monsònia*, sometimes some of them are sterile, equal or unequal. Ovary at first 5-celled (f. 119. *d.*), ending in a long thick style, crowned by 5 stigmas (f. 119. *e.*). Carpels 5, rather membranous, indehiscent, 1-celled, biovulate, at first pressed to the base of the torus, each ending in a style or awn, which is closely adnate to the angles of the torus, but after maturity twisting variously from the base to the apex, and by their elasticity separating the carpels from the torus (f. 119. *e.*), but still adhering at the middle to the top of the torus. Seeds solitary in the carpels, pendulous, exalbuminous. Embryo curved, with a deflexed radicle directed to the bottom of the carpel, with leafy, convolute, or flexuously plicate cotyledons, which are sometimes lobed.—Herbs or soft-stemmed shrubs, with the young stems jointed at the articulations, and separable as in *Ampelideæ*. Lower leaves opposite, upper ones alternate, with the peduncles opposite the leaves as in *Vìtis*, but never changing to tendrils. Flowers of various hues, solitary, or umbellate on the peduncles. The *Pelargòniums*, commonly called *Geraniums*, are well known to all gardeners for their beauty, and the facility with which hybrid varieties are produced among them. M. de Candolle remarks that of the true *Geraniàceæ* some are slightly acid, especially those with succulent leaves, some exhale a resinous smell, which is sometimes agreeable, but occasionally so powerful as to be unpleasant. This resinous principle is so powerful in *Sarcocaúlon L'Heretièri*, that its stem burns like a torch, and exhales an agreeable perfume. The most common property of the European *Geraniums* is to be astringent, which is chemically determined by their juice being blackened by sulphate of iron; this is particularly remarkable in *G. Robertiànum* and *G. sanguíneum*, which are both accounted vulnerary, and *Eròdium moschàtum* and *G. praténse*, in which it is united to a slight aromatic principle, whence they have been recommended for various purposes, and among others for removing calculous disorders. The *G. maculàtum*, which grows in great abundance about Philadelphia

the roots of which boiled in milk are used for the cholera in children. Barton is of opinion that it would be a good substitute for gum kino in nephrites and obstinate diarrhœas. The order is easily distinguished from the neighbouring orders in the carpels separating from the axis, from the elastic nature of the styles, but which closely adhere to it near the apex, see f. 119. *e*.

Synopsis of the genera.

1 Rhynchothe'ca. Sepals 5, equal. Petals wanting. Stamens 10; filaments free.

2 Monsònia. Sepals 5, equal. Petals 5, equal. Stamens 15, disposed in 5 3-anthered bundles.

3 Sarcocau'lon. Sepals 5, equal. Petals 5, equal. Stamens 15, monadelphous at the base.

4 Gera'nium. Sepals 5, equal. Petals 5, equal. Stamens 10, monadelphous at the base, rarely all fertile, but usually with the alternate ones fertile, with a gland at the base of each of the fertile ones.

5 Ero'dium. Sepals 5, equal. Petals 5, regular, or irregular. Stamens 10, monadelphous at the base, 5 alternate ones sterile, with a gland at the base of each of the sterile ones.

6 Pelargònium. Calyx 5-parted, upper segment drawn out into a tube or spur, which is adnate to the peduncle. Petals 5, rarely 4, irregular. Stamens 10, unequal, monadelphous, 4-7 of which are fertile, the rest sterile.

7 Grie'lum. Calyx 5-cleft, without a nectariferous tube. Petals 5, equal. Stamens 10, all fertile, connate at the base, permanent. Carpels 5, closely connected, 1-seeded.

I. RHYNCHOTHE'CA (from *ῥυγχος, rhynchos*, a beak, and *θηκη, theke*, a box; form of capsule). Ruiz et Pav. fl. per. prod. p. 142. t. 15. H. B. et Kunth, nov. gen. amer. 5. p. 232. D. C. prod. 1. p. 637.

Lin. syst. *Decándria, Monogýnia.* Calyx of 5 equal sepals. Petals wanting. Stamens 10, with free filaments. Style short, adpressed. Stigmas 5, long, thick. Carpels 5, ending each in a tail, opening at the base. Ovulæ 2 in each carpel, pendulous, fixed to the axis. Receptacle columnar, pentagonal. Seeds rather keeled. Embryo straight, inverted, placed in a fleshy albumen.—Shrubs with spiny branchlets. Branches opposite, tetragonal. Flowers stalked in fascicles at the tops of the branches. This genus differs from *Gerànium* in being without petals, and in the stamens being free, as well as in the seeds being albuminous.

1 R. integrifòlia (H. B. et Kunth, l. c. t. 464.) leaves oblong, entire; sepals somewhat mucronate. ♄. G. Native of South America, in the temperate parts of Quito, near the town of Alausi.

Entire-leaved Rhynchotheca. Shrub 6 feet.

2 R. diversifòlia (H. B. et Kunth, l. c. t. 465.) leaves ovate-oblong, entire, or trifid; sepals mucronately awned. ♄. G. Native of South America, at Pillao and Pamallacta. R. spinòsa, Ruiz et Pav. fl. per. syst. p. 142. This shrub is used to make hedges.

Variable-leaved Rhynchotheca. Shrub 8 feet.

Cult. Rhynchothèca is a genus of remarkable shrubs, none of which has as yet been introduced in a living state into Britain. But should they ever be introduced into our gardens, we would recommend their being grown in a mixture of turfy loam, vegetable mould, and sand; and young cuttings will no doubt root in sand under a hand-glass, in a moderate heat.

II. MONSO'NIA (in honour of Lady Ann Monson, who brought many curious plants from India, and who assisted Mr. Lee in his Introduction to Botany). Lin. fil. suppl. p. 342. D. C. prod. 1. p. 638.

Lin. syst. *Polyadélphia, Monogýnia.* Calyx of 5 equal sepals, with an awned mucrone at the apex of each. Petals 5, equal, twice the size of the calyx. Stamens 15, disposed in 5 bundles, containing 3 anthers each.—Perennial or biennial plants, with toothed, lobed, or decompound leaves, and large, shewy flowers. Fruit as in *Eròdium* and *Gerànium*.

Sect. I. Olope'talum (from *ολος, olos*, entire, and *πεταλον, petalon*, a petal; petals entire). D. C. prod. 1. p. 638. Stems herbaceous. Leaves suboval, toothed. Stipulas and bracteas awl-shaped, rather firm. Peduncles 1-2-flowered, bearing 2 or 4 bracteas in their middle. Petals obovate, entire.

1 M. ova'ta (Cav. diss. 4. p. 193. t. 113. f. 1.) leaves ovate-oblong, rather cordate, crenated, wavy; stipulas stiff; peduncles axillary, 1-flowered, each bearing 2 bracteas. ♂. G. Native of the Cape of Good Hope. Gerànium emarginàtum, Lin. fil. suppl. 306. M. emarginàta, Lher. ger. t. 41. Stem filiform. Flowers large, with whitish-yellow petals, having 3 streaks each.

Ovate-leaved Monsonia. Fl. Aug. Clt. 1774. Pl. $\frac{1}{2}$ foot.

2 M. biflòra (D. C. prod. 1. p. 638.) leaves elliptical-oblong, blunt, toothed, rather wedge-shaped at the base; stipulas spiny; peduncles 2-flowered, each bearing 4 bracteas. ♃. G. Native of the Cape of Good Hope. Burch, cat. afr. austr. no. 2611. Flowers the size and colour of those of the preceding.

Two-flowered Monsonia. Fl. Aug.? Pl. 1 foot.

Sect. II. Odontope'talum (from *οδους οδοντος, odous odontos*, a tooth, and *πεταλον, petalon*, a petal; petals toothed). D. C. prod. 1. p. 638. Stems herbaceous. Leaves lobed or multifid. Peduncles long, 1-flowered, furnished with 6 or 8 whorled bracteas in the middle. Petals oblong, coarsely toothed at the apex.

3 M. loba'ta (Mont. act. goth. 2. p. 1. t. 1. ex Willd. spec. 3. p. 718.) leaves cordate, 5-7-lobed; lobes blunt, serrated, pilose beneath as well as the petioles and calyxes. ♃. G. Native of the Cape of Good Hope. Curt. bot. mag. t. 385. Sweet, ger. 273. Lois. herb. amat. t. 5. M. fília, Lin. fil. suppl. 341. Cav. diss. 3. p. 180. t. 74. f. 2. Gerànium anemonoìdes, Thunb. prod. 112. The flowers of this plant are said by Mr. Curtis to be more beautiful in the bud than when expanded; they are variegated with purple, red, white, and greenish on the outside, but pale-blush, with a darker base inside. Fruit with a very long beak. Leaves more or less hairy.

Lobed-leaved Monsonia. Fl. April, May. Clt. 1774. Pl. 1 ft.

4 M. pilòsa (Willd. enum. 717.) leaves palmately 5-parted, with 3-parted, pinnatifid segments, pilose beneath as well as the petioles and calyxes. ♃. G. Native of the Cape of Good Hope. M. fília, Pers. ench. no. 3. Gerànium Monsònia. Thunb. prod. 112. — Sweet, ger. 199. Petals greenish-red on the outside, white within, and red at the base. This is very like the following species.

Var. β, suffruticòsa (Coll. hort. rip. t. 2.) leaves with 5 pinnatifid segments; flowers large, yellowish on the outside, white within, and striped with red, with a darker base; ovary and anthers dark.

Pilose Monsonia. Fl. July, Aug. Clt. 1778. Pl. 1 foot.

5 M. speciòsa (Lin. fil. suppl. 342.) leaves palmately 5-parted, with the segments finely bipinnatifid, and are hairy as well as the petioles and calyxes. ♃. G. Native of the Cape of Good Hope. Curt. bot. mag. t. 73. Cav. diss. 3. t. 74.

f. 1. Gerànium speciòsum, Thunb. Flowers large, rose-coloured, eye purple, greenish outside.

Var. β, pállida (Sweet, Ger. 1. t. 77.). Flowers straw-coloured, with a red centre and dark velvety eye.

Shewy Monsonia. Fl. April, May. Clt. 1774. Pl. ½ foot.

Cult. *Monsònia* is a very shewy genus of herbaceous plants, therefore deserve to be cultivated in every greenhouse. Sweet says a mixture of light turfy loam and decayed leaves suits the species best, and they are easily increased by cuttings and by pieces of the roots; these should be planted in the same kind of soil recommended for the plants, and a hand-glass placed over them.

III. SARCOCAU'LON (from *σαρξ σαρκος, sarx sarkos*, flesh, and *καυλος, kaulos*, a stem; stem fleshy). Sweet, hort. brit. p. 73. Monsònia, sect. 1. Sarcocaúlon, D. C. prod. 1. p. 638. Monsònia, Lher. ger. t. 42.

Lin. syst. *Monadélphia, Dodecándria.* Calyx of 5 equal mucronately-awned sepals. Petals 5, equal, twice as large as the sepals. Stamens 15, joined together in one body at the base. —Shrubs with fleshy, spiny stems, and ovate or oblong, entire or toothed leaves. Peduncles 1-flowered, each furnished at the base with 2 small bracteas. Petals entire.

1 S. L'heritie'ri (Sweet, hort. brit. p. 73.) leaves ovate, mucronate, entire, some of them are almost sessile, others on long stalks. ♄. G. Native of the Cape of Good Hope. Monsònia spinòsa, Lher. ger. t. 42. M. L'heritièri, D. C. prod. 1. p. 638. Petioles permanent, spiny. Flowers 2 inches in diameter, purple.

L'Heritier's Sarcocaulon. Fl. May, Ju. Clt. 1790. Sh. 2 ft.

2 S. Patersònii; leaves oblong-wedge-shaped, blunt, entire, some of them are almost sessile, others on short petioles. ♄. G. Native of the Cape of Good Hope. Monsònia Patersònii, D. C. prod. 1. p. 638.—Paters. itin. t. 14. Flowers an inch in diameter, purple. Peduncles, according to the figure, spinescent.

Paterson's Sarcocaulon. Fl. May, Ju. Clt. 1827. Sh. 1 ft.

3 S. Burma'nni (Sweet, hort. brit. p. 73.) leaves oblong-cuneated, crenate; branches knotted. ♄. G. Native of the Cape of Good Hope. Monsònia Burmánni, D. C. prod. 1. p. 638. Gerànium spinòsum, Burm. ger. no. 2. Cav. diss. 4. p. 195. t. 75. f. 2.—Burm. afr. p. 81. t. 31. Leaves, according to the figures, some are sessile, others on long petioles. Petioles permanent, at length becoming spines. Flowers half an inch in diameter, purple. Stamens are said to be 10, but the number is not sufficiently known. Fruit with twisted awns.

Burmann's Sarcocaulon. Fl. July. Clt. 1790. Shrub 1 ft.

Cult. This is a genus of curious spiny shrubs, bearing beautiful large flowers, sometimes 2 inches in diameter. The species thrive well in a mixture of turfy loam, decayed leaves, and a little sand; and cuttings and slips of the roots will root readily in good mould, under a hand-glass.

IV. GERA'NIUM (from *γερανος, geranos*, a crane, the long beak which terminates the carpels resembles the bill of the crane). Lher. ger. D. C. fl. fr. 4. p. 844.

Lin. syst. *Monadélphia, Decándria.* Calyx of 5 equal sepals (f. 119. *a.*). Petals 5, equal (f. 119. *b.*). Stamens 10, 5 of which are fertile and larger than the sterile 5, alternating with each other, with a nectariferous gland at the base of each of the larger stamens. Awns of carpels smooth on the inside, at length separating elastically from the base to the apex of the axis, where it adheres, circinnately revolute.—Herbs, rarely subshrubs, with palmate-lobed leaves, and 1-2-flowered peduncles, bearing usually beautiful flowers of various hues.

§ 1. *Perennials. Peduncles* 1-*flowered.*

* *Plants stemless.*

1 G. sessiliflòrum (Cav. diss. 4. p. 198. t. 77. f. 2.) stemless; peduncles rising from the root, much shorter than the petioles; leaves reniform, 5-7-parted, with 3-cleft lobes. ♃. H. Native of the Straits of Magellan. G. brévipes, Lher. mss. Flowers purplish.

Sessile-flowered Crane's-bill. Pl. ½ foot.

2 G. acau'le (Willd. mss. in H. B. et Kunth. nov. gen. amer. 5. p. 231.) stemless; peduncles rising from the root, short; leaves many-parted, with linear, quite entire segments. ♃. G. Native of South America on the Andes about Quito, at the height of 6600 feet above the level of the sea. Flowers red.

Stemless Crane's-bill. Pl. ½ foot.

3 G. Humbóldtii (Spreng. syst. 3. p. 70.) almost stemless; leaves 5-parted, thick, hoary beneath; segments linear, intermediate one trifid; peduncles very short; calyxes and fruit silky. ♃. F. Native of South America. G. potentilloides, Willd. herb.

Humboldt's Crane's-bill. Pl. ½ foot.

4 G. seríceum (Willd. herb. ex Spreng. syst. 3. p. 70.) stem very dwarf, woody; petioles dilated, divided; leaves multifid, silky-villous; segments linear. ♃. G. Native of South America.

Silky Crane's-bill. Pl. ¼ foot.

** *Stems trailing or tufted.*

5 G. cucullà'tum (H. B. et Kunth, l. c. 5. p. 231.) tufted; branches leafy; peduncles a little longer than the leaves; leaves 5-parted, hollow, ciliated, smooth, intermediate segments bifid or trifid; calyxes mucronated. ♃. G. Native on mountains about Popayan. G. ciliàtum, Willd. herb. Flowers reddish.

Hollow-leaved Crane's-bill. Pl. ½ foot.

6 G. philonòthum (D. C. prod. 1. p. 639.) stems prostrate; peduncles longer than the petioles, furnished with bracteas at the base, usually twisted; leaves kidney-shaped, 3-5-parted, with wedge-shaped lobes, which are 3-toothed at the apex. ♃. G. Native of New Holland on the south-west coast. Habit almost of *Ranúnculus parviflòrus* or *R. philonòtis*, but the plant is smooth.

Marsh-loving Crane's-bill. Pl. trailing.

7 G. potentilloìdes (Lher. mss. D. C. prod. 1. p. 639.) stems prostrate; peduncles longer than the petioles, and furnished above the middle with 2 bracteas; leaves kidney-shaped, 5-parted, with trifid lobes. ♃. G. Native of New Holland.

Cinquefoil-like Crane's-bill. Pl. trailing.

8 G. arachnoìdeum (St. Hil. fl. bras. 1. p. 102. t. 20.) elegantly hairy; stem decumbent, slender, branched; radical leaves kidney-shaped, 7-parted, with narrow, lanceolate, trifid segments; peduncles filiform, elongated; fruit villous. ♃. G. Native of Brazil in the province of St. Paul. Petals emarginate, red.

Cobwebbed Crane's-bill. Pl. trailing.

9 G. multi'fidum (Sweet, ger. 245. but not of D. Don,) stem branched, diffuse, slender, pubescent; leaves silky, white beneath, quinate, or deeply 5-parted; leaflets and segments 3-parted, multifid, linear; peduncles elongated, 1-2-flowered; sepals silky, 3-nerved; petals emarginate, much longer than the calyx. ♃. G. Native of the Cape of Good Hope. Petals rose-coloured, bearded at the base. Filaments slightly fringed.

Multifid-leaved Crane's-bill. Fl. May, Aug. Clt. 1825. Pl. prostrate.

10 G. Lancastrie'nse (With. fl. brit. 600.) stem prostrate, rather tumid at the joints; peduncles axillary, much longer than the petioles, furnished with 2 bracteas in the middle; leaves opposite, 5-7-parted, with trifid lobes; lobules linear. ♃. H. Native of Europe on the sandy sea-coast; in England on the sandy coast in the Isle of Walney, Lancashire. Flowers large, beautiful, flesh-coloured, with purple veins. G. prostràtum, Cav. diss. 4. p. 196. t. 76. f. 3.

Lancashire Crane's-bill. Fl. July, Sept. Brit. Pl. trailing.

* * * *Stems erect, rarely diffuse.*

11 G. sangui'neum (Lin. spec. 958.) stems erect or diffuse, branched; peduncles axillary, much longer than the petioles, furnished with 2 bracteas in the middle; leaves opposite, 5-7-parted, with trifid lobes and linear lobules. ♃. H. Native of Europe, in bushy, stony, rather hilly situations, or upon limestone rocks; plentiful in Britain. Cav. diss. 4. t. 76. f. 1. Œd. fl. dan. t. 1107. Hook. fl. lond. t. 155. Engl. bot. t. 272. G. hæ'matodes, Ray. Roots stout, woody, of a dark-reddish-brown, and an astringent quality: for other qualities see *Gerànium maculàtum*. Flowers large, of a beautiful crimson or blood-colour.

Var. β, villosíssimum (D. C. fl. fr. no. 4541.) stems prostrate, and are, as well as the leaves, very villous; flowers purple, with white claws. ♃. H. Native of Europe, particularly in the south of France, in bushy places.

Var. γ, biflòrum; peduncles 2-flowered. ♃. H. Native of Switzerland.

Bloody-flowered Crane's-bill. Fl. July, Sept. Britain. Pl. 1 to 2 feet. β trailing.

12 G. potentillæfòlium (D. C. prod. 1. p. 639.) stem branched, rather diffuse; peduncles axillary, much longer than the petioles, furnished with 2 bracteas above the middle; leaves opposite, on short petioles, clothed with white down beneath, 5-parted, with jagged lobes and linear lobules. ♃. S. Native of New Spain. G. pedunculàre, Willd. herb. Flowers very like those of *G. incànum*, but the peduncles are 1-flowered.

Cinquefoil-leaved Crane's-bill. Pl. diffuse.

13 G. Sibi'ricum (Lin. spec. 957.) stem erect, rather diffuse, branched; peduncles longer than the leaves, furnished with 2 bracteas beneath the middle; leaves 5-6-parted, with oblong, deeply-toothed lobes. ♃. H. Native of Siberia, Caucasus, and China. Cav. diss. 4. t. 77. f. 1. Jacq. hort. vind. 1. t. 19.—Gmel. sib. 3. t. 67. Corolla lilac, marked with purple stripes.

Siberian Crane's-bill. Fl. June, Jul. Clt. 1758. Pl. 1 to 2 ft.

14 G. Chiloe'nse (Willd. in H. B. et Kunth, nov. gen. amer. 5. p. 231.) stem branched, silky, glandularly-pilose; leaves 5-lobed, pubescent, with oblong, trifid, toothed segments; flowers axillary? ♃. G. Native of Quito and Chiloe. G. pubéscens, Willd. herb. Flowers white.

Chiloe Crane's-bill. Pl. 1 foot.

15 G. Agavace'nse (Willd. mss. in H. B. et Kunth, l. c. p. 231.) stem divaricate, smooth; leaves 5-parted, with lanceolate, 2-parted segments, intermediate one bifid; flowers axillary, on long peduncles. ♃. G. Native of Peru, near Ayavaca. G. partìtum, Willd. herb. Flowers white.

Ayavaca Crane's-bill. Pl. 1 foot.

16 G. diffu'sum (H. B. et Kunth, nov. gen. amer. l. c.) stems branched, diffuse, beset with reflexed hairs; peduncles a little shorter than the petioles; leaves profoundly 5-cleft, covered with close-pressed hairs beneath; segments 3-lobed; calyxes mucronated. ♃. G. Native of Peru on the mountains. Flowers unknown. Very like *G. mólle*.

Diffuse Crane's-bill. Pl. diffuse.

§ 2. *Perennials. Peduncles 2-flowered.*

* *Stem permanent, or shrubby at the base.*

17 anemonæfòlium (Lher. ger. t. 36.) stem suffruticose; leaves smooth, palmately 5-cleft, with bipinnatifidly-cleft segments, upper ones 3-parted; peduncles opposite, erect, smooth ♄. F. Native of Madeira and Teneriffe. Sweet, ger. t. 244. Curt. bot. mag. 206. G. palmàtum, Cav. diss. 4. t. 84. f. 2. G. lævigàtum, Burm. ex Lher. mss. Flowers large, purplish-red.

Anemone-leaved Crane's-bill. Fl. May, Aug. Clt. 1788. Pl. 1 to 2 feet.

18 G. macrorhi'zon (Lin. mant. 343.) stem suffruticose at the base, dichotomous at the apex; leaves smooth, 5-parted, with the lobes toothed at the apex; calyxes globose, inflated; petals entire, a little reflexed; stamens bending down. ♃. H. Native of Italy, Carinthia, and Greece. Jacq. icon. rar. 1. t. 134. Cav. diss. 4. p. 212. t. 85. Sims, bot. mag. t. 2420. Sweet, ger. 271. Flowers deep-red, or bright-purple. Peduncles sometimes umbellate.

Long-rooted Crane's-bill. Fl. May, July. Clt. 1576. Pl. 1 ft.

* * *Stems short, permanent at the base.*

19 G. inca'num (Lin. spec. 957.) stems trailing; leaves clothed with white down beneath, 5-7-parted, with multifid, linear lobes; peduncles elongated; calyx clothed with pressed, silky hairs; petals entire. ♃. G. Native of the Cape of Good Hope.—Burm. ger. 26. t. 1. Cav. diss. 4. t. 82. f. 2. Leaves almost like those of *Potentílla argéntea*. Flowers white?

Hoary-leaved Crane's-bill. Fl. May, Jul. Clt. 1701. Pl. proc.

20 G. cane'scens (Lher. ger. t. 38.) stems trailing; leaves hoary beneath, 5-parted, with oblong, deeply-toothed segments; peduncles very long, and are, as well as the calyxes, clothed with glandular hairs; petals emarginate. ♃. G. Native of the Cape of Good Hope. This species is allied on the one hand to *G. incànum*, and on the other hand to *G. asphodeloìdes*. Flowers pink. This and the preceding species have long trailing stems.

Canescent Crane's-bill. Fl. May, June. Clt. 1787. Pl. proc.

21 G. subcaule'scens (Lher. mss. D. C. prod. 1. p. 640.) stem very short; leaves almost radical, villous, rather greyish, 5-parted, with blunt, 3-toothed lobes; down on peduncles, and petioles spreading; petals very blunt, longer than the villous calyx. ♃. H. Native on the top of mount Parnassus. G. asphodeloìdes, Smith, fl. græc. 2. t. 661. prod. 2. p. 40. Habit of *G. canéscens*. It is probably only a variety of *G. asphodeloìdes*. Flowers red.

Subcaulescent Crane's-bill. Pl. ½ foot.

22 G. Donia'num (Sweet, ger. 338.) stemless; leaves deeply 5-parted, with multifid segments, and linear, blunt lobes, pilose beneath; scape tetragonal, ascending, somewhat trichotomous at the base, villous. ♃. H. Native of Nipaul in Gosaingsthan. G. multífidum, D. Don, prod. fl. nep. p. 207. Flowers purple. Calyxes pointed. Herb without, or with a very short stem.

Don's Crane's-bill. Fl. June, Nov. Clt. 1817. Pl. ½ foot.

23 G. arge'nteum (Lin. amœn. 4. p. 324.) stem very short; leaves all almost radical, on long petioles, hoary or silky on both surfaces, 5-7-parted, with trifid lobes, and linear lobules; peduncles almost radical; petals emarginate. ♃. F. Native of the Alps of Provence, Piedmont, and Carinthia. Sweet, ger. t. 59. Sims, bot. mag. t. 504.—Pon. bald. t. 342.—Segu. ver. 1. p. 471. t. 10. Flowers large, pale-red, with darker stripes.

Silvery-leaved Crane's-bill. Fl. Ju. Jul. Clt. 1699. Pl. ¼ ft.

24 G. cine'reum (Cav. diss. 4. p. 204. t. 89. f. 1.) plant almost stemless; leaves almost radical, stalked, clothed with glaucous pubescence, 5-7-parted, with wedge-shaped, trifid lobes; peduncles almost radical; petals emarginate. ♃. F. Native of the Pyrenees. G. vàrium, Lher. ger. t. 37. G. cineràceum, Lapeyr. pyr. t. 2. Root as in the preceding, thick, and woody. Flowers pale-red, with darker stripes.

Grey Crane's-bill. Fl. June, Aug. Pl. ½ foot.

* * * *Roots tuberous; stems erect or diffuse.*

25 G. tubero'sum (Lin. spec. 953.) root almost globose; stem from the base to the fork naked; leaves many-parted, with linear, pinnatifid, serrated lobes. ♃. H. Native in fields from Marseilles to Tauria, particularly in Italy and Silesia. Sweet, ger. t. 155. Cav. diss. 4. t. 78. f. 1.—Lob. icon. t. 661. f. 2. Mor. oxon. 5. t. 16. f. 21. G. radicàtum, Bieb. fl. taur. 2. p. 132.

exclusive of the synonyme of Moris. Flowers large, numerous, purple, elegant. Petals bifid.

Tuberous-rooted Crane's-bill. Fl. May, Aug. Clt. 1596. Pl. ½ foot.

26 G. LINEARI'LOBUM (D. C. fl. fr. suppl. p. 628. in a note,) roots almost globose; stem rather pubescent, naked from the base to the fork; leaves many-parted, with linear, subdivided, quite entire lobes. ♃. H. Native of Siberia in groves and fields, on the lower Volga, and at Cape Caucasus. G. tuberòsum, Bieb. fl. taur. cauc. 2. p. 135. exclusive of the synonymes of Lin. Cav. Lam. Mor. Flowers red. An elegant plant.

Linear-lobed Crane's-bill. Fl. May, July. Pl. 1 foot.

27 G. GYMNOCAU'LON (D. C. prod. 1. p. 640.) root almost globose? stem from the base to the divisions naked; upper leaves 3-parted, with pinnate-cut lobes; calyxes ciliated, villous; petals entire. ♃. H. Native of Iberia. Root and radical leaves unknown. Flowers large, blue.

Naked-stemmed Crane's-bill. Fl. May, July. Clt. 1814. Pl. 1 foot.

28 G. ASPHODELOI'DES (Willd. in Schrad. jour. 2. p. 26. t. 1.) root tuberous; stem flaccid, diffuse, hispid from reflexed hairs; leaves 5-lobed; lobes trifid, a little cut; peduncles and calyxes villous; petals emarginate; stamens awl-shaped, smooth. ♃. H. Native of fields in Greece, about Constantinople, and of the Levant. Tourn. voy. 1. p. 526. with a figure, ed. germ. 2. p. 339. t. 36. G. orientàle, Mill. dict. no. 10. Flowers dark-purple.

Asphodelus-like-rooted Crane's-bill. Pl. 1 foot.

* * * * *Stems herbaceous, erect, or diffuse. Roots fibrous.*

29 G. IBE'RICUM (Cav. diss. 4. p. 209. t. 124. f. 1.) stem villous, dichotomous, erect; leaves 5-7-parted, with pinnately-cut lobes and toothed lobules, villous; calyxes very villous; petals obcordate, or somewhat trifid. ♃. H. Native of Iberia. Sims, bot. mag. t. 1386. Sweet, ger. t. 84. G. grandiflòrum, Guld. itin. 1. p. 426. Flowers large, blue. This is a very elegant plant.

Iberian Crane's-bill. Fl. June, Sept. Clt. 1802. Pl. 1 foot.

30 G. NODO'SUM (Lin. spec. 953.) stem erect, tetragonal, lower leaves 5-lobed, upper ones 3-lobed, with oblong, acuminated, serrated lobes; petals emarginate. ♃. H. Native of France and Britain, in the mountainous parts of Cumberland, and between Hatfield and Welwyn, Herts, in thickets. Smith, engl. bot. t. 1091. Cav. diss. 4. p. 208. t. 80. f. 1.—Mor. 2. p. 516. sect. 5. t. 16. f. 22. Carpels downy. Root rather tuberous. Flowers rather large, purple, veined. Leaves shining.

Knotted Crane's-bill. Fl. May, Aug. Britain. Pl. 1½ foot.

31 G. HERNANDE'SII (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 640.) stem roundish, erect; branches and petioles beset with spreading, long hairs; lower leaves 5-lobed, upper ones 3-lobed, with oblong, acuminated, serrated lobes; petals oblong, cuneated, almost entire. ♃. H. Native of Mexico. Flowers pale-red, veined. Hern. mex. 293. f. 2. This plant is probably sufficiently distinct from the following.

Hernandes's Crane's-bill. Fl. May, July. Pl. 1½ foot.

32 G. MEXICA'NUM (H. B. et Kunth, nov. gen. amer. 5. p. 230.) stem erect, beset with reflexed hairs; leaves pedately 5-cleft, covered with long close-pressed hairs on both surfaces; segments 3-7-cleft at the apex; peduncles clothed with glandular hairs; calyxes mucronated. ♃. F. Native of Mexico between Guanaxuato and Santa Rosa. G. hírtum, Willd. herb. Flowers pale-red, veined.

Mexican Crane's-bill. Pl. 1 foot.

33 G. HOLOSERI'CEUM (Willd. herb. ex Spreng. syst. 3. p. 73.) stem erect, branched, smooth, covered with stipulas at the base; leaves kidney-shaped, 5-lobed, clothed with soft hairs on both surfaces; lobes 3-toothed, obtuse; peduncles and calyxes hairy. ♃. G. Native of South America.

Whole-silky Crane's-bill. Pl. 1 foot.

34 G. ANGULÒSUM (Curt. bot. mag. t. 203.) stem angular, erect; radical leaves 7-lobed, cauline ones 5-lobed; lobes oblong, pointed, toothed; petals emarginate. ♃. H. Native of? G. venòsum, Pers. ench. 2. p. 235. Flowers pale-red, with darker veins.

Angular-stemmed Crane's-bill. Fl. May, July. Clt. 1789. Pl. 1½ foot.

35 G. REFLE'XUM (Lin. mant. 257.) stem erect, round; leaves alternate, 5-7-lobed, deeply-toothed, upper ones sessile; petals reflexed, toothed at the apex; stamens smooth; carpels transversely plaited. ♃. H. Native of Italy and France. Cav. diss. 4. t. 81. f. 1. Flowers with purple petals, and white stamens.

Reflexed-petalled Crane's-bill. Fl. May, June. Clt. 1758. Pl. 1 foot.

36 G. PHÆ'UM (Lin. spec. 933.) stem round, forked; leaves 5-9-lobed, deeply-toothed, upper ones sessile; petals spreading, entire; filaments of stamens hairy at the base; carpels transversely plaited. ♄. H. Native of France and Switzerland; also in England in mountainous thickets, but rare at Tovell near Maidstone. About Clapham, Ingleton, and Newburgh, Yorkshire, as well as Lancashire, Cambridgeshire, and Bedfordshire. Smith, engl. bot. t. 322. Oed. fl. dan. t. 987. Cav. diss. 4. p. 210. t. 89. f. 2. G. phæ'um var. α, vulgàtius, D. C. prod. 1. p. 641. Petals dark-brown, almost inclining to black, with a white spot at the base of each. Carpels hairy at the base.

Dusky-flowered Crane's-bill. Fl. May, June. Britain. Pl. 1 to 2 feet.

37 G. FU'SCUM (Lin. mant. 97.) stem round, simple; leaves 5-9-lobed, deeply-toothed, upper ones sessile; petals a little reflexed, entire; stamens hairy at the base; carpels transversely plaited. ♃. H. Native of the south of Europe. Flowers dirty purple. This species differs from *G. phæ'um*, in the stems being simple, not forked, and in the leaves being stiffer and more pubescent, as well as in the peduncles being twin, 1-flowered, not solitary and 2-flowered.

Brown-flowered Crane's-bill. Fl. May, June. Clt. 1759. Pl. 1 to 2 feet.

38 G. LI'VIDUM (Lher. ger. t. 39.) stem round, simple; radical leaves 9-lobed, obtuse, deeply-toothed, upper ones 5-lobed, acute; petals roundish-obcordate, waved; stamens hairy at the base; carpels transversely plaited. ♃. H. Native of France and Switzerland. Sweet, ger. 268. G. pàtulum, Vill. dauph. 3. p. 371. G. subcærùleum, Schleich. cat. 25. Flowers lead-coloured.

Livid-flowered Crane's-bill. Fl. May, June. Clt. 1775. Pl. 1 to 2 feet.

39 G. ERIOSTE'MON (Fish. ined. D. C. prod. 1. p. 641.) stem slightly angled, forked, erect; leaves 5-lobed, with ovate, deeply-toothed lobes, lower leaves on long stalks, alternate, upper ones sessile, opposite; petals entire, bearded at the base; filaments of stamens very villous, distinct at the base. ♃. H. Native of Nipaul at Gosaingsthan, and of Dahuria in birch woods. Sweet, ger. t. 197. Stem tumid at the joints, and is, as well as the leaves, villous. Flowers pale-violet, with white stamens, but purple towards the apex, as well as the stigmas.

Var. β, pállidum (Sweet, ger. t. 197. f. b.) flowers pale-blue. ♃. H. Native of Nipaul only.

Hairy-stamened Crane's-bill. Fl. June, Aug. Clt. 1822. Pl. ½ to 3 feet.

40 G. ERIA'NTHUM (D. C. prod. 1. p. 641.) stem erect, round, almost simple, naked below; leaves all stalked, palmately 5-7-lobed, with the lobes deeply and acutely serrate-jagged; peduncles crowded, short; calyxes very villous; petals entire; fila-

ments of stamens pilose. ♃. H. Native of Kamtschatka and the western coast of North America. Flowers blue.

Hairy-flowered Crane's-bill. Pl. 1 foot.

41 G. SYLVA'TICUM (Lin. spec. 954.) stem round, erect, smooth; leaves somewhat 5-7-lobed, with the lobes oblong, deeply-toothed; peduncles rather corymbose; petals somewhat emarginate, hairy at the claws; filaments of stamens ciliated to the middle. ♃. H. Native of the north of Europe in thickets and pastures. Plentiful in the north of England and Scotland in thickets by the sides of rivers or rivulets. Smith, engl. bot. t. 121. Carpels hairy. Stem beset with reflexed hairs. Flowers purple or blue, with crimson veins.

Wood Crane's-bill. Fl. June, July. Britain. Pl. 2 feet.

42 G. BATRACHIOI'DES (Cav. diss. 4. p. 211. t. 85. f. 1.) stem round, erect, hairy; leaves with 5-7 deep lobes, which are pinnatifid, or deeply-serrated; peduncles rather corymbose; petals entire; filaments of stamens awl-shaped, ciliated at the middle. ♃. H. Native of the south of Europe in woods. Calyx inflated. Flowers larger than those of *G. sylváticum*, blue. This species differs from *G. sylváticum* in having leaves more like those of *G. praténse*, and in the flowers being larger and blue, with entire petals, never notched. We are of opinion that the double flowering variety of *G. praténse* in the gardens is a variety of this species.

FIG. 119.

Batrachium-like Crane's-bill. Fl. June, July. Clt. 1817. Pl. 2 feet.

43 G. PRATE'NSE (Lin. spec. 954.) stem round, erect, downy; leaves 7-parted, with sharply-pinnatifid and deeply-serrated, linear lobes; peduncles somewhat corymbose; petals entire; filaments of stamens smooth, but much dilated at the base. ♃. H. Native of Europe in rich, rather moist pastures and thickets. In several places of Britain in hilly parts; also at Battersea, Harrow, and other places not far from London. Smith, engl. bot. t. 424. Curt. fl. lond. fasc. 4. t. 49. Cav. diss. 4. p. 210. t. 87. f. 1. Delaun. herb. amat. t. 118. G. batrachioìdes, Rai. syn. 360. This species is larger in every part than *G. sylvâticum*. Flowers large, blue. Carpels hairy.

Var. β, flòre âlbo; flowers white.

Var. γ, flòre variegàto; flower variegated with white and blue, sometimes some of the petals are white and others blue.

Var. δ, flòre plèno; flowers double, blue; leaves not so much cut as those of the single varieties, and more hairy. This is probably a variety of *G. batrachioìdes*. Found by the late lady Charlotte Murray in Scotland, near Athol house.

Meadow Crane's-bill. Fl. June, July. Britain. Pl. 2 to 3 ft.

44 G. LO'NGIPES (D. C. mem. soc. gen. 1. p. 442.) stem round, erect, smooth; leaves palmate, rather peltate, with 5-7 deeply-cut, oblong lobes; peduncles very long, from the forks of the branches; petals entire; filaments of stamens awl-shaped, smooth. ♃. H. Native of? G. Londèsii, Link. enum. 2. p. 196. Flowers large, of a lilac-violet colour. Calyx awned.

Long-stalked Crane's-bill. Fl. May, July. Clt. 1823. Pl. 1 to 1½ foot.

45 G. MACULA'TUM (Lin. spec. 955.) stem rather angular, erect, dichotomous, covered with retrograde pubescence; leaves 3-5-parted, with deeply-toothed lobes; radical ones on long stalks, upper ones opposite, sessile; petals obovate, entire; filaments of stamens hardly ciliated at the base. ♃. H. Native of North America from Canada to Carolina, in shady woods and meadows. Cav. diss. 4. t. 86. f. 2. Bigel. am. med. bot. 1. p. 84. t. 8.—Sweet, ger. 332. Flowers pale-lilac, sometimes as large as those of *G. praténse*, at others one-half smaller. This species is known in some parts of the mountains of North America by the name of alum root, on account of the astringent taste of its roots, which are very successfully employed in curing the flux and dysentery among children, which is a disease very prevalent in those countries. It may be used in powder or in extract. Its doses are similar to those of kino, a drachm or two of the tincture, 20 or 30 grains of the powder, and a quantity somewhat less of the extract. The tincture forms an excellent external application in sore throats and ulcerations of the mouth. The experiments of D. Bigelow indicate the presence of tannin and gallic acid, the former in large quantities. The proportion of tannin seems considerably to exceed that of the kino. Alcohol and proof spirit readily dissolve the active constituents of the root. The tincture is the most convenient mode for keeping the article for use.

Spotted Crane's-bill. Fl. May, July. Clt. 1732. Pl. 1½ foot.

46 G. DAHU'RICUM (D. C. prod. 1. p. 642.) stem erect, smooth, naked at the base; cauline leaves opposite, 3-5-parted, with cut, acute lobes; peduncles 3 times longer than the leaves, fruit bearing ones deflexed; calyxes smoothish; petals entire, much bearded at the base; stamens awl-shaped, ciliated. ♃. H. Native of Dahuria in bogs. Root with elongated tubers in fascicles, as in *G. aconitifòlium*, to which it is very nearly allied. Flowers pale-blue?

Dahurian Crane's-bill. Fl. June, July. Clt. 1820. Pl. 1½ foot.

47 G. ACONITIFÒLIUM (Lher. ger. t. 40.) stem rather ascending, smoothish; leaves rather peltate, 7-9-parted, with jagged lobes; peduncles and calyxes villous; petals entire; stamens awl-shaped, smoothish. ♃. H. Native of the Alps of Dauphiny and Switzerland by the sides of rivulets. G. rivulàre, Vill. dauph. 3. t. 40. Roots fascicled. Flowers white, and full of purple lines, but are one-half smaller than those of *G. praténse*. Anthers purple. Stems rather ascending, not truly erect.

Monk's-hood-leaved Crane's-bill. Fl. May, June. Clt. 1775. Pl. 1½ foot.

48 G. BIFÒLIUM (Patrin, ined. D. C. prod. 1. p. 642.) stem smooth, erect, naked under the bifurcation; radical leaves two, stalked, three times shorter than the stem, the rest opposite, and sessile, all of which are clothed with pressed hairs, 7-parted, with linear, pinnate-toothed lobes; calyxes clothed with close-pressed villi; petals entire; stamens ciliated. ♃. H. Native of Dahuria about Barnaoul. Flowers blue?

Two-leaved Crane's-bill. Fl. May, July. Pl. 1 foot.

49 G. CÆRU'LEUM (Patr. ined. D. C. prod. 1. p. 642.) stem smooth, naked at the base, dichotomous; cauline leaves opposite, 5-7-parted, with pinnate-cut, acute lobes; calyxes very villous; petals entire, scarcely puberulous at the base; stamens ciliated. ♃. H. Native of Dahuria in fields. Flowers small, light-blue. This species is like the three preceding, in having the petals just a little longer than the calyx.

Blue Crane's-bill. Fl. May, June. Clt. 1824. Pl. 1 foot.

50 G. CRISTA'TUM (Stev. mem. soc. hist. nat. mosc. 4. p. 50. t. 5.) stem flaccid, simple; leaves kidney-shaped, 7-lobed; lobes trifid; lobules 3-toothed; peduncles elongated, and are, as well as the calyxes, hispid; petals emarginate, larger than the calyx; carpels crested, as in *Onobrỳchis Càput-Gálli*. ♃. H. Native of Albania and Iberia at the river Jucharibasch. G. Albànum, Bieb. fl. taur. 2. p. 137. Flowers purple.

Crested-carpelled Crane's-bill. Fl. May, Aug. Clt. 1820. Pl. 1 foot.

51 G. PYRENA'ICUM (Lin. mant. 97.) stem erect, branched; leaves kidney-shaped, 7-lobed; lobes oblong, blunt, trifid, with 3-toothed lobules; floral leaves 3-parted; petals emarginate, twice as long as the calyx; carpels keeled, pubescent. 4. H. Native of Europe from Spain to Britain, in meadows and pastures. In England by a river between Bingley and Keighley, Yorkshire; also near Enfield, and about Brompton Chelsea, and elsewhere near London. At East Winch and West Bilney, Norfolk; also near Oxford. In Scotland, near Edinburgh, and near Forfar. Smith, engl. bot. t. 405. Curt. lond. fasc. 3. t. 42. Cav. diss. 4. p. 203. t. 79. f. 2. G. perénne, Huds. ed. 1. p. 265. Root fibrous. Leaves finely hairy, rather soft to the touch. Flowers light-purple, much larger than those of *G. mólle*. There is also a white flowering variety.

Pyrenean Crane's-bill. Fl. June, July. Britain. Pl. 2 to 3 feet.

52 G. UMBRÒSUM (Walds. et Kit. pl. hung. 2. p. 131. t. 124.) lower leaves 7-lobed, with the lobes lobed, upper leaves 3-5-lobed; petals red, emarginate, or 2-lobed, twice the length of the calyx; carpels smooth. 4. H. Native of Hungary.

Shaded Crane's-bill. Fl. June, July. Clt. 1804. Pl. 2 feet.

53 G. NEMORÒSUM (Ten. cat. 1819. p. 60.) stem erect, branched; leaves kidney-shaped, deeply 7-lobed, with trifid lobes and 3-toothed lobules; petals entire, a little larger than the calyx; carpels crested, pubescent when young. 4. H. Native of Naples in groves. G. Pyrenàicum, var. γ, nemoròsum, D. C. prod. 1. p. 643. Flowers purplish-blue. Like *G. pyrenàicum*, but differs in the petals being entire.

Grove Crane's-bill. Fl. June, July. Clt. 1821. Pl. 2 feet.

* * * * * *Stems decumbent or procumbent.*

54 G. NIPAULE'NSE (D. C. prod. 1. p. 643.) stem procumbent, villous; leaves 5-lobed, villous; lobes wedge-shaped, bluntly and unequally toothed; peduncles elongated, and are, as well as the calyxes, pilose; petals obovate, somewhat emarginate, scarcely exceeding the length of the calyx; carpels pilose. 4. H. Native of Nipaul on the shady banks of the river called Kuli-Khana. Sweet, ger. t. 12. G. ràdicans, D. C. prod. 1. p. 639. ex D. Don, prod. p. 208. G. quinquenérve, Hamilt. mss. Flowers bright rose-coloured. *G. rádicans* is said to root at the joints by De Candolle, and the leaves are said to be only 3-lobed, and the peduncles 1-flowered; it is therefore probably a distinct species.

Nipaul Crane's-bill. Fl. May, Aug. Clt. 1819. Pl. trailing.

55 G. PARVIFLÒRUM (Willd. enum. 716.) stem somewhat decumbent; petioles, peduncles, and calyxes smooth; cauline leaves opposite, 3-5-parted, with trifid, toothed lobes; petals rather shorter than the calyx; stamens smooth. 4. G. Native of New Holland and Van Diemen's Land. Flowers small, of a bright lilac-colour. Petals entire.

Small-flowered Crane's-bill. Fl. May, Aug. Clt. 1816. Pl. decumbent.

56 G. PILÒSUM (Forst. prod. p. 531.) stem rather decumbent, branched; petioles and peduncles hispid with spreading hairs; leaves 3-5-parted, with the lobes divided into linear, obtuse, trifid segments; calyxes ciliated; stamens smoothish. 4. G. Native of New Zealand. Sweet, ger. t. 119. Petals obovate, rather emarginate, pale-purplish.

Pilose Crane's-bill. Fl. May, Aug. Clt. 1821. Pl. decumb.

57 G. PALU'STRE (Lin. amœn. 4. p. 323.) stem decumbent, hispid from spreading hairs; leaves 5-7-lobed; lobes deeply toothed; peduncles very long, rather hairy, with declinate pedicels; petals entire; stamens awl-shaped, smooth. 4. H. Native from France to Dahuria in subsylvan meadows and marshes. Sweet, ger. t. 3. Œd. fl. dan. t. 596. Cav. diss. 4. p. 211. t. 87. f. 2. Upper leaves 3-parted. Flowers purple, each petal marked with 3 brown nerves.

Marsh Crane's-bill. Fl. Ju. Aug. Clt. 1732. Pl. decumb.

58 G. COLLÌNUM (Bieb. fl. taur. 2. p. 137. suppl. 455.) stem angular, diffuse, and somewhat decumbent, clothed with retrograde pubescence; leaves palmately 5-parted, with somewhat 3-lobed lobes, deeply serrated; peduncles and calyxes covered with clammy villi; petals entire, roundish, hardly longer than the calyx; stamens awl-shaped, smooth. 4. H. Native of Tauria and Caucasus, in mountain meadows. Flowers purplish-blue; anthers violet. The varieties of this species are truly intricate, and are not sufficiently defined.

Hill Crane's-bill. Fl. May, Aug. Clt. 1815. Pl. rather decumbent.

59 G. WALLICHIA'NUM (D. Don. in bot. mag. t. 2377.) stem decumbent, purple; leaves 5-parted, with broadly cuneated-ovate, deeply toothed lobes, clothed on both surfaces as well as the stem with silky villi; stipulas ovate, obtuse; petals emarginate; stigmas very long. 4. H. Native of Nipaul in Gosaignsthan. Sweet, ger. t. 90. Flowers large, purple. The whole plant is clothed with silky villi. Leaves opposite.

Wallich's Crane's-bill. Fl. June, Sept. Clt. 1820. Pl. decumbent.

60 G. LAMBE'RTI (Sweet, ger. t. 338.) stem diffuse, geniculately-branched, elongated; leaves opposite, cordate, 5-lobed, pilose on both surfaces, soft; lobes wedge-shaped, cut, bluntly toothed; peduncles 2-flowered; calyxes mucronate; petals large, roundish-ovate, concave, and veiny. 4. H. Native of Nipaul. Flowers large, lilac. Filaments beset with white hairs.

Lambert's Crane's-bill. Fl. June, Sept. Clt. 1824. Pl. decumbent.

61 G. VLASSOVIA'NUM (Hort. and D. C. in mem. soc. gen. 1. p. 441.) stem round, decumbent; leaves with 5 oval, acuminated, deeply toothed lobes; upper leaves 3-lobed; stipulas distinct; petals obovate, entire. 4. H. Native of Siberia? Sweet, ger. t. 228. Flowers pink and beautifully variegated with darker veins, like those of *G. striàtum*.

Vlassove's Crane's-bill. Fl. May, Aug. Clt. 1820. Pl. decumbent.

62 G. STRIA'TUM (Lin. amœn. p. 282.) stem round, decumbent; lower leaves 5-lobed, upper ones 3-lobed; lobes ovate, acute, deeply toothed; stipulas free; petals emarginately 2-lobed. 4. H. Native of Italy and Greece. Cav. diss. 4. t. 79. f. 1. Curt. bot. mag. t. 55. Delaum. herb. amat. t. 9. Flowers pink, beautifully striped with darker veins. Carpels villous at the base. Leaves spotted with brown at the recesses.

Striped-flowered Crane's-bill. Fl. May, Oct. Clt. 1629. Pl. decumbent.

§ 3. *Annual species with 2-flowered peduncles.*

63 G. MÓLLE (Lin. spec. 955.) leaves kidney-shaped, radical ones 9-lobed, cauline ones 7-lobed; petals bifid, length of awnless calyx; carpels smoothish, wrinkled; seeds even. ⊙. H. Native of Europe, in cultivated and waste ground, meadows, pastures and by way-sides every where; plentiful in Britain. Smith, engl. bot. t. 778. Curt. lond. fasc. 2. t. 50. Œd. fl. dan. t. 679. Cav. diss. 4. p. 203. t. 83. f. 3. G. columbìnum, Ray. syn. 359. Herb of a light hoary green, downy all over with fine soft hairs. Flowers rather small, light reddish-purple.

Soft or Common Dove's-foot Crane's-bill. Fl. April, Aug. Britain. Pl. ¼ to 2 feet.

64 G. PUSI'LLUM (Lin. spec. 957.) leaves rather kidney-shaped, with 7 trifid lobes; petals emarginate, length of awnless calyx; carpels pubescent, keeled, not wrinkled; seeds even; anthers only 5. ⊙. H. Native of Europe in gravelly fields

and waste grounds, very common; plentiful in Britain. Smith, engl. bot. t. 385. Cav. diss. 4. p. 202. t. 83. f. 1. G. mólle β, Huds. ed. 2. p. 303. G. parviflòrum, Curt. lond. fasc. 6. t. 36. G. malvæfòlium, Scop. carn. 2. p. 37. Lam. fl. fr. 3. p. 18.—Vaill. par. 79. t. 15. f. 1. Habit and pubescence much like the last species, but smaller in every part. Flowers small, bluish-purple.

Var. β, hùmile (Cav. diss. 4. t. 83. f. 2.) leaves more finely cut, and stems dwarfer. ⊙. H. Growing with the species G. pusíllum, Burm. ger. 27.

Small-flowered Crane's-bill. Fl. Ju. Sept. Brit. Pl. $\frac{1}{4}$ to $\frac{3}{4}$ ft.

65 G. rotundifòlium (Lin. spec. 957.) radical leaves kidney-shaped, 7-lobed, cauline ones roundish, truncate at the base, 5-lobed; lobes trifid; petals entire, length of awned calyx; carpels hairy; seeds reticulated. ⊙. H. Native of Europe in waste ground and barren pastures, as also on walls and banks. In Britain, but rather rare. About Bath, Bristol, and London; at Hackney and Islington, and at Church Bramton, Northamptonshire, common in Suffolk, &c. Smith, engl. bot. t. 157. Cav. diss. 4. p. 214. t. 93. f. 2. G. malvàceum α, Burm. ger. 24. The whole herb is peculiarly soft, like velvet, with a considerable degree of viscidity noticed by Haller. In general appearance it most resembles the usual state of *G. mólle*. Flowers small, reddish-purple.

Round-leaved Crane's-bill. Fl. Ju. Jul. Brit. Pl. $\frac{1}{2}$ to 1 ft.

66 G. a'lbicans (St. Hil. fl. bras. 1. p. 103.) radical leaves kidney-shaped, orbicular, deeply 5-7-cleft, covered with adpressed pili; upper leaves truncate at the base; petals hardly emarginate, a little longer than the calyx; carpels obovate, pilosely-pubescent; seeds reticulated. ⊙. H. Native of Brazil in the provinces of Cisplatine and Rio Grande do Sul. Stems diffuse, hairy, as well as the peduncles and petioles. Petals pale-purple, ciliated at the claws. Filaments villous.

Whitish-leaved Crane's-bill. Fl. June, July. Pl. spreading.

67 G. pa'llens (Bieb. fl. taur. 2. p. 138.) lower leaves stalked, upper ones sessile, palmately 5-parted, with 3-lobed lobes; petals entire, a little longer than the awned calyx; carpels hairy; seeds reticulated. ⊙. H. Native of Western Iberia. Habit and pubescence much like that of *G. rotundifòlium*. Flowers small, reddish-purple, or almost white.

Pale-flowered Crane's-bill. Fl. June, Aug. Clt. 1827. Pl. $\frac{1}{2}$ to 1 foot.

68 G. columbìnum (Lin. spec. 959.) leaves 5-parted, with multifid, linear-lobes; petals emarginate, length of awned calyx; carpels smooth, even; seeds reticulated. ⊙. H. Native of Europe in corn-fields and hedges; in Britain in fields, or on dry banks on a gravelly or limestone soil, but sparingly. Smith, engl. bot. t. 259. Cav. diss. 4. p. 200. t. 82. f. 1. Œd. fl. dan. t. 1222. The whole herb is slender, mostly procumbent, bright green, clothed with small, rigid, bristly hairs, those of the stem and stalks pointing downwards, the rest upwards. Flowers of a bluish rose-colour.

Columbine Crane's-bill. Fl. June, July. Britain. Pl. procumbent, seldom erect.

69 G. disse'ctum (Lin. spec. 956.) leaves 5-7-parted, with trifid, linear lobes; petals emarginate, length of awned calyx; carpels pilose; seeds reticulated. ⊙. H. Native of Europe and Iberia on barren gravelly waste ground, hedges, and fallow fields; plentiful in Britain; also of North America in fields near New York. Smith, engl. bot. t. 753. Curt. fl. lond. fasc. 6. t. 45. Cav. diss. 4. p. 199. t. 78. f. 2. Œd. fl. dan. t. 936. Stems weak, straggling, rather angular, beset with deflexed hairs. Leaves hairy. Flowers pale-crimson, rather small.

Dissected-leaved Crane's-bill. Fl. May, June. Britain. Pl. 1 foot long.

70 G. Carolinia'num (Lin. spec. 956.) leaves divided into 5 lobes beyond the middle, with the lobes deeply 3-5-cleft; peduncles crowded at the apex of the branches; petals emarginate, length of awned calyx; carpels hairy; seeds even, smooth. ⊙. H. Native of North America in fields, from Virginia to Georgia. Cav. diss. 4. t. 84. f. 1. and t. 124. f. 2. G. lanuginòsum, Jacq. hort. schœnbr. 2. t. 140. differs in the stem, petioles, and peduncles being hispid, and in the petals being purplish. Flowers small, white, with red veins.

Carolina Crane's-bill. Fl. June, July. Clt. 1725. Pl. 1 ft.

71 G. villòsum (Ten. cat. 1819. p. 60.) leaves orbicular, cordate, divided into 9 trifid, blunt lobes; corolla twice the length of the calyx; petals emarginate; stem erect. ⊙. H. Native of Naples in the marshes of Sila. Flowers red.

Villous Crane's-bill. Fl. June, July. Clt. 1820. Pl. $\frac{3}{4}$ foot.

72 G. retro'rsum (Lher. mss. D. C. prod. 1. p. 644.) leaves 5-parted, with trifid, somewhat linear lobes, and 3-toothed, blunt lobules; hairs of stems pressed downwards; petals blunt, hardly longer than the awned calyx; carpels villous; seeds reticulated? ⊙. H. Native of New Zealand. Flowers red.

Retrograde-haired Crane's-bill. Pl. $\frac{1}{2}$ foot.

73 G. Bohe'micum (Lin. amœn. 4. p. 323.) leaves 5-lobed; lobes cuneately-ovate, deeply-toothed; hairs of stem spreading, hispid; petals emarginate, length of the long awned calyx; carpels hairy; seeds even, smooth. ⊙. H. Native of Bohemia, Silesia, and Valais, in mountain-woods.—G. lanuginòsum, Lam. dict. 2. p. 655. is a native of Numidia, and agrees with this species according to the description.—Cav. diss. 4. p. 206. t. 81. f. 2.—Dill. elth. t. 133. f. 160. The whole herb is downy and viscid. Flowers rather large, bluish-purple.

Bohemian Crane's-bill. Fl. June, Aug. Clt. 1683. Pl. $\frac{3}{4}$ ft.

74 G. divarica'tum (Ehrh. beitr. 7. p. 164.) leaves 5-lobed, upper ones 3-lobed; lobes oblong, coarsely and irregularly toothed; stem hispid, with spreading hairs; petals emarginate, rather longer than the calyx, which is a little awned; carpels scabrous, wrinkled above; seeds even, smooth. ⊙. H. Native of Hungary, Valais, and Caucasus. Walds. et Kit. pl. hung. 2. t. 123. G. nòvum, Wint. icon. t. 2. G. Wintérli, Roth. cat. 2. p. 78. Flowers small, purplish.

Divaricated Crane's-bill. Fl. May, Aug. Clt. 1799. Pl. $\frac{1}{2}$ to 1 foot, decumbent.

75 G. lu'cidum (Lin. spec. 955.) plant quite smooth; leaves roundish, 5-lobed, shining; calyx pyramidal, angular, transversely wrinkled; carpels muricated, triply keeled. ⊙. H. Native of Europe on walls, cottage roofs, and moist rocks, chiefly in mountainous parts; plentiful in several parts of Britain. Smith, engl. bot. t. 75. Hook. fl. lond. t. 32. Oed. fl. dan. t. 218. Cav. diss. 4. p. 214. t. 80. f. 2. Herb shining, succulent, turning bright red when exposed to the sun, quite smooth, except a few variable scattered hairs on the foliage. Stems spreading in every direction. Flowers small, bright rose-coloured.

Shining Crane's-bill. Fl. May, Aug. Britain. Pl. $\frac{1}{2}$ to 1 ft.

76 G. Robertia'num (Lin. spec. 955.) leaves 3-5-parted, with trifid, pinnatifid lobes; petals entire, twice the length of the angular, awned calyx; carpels downy, reticulately-wrinkled, simply-keeled; seeds even, smooth. ⊙. H. Native of Europe in waste ground, on walls, banks, and under hedges, frequent; plentiful in Britain. It is also to be found in Brazil and Chili. Smith, engl. bot. t. 1486. Curt. fl. lond. fasc. 1. t. 52. Cav. diss. 4. p. 215. t. 86. f. 1. Oed. fl. dan. t. 694. Stems spreading in every direction, and partly recumbent, red, brittle, and succulent, a little hairy at one side. Flowers small, bright crimson. Calyx brownish, hairy, with 10 angles when closed. The whole herb has a strong disagreeable smell. Bugs are said to avoid it. In autumn it assumes a deep-red hue. A decoction of the herb has been known to give relief in calculous cases.

It is considerably astringent, and is given to cattle when they make bloody water, or have the bloody flux.

Var. β, *marítimum;* leaves more shining, as well as more fleshy. ⊙. H. Native of Britain, near the sea in Dorsetshire, Selsy Island, Sussex. Flowers deep-crimson.

Var. γ, *incìsum* (St. Hil. fl. bras. 1. p. 102.) stems shorter, more diffuse, and more hairy; leaves more cut and smaller. In Brazil.

Var. δ, *albiflòrum;* flowers white. ⊙. H. Native of England, on rocks near Bristol. G. Briceànum, Sweet, hort. brit.

Herb *Robert* or Stinking Crane's-bill. Fl. May, Oct. Britain. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

75 G. purpu'reum (Vill. dauph. 3. p. 374. t. 40.) hairy; leaves 3-5-parted, with trifid, pinnatifid lobes; petals entire, a little longer than the angular, awned calyx; carpels transversely wrinkled; seeds even, smooth. ♂. H. Native of Dauphiny, on rocks. G. Robertiànum β, purpùreum, D. C. prod. 1. p. 644. Stem ascending. Flowers bright-crimson. Very like the preceding, but is easily distinguished by the leaves being 5 times smaller; petals shorter; carpels with 3 transverse wrinkles each. Herb with a strong disagreeable scent.

Purple Herb-Robert or Crane's-bill. Fl. May, Oct. Clt. 1819. Pl. $\frac{1}{2}$ foot.

76 G. Mosque'nse (Goldb. mem. soc. mosc. 5. p. 133.) stem erect, corymbosely-panicled; leaves 3-5-parted, with very narrow, cuspidate segments; petals entire, longer than the calyx. ⊙. H. Native of Russia, in marshes about Moscow. Herb with a very faint smell. It differs from *G. Robertiànum* in the stem being corymbosely-panicled, erect, not dichotomous, nor diffuse, and with the segments of the leaves much narrower, cuspidate, not obtuse.

Moscow Herb-Robert or Crane's-bill. Fl. May, Oct. Pl. 1 foot.

77 G. inodòrum; diffuse, hairy; leaves opposite, ternate, and quinate, trifidly-pinnatifid; peduncles 2-flowered; petals entire, twice the length of the awned calyx; carpels reticulated. ♂. H. Native of North America, from New York to Virginia, in shady moist places on rocks. G. Robertiànum, Pursh. fl. amer. sept. 2. p. 449. Flowers pale-red. Like the four preceding species, but without that strong disagreeable smell.

Scentless Herb-Robert or Crane's-bill. Fl. June, Oct. Clt. 1800. Pl. $\frac{1}{2}$ foot.

† *Species not well known.*

78 G. ranunculoìdes (Burm. ger. no. 4.) peduncles very long, 1-flowered; leaves orbicular, multifid; root tuberous; branches dichotomous. ♃. G. Native of the Cape of Good Hope. This species is probably distinct from *G. canéscens.*

Crowfoot-like Crane's-bill. Pl.

79 G. lupinoi'des (Burm. ger. no. 65.) peduncles radical, twin, bifid, twice the length of the petioles; leaves orbicular, cut, downy; lobes linear. ♃. G. Native of the Cape of Good Hope.—Pluk. t. 186. f. 3. This species comes near to *G. argénteum.*

Lupine-like Crane's-bill. Pl. $\frac{1}{4}$ foot.

Cult. The hardy, perennial, herbaceous kinds of *Geràniums* are mostly beautiful plants, with shewy flowers, of various hues; these are well adapted for ornamenting flower-borders; they will thrive well in any common garden soil, except the *G. argénteum* and the Nipaul species, which should be grown on rock-work or in pots, in order that they may be protected during winter. A mixture of loam, peat, and a little sand, will suit these last well. The green-house and frame species will thrive best in a mixture of loam and peat, or any light vegetable soil; these are readily increased by cuttings, planted in the same kind of soil, or from cuttings of the roots, but the hardy herbaceous, perennial kinds are to be increased by dividing the plants at the root in spring or autumn, and the whole may be increased by seeds, which ripen in abundance. The annual kinds are in general not so shewy as the perennial species; the seeds of them only require to be sown in the open border early in spring.

V. ERO'DIUM (from ερωδιος, *erodios*, a heron; form of carpels resembling the head and beak). Lher. ger. icon. et text. ined. D. C. fl. fr. 4. p. 838. prod. 1. p. 644.

Lin. syst. *Monadélphia, Pentándria.* Calyx of 5 ovate, glandular, pointed, concave, permanent sepals. Petals 5, regular or irregular. Stamens 10, monadelphous at the base, 5 of which are fertile, the alternate 5 sterile, with a gland at the base of each of the sterile filaments. Awns of carpels bearded on the inside, and at length spirally twisted, adhering by their points to the top of the style.—Herbs or subshrubs. Leaves various in form. Stipulas membranous. Peduncles generally many-flowered, very seldom 1-flowered. Every part of the plants, when bruised, emit a strong peculiar odour.

§ 1. *Leaves pinnate or pinnatifid.*

* *Stemless.*

1 E. Tata'ricum (Willd. spec. 3. p. 625.) stemless; peduncles usually 2-flowered; leaves pubescent, pinnate; leaflets pinnatifid, with linear lobes; rachis naked between the segments; petals obovate, twice as long as the calyx. ♃. H. Native of Tartary and Ulterior Siberia. Root about the thickness of the little finger. Flowers blue or violet.

Tartarian Heron's-bill. Pl. $\frac{1}{4}$ foot.

2 E. supraca'num (Lher. ger. t. 2.) stemless; peduncles 2-4-flowered; leaves hoary above, pinnate, with pinnatifid leaflets, and lanceolate-linear lobes; rachis toothed between the segments; petals retuse, twice as long as the calyx. ♃. H. Native of Spain near Barcelona on rocks in the mountains. Geràniun rupéstre, Cav. diss. 4. t. 90. f. 4. Root thick, woody. Flowers bluish-purple.

Hoary-above-leaved Heron's-bill. Pl. $\frac{1}{4}$ foot.

3 E. petræ'um (Willd. spec. 3. p. 625.) stemless; peduncles many-flowered; leaves smoothish, pinnate, with pinnatifid segments and lanceolate-linear lobes; rachis toothed between the segments; petals retuse, twice as long as the calyx. ♃. H. Native of the south of France on dry exposed rocks. Geràniun petræ'um, Gouan. ill. 45. t. 21. f. 1. Cav. diss. 4. p. 224. t. 96. f. 2. Geràniun fœ'tidum, Park. theatr. 709. E. fœ'tidum, Lher. ger. ined. no. 6. Leaves smoothish. Peduncles and petioles beset with spreading hairs. Flowers purple.

Var. β, *crìspum* (Lapeyr. abr. 390.) leaves more villous, and more curled. ♃. H. Native of the Pyrenees on rocks.

Var. γ, *lùcidum* (Lapeyr. abr. 390.) leaves smooth. ♃. H. Native of the Pyrenees on rocks.

Rock Heron's-bill. Fl. June, July. Clt. 1640. Pl. $\frac{1}{4}$ foot.

4 E. glandulòsum (Willd. spec. 3. p. 628.) stemless; peduncles many-flowered; leaves clothed with glandular pubescence, pinnate, with bipinnatifid segments and lanceolate linear lobes; rachis toothed between the segments; petals somewhat equal, twice the length of the calyx. ♃. H. Native of Spain and the Pyrenees. E. macradènum, Lher. ger. t. 1. Geràniun glandulòsum, Cav. diss. 5. t. 125. f. 2. Geràniun radicàtum, Lapeyr. pyr. t. 1. Corolla pale-violet; petals acute, the two broadest ones dark-purple at the base, and with branched lines.

Glandular Heron's-bill. Fl. June, July. Clt. 1798. Pl. $\frac{1}{2}$ ft.

5 E. trichomanefòlium (Lher. ined. no. 3. D. C. prod. 1. p. 645.) stemless; peduncles 4-flowered; leaves hairy, rather glandular, bipinnate, with oblong-linear lobules; petals blunt, a little longer than the calyx. ♃. H. Native of mount Libanon. Flowers flesh-coloured, and marked with darker lines.

Maiden-hair-leaved Heron's-bill. Pl. ½ foot.

6 E. præ'cox (Cav. diss. 5. t. 126. f. 2.) stemless; peduncles 2-flowered; leaves pinnate, with oblong, obtuse, unequally-toothed leaflets, clothed with white hairs all over. ♃. H. Native of Spain between Aranjuez and Lake Antigola. E. cicutàrium α præ'cox, D. C. prod. 1. p. 646. Flowers rose-coloured, with darker lines at the base. This species comes very near E. pimpinellæfòlium, but differs in being without the stem, as well as in being clothed with white hairs.

Early Heron's-bill. Pl. ½ foot.

* * *Species almost without stems.*

7 E. Chrysa'nthum (Lher. ined. no. 2. D. C. prod. 1. p. 645.) almost stemless; peduncles 3-4-flowered; leaves clothed with close-pressed silky down, bipinnate, with linear lobules; petals roundish, longer than the calyx. ♃. H. Native of mount Parnassus, and probably of mount Olympus. E. absinthioìdes, Smith, fl. græc. t. 652. ex prod. 2. p. 34. A very distinct species, with yellow flowers.

Yellow-flowered Heron's-bill. Pl. ½ foot.

8 E. Roma'num (Willd. spec. 1. p. 630.) almost stemless; leaves pinnate, with ovate pinnatifid leaflets; peduncles many-flowered; petals equal, longer than the calyx. ♃. H. Native of Montpelier and Italy, by way-sides. Geràniun Romànum, Lin. spec. 951. Cav. diss. 4. t. 94. f. 2.—Barrel. icon. rar. t. 1245. Root thick, red within. Flowers purple. Resembles *E. cicutàrium*.

Roman Heron's-bill. Fl. May, June. Clt. 1724. Pl. ¾ foot.

9 E. caucalifòlium (Sweet, ger. t. 6.) stemless; peduncles many-flowered; leaves pinnate; leaflets alternate, on short stalks, pinnatifid, or deeply toothed; common petiole naked, hairy; petals ovate, obtuse, densely-ciliated at the base, twice the length of the calyx. ♃. H. Native of France. E. alpínum, Desf. hort. par. Root tuberous. Flowers rose-coloured, with a blue centre. Resembles *E. Romànum*.

Caucalus-leaved Heron's-bill. Fl. May, Oct. Clt. 1816. Pl. ½ foot.

10 E. cicutæfòlium (Thuil. fl. par. ed. 2. p. 347.) almost stemless; leaves pinnate, with sessile, oblong, bluntly-cut leaflets; rachis toothed between the leaflets; petals length of calyx, 2 of which are somewhat emarginate. ⊙. H. Native of France in dry exposed places. E. cicutàrium ε, cicutæfòlium, D. C. prod. 1. p. 647. Flowers pale-red or rose-coloured.

Cicuta-leaved Heron's-bill. Fl. Ap. Sept. Clt. 1816. Pl. ½ ft.

* * * *Stems prostrate or procumbent.*

11 E. cicuta'rium (Leman, ind. D. C. fl. fr. 4. p. 840.) stem procumbent, hairy; leaves pinnate, with sessile pinnatifid-cut leaflets; peduncles many-flowered; petals nearly regular. ⊙. H. Native throughout the whole of Europe, north of Africa, and the Levant, in waste ground, and among rubbish; plentiful in Britain; also about Conception in Chili. Smith, engl. bot. t. 1768. Geràniun cicutàrium, Lin. spec. 951. Curt. fl. lond. fasc. 1. t. 51. Petals rose-coloured, with 3 dark lines at the base, nearly regular. Awns of carpels smooth.

Var. β, álbum; stem prostrate, hairy; flowers white; petals unequal. ⊙. H. Native of Britain by the sea-side, in barren sandy places.

Var. γ, pimpinellæfòlium; flowers rose-coloured, with 2 or 3 of the petals marked with a green depression towards the claw, but this circumstance is extremely variable. ⊙. H. Native of England, near Hackney, about Oxford. On sandy ground near the sea, or on chalky ground.

Var. ε, chærophyllum (Cav. diss. 4. t. 95. f. 1.) plant many-stemmed, rather prostrate; leaflets finely pinnatifid; flowers pale-blue; petals rather unequal. ⊙. H. Native of Europe in dry stony places. Awns of carpels bearded.

Var. ζ, pilòsum (Thuil. fl. par. ed. 2. p. 347.) plant many-stemmed, rather prostrate, clothed with long hairs; leaflets finely pinnatifid; flowers deep-purple. ⊙. H. Native of Europe, in sandy places.

Hemlock Heron's-bill. Fl. June, Oct. Britain. Pl. prostrate.

12 E. pimpinellæfòlium (Cav. diss. 4. t. 126. f. 1.) stem decumbent, rather pilose, at length rather erect; leaves on long petioles, pinnate; leaflets sessile, pinnatifid, acutely-cut; peduncles many-flowered; petals hardly longer than the calyx. ♂. H. Native of France and Germany in barren places. Geràniun cicutàrium β, pimpinellæfòlium, D. C. prod. 1. p. 646. Flowers purple. This species is very like *E. cicutàrium*, but differs in the cotyledons being cordate, undivided, not 3-lobed, as well as the leaflets being broader at the base, and in the petals being smaller, or equal in length to the calyx, not longer.

Pimpernell-leaved Heron's-bill. Fl. June, Oct. Clt. 1800. Pl. decumbent.

13 E. bipinna'tum (Cav. diss. 5. t. 126. f. 3.) stem diffuse, decumbent, smooth; leaves pinnate, with deeply-bipinnatifid leaflets, divided into linear lobes; peduncles 2-flowered; petals unequal. ⊙. H. Native of Numidia in sandy places. G. Numídicum, Poir. barb. 2. p. 101. E. Petroselìnum, Lher. diss. no. 9. Geràniun Æthiópicum, Lam. dict. 2. p. 655. E. cicutàrium var. ζ, bipinnàtum, D. C. prod. 1. p. 647. Flowers rose-coloured. This species differs from *E. cicutàrium*, in the stems being smooth, as well as in the leaflets being divided into very narrow lobes.

Bipinnate-leaved Heron's-bill. Fl. June, Oct. Clt. 1803. Pl. decumbent.

14 E. hi'spidum (Presl. fl. cech. ex Spreng. syst. 3. p. .) stem prostrate, clothed with retrograde bristles; leaves bipinnatifid, hoary from pubescence on both surfaces; segments linear, acute; stipulas ovate, scarious; peduncles many-flowered; petals about equal in length with the calyx. ⊙ ? H. Native of Sicily. Geràniun laciniàtum, Biv. pl. sic. Flowers blue?

Hispid-stemmed Heron's-bill. Fl. June, July. Pl. prostrate.

15 E. moscha'tum (Willd. spec. 3. p. 631.) stem procumbent, hairy; leaves pinnate; leaflets nearly sessile, elliptical, unequally cut; peduncles many-flowered, clothed with glandular pubescence; perfect stamens toothed at the base. ⊙. H. Native of Europe, north of Africa, also of Peru, and at the Cape of Good Hope, in mountainous pastures. In Britain between Bristol and St. Vincent's rocks; very common in Craven, Yorkshire; on Shotover hill, near Oxford; on Ampthill Warren, Bedfordshire. Smith, engl. bot. t. 902. Geràniun moschàtum, Lin. spec. 951. Jacq. hort. vind. 1. t. 55. Cav. diss. t. 94. f. 1. This species is nearly akin to *E. cicutàrium*, but differing in the larger paler leaflets, much less deeply cut, and in the powerful musky smell, as well as the greater viscidity of the whole herbage. Flowers rose-coloured. There is a variety of this which is smooth, except the stem and ribs of the leaves, which are clothed with glandular pubescence.

Musky Heron's-bill. Fl. June, July. Britain. Pl. trailing.

16 E. lacinia'tum (Cav. diss. 4. p. 228. t. 113. f. 3.) plant smooth; stem prostrate, diffuse; leaves trifidly bipinnatifid; lobules linear, acute, lower leaves usually 3-lobed; stipulas and bracteas ovate, scarious; peduncles many-flowered. ⊙. H. Native of the south of Europe from Crete to Spain. Geràniun laciniàtum, Desf. atl. 2. p. 110. There are two varieties of this species. The first with the leaves all jagged. G. laciniàtum, Lher. ined. no. 15. The second with the lower leaves 3-lobed. G. diphýllum, Lher. ined. no. 18. Petals blue, a little longer than the calyx.

Jagged-leaved Heron's-bill. Fl. June, July. Clt. 1794. Pl. prostrate.

17 E. millefòlium (Willd. in H. B. et Kunth, nov. gen. amer. 5. p. 228.) stems procumbent, diffuse, hispid; leaves bi-

pinnatifid, with toothed, acuminated segments, hispid beneath; stipulas ovate; peduncles many-flowered. ⊙. H. Native of South America, at the bottom of the burning mountain of Cotopaxi. Flowers violet.

Thousand-leaved Heron's-bill. Fl. Ju. Jul. Pl. procumbent.

18 E. Morane'nse (Willd. in H. B. et Kunth, nov. gen. amer. 5. p. 228.) stems procumbent, hairy; leaves bipinnatifid, acute, hairy beneath; peduncles many-flowered. ⊙. H. Native of Mexico, near Moran. Flowers violet.

Moran Heron's-bill. Fl. June, July. Pl. procumbent.

* * * * *Stems erect, diffuse, or ascending.*

19 E. absinthoi'des (Willd. spec. 3. p. 627.) stem ascending; peduncles usually 4-flowered; leaves rather pubescent, bipinnate, with linear, acute lobules; rachis toothed; petals obtuse, emarginate, larger than the calyx. ♃. H. Native of Armenia.—Tourn. cor. 20. no. 5. Lher. ger. ined. no. 1. Stem simple. Root thick. Leaves resembling those of *Artemèsia absínthium*, hoary. Flowers purple?

Wormwood-like Heron's-bill. Pl. ½ foot.

20 E. fumarioi'des (Stev. mem. soc. mosc. 4. p. 49.) stem ascending; peduncles usually 4-flowered; leaves rather pubescent, bipinnate, with linear, obtuse leaflets; rachis toothed; petals emarginate, a little larger than the calyx. ♃. H. Native of Eastern Caucasus, by the sides of rivulets. Flowers violet-coloured, obscurely striped. This species is probably not sufficiently distinct from the preceding.

Fumitory-like Heron's-bill. Pl. ½ foot.

21 E. pulverule'ntum (Willd. spec. 3. p. 632.) stem decumbent at first, but at length becoming erect, hoary with crowded short down; peduncles many-flowered; petals obtuse, a little longer than the calyx; leaves pinnatifid, hoary, with cut or toothed segments. ♃. H. Native of Spain, on little sandy hills, between Aranjuez and Lake Antigola. Geràmium pulverulèntum, Cav. diss. 5. p. 272. t. 125. f. 1. E. pulveruléntum β, Hispánicum, D. C. prod. 1. p. 655. Flowers pale-violet. Peduncles 4-5-flowered.

Powdery Heron's-bill. Pl. ½ foot.

22 E. Tuneta'num; stem reclinately erect, hoary with crowded short down, as well as the leaves, which are bipinnate, with finely cut lobules; peduncles 7-8-flowered; petals obtuse, a little longer than the calyx. ♃. H. Native of North Africa, in sandy places near Cafsa. Geràmium pulveruléntum, Desf. atl. 2. p. 111. E. pulveruléntum, Lher. ined. no. 4. E. pulveruléntum α, Tunetànum, D. C. prod. 1. p. 645.

Tunis Heron's-bill. Pl. 1 foot.

23 E. anthemidifòlium (Bieb. fl. taur. 2. p. 131.) stems branched, diffuse; peduncles many-flowered, hispid from rather clammy, short down; leaves clothed with hoary pubescence, bipinnate, with linear lobules; rachis toothed; petals rather emarginate, longer than the calyx. ♃. H. Native of western Iberia. Flowers bluish.

Anthemis-leaved Heron's-bill. Fl. Ju. Jul. Clt. 1820. Pl. ½ ft.

24 E. Stephania'num (Willd. spec. 3. p. 625.) stem villous, branched; peduncles 2-5-flowered; leaves smoothish, bipinnatifid; lobes decurrent; lobules linear; petals obtuse, hardly longer than the long-pointed sepals. ♃. H. Native of Dahuria on hills, and in the desert of the Kirghises. Geràmium multífidum, Patr. ined. Flowers blue. Lower lobes of leaves almost palmate-parted.

Stephan's Heron's-bill. Fl. June, July. Clt. 1820. Pl. 1 to 2 feet.

25 E. alpi'num (Lher. ger. t. 3.) stem smoothish, branched; peduncles many-flowered; leaves smoothish, bipinnatifid; rachis toothed; lobules linear; petals obtuse, longer than the long-pointed sepals. ♃. H. Native of the mountains of Italy and Greece. Geràmium alpìnum, Burm. ger. no. 31. Cav. diss. 4. p. 229. t. 96. f. 1. Root tuberous. Flowers purple.

Alpine Heron's-bill. Fl. May, Aug. Clt. 1814. Pl. 1 foot.

26 E. Steve'ni (Bieb. fl. taur. 2. p. 132.) stem diffuse, rather hoary; peduncles usually 3-flowered; leaves smoothish, pinnate; leaflets bipinnatifid, alternate, entire, and trifid; petals obtuse, twice the length of the calyx. ♃. H. Native of Cape Caucasus. Flowers bluish. Segments of leaves linear.

Steven's Heron's-bill. Pl. ½ to 1 foot.

27 E. styla'tum (Leman, in herb. D. C. prod. 1. p. 646.) stem smoothish, diffuse; peduncles 3-4-flowered; leaves smooth, bipinnate; lobules linear; rachis entire; sepals and beaks of carpels downy; style very long. ♃. H. Native of? One of the petals is shorter than the calyx. This is a very distinct species, with the habit of *Grielum*. Flowers bluish-purple?

Long-styled Heron's-bill. Fl. June, July. Clt. 1826. Pl. ½ ft.

28 E. crassifòlium (Desf. atl. 2. p. 111.) stem branched, diffuse, puberulous; leaves thick, pinnately jagged, with linear lobules; peduncles 2-4-flowered; bracteas ovate, scarious; awns of carpels very long, feathery. ♃. H. Native of North Africa in sandy places near Cafsa. Sweet, ger. t. 111. Leaves smooth. Petals equal, rose-coloured or blue.

Var. β, *salinàrium* (Sibth. ined. in herb. Lher. D. C. prod. 1. p. 646.) leaves pubescent. ♃. H. Native of the Island of Cyprus, near the salt marshes of Arnaca. E. crassifòlium, Lher. ined. no 5. Flowers blue?

Thick-leaved Heron's-bill. Fl. Mar. Aug. Clt. 1788. Pl. ½ ft.

29 E. hírtum (Willd. spec. 3. p. 632.) stem branched, diffuse, villous; leaves hairy, somewhat bipinnate, with lanceolate, acute lobules; stipulas lanceolate; peduncles many-flowered, clothed with glandular hairs. ♃. H. Native of Egypt. Geràmium hírtum, Forsk. descr. 123. Jacq. eclog. 1. p. 85. t. 58. Root woody. Flowers violet.

Hairy Heron's-bill. Fl. June, July. Clt. 1818. Pl. ½ foot.

30 E. cicònium (Willd. spec. 3. p. 629.) stem ascending, and is as well as the leaves rather villous; leaves pinnate, with blunt pinnatifid, toothed leaflets; rachis toothed between the segments; peduncles many-flowered; petals length of calyx, 2 of which are rather emarginate. ⊙. H. Native in the region of the Mediterranean, in fields among rubbish. Geràmium cicònium, Lin. spec. 952. Jacq. hort. vind. 1. p. 7. t. 18. Cav. diss. 4. p. 228. t. 95. f. 2.—Colum. ecphr. 1. p. 136. t. 135. Flowers blue. Sepals with long points.

Var. β, *eréctum* (D. C. prod. 1. p. 464.) stem erect. ⊙. H. Native of Tauria.

Stork's Heron's-bill. Fl. June, Jul. Clt. 1711. Pl. 1 foot.

31 E. tordylioìdes (Lher. ined. no. 14. D. C. prod. 1. p. 647.) caulescent, but sometimes almost stemless; leaves villous, pinnate, with ovate lobed, sharply toothed leaflets; peduncles many-flowered, very long. ♃. H. Native of Algiers in the fissures of rocks. Geràmium tordylioìdes, Desf. atl. 2. p. 107. Calyxes striated, awned. Petals pale-blue.

Tordylium-like Heron's-bill. Pl. 1 foot.

32 E. bòtrys (Bert. amœn. itin. p. 35.) stem hispid from rather trigonal bristles; leaves sinuately-pinnatifid; lobes blunt, toothed; peduncles 2-4-flowered; calyx pubescent, with short-pointed sepals. ⊙. H. Native of the south of Italy, Corsica, and Mauritania. E. gruìnum β, Willd. spec. 3. p. 634. Geràmium bòtrys, Cav. diss. 4. t. 90. f. 2.—Bocc. mus. 2. p. 145. t. 109. Stems diffuse and erect. Leaves more or less cut. Bristles on the lower part of the stem reflexed. Flowers blush.

Grape Heron's-bill. Fl. June, July. Clt. 1818. Pl. ½ ft.

§ 2. *Leaves somewhat 3-lobed or undivided.*

* *Stems diffuse or erect.*

33 E. Murcìnum (Willd. spec. 3. p. 636.) stems diffuse,

smooth, branched; leaves pinnatifid, somewhat 3-parted, lobes blunt, crenated, middle one longest; peduncles many-flowered; calyxes streaked with lines. ⊙. H. Native of Spain in the province of Murcia and of the north of Africa. Geràmium Murcìnum, Cav. diss. 5. t. 126. f. 1. Resembles *E. bòtrys*. Flowers purple. Plant rather hoary.

Murcia Heron's-bill. Fl. June, Jul. Clt. 1818. Pl. ½ foot.

34 E. gruìnum (Willd. spec. 3. p. 633. exclusive of var. β.) stem erect, pilose; leaves ternate, with deeply-toothed leaflets, lower ones divaricating, middle one longest; peduncles many-flowered; calyxes streaked with nerves. ⊙. H. Native of Crete, North of Africa, and Spain. Geràmium gruìnum, Lin. spec. 952. Cav. diss. 4. p. 217. t. 88. f. 2.—Bocc. mus. 2. p. 145. t, 109. Lower leaves cordate. Flowers bluish-purple.

Crane Heron's-bill. Fl. Ju. Jul. Clt. 1596. Pl. ½ to 1 ft.

35 E. serótinum (Stev. mem. act. petersb. 3. p. 297. t. 15. f. 2.) stems diffuse; leaves opposite, ternate, lateral leaflets deeply toothed, divaricating, middle one largest, somewhat lobed, deeply toothed; peduncles many-flowered. 4. H. Native of fields at the Black Sea and at Tyra. E. Ruthénicum, Bieb. pl. rar. cent. t. 48. E. multicaúle, Link. enum. 2. p. 184. Sweet, ger. t. 137. Flowers purplish-blue. Sepals with long awns.

Late-flowering Heron's-bill. Fl. Jul. Sept. Clt. 1821. Pl. 1 ft.

36 E. Chíum (Willd. spec. 3. p. 634.) stem erect and somewhat diffuse; leaves smooth, rather cordate, lobed, upper ones 3-parted; lobes deeply toothed, middle one rather trifid; stipulas and bracteas ovate-lanceolate; peduncles many-flowered. ⊙. H. Native of the islands in the Grecian Archipelago, and about Naples. Geràmium Chíum, Lin. spec. 951. Cav. diss. 4. p. 92. f. 1. Flowers purplish-blue.

Chio Heron's-bill. Fl. May, July. Clt. 1724. Pl. ½ to 1 ft.

37 E. Gussòni (Tenore, prod. 39. Sweet, ger. 200.) stem diffuse, beset with long, soft, retrograde hairs; peduncles many-flowered, elongated; leaves cordate, entire, and lobed, dentately-crenated, pubescent; stipulas and bracteas scarious, ovate; sepals awned, one-half shorter than the petals. 4. H. Native of Naples in meadows exposed to the sun. Flowers pale-purple, 2 upper petals with a dark patch at the base.

Gusson's Heron's-bill. Fl. year. Clt. 1821. Pl. ½ to 1 ft.

38 E. malachoìdes (Willd. spec. 3. p. 639.) stem herbaceous, branched, hairy; leaves cordate, undivided or 3-lobed, obtuse, toothed; peduncles many-flowered; petals length of calyx. ⊙. H. Native of the south of Europe and north of Africa, as well as in the Canary Islands. Geràmium malachoìdes, Cav. diss. 4. t. 91. f. 1.—Mor. hist. 2. sect. 5. t. 15. f. 7.—Lob. icon. t. 662. Flowers blue.

Var. β, ribifòlium (Jacq. icon. rar. 3. t. 509.) leaves 3-lobed, hispid; flowers purple. ⊙. H. Native of the Cape of Good Hope.

Mallow-like Heron's-bill. Clt. 1596. Pl. procumbent.

39 E. glaucophy'llum (Ait. hort. kew. ed. 1. vol. 2. p. 416.) stem erect, pubescent; leaves rather pubescent, oblong, somewhat lobed, crenated, rather fleshy; peduncles 2-6-flowered; awns of seeds from the middle to the top feathery, yellow. 4. H. Native of Egypt, near Memphis. Sweet, ger. 283. Geràmium glaucophýllum, Lin. spec. 952. Cav. diss. 4. t. 92. f. 2. G. crassifòlium, Forsk. descr. 123.—Dill. elth. 150. t. 124. f. 153. Flowers lilac, but of a deeper colour at the base. Petals equal.

Glaucous-leaved Heron's-bill. Fl. July, Aug. Clt. 1732. Pl. ¼ to ¾ foot.

40 E. nervulòsum (Lher. ined. no. 24. D. C. prod. 1. p. 648.) stem diffuse, short; leaves cordate, undivided, toothed, thick, full of nerves, rather hoary from pubescence; stipulas ovate, membranous; peduncles many-flowered. 4. H. Native of Sicily.—Bocc. mus. 2. t. 128. right hand figure. Resembles *E. laciniàtum*. Flowers purple.

Nerved-leaved Heron's-bill. Pl. ½ foot.

41 E. malopoìdes (Willd. spec. 3. p. 640.) stem erect, sometimes almost stemless; leaves ovate, somewhat cordate, crenated, sometimes rather lobed; peduncles 3-4-flowered; awns of carpels bearded. 4. H. Native of Egypt, Algiers, and Sicily, in sand by the sea-side. Geràmium malopoìdes, Cav. diss. 4. t. 90. f. 1.—Bocc. mus. 2. p. 109. t. 89. Flowers small, pale rose-coloured. The whole plant is clothed with velvety pubescence.

Var. β, Córsicum (Leman, in D. C. fl. fr. 4. p. 842.) peduncles usually 2-flowered; leaves more downy. 4. H. Native of Corsica among rocks by the sea-side. Flowers small, pale rose-coloured. The stems of both these plants are said by authors to be weak and trailing.

Malope-like Heron's-bill. Fl. June, Jul. Clt. 1810. Pl. ½ ft.

* * *Stems prostrate.*

42 E. mari'timum (Smith, fl. brit. 2. p. 728.) stems diffusely prostrate, hairy; leaves cordate, ovate, deeply crenated, pubescent; peduncles usually 2-flowered; awns of seeds beardless. 4. H. Native of France and Britain by the sea-side; in England particularly on the coasts of Wales, Cornwall, Sussex, &c. Smith, engl. bot. t. 646. Geràmium marítimum, Lin. spec. 951. Cav. diss. 4. p. 218. t. 88. f. 1. Stems spreading close to the ground. Leaves roundish, slightly lobed, and variously notched, rough on both surfaces, with minute close hairs. Stipulas purplish. Peduncles 1-2, rarely 3-flowered. Flowers pale-red, very minute.

Sea-side Heron's-bill. Fl. May, Sept. Brit. Pl. trailing.

43 E. littòreum (Leman, in D. C. fl. fr. 4. p. 842.) stems prostrate, smoothish; leaves roundish-cordate, 3-lobed, unequally crenated; peduncles many-flowered, elongated; awns of carpels bearded. 4. H. Native of Narbonne and Liguria by the sea-side. Flowers pale-red. Resembles *E. marítimum*.

Sea-shore Heron's-bill. Fl. May, Sept. Clt. 1818. Pl. prostrate.

44 E. cunea'tum (Viv. append. fl. cors. in Schlecht. Linnæa. 1. p. 506.) branches diffuse; leaves ovate, somewhat cordate, sinuately 3-parted, lateral segments rectangular, spreading, oblong, middle one longer and wedge-shaped, crenately toothed at the top; lower peduncles 1-flowered, upper ones umbellate; corolla a little longer than the awned calyx. 4. H. Native of Corsica. Stems diffusely-prostrate.

Wedge-leaved Heron's-bill. Pl. prostrate.

45 E. Boccòni (Viv. append. fl. cors. ex Schlecht. Linnæa. 1. p. 506.) plant dwarf, tufted; stems prostrate, hairy; leaves ovate, cordate, deeply crenated, obovate; stipulas and bracteas lanceolate; peduncles 2-flowered; petals hardly the length of the calyx; sepals mucronate; carpels hairy, with smooth awns. 4. H. Native of Corsica on the mountains. Geràmium minimum. Chamædryoìdes, Bocc. mus. 2. p. 160. t. 128. Flowers nearly white. Plant very small, almost stemless, but, according to Saltzman, the stems are sometimes a foot long.

Bocconi's Heron's-bill. Fl. May, Sept. Pl. trailing.

46 E. oxyrhínchum (Bieb. fl. taur. 2. p. 133.) stem prostrate; leaves cordate, oblong, somewhat 3-parted, crenated, hoary beneath, middle lobe trifid; peduncles usually 3-flowered. 4. H. Native of Eastern Iberia on dry hills. Flowers as large as those of *E. cicutàrium*, with oblong purple petals.

Sharp-beaked Heron's-bill. Pl. prostrate.

47 E. gutta'tum (Willd. spec. 3. p. 636.) stem prostrate; leaves cordate, oblong, somewhat 3-lobed, toothed, hoary; peduncles usually 3-flowered; calyxes long awned. 4. F. Native of the north of Africa, near Belida, among sand. Geràmium guttàtum, Desf. atl. 2. p. 113. t. 169. Petals large, obtuse, violet, spotted at the base.

Spotted-petalled Heron's-bill. Pl. prostrate.

48 E. geoìdes (St. Hil. fl. bras. 1. p. 99. t. 19.) stem herbaceous, prostrate, hairy; leaves pinnate; leaflets 5-7, ovate, roundish, deeply toothed, 2 lower ones free, sessile, the rest confluent; stipulas ovate, triangular; peduncles 4-6-flowered. ⊙. H. Native of Brazil at the river Plate. Flowers purple.

Geum-like Heron's-bill. Pl. prostrate.

* * * *Stemless, or almost so.*

49 E. asplenioìdes (Willd. spec. 3. p. 635.) plant villously pubescent, stemless; peduncles many-flowered; leaves ternate; leaflets obovate, obtuse, deeply toothed, terminal one somewhat lobed. 4. F. Native of the north of Africa on the mountains of Sbiba. Geràniumasplenioìdes, Desf. atl. 2. p. 109. t. 168. E. múticum, Lher. ined. Root thick. Corolla purplish-violet, twice the length of awnless calyx.

Spleen-wort-like Heron's-bill. Pl. $\frac{1}{4}$ foot.

50 E. Arduìnum (Willd. spec. 3. p. 637.) stemless; leaves cordate, 5-lobed, crenated, blunt; peduncles many-flowered. 4. G. Native of the Cape of Good Hope. Geràniumarduìnum, Lin. spec. 952. Flowers?

Arduin's Heron's-bill. Pl. $\frac{1}{4}$ foot.

51 E. Reicha'rdi (D. C. prod. 1. p. 649.) plant almost stemless, tufted; leaves small, cordate, crenated, obtuse, smoothish; peduncles 1-flowered; petals larger than the calyx. 4. H. Native of Majorca. Geràniumreichárdi, Murr. comm. goett. 1780. p. 11. t. 3. G. párvulum, Scop. ins. 8. t. 3. f. B. E. chamædryoìdes, Lher. ger. t. 6. exclusive of the synonyme of Bocconi. Curt. bot. mag. t. 18. Flowers white.

Reichard's Heron's-bill. Fl. Apr. Sep. Clt. 1783. Pl. $\frac{1}{8}$ ft.

* * * * *Stems suffruticose.*

52 E. hymenoìdes (Lher. ger. t. 4.) stem erect, branched, shrubby at the base; branches clothed with long soft hairs; peduncles many-flowered; leaves somewhat 3-lobed or 3-parted, very blunt, deeply toothed; stipulas and bracteas scarious, ovate; calyxes awnless. ♄. G. Native on Mount Atlas in fissures of rocks. Sweet, ger. t. 23. Geràniumgeifòlium, Desf. atl. 2. p. 108. G. trifòlium, Cav. diss. 4. t. 97. f. 3. E. trilobàtum, Jacq. icon. rar. 3. t. 508. Flowers pink; upper petals with a reddish-brown spot at the base.

Hymen-like Heron's-bill. Fl. year. Clt. 1789. Sh. 1 foot.

53 E. arbore'scens (Willd. spec. 3. p. 638.) stem shrubby, erect; leaves on long footstalks, cordate, somewhat lobed, crenated; stipulas ovate, rather acute; peduncles many-flowered. ♄. F. Native of the north of Africa on mountains at Cafsa. Geràniumarboréscens, Desf. atl. 2. p. 110. At first sight this plant resembles a species of *Pelargònium*. Flowers unknown.

Arborescent Heron's-bill. Shrub 3 to 4 feet.

54 E. incarna'tum (Lher. ger. t. 5.) stem suffruticose, scabrous; leaves scabrous, lower ones cordate, toothed, 3-parted, ternate or 5-lobed, with wedge-shaped, 3-toothed lobes; peduncles many-flowered. ♄. G. Native of the Cape of Good Hope. Sims, bot. mag. t. 261. Sweet, ger. t. 94. Delaum. herb. amat. t. 11. Geràniumincarnàtum, Lin. fil. suppl. 308. Cav. diss. 4. p. 223. t. 91. f. 2. Flowers large, very beautiful, with oblong, obtuse, flesh-coloured petals, yellowish at their base, and painted with a blood-coloured circle.

Flesh-coloured-flowered Heron's-bill. Fl. May, July. Clt. 1787. Shrub $\frac{3}{4}$ foot.

55 E. heliotropioìdes (Willd. spec. 3. p. 638.) stem suffruticose, hispid; leaves roundish-ovate, crenated, villous; peduncles many-flowered; awns of carpels very long, feathery. ♄. G. Native of? Geràniumheliotropioìdes, Cav. diss. 4. p. 220. t. 113. f. 2. Stem hardly an inch in height. Leaves clothed with dense white villi. Peduncles usually 4-flowered. Flowers?

Turnsole-like Heron's-bill. Shrub $\frac{1}{8}$ foot.

Cult. Most of the perennial species of *Eròdium* are rather ornamental, and they will thrive well in any kind of soil. The frame kinds will grow well in a mixture of loam and peat or decayed leaves; these are easily increased by dividing the plants at the root or by seeds, which ripen in abundance. The greenhouse species are mostly sub-shrubby; they will thrive well in sandy loam and leaf mould, and young cuttings, planted in pots filled with the same kind of soil, will strike root; they are also easily increased by dividing the plants at the root or by seed. The annual kinds, several of which are rather handsome, only require to be sown in the open border in spring, in any kind of soil.

VI. PELARGO'NIUM (from πελαργος, *pelargos*, a stork; resemblance in the carpels being like the head and beak of a stork). Lher. ger. icon. et text. ined. Ait. hort. kew. 2. p. 417. Pelargonièæ, Sweet. ger. 1. p. 8.

Lin. syst. *Monadélphia, Tetra-Heptándria.* Calyx 5-parted; upper segments ending in a spur, or slender nectariferous tube, running down the peduncle, and adnate to it. Petals 5, rarely 4, more or less irregular. Filaments 10, 4 or 7 of which are fertile, the rest sterile. Beaks or styles bearded inside, and spirally twisted at maturity. All the proper species of this genus are natives of the Cape of Good Hope, except a very few. This vast and favorite genus, the greater part being of the easiest cultivation, and many of them bearing the confined air of a sitting room better than most plants, have therefore become objects of cultivation and attention, of which, in most cases, they are deserving for their neatness and beauty. The popular taste for *Pelargòniums*, or for *Geràniums* as they are commonly called, has been much aided by several splendid publications, both at home and abroad, and more especially by the Geraniaceæ of Mr. Sweet, in which he has figured both hybrids and species; but these hybrids, for the most part, vanish even before the eyes of those who have witnessed their origin, we shall therefore only describe the species, and give the names and references to the hybrids, for the convenience of those who wish to be farther acquainted with these productions; for to admit descriptions of them into this work could lead to no end, except that of swelling its bulk, which would be very considerable. In the arrangement here adopted, the names of all those kinds which are avowedly artificial are placed at the end of their proper sections.

Sect. I. Hoa'rea (named in compliment to Sir Richard Hoare). Sweet, ger. no. 18 and 72. Petals 5, rarely 4, lanceolate or linear, 2 upper ones parallel, with long claws, abruptly reflexed in the middle. Stamens 10, in a long tube, length of lower sepals, 4-5 of which bear anthers, the rest sterile, straight, or incurved at the top, shorter than the fertile ones.—Stemless herbs, with tuberous, turnip-like roots, and radical stalked leaves.

* *Leaves oblong, entire, or lobed, with the lobes entire or hardly toothed.*

1 P. longifòlium (Jacq. icon. rar. 3. t. 518.) leaves lanceolate, quite entire, acute, smooth, older ones pinnatifid, with linear lobes; umbels compound; flowers tetrandrous; petals obtuse, lanceolate, upper ones ovate. 4. G. G. acaûle, Burm. ger. 67. t. 2. Cav. diss. 4. t. 102. f. 1. Petals rose-coloured.

Long-leaved Stork's-bill. Fl. May, June. Clt. 1812. Pl. $\frac{1}{2}$ ft.

2 P. longiflòrum (Jacq. icon. rar. 3. t. 521.) leaves lanceolate, quite entire, acute, smooth; umbels compound, 4-flowered; flowers tetrandrous; petals linear. 4. G. Petals cream-coloured, upper ones lined with red.

Var. β, depréssum (Jacq. icon. rar. 3. t. 520.) umbels 8-flowered; pedicels at length somewhat reflexed; filaments 9.

4. G. Petals cream-coloured, upper ones marked with purple lines.

Long-flowered Stork's-bill. Fl. May, Aug. Clt. 1812. Pl. ½ ft.

3 P. ovalifòlium (D. C. prod. 1. p. 649.) leaves oval, or oval-oblong, obtuse, flat, with involute margins, quite entire, hairy; umbels simple or compound; petals linear, waved, twisted. 4. G. Hoárea ovalifòlia, Sweet. ger. t. 106. Petals white, 2 upper ones with a pale-red line in the middle at the base.

Oval-leaved Stork's-bill. Fl. May, Aug. Clt. 1820. Pl. ½ ft.

4 P. reticula'tum (Sweet, ger. t. 91. under *Hoárea*,) leaves elliptic-lanceolate, or oblong, quite entire, pilose, with revolute margins; umbels compound; flowers pentandrous; petals linear-spatulate, waved, reflexed. 4. G. P. scapiflòrum, Lher. ger. ined. no. 8. Petals rose-coloured, reticulated, with purple lines, 2 upper ones with a deep-purple spot in the middle of each.

Reticulated-petalled Stork's-bill. Fl. May, Aug. Clt. 1820. Pl. ½ foot.

5 P. parnassioìdes (Lher. ger. ined. no. 1.) leaves ovate, obtuse, quite entire, ciliated; umbel compound; flowers pentandrous; petals linear, rather spatulate. 4. G. G. ciliàtum, Cav. diss. 4. p. 234. t. 118. f. 2. P. ciliàtum, Willd. spec. 3. p. 643. exclusive of the synonyme of Lher. Petals pale, spotless.

Parnassia-like Stork's-bill. Pl. ½ foot.

6 P. cilia'tum (Lher. ger. t. 7. ined. no. 2.) leaves ovate, acute, quite entire, rather ciliated; umbels compound; flowers pentandrous; petals linear, rather spatulate. 4. G. Petals flesh-coloured, 2 upper with a red spot in the middle.

Var. β, hírtum (Willd. spec. 3. p. 644.) leaves somewhat 3-lobed. 4. G. G. pilòsum, Cav. diss. 5. p. 273. 6. p. 199. Leaves, according to L'Heretier, painted; perhaps a garden variety.

Ciliated-leaved Stork's-bill. Fl. May, Aug. Clt. 1795. Pl. ½ foot.

7 P. labyrínthicum (Sweet, ger. 276. under *Hoárea*,) hoary, pilose; lower leaves simple, ovate, or ternate, upper ones pinnatifid; leaflets and segments oblong-ovate; scape branched; calyx reflexed. 4. G. Petals rose-coloured, 2 upper ones marked with a dark spot near the base.

Labyrinth Stork's-bill. Fl. May. Clt. 1823. Pl. ½ foot.

8 P. radica'tum (Vent. malm. t. 65.) leaves oval-oblong, quite entire, acute at both ends, smooth, ciliated; umbels simple; flowers pentandrous; petals linear-oblong, retuse; nectariferous tube 4 times longer than the calyx. 4. G. Geràniùm ciliàtum, Andr. bot. rep. 247. P. concavifòlium, Pers. ench. 2. p. 226. Hoárea radicàta, Sweet, ger. 174. Petals yellowish.

Large-rooted Stork's-bill. Fl. May, Aug. Clt. 1802. Pl. ½ ft.

* * *Leaves cordate, sagittate, 3-lobed, or appendiculate at the base.*

9 P. oxaloìdes (Willd. spec. 3. p. 642.) leaves oblong, sagittate, quite entire, fleshy, smooth; umbel compound. 4. G. Geràniùm oxaloìdes, Burm. ger. 71. t. 2. Cav. diss. 4. t. 97. f. 1. G. oxaloìdes, Andr. is perhaps distinct. Flowers red.

Oxalis-like Stork's-bill. Pl. ½ foot.

10 P. chelidònium (Houtt. pfl. syst. 8. p. 398. t. 61. f. 1.) leaves roundish, truncate at the base, acute, quite entire, pubescent; umbel compound. 4. G. P. Ficària, Willd. spec. 3. p. 643. P. deltoìdeum, Lher. ined. no. 111.

Swallow-wort-like Stork's-bill. Pl. ½ foot.

11 P. velutìnum (Lher. ger. ined. no. 82.) leaves cordate, very blunt, undivided, crenately-sinuated, hoary-tomentose beneath; umbels compound. 4. G. Burch, cat. no. 2828. Petals linear, when dry waved and of a dark colour.

Velvety Stork's-bill. Pl. ½ foot.

12 P. bifòlium (Willd. spec. 3. p. 645.) leaves 2, cordate, acutish, deeply toothed; umbels simple. 4. G. Burm. afr. t. 35. f. 1. Geràniùm bifòlium, Cav. diss. 4. p. 254. t. 115. f. 3. Petals pale-red, oblong-cuneated, 2 superior ones marked with an oblong spot.

Two-leaved Stork's-bill. Pl. ½ foot.

13 P. stipula'ceum (Willd. spec. 3. p. 655.) stem very short, covered with the rudiments of the old stipulas; leaves rather cordate, ovate, deeply toothed, villous; umbels simple, few-flowered. 4. G. G. stipulàceum, Cav. diss. 4. p. 254. t. 122. f. 3. Perhaps the flowers are pentandrous, and therefore perhaps belonging to sect. *Campýlia*. Petals yellowish.

Stipuled-stemmed Stork's-bill. Pl. ½ foot.

14 P. articula'tum (Willd. spec. 3. p. 655.) stem very short, covered with the rudiments of the stipulas; leaves kidney-shaped, 5-7-lobed, villous; lobes 3-lobed; umbels simple, few-flowered. 4. G. G. articulàtum, Cav. diss. 4. p. 252. t. 122. f. 1. This plant comes very near the preceding, but the number of anthers is unknown. Probably belonging to a different section. Flowers yellowish.

Jointed Stork's-bill. Fl. May, July. Pl. ½ foot.

15 P. auricula'tum (Willd. spec. 3. p. 643.) leaves oblong-lanceolate, acuminated at both ends, hairy, with ciliated margins, sometimes entire, but usually furnished with 2 oblong-linear appendages at the base; umbels compound. 4. G. P. ciliàtum, Jacq. icon. rar. 3. t. 519. Petals linear, pale-red.

Auricled-leaved Stork's-bill. Fl. May, July. Clt.? Pl. ½ ft.

16 P. auri'tum (Willd. spec. 3. p. 646.) leaves oblong, obtuse, sometimes entire, but usually furnished with 2 oblong-linear appendages at the base; umbel rather compound. 4. G. Geràniùm auritum, Lin. mant. 433.—Comm. hort. 2. t. 61. Flowers, in a dry state, apparently purplish-red.

Eared-leaved Stork's-bill. Pl. ½ foot.

17 P. trífidum (Willd. spec. 3. p. 646.) leaves 3-parted; with the segments linear, wedge-shaped, and 3-toothed at the apex; umbel simple. 4. G. Burm. afr. t. 35. f. 2. G. trífidum, Cav. diss. 4. t. 115. f. 1. Flowers blood-coloured.

Trifid-leaved Stork's-bill. Pl. ½ foot.

18 P. lacinia'tum (Pers. ench. 2. p. 228.) leaves entire or deeply lobed at the apex; scape flexuous; umbel compound. 4. G. G. laciniàtum, Andr. bot. rep. 131. Petals pink.

Jagged-leaved Stork's-bill. Fl. Ju. Jul. Clt. 1800. Pl. ½ ft.

19 P. nervifòlium (Jacq. icon. rar. 3. t. 517.) leaves smooth, ternate, glaucous beneath, with rather lobed, nerved, obtuse leaflets; scape hispid; umbels compound. 4. G. Petals oblong-cuneated, white, painted with branched, blood-coloured lines at the base.

Nerved-leaved Stork's-bill. Fl. May, Aug. Clt. 1812. Pl. ½ ft.

20 P. triphy'llum (Jacq. icon. rar. 3. t. 515.) leaves smooth, ternate, with obtuse, crenated leaflets; scapes and petioles pubescent; umbels simple. 4. G. Petals linear, flesh-coloured, 2 superior ones with blood-coloured spots at the base.

Three-leaved Stork's-bill. Fl. May, Aug. Clt. 1812. Pl. ½ ft.

21 P. lu'teum (Andr. bot. rep. 423. under *Geràniùm*,) smooth; leaves pinnate; leaflets usually with a lobe on one side; umbels simple, many-flowered; petals all spatulately-linear. 4. G. Petals yellow, 2 upper ones with 2 red streaks at the base.

Yellow-flowered Stork's-bill. Fl. May, Aug. Clt. 1800. Pl. ½ foot.

22 P. ròseum (Ait. hort. kew. ed. 2. vol. 4. p. 161.) stemless; leaves lobed and jagged, obtuse, toothed, tomentose; scape simple, very long; umbels many-flowered; lower petals much the smallest; nectariferous tube 4-times longer than the reflexed calyx. 4. G. Petals of a bright rose-colour. Ger. ròseum, Andr. bot. rep. t. 173. P. condensàtum, Pers. ench. 2. p. 227. Hoárea ròsea, Sweet, ger. 262.

Rose-coloured-flowered Stork's-bill. Fl. May, Aug. Clt. 1792. Pl. 1 foot.

* * * *Leaves pinnate, with the leaflets cut or multifid.*

23 P. RAPA'CEUM (Jacq. icon. rar. 3. t. 510.) leaves pilose, bipinnate; lobules linear, rather obtuse; 2 superior petals refracted, 2 inferior ones connivent. ♃. G. Ger. selìnum, Andr. bot. rep. 239. Petals of a whitish rose-colour, 2 upper ones spotted.

Turnip-rooted Stork's-bill. Fl. May, Jul. Clt. 1788. Pl. ½ ft.

24 P. NU'TANS (D. C. prod. 1. p. 651.) leaves bipinnate, hairy; leaflets pinnatifidly jagged, multifid, linear, rather toothed; umbels capitate, crowded, depressed; flowers nodding; superior petals refracted, inferior ones concave, connivent. ♃. G. P. rapàceum lùteum, Sims. bot. mag. 1877. Hoárea carinàta, Sweet. ger. t. 135. Flowers yellow.

Nodding-flowered Stork's-bill. Fl. May, July. Clt. 1788. Pl. ½ foot.

25 P. CORYDALIFLÒRUM (Sweet, ger. t. 18. under *Hoárea*,) leaves pilose, pinnate; leaflets pinnatifid or trifid; lobules linear, acute; 2 superior petals refracted, lower ones connivent. ♃. G. Petals pale sulphur-coloured, 2 upper ones with blood-coloured spots.

Corydalis-flowered Stork's-bill. Fl. May, Aug. Clt. 1812. Pl. ½ foot.

26 P. SETÒSUM (Sweet, ger. t. 38. under *Hoárea*,) leaves pinnate, pubescent; leaflets cuneated, 3-5-toothed at the apex, with the teeth ending in bristles; umbels compound; superior petals refracted, lower ones rather connivent. ♃. G. Petals rose-coloured, 2 superior ones spotted.

Bristly-leaved Stork's-bill. Fl. May, Aug. Clt. 1818. Pl. ½ ft.

27 P. BUBONIFÒLIUM (Pers. ench. 2. p. 227.) leaves smooth, pinnate; leaflets deeply lobed, acute; umbel simple; petals emarginate. ♃. G. Ger. bubonifòlium, Andr. bot. rep. 328. Petals white, 2 upper ones with a purple spot each.

Bubon-leaved Stork's-bill. Fl. Mar. Jul. Clt. 1800. Pl. ½ ft.

28 P. VIOLÆFLÒRUM (Sweet, ger. 123. under *Hoárea*,) stem short; leaves pinnate-parted, or trifoliate; leaflets oblong-lanceolate, smooth, entire, with ciliated margins, acuminated, and beset with pencilled hairs at the apex, lower ones bifid; petioles hispid; umbels compound; petals reflexed, lower ones smallest. ♃. G. Flowers white. Superior lobes of calyx erect, the rest reflexed.

Violet-flowered Stork's-bill. Fl. May, Aug. Clt. 1821. Pl. ½ ft.

29 P. LEEA'NUM (Sweet, ger. 323. under *Hoárea*,) leaves smooth, pinnate; leaflets pinnatifidly cut, acute; petioles pubescent; stipulas linear, acute, membranous, adhering to the petioles; umbel compound, of several flowers; superior petals obovate, retuse; calyxes spreading, bearded at the apex; nectariferous tube about half as long again as the calyx. ♃. G. Petals white, with a purple spot in the centre of each.

Lee's Stork's-bill. Fl. May, Aug. Clt. 1823. Pl. ½ foot.

30 P. NI'VEUM (Sweet, ger. 182. under *Hoárea*,) stemless; umbels compound; leaves smooth, lower ones ovate, entire, upper ones pinnatifid; petals white, reflexed, lower ones much the smallest. ♃. G.

Snowy-flowered Stork's-bill. Fl. May, Aug. Clt. 1821. Pl. ½ foot.

31 P. PILÒSUM (Pers. ench. 2. p. 227.) leaves pinnate, hairy; leaflets cut or multifid; umbel simple, 4-6-flowered; petals linear. ♃. G. Ger. pilòsum, Andr. bot. rep. 259. Petals purple.

Pilose Stork's-bill. Fl. May, Jul. Clt. 1801. Pl. ½ foot.

32 P. BICOLOR (Sweet, hort. brit. p. 76. under *Hoárea*,) pilose; leaves pinnate; leaflets oblong, or obovately-oblong, sometimes slightly 2-3-lobed; umbels many-flowered; upper petals emarginate, 3 lower ones small; nectariferous tube about 3-times longer than the calyx. ♃. G. Ger. pilòsum, var. 2. Andr. ger. icon. Petals red with white claws, upper ones marked with a red spot just under the red part of the petals.

Two-coloured-flowered Stork's-bill. Fl. Feb. Aug. Clt. 1801. Pl. ½ foot.

33 P. BLA'NDUM (Sweet, hort. brit. 76. under *Hoárea*,) pilose; leaves pinnate; leaflets obovately-oblong, sometimes slightly 3-lobed; umbels many-flowered; nectariferous tube 3-times longer than the calyx; petals all wedge-shaped, upper ones emarginate, lower ones narrower. ♃. G. Flowers blush.

Blush-flowered Stork's-bill. Fl. Feb. Aug. Clt. 1801. Pl. ½ ft.

34 P. PENNIFÓRME (Pers. ench. 2. p. 227.) leaves pinnate-parted, with lanceolate-linear, entire segments; umbels compound. ♃. G. Ger. laciniàtum, Andr. bot. rep. 269. Petals yellow, red at the base. Radical leaves sometimes entire.

Feather-formed-leaved Stork's-bill. Fl. May, July. Clt. 1800. Pl. ½ foot.

35 P. PURPURA'SCENS (Pers. ench. 2. p. 227.) leaves lanceolate-linear, entire, and pinnatifid; umbel compound. ♃. G. Ger. laciniàtum, Andr. bot. rep. 204. Peduncles elongated. Flowers purplish, with darker stripes.

Purplish-flowered Stork's-bill. Fl. May, Jul. Clt. 1800. Pl. ½ ft.

36 P. INCRASSA'TUM (Sims, bot. mag. t. 761.) leaves pinnatifid, with lobed, obtuse segments; scape a little branched; superior petals obcordate. ♃. G. Ger. incrassàtum, Andr. bot. rep. t. 246. Flowers pale rose-coloured, netted with red veins.

Thickened Stork's-bill. Fl. June, July. Clt. 1801. Pl. ½ ft.

37 P. CENTAUROÌDES (Lher. ger. ined. no. 12.) leaves hairy, pinnate-parted, with remote, cut, or entire segments; umbel simple, crowded, many-flowered. ♃. G. Pedicels elongated and the flowers purplish, as in the preceding.

Centauria-like Stork's-bill. Pl. ½ foot.

38 P. HIRSU'TUM (Ait. hort. kew. ed. 1. vol. 2. p. 417.) leaves hairy, ciliated, obovate or lanceolate, quite entire or pinnatifid; stipulas adnate to the petioles; umbels compound. ♃. G. Ger. hirsùtum, Cav. diss. 4. p. 247. t. 101. f. 2. P. heterophýllum, Lher. ger. ined. no. 10. Petals pale-flesh-coloured, marked with blood-coloured veins, upper ones marked with a large dark-red spot each.

Hairy Stork's-bill. Fl. Mar. May. Clt. 1788. Pl. ½ foot.

39 P. MELANA'NTHUM (Jacq. icon. rar. 3. t. 514.) leaves hairy, pinnate-parted, with oval-oblong, obtuse, somewhat pinnatifid or toothed segments; umbels compound; petals linear, obtuse. ♃. G. Hoárea melanántha, Sweet, ger. 73. The first leaves ovate, or 3-lobed. Petals dark-brown; claws white.

Black-flowered Stork's-bill. Fl. May, Aug. Clt. 1790. Pl. ½ ft.

40 P. DIOI'CUM (Ait. hort. kew. ed. 2. vol. 4. p. 162.) leaves hispid, entire, and ternate; umbel compound; flowers dioecious. ♃. G. Ger. melanánthum, Andr. bot. rep. 209. Petals dark-brown. Leaflets entire.

Dioecious Stork's-bill. Fl. June, Aug. Clt. 1795. Pl. ½ ft.

41 P. A'TRUM (Lher. ger. t. 44.) leaves puberulous, some of which are oblong and entire, and others pinnate-parted; umbels compound; superior segments of the calyx erect; petals linear; sterile filaments incurved at the apex. ♃. G. Hoárea àtra, Sweet, ger. t. 72. Petals dark-brown, with white claws.

Dark-flowered Stork's-bill. Fl. May, Aug. Clt. 1793. Pl. ½ foot.

42 P. UNDULÆFLÒRUM (Sweet, ger. 263. under *Hoárea*,) leaves hairy, lower ones simple, roundish-ovate, upper ones trifid and ternate, rarely pinnatifid; umbels compound, many-flowered; calyxes villous, bearded at the apex; petals waved, spreading. ♃. G. Petals blackish-brown, with white claws.

Waved-flowered Stork's-bill. Fl. May, Aug. Clt. 1821. Pl. ½ foot.

43 P. CONGE'STUM (Sweet, ger. 302. under *Hoárea*,) stemless;

leaves pinnate or pinnatifid, pilose; leaflets and segments pinnatifidly-lobed or cut, unequally-toothed, acutish; stipulas lanceolate, acute; umbels many-flowered, crowded; petals ligulate, spotted, superior ones bent back. 4. G. Petals flesh-coloured, with numerous small dots, the upper ones darker above the bent part.

Crowded-flowered Stork's-bill. Fl. May, Aug. Pl. ½ foot.

† *Names of garden Hybrids belonging to Sect. I. Hoárea.*

1 *P. silinifòlium* (Sweet, ger. 159.) Flowers purple.
2 *P. integrifòlium* (Sweet in Colv. cat.) Flowers red.
3 *P. fucàtum* (Sweet in Colv. cat.) Flowers red.
4 *P. nígricans* (Sweet in Colv. cat.) Flowers red.
5 *P. mágicum* (Sweet in Colv. cat.) Flowers red.
6 *P. vàrium* (Sweet, ger. t. 166.) Flowers dark.
7 *P. Colvíllii* (Sweet, ger. 260.) Flowers blush.
8 *P. Jenkensònii* (Sweet in Colv. cat.) Flowers crimson.
9 *P. dilùtum* (Sweet, hort. brit. 76.) Flowers blush.
10 *P. replicàtum* (Sweet, hort. brit. 72.) Flowers red.
11 *P. rubéscens* (Sweet, hort. brit. 76.) Flowers red.
12 *P. intermíxtum* (Sweet, hort. brit. 76.) Flowers red.
13 *P. capitàtum* (Sweet, hort. brit. 76.) Flowers blush.
14 *P. supérbum* (Sweet, hort. brit. 76.) Flowers crimson.
15 *P. villòsum* (Sweet, hort. brit. 76.) Flowers crimson.
16 *P. unguiculàtum* (Sweet, hort. brit. 76.) Flowers red.
17 *P. tenuifòlium* (Sweet, hort. brit. 76.) Flowers blush.
18 *P. marginàtum* (Sweet, hort. brit. 76.) Flowers blush.
19 *P. atrosanguíneum* (Sweet, ger. 151.) Flowers crimson.
20 *P. Sweetiànum* (D. C. H. élegans, Sweet, ger. 132.) Flowers crimson.
21 *P. coccíneum* (Sweet, ger. 398.) Flowers scarlet.
22 *P. recurviflòrum* (Sweet, hort. brit. 76.) Flowers crimson.
23 *P. sanguinoléntum* (Sweet, hort. brit. 76.) Flowers red.
24 *P. pulchéllum* (Sweet, hort. brit. 76.) Flowers red.
25 *P. amœ'num* (Sweet, hort. brit. 76.) Flowers red.
26 *P. pàtens* (Sweet, hort. brit. 76.) Flowers red.
27 *P. lilácinum* (Sweet, hort. brit. 76.) Flowers red.
28 *P. venòsum* (Sweet, ger. 209.) Flowers striped.
29 *P. literàtum* (Sweet, hort. brit. 76.) Flowers striped.
30 *P. hedysarifòlium* (Sweet, ger. 355.) Flowers crimson.
31 *P. galegifòlium* (Sweet, ger. icon.) Flowers red.
32 *P. sisymbrifòlium* (Sweet, ger. 358.) Flowers red.
33 *P. orobifòlium* (Sweet, ger. 304.) Flowers purple.
34 *P. retúsum* (Sweet, ger. 307.) Flowers dark.
35 *P. coluteæfòlium* (Sweet, ger. 311.) Flowers crimson.

SECT. II. DIMA'CRIA (from δις, *dis*, two, and μακρος, *macros*, long; in allusion to the 2 lowest fertile stamens being twice the length of the rest). Lindl. in Sweet, ger. no. 46. Petals 5, unequal, 2 upper ones conniving, divaricate at the apex. Stamens shorter than the sepals, 5 of which are fertile, the 2 lowest ones twice the length of the rest, stretched out, upper ones shortest, the 5 sterile ones very short, and nearly equal.—Stemless herbs, with turnip-like roots, and stalked, radical leaves.

* *Leaves pinnate; leaflets entire.*

44 P. VICIÆFÒLIUM (Lher. ger. ined. no. 15. D. C. prod. 1. p. 653.) leaves pinnate, villous, with 4-5 pairs of ovate, nearly entire, flat leaflets. 4. G. Ger. pinnàtum, Cav. diss. 4. t. 115. f. 2. but not of Lin. Dimàcria pinnàta, Sweet, ger. t. 46. Petals pale rose-coloured, 2 upper ones lined, and dotted with blood-coloured spots at the base.

Vetch-leaved Stork's-bill. Fl. May, June. Clt. 1779. Pl. ½ ft.

45 P. FOLIOLÒSUM (D. C. prod. 1. p. 653.) leaves pinnate, with 15-20 pairs of bifid leaflets. 4. G. Geràmium pinnàtum, Andr. bot. rep. 311. Petals yellow, spotted with red.

Leafy Stork's-bill. Fl. May, Aug. Clt. 1800. Pl. ½ foot.

46 P. ASTRAGALÆFÒLIUM (Pers. ench. 2. p. 227.) leaves pinnate, hairy, with many pairs of elliptic leaflets; petals waved, twisted at the base. 4. G. Ger. astragalæfòlium, Cav. diss. 4. t. 104. f. 2. Andr. bot. rep. 190. Ger. pinnàtum, Lin. spec. 677. Dimàcria astragalæfòlia, Sweet, ger. 103.—Comm. præl. 53. t. 3. Petals white, narrow, spotted and streaked with purple.

Astragalus-leaved Stork's-bill. Fl. June, Aug. Clt. 1788. Pl. ½ foot.

47 P. CORONILLÆFÒLIUM (Pers. ench. 2. p. 227.) leaves pinnate, smooth, with 1-2 pairs of obovate or oblong leaflets. 4. G. Ger. coronillæfòlium, Andr. bot. rep. 305. Petals fulvous, 2 upper ones spatulate and retuse, spotted with red, lower ones lanceolate.

Coronilla-leaved Stork's-bill. Fl. June, Aug. Clt. 1795. Pl. ½ foot.

48 P. HERACLEIFÒLIUM (Lodd. bot. cab. 437.) leaves pinnate, smooth, with 2-3 pairs of obovate leaflets, the ultimate ones confluent. 4. G. Petals obovately-cuneated, dark-brown, with the base and margins yellowish.

Cow-parsnip-leaved Stork's-bill. Fl. June, July. Clt. 1818. Pl. ½ foot.

** *Leaves pinnate, with the leaflets cut or multifid.*

49 P. CA'RNEUM (Jacq. icon. rar. 3. t. 512.) leaves smooth, bipinnate; lobes trifid, linear, bluntish; scape simple. 4. G. Ger. pinnatífidum, Cav. diss. 4. t. 260. t. 121. f. 1. Petals pale rose-coloured, painted with darker veins.

Flesh-coloured-flowered Stork's-bill. Fl. May, July. Clt. 1812. Pl. ½ foot.

50 P. RECURVA'TUM (Sweet, hort. brit. 77. under *Dimàcria*,) leaves pinnate; leaflets trifid, with the lobes bearded; umbels simple; petals linear, obtuse, recurved. 4. G. Ger. barbàtum, var. mìnor, Andr. bot. rep. 323. Petals white, 2 upper ones streaked, and dotted with red.

Recurved-petalled Stork's-bill. Fl. May, Aug. Clt. 1790. Pl. ½ foot.

51 P. ARISTA'TUM (Sweet, hort. brit. p. 77. under *Dimàcria*,) leaves pinnate; leaflets variously lobed, each lobe ending in a tuft of hairs; petals linear, obtuse. 4. G. Ger. barbàtum, var. undulàtum, Andr. bot. rep. 366. Petals white, but all streaked with red at the base.

Awned-leaved Stork's-bill. Fl. May, Aug. Clt. 1790. Pl. ½ ft.

52 P. BARBA'TUM (Jacq. icon. 3. t. 513.) leaves pinnate; leaflets trifid; lobules linear, acuminated, bearded at the apex; umbels compound; petals linear, obtuse. 4. G. Ger. molíferum, Burm. ger. 70. t. 2. Cav. diss. 4. t. 120. f. 3. Ger. barbàtum, Andr. bot. rep. t. 303. Petals flesh-coloured or white, upper ones painted with a red patch in the middle of each.

Bearded-leaved Stork's-bill. Fl. May, Aug. Clt. 1790. Pl. ½ foot.

53 P. PETROSELINIFO'LIUM; hairy; leaves pinnate, with 2-3 pairs of distant, jagged, reflexed leaflets; umbels many-flowered; nectariferous tube twice the length of the calyx. 4. G. Petals blush, with a linear red spot in the centre of each, emarginate, and spatulately-linear. Ger. apiifòlium, Andr. ger. icon. Dimàcria apiifòlium, Sweet, hort. brit. p. 77.

Parsley-leaved Stork's-bill. Fl. Ap. Aug. Clt. 1802. Pl. ½ ft.

54 P. FISSIFÒLIUM (Pers. ench. 2. p. 227.) leaves pinnate, with trifid and bifid leaflets, cut and naked at the apex; umbel simple; petals obtuse, all marked with an oblong spot. 4. G. Ger. fissifòlium, Andr. bot. rep. 378. Petals white, red at the base.

Cleft-leaved Stork's-bill. Fl. May, Aug. Clt. 1795. Pl. ½ ft.

55 P. FLORIBU'NDUM (Ait. hort. kew. ed. 2. vol. 4. p. 163.) leaves pinnate, with 2 parted leaflets; umbels compound. 4. G. Ger. floribúndum, Andr. bot. rep. 420. Petals white, upper

ones marked each with 3 lunate spots, lower ones marked with a red linear line each.

Bundle-flowered Stork's-bill. Fl. March, Aug. Clt. 1795. Pl. ½ foot.

*** *Leaves cordate, 3-lobed, ternate, or furnished with 2 auricles at the base.*

56 P. REVOLU'TUM (Pers. ench. 2. p. 226.) leaves cordate, obtuse, nerved, quite entire, but usually with an auricle on each side at the base; umbels compound; leaflets of involucre revolute. 4. G. Ger. revolùtum, Andr. bot. rep. 354. Flowers rose-coloured, lined with purple.

Revolute-involucred Stork's-bill. Fl. July, Aug. Clt. 1800. Pl. ½ foot.

57 P. HETEROPHY'LLUM (Jacq. icon. rar. 3. t. 516.) leaves ciliated, undivided, 3-lobed or ternate, with the middle segment 3-lobed; umbel compound. 4. G. Petals white, 2 superior ones retuse, with a blood-coloured spot at the base of each.

Various-leaved Stork's-bill. Fl. May, Aug. Clt. 1800. Pl. ½ ft.

58 P. ANDRE'WSII (Sweet, hort. brit. 77. under *Dimàcria*,) lower leaves oblong, ovate, entire, others pinnate, with linear segments; umbels compound, many-flowered; nectariferous tube about twice the length of the calyx; petals spatulately-linear, blush. 4. G. Ger. heterophýllum, Andr. ger. icon. Petals blush, upper ones marked with a dark-red spot, dotted with red underneath the spot, lower ones each with a red line.

Andrews's Stork's-bill. Fl. April, Aug. Clt. 1802. Pl. ½ ft.

59 P. OXALIDIFÒLIUM (Pers. ench. 2. p. 227.) leaves ciliated, ternate, with roundish, obtuse leaflets; umbel compound. 4. G. G. oxalidifòlium, Andr. bot. rep. t. 300. Petals pale-yellow, 2 upper ones marked with a blood-coloured patch at the base.

Wood-sorrel-leaved Stork's-bill. Fl. May, Aug. Clt. 1801. Pl. ½ foot.

60 P. TENE'LLUM (Andr. ger. icon. under *Gerànium*,) leaves smooth, trifoliate, and trifid; leaflets and segments oblong, middle ones broadest; umbels compound, many-flowered; nectariferous tube 2 or 3 times longer than the calyx; petals linear. 4. G. Petals white, upper ones spotted with red at the base, lower ones with one spot each.

Slender Stork's-bill. Fl. July, Aug. Clt. 1802. Pl. ½ foot.

61 P. REFLE'XUM (Pers. ench. 2. p. 227.) nearly stemless; leaves ternate, with deeply-lobed, recurved leaflets; umbels simple; 2 superior filaments, as well as the stigmas, reflexed. 4. G. Ger. refléxum, Andr. bot. rep. 224. Petals white.

Reflexed-stigmaed Stork's-bill. Fl. June, July. Clt. 1800. Pl. ½ foot.

**** *Leaves oblong or lanceolate, entire or toothed.*

62 P. PUNCTA'TUM (Willd. spec. 3. p. 645.) leaves ovate, toothed, smooth; umbel compound; flowers diandrous; petals linear, 3 inferior ones one-half shorter than the rest. 4. G. Ger. punctàtum, Andr. bot. rep. t. 60. Petals cream-coloured, 2 superior ones marked with blood-coloured spots.

Dotted-petalled Stork's-bill. Fl. April, July. Clt. 1794. Pl. ½ foot.

63 P. SPATULA'TUM (Andr. bot. rep. t. 152. under *Gerànium*,) leaves lanceolate, rather spatulate, obtuse, smooth; umbel compound; flowers pentandrous; petals linear, obtuse, rather revolute. 4. G. Petals yellow, 2 superior ones marked with 2 dark-red lines.

Spatulate-leaved Stork's-bill. Fl. April, July. Clt. 1795. Pl. ½ foot.

64 P. AFFI'NE (Sweet, hort. brit. 76. under *Dimàcria*,) leaves lanceolate-spatulate, tapering to both ends, ciliated on the margins; scape bifid, bearing 2 umbels; flowers pentandrous; petals linear-spatulate, revolute. 4. G. Ger. spatulàtum var. curviflòrum, Andr. bot. rep. 282. Petals yellow, 2 upper ones marked with a double row of red spots.

Allied Stork's-bill. Fl. April, July. Clt. 1794. Pl. ½ foot.

65 P. RADIA'TUM (Pers. ench. 2. p. 226.) leaves elliptic-spatulate, quite entire, smooth; umbel compound; flowers pentandrous; petals wedge-shaped. 4. G. Ger. radiàtum, Andr. bot. rep. t. 222. Petals yellow, 2 upper ones marked with a double row of red spots.

Ray-flowered Stork's-bill. Fl. Ju. Aug. Clt. 1801. Pl. ½ ft.

66 P. VIRGI'NEUM (Pers. ench. 2. p. 226.) leaves ovate-elliptic, acute at both ends, smooth; umbel compound; flowers pentandrous; petals lanceolate-cuneated, equal, waved. 4. G. Ger. undulàtum, Andr. bot. rep. 317. Petals white, lined with red.

Virgin Stork's-bill. Fl. May, July. Clt. 1795. Pl. ½ foot.

67 P. UNDULA'TUM (Ait. hort. kew, ed. 2. vol. 4. p. 160.) leaves linear-lanceolate, entire, ciliated; umbel simple; flowers pentandrous; petals waved, nearly equal. 4. G. Ger. undulàtum, Andr. bot. rep. t. 292. Petals white, 2 superior ones with dark spots on the margin, lower ones with a red line.

Waved Stork's-bill. Fl. May, July. Clt. 1795. Pl. ½ foot.

68 P. LINEA'RE (Pers. ench. 2. p. 228.) leaves lanceolate, repand; umbel nearly simple; flowers pentandrous; petals linear. 4. G. Ger. lineàre, Andr. bot. rep. t. 193. Petals very long, yellow, streaked at the base.

Linear-leaved Stork's-bill. Fl. June, Aug. Clt. 1800. Pl. ½ foot.

69 P. LANCEOFÒLIUM (Sweet, ger. 387. under *Dimàcria*,) stemless; leaves quite entire, rarely appendiculate, pilose on both surfaces, lower ones ovate, upper ones lanceolate, tapering to both ends; stipulas awl-shaped, linear; umbels of several flowers, compound; peduncles and calyxes densely tomentose. 4. G. Petals white, stained with blush, and marked with light red veins, 2 upper ones with a dark-purple patch each, branching at the apex.

Lance-leaved Stork's-bill. Fl. May, Aug. Clt. 1825. Pl. ½ ft.

† *A list of garden Hybrids belonging to Section II. Dimàcria.*

1 *P. bipartìtum* (Sweet, ger. 142.) Flowers striped.
2 *P. imbùtum* (Sweet, hort. brit. 77.) Flowers blush.
3 *P. fúlgens* (Sweet in Colv. cat.) Flowers crimson.
4 *P. élegans* (Sweet, ger. 3. t. 202.) Flowers scarlet.
5 *P. sulphùreum* (Sweet, ger. t. 163.) Flowers straw-coloured.
6 *P. Smithiànum* (Sweet, ger. 358.) Flowers red.

SECT. III. OTI'DIA (*ους ωτος, ous otos*, an ear; in allusion to the 2 superior petals being auricled at the base). Lindl. in Sweet, ger. p. 8. no. 98. Petals oblong-linear, nearly equal, about double the length of the calyx, 2 superior ones auricled at the base on the upper side. Stamens 10, erect, 5 of which are antheriferous, 2 upper ones of these spatulate or awl-shaped, 3 lower ones shortest, the 3 lower sterile ones erect or uncurved. Stems shrubby, fleshy. Leaves alternate, pinnate, fleshy. Flowers white.

70 P. CERATOPHY'LLUM (Lher. ger. t. 13.) stem shrubby, fleshy, branched; leaves pinnate-parted; lobes linear, terete, entire, or 3-toothed at the apex, rather channelled; peduncles many-flowered. h. G. Curt. bot. mag. 315. Petals white, linear-lanceolate, equal.

Horn-leaved Stork's-bill. Fl. May, Jul. Clt. 1786. Sh. 1 ft.

71 P. DASYCAU'LON (Sims, bot. mag. t. 2029.) stem shrubby, fleshy, tubercled; leaves fleshy, pinnate, with the segments deeply pinnatifid, rather trifid at the apex; peduncles 3-flowered. h. G. Sweet, ger. 196. P. dasycaúle, Haw. succ. p. 309. Petals linear, white.

Thick-stemmed Stork's-bill. Fl. July, Dec. Clt. 1795. Sh. 1 ft.

72 P. FERULA'CEUM (Willd. spec. 3. p. 687.) stem shrubby, fleshy; leaves pinnate, with deeply-toothed, waved segments;

peduncles many-flowered; petals acute, length of calyx. ♄. G. Burm. afr. t. 36. f. 1. Ger. ferulàceum, Cav. diss. 4. t. 110. f. 2.

Fennel-like Stork's-bill. Fl. July, Sept. Shrub 1 foot.

73 P. crithmifòlium (Smith, icon. pict. 1. t. 13.) stem shrubby, fleshy; leaves fleshy, bipinnate; lobes dilated at the apex, cut; peduncles many-flowered, panicled; petals obtuse, longer than the calyx, 2 upper ones curled at the base. ♄. G. Sweet, ger. 364. P. paniculàtum, Jacq. schœnbr. 2. t. 137. Petals white, 2 upper ones spotted with red at the base.

Samphire-leaved Stork's-bill. Fl. April, Sept. Clt. 1790. Shrub 1 to 3 feet.

74 P. alte'rnans (Wendl. hort. herrenh. 1. p. 14. t. 10.) stem shrubby, rather fleshy; branches pilose; leaves pinnate, with stalked, rather alternate, wedge-shaped segments, deeply-toothed at the apex; umbels few-flowered. ♄. G. Sweet, ger. 286. Petals white, 2 upper ones marked with two red lines at the apex.

Alternating-leafletted Stork's-bill. Fl. May, Aug. Clt. 1791. Shrub 1 foot.

75 P. la'xum (Sweet, ger. 196. under *Otídia*,) umbels many-flowered, loosely panicled; leaves pinnate, smooth; leaflets pinnatifid or cut; segments wedge-shaped, flat, erosely toothed at the apex; stem shrubby, fleshy; petals a little toothed; nectariferous tube a little shorter than the reflexed calyx. ♄. G. Petals white, upper ones marked with pale-lilac, branched lines near the base; lower petals concave, white.

Loose-flowered Stork's-bill. Fl. Ju. Sept. Clt. 1821. Sh 1 ft.

76 P. carnòsum (Ait. hort. kew, 2. p. 421.) stem thick, fleshy, shrubby at the base; leaves smooth, thick, sinuately-pinnatifid, with oblong, obtuse segments, which are deeply toothed at the apex; umbels many-flowered; petals linear; nectariferous tube rather longer than the calyx. ♄. G.—Dill. elth. 1. p. 153. t. 127. f. 154. Ger. carnòsum, Lin. spec. 946. Cav. diss. t. 99. f. 1. Otídia carnòsa, Sweet, ger. t. 98. Flowers white.

Fleshy Stork's-bill. Fl. June, Aug. Clt. 1724. Shrub 1 ft.

Sect. IV. Campy'lia (from *καμπυλος*, *campylos*, a curve; in allusion to the two upper filaments being hooked). Sweet, ger. 43 and 48. Petals 5, unequal, 2 upper ones largest, rather auricled at the claw. Filaments 10, pilose or pubescent, 5 fertile ones erect, 5 alternate ones sterile, 2 upper ones of these longer, and hooked at the apex.—Herbs hardly suffruticose at the base, branched. Leaves stalked, ovate or oblong, toothed or cut.

77 P. blatta'rium (Jacq. schœnbr. 2. p. 3. t. 131.) stem suffruticose, erect; leaves ovate-roundish, obtuse, hoary, and silky on both surfaces, toothed; peduncles 4-8-flowered; 2 superior petals roundish, lower ones oblong. ♄. G. Campýlia blattària, Sweet, ger. 88. Petals pale-violet. Stamens pilose.

Moth-Mullein-like Stork's-bill. Fl. June, Sept. Clt. 1790. Shrub 1 foot.

78 P. dichondræfòlium (D. C. prod. 1. p. 656.) stem suffruticose, erect; leaves kidney-shaped, crenulated, hoary; peduncles 5-flowered; 2 upper petals obovate, lower ones oblong. ♄. G. Burch. cat. afr. no. 3084. This is very like *P. blattàrium* and *P. trichostèmon*, but the leaves are kidney-shaped.

Dichondra-leaved Stork's-bill. Shrub 1 foot.

79 P. scapòsum (D. C. prod. 1. p. 656.) plant nearly stemless, the neck imbricated with scales; leaves ovate, obtuse, toothed, hoary-tomentose on both surfaces; scapes radical, 1-flowered. ♄. G. Ger. glaúcum, Cav. diss. 4. p. 237. t. 103. f. 2. but not of Andr. P. tomentòsum, Lher. ger. ined. no. 80. but not of Jacquin.

Scape-flowered Stork's-bill. Shrub ½ foot.

80 P. erioste'mon (Jacq. schœnbr. 2. p. 4. t. 132.) stem suffruticose, erect; leaves elliptically-roundish, obtuse, crenated, silky; peduncles 4-flowered; upper petals obovate, acutely-emarginate. ♄. G. Ger. ovàtum, Cav. diss. 4. t. 103. f. 3. Ger. ovàle, Burm. cap. 19. Petals white. Stamens pilose.

Woolly-stamened Stork's-bill. Fl. March, June. Clt. 1794. Shrub ½ foot.

81 P. trichoste'mon (Jacq. icon. rar. 3. t. 524.) stem suffruticose, ascending; leaves elliptically-roundish, crenated, silky; peduncles 3-flowered; superior petals roundish, lower ones oblong. ♄. G. Petals pale-violet, nearly as in *P. blattàrium*. Stamens pilose.

Hairy-stamened Stork's-bill. Shrub 1 foot.

82 P. verbasciflo'rum (Andr. ger. icon. under *Gerànium*,) stem suffruticose, ascending; leaves roundish-ovate, bluntly and doubly crenated, with waved margins, recurved; stipulas acuminated; umbels 3-5-flowered; upper petals roundish; nectariferous tube 3 times shorter than the calyx. ♄. G. Campýlia verbasciflòra, Sweet, ger. 2. t. 157. Petals pale-lilac.

Mullein-flowered Stork's-bill. Fl. June, Sept. Clt. 1811. Shrub 1 foot.

83 P. rumicifòlium (Sweet, ger. t. 318.) nearly stemless; leaves oblong-ovate, quite entire, acutish, blistered, and wrinkled, rather pilose, rarely auricled; stem leafy, very villous; umbels many-flowered; flowers tetrandrous; petals linear, very long, spreading, superior ones dotted at the base, 3 times longer than the calyx. ♃. G. Root fusiform. Petals yellow.

Dock-leaved Stork's-bill. Fl. May, Aug. Clt. 1825. Pl. ½ ft.

84 P. Œnothe'ra (Jacq. icon. rar. 3. t. 525.) stem herbaceous, ascending; leaves oblong-lanceolate, obtuse, toothed, hoary-tomentose; peduncles 1-2-flowered; superior petals obovate, hardly larger than the lower ones. ♃. G. Flowers rose-coloured, pentandrous.

Œnothera-like Stork's-bill. Fl. April, Aug. Clt. 1812. Pl. 1 foot.

85 P. coronopifo'lium (Jacq. icon. rar. 3. t. 526.) stem suffruticose, ascending; leaves linear-lanceolate, deeply toothed at the apex, hoary beneath; peduncles 3-flowered; superior petals obovate-oblong, appendiculate at the claws. ♄. G. Corolla pale-red, streaked with darker veins.

Buckhorn-leaved Stork's-bill. Fl. June, Sept. Clt. 1791. Shrub 1 foot.

86 P. capilla're (Willd. spec. 3. p. 660.) stem suffruticose, short; leaves lanceolate, deeply-pinnatifid, pubescent; peduncles 2-flowered. ♄. G. Ger. capillàre, Cav. diss. 4. p. 258. t. 97. f. 1. P. Mahérnium, Lher. ger. ined. no. 45. Very like *P. coronopifòlium*. Corolla pale-red.

Capillary Stork's-bill. Shrub ½ foot.

87 P. ca'num (Pers. ench. 2. p. 229.) stem suffruticose; leaves ovate, plaited, serrated, tomentose; peduncles 3-flowered, 2 superior petals very broad, and ovate. ♄. G. Campýlia càna, Sweet, ger. 114. Ger. tomentòsum, Andr. bot. rep. t. 115. but not of others. Two upper filaments revolute, and ciliated. Petals rose-coloured. Tube straight, one-half shorter than the calyx.

Hoary Stork's-bill. Fl. July, Dec. Clt. 1794. Shrub 1 foot.

88 P. carina'tum (Sweet, ger. t. 21. under *Campýlia*,) stem suffruticose, ascending; leaves ovate, unequally toothed or cut; stipulas keeled; peduncles 2-4-flowered; 2 superior petals ovate, waved, rather emarginate. ♄. G. Ger. tricolor ovalifòlium, Andr. ger. icon. Ger. ovàtum, Cav. diss. 4. t. 103. f. 3? Two superior petals reddish-purple, the three lower ones white.

Keeled-stipuled Stork's-bill. Fl. April, Sept. Clt. 1810. Shrub 1 foot.

† *Garden Hybrids belonging to Section* IV. *Campýlia.*

1 *P. variegàtum* (Sweet, ger. 3. t. 266.) Flowers striped.
2 *P. holosericeum* (Sweet, ger. 1. t. 75.) Flowers dark.

3 *P. élegans* (Sweet, ger. 3. t. 222.) Flowers blush.
4 *P. laciniàtum* (Sweet, ger. n. s. no. 1.) Flowers dark-red.

Sect. V. Phymata'nthus (from φυμα, *phyma*, a wart or tumour, and ανθος, *anthos*, a flower; in allusion to the warted claws of the petals). Lindl. in Sweet, ger. no. 43. Petals 5, unequal, 2 superior ones warted at the claws. Stamens 10, in a short tube, the 5 fertile ones recurved, and the 5 sterile ones straight, all pilose or pubescent.—Small, branched shrubs, with ovate or lanceolate, toothed leaves.

89 P. ela'tum (Sweet, ger. 96. under *Phymatánthus*,) stem erect, branched; leaves lanceolate, canescent, deeply toothed; peduncles usually 3-flowered; superior petals largest, rather smooth at the base, lower ones oval-oblong. ♄. G. Ger. trícolor arbòreum, Andr. ger. icon. Flowers white, with the upper petals red.

Tall Stork's-bill. Fl. June, Oct. Clt. 1791. Shrub 1½ foot.

90 P. tri'color (Curt. bot. mag. 240.) stem erect; leaves lanceolate, villously-canescent, deeply-toothed, or jagged; peduncles usually 3-flowered; upper petals roundish, short, warted at the base, lower ones oval. ♄. G. Ger. violàrium, Jacq. icon. rar. 3. t. 527. Ger. trícolor, Andr. ger. icon. Phymatánthus trícolor, Sweet, ger. 43. The 2 superior petals are reddish-purple, and nearly black towards the claws, the 3 lower ones white.

Three-coloured-flowered Stork's-bill. Fl. June, Oct. Clt. 1791. Shrub 1 foot.

† *Garden Hybrids belonging to the present Section.*

1 *P. villòsum* (Sweet, hort. brit. 75.) Flowers white and purple.
2 *P. grandiflòrum* (Sweet, l. c.) Flowers white and purple.
3 *P. latifòlium* (Sweet, l. c.) Flowers white and purple.
4 *P. intertinctum* (Sweet, ger. n. s. 54.) Flowers striped.

Sect. VI. Grenvi'llea (named in compliment to Lady Grenville, a great lover of geraniums). Sweet, ger. 262. f. 2. Petals 5, 2 superior ones largest, obliquely obovate, on long claws, 3 lower ones small, spatulate. Stamens 10, the 4 fertile ones ascendent at the apex, the 6 sterile ones short and awl-shaped.—A tuberous rooted herb, with simple leaves.

91 P. conspi'cuum (Sweet, ger. l. c. under *Grenvíllea*,) stemless; leaves spatulately-ovate or obovate, deeply-crenated, villous; stem long, a little branched; umbels many-flowered; superior petals emarginate; nectariferous tube nearly 3 times longer than the calyx. ♃. G. Ger. Grenvílliæ, Andr. ger. icon. Petals blush, 2 superior ones with a purple spot in the centre of each, and with their bases dark-velvety.

Conspicuous Stork's-bill. Fl. July, Nov. Clt. 1810. Pl. 1 ft.

Sect. VII. Seymou'ria (named in compliment to the hon. Emily Seymour). Sweet, ger. 3. t. 206. Petals 2, distinct at the base, abruptly reflexed in the middle. Stamens 5, nearly equal, in a long straight tube, all fertile.—Stemless herbs, with turnip-like roots.

92 P. asarifòlium (Sweet, ger. l. c. under *Seymoúria*,) leaves roundish, cordate, bluntish, quite entire, ciliated, smooth, and shining above, but velvety-tomentose beneath; umbels compound, capitate; petals lanceolately-spatulate, emarginate at the apex. ♃. G. Flowers dark-purple.

Asarabacca-leaved Stork's-bill. Fl. Nov. Feb. Clt. 1821. Pl. ½ foot.

93 P. L'Hereti'eri (Sweet, ger. l. c.) leaves ovate, quite entire, acute, smooth; umbels simple; petioles ciliated with hairs. ♃. G. Ger. dipétalum, Lher. ger. t. 43. Petals pale-purple, spotted at the base.

L'Heretier's Stork's-bill. Fl. April, May. Clt. 1795. Pl. ½ ft.

Sect. VIII. Jenkinsònia (named in compliment to Mr. Jenkinson, treasurer to the horticultural society; a great cultivator of geraniums). Sweet, ger. no. 76. Petals 4-5, superior ones much larger than the rest, emarginate at the apex, streaked with lines. Stamens 10, ascending, spreading at the top, and pilose at the base, 5-7 of which usually bear anthers, the sterile ones very short and awl-shaped.—Shrubs or herbs. Leaves pinnately, rarely ternately or palmately cleft, usually multifid.

* *Flowers with 4 petals and 5 anthers.*

94 P. Canarie'nse (Willd. hort. berl. t. 17.) stem herbaceous; leaves 3-parted; lobes toothed at the apex, obtuse, lower ones obovate, middle ones ovate, usually trifid; peduncles generally 2-flowered. ♂. G. Native of the Canary Islands. Petals white, 2 upper ones streaked with red.

Canary-Island Stork's-bill. Fl. May, Sept. Clt. 1802. Pl. 1 foot.

95 P. Synnòtii (Sweet, ger. 342. under *Jenkinsònia*,) stem suffruticose at the base, branched; branches flexuous, diffuse, ascending, pilose; leaves 3-parted and pinnatifid, rather recurved and pilose above, shining, but pubescent beneath, with ciliated edges; segments jagged, bluntly and roundedly toothed; umbels usually 5-flowered; flowers with 4 petals and 5 anthers; nectariferous tube shorter than the calyx. ♄. G. Petals lilac, upper ones marked each with 2 branched lines.

Synnot's Stork's-bill. Fl. May, Sept. Clt. 1825. Shrub 1 to 3 feet.

96 P. bulla'tum (Jacq. icon. rar. 3. t. 530. coll. 5. p. 124.) stem shrubby, procumbent, puberulous; leaves pinnate-parted; lobes deeply-lobed, rather hispid on both surfaces, lower ones largest; peduncles 2-flowered. ♄. G. P. myrrhifòlium β, Willd. spec. p. 661. Jenkinsònia bullàta, Sweet, ger. 3. t. 530. Petals pale-red, 2 upper ones lined with red.

Blistered Stork's-bill. Fl. May, Aug. Clt.? Pl. procumbent.

97 P. myrrhifòlium (Ait. hort. kew, ed. 1. vol. 2. p. 421.) stem shrubby, ascending; leaves rather hispid on both surfaces, stiff, pinnate-parted; lobes deeply-serrated, lower ones largest; peduncles 2-3-flowered. ♄. G. Ger. myrrhifòlium, Lin. spec. 949. P. betónicum, Jacq. icon. rar. 3. t. 531. coll. 5. p. 127. Petals like those of the last species, but sometimes 5.

Myrrh-leaved Stork's-bill. Fl. May, Aug. Clt. 1696. Sh. 1 ft.

98 P. coriandrifòlium (Jacq. icon. rar. 3. t. 528. coll. 5. t. 142.) stem herbaceous, perennial, rather puberulous; leaves bipinnate, smooth; lobes linear, subpinnatifid. ♃. G. Ger. coriandrifòlium, Cav. diss. 4. t. 116. Jenkinsònia coriandrifòlia, Sweet, ger. t. 34. Peduncles usually 3-flowered. Petals white, 2 superior ones streaked with red.

Coriander-leaved Stork's-bill. Fl. March, Aug. Clt. 1724. Pl. 1 foot.

** *Flowers with 5 anthers and 5 petals.*

99 P. la'cerum (Jacq. icon. rar. 3. t. 532. coll. 5. t. 122.) stem herbaceous, hairy, rather erect; leaves bipinnatifid; segments lanceolate, obtuse, toothed at the apex; peduncles 3-5-flowered. ♃. G. Jenkinsònia lácera, Sweet, ger. 3. p. 532. Petals blush, marked with blood-coloured veins. Pedicels short, cuniculate even to the base.

Jagged-leaved Stork's-bill. Fl. Ju. Aug. Clt. 1731. Pl. 2 ft.

*** *Flowers with 7 anthers and 4 petals.*

100 P. longicau'le (Jacq. icon. rar. 3. t. 533. coll. 5. p. 125.) stem herbaceous, hairy; leaves pinnate-parted; segments jagged, toothed at the apex, lower ones more profound; peduncles 1-5-flowered. ♂. G. Petals 4-5, pale-rose coloured, veined with red.

Long-stemmed Stork's-bill. Fl. May, Aug. Clt.? Pl. long.

101 P. anemonefòlium (Jacq. icon. rar. 3. t. 535. coll. 5.

p. 133.) stem shrubby at the base, hairy, erect; leaves pinnate-parted, hairy beneath, but smooth above; lobes toothed; peduncles usually 5-flowered. ♄. G. Jenkinsònia anemonefòlia, Sweet, ger. 3. t. 535. Petals usually 5 in number, rose-coloured, striped with deeper veins.

Anemone-flowered Stork's-bill. Fl. May, Aug. Pl. 1 foot.

102 P. caucalifòlium (Jacq. icon. rar. 3. t. 529. coll. 5. p. 145.) stem herbaceous, hairy; leaves bipinnate; lobes linear, smoothish; peduncles 1-flowered. ♃. G. Jenkinsònia caucalifòlia, Sweet, ger. 3. t. 529. Petals white or flesh-coloured, veined with red.

Caucalis-leaved Stork's-bill. Fl. Mar. Sept. Clt. 1812. Pl. 1 ft.

103 P. multicau'le (Jacq. icon. rar. 3. t. 534. coll. 5. p. 126.) stems herbaceous, procumbent, smooth; leaves somewhat bipinnatifid, toothed; peduncles many-flowered, capitate. ♃. G. Jenkinsònia multicaúlis, Sweet, ger. 3. t. 534. Petals pale-violet, 2 superior ones veined and spotted.

Many-stemmed Stork's-bill. Fl. June, Aug. Clt. 1802. Pl. procumbent.

104 P. pe'ndulum (Sweet, ger. 2. t. 188. under *Jenkinsònia*,) peduncles usually 5-flowered; leaves bipinnatifidly jagged, hairy; segments lanceolate, obtuse, toothed at the apex; stem procumbent, hairy; flowers heptandrous, 4-petalled, nectariferous tube keeled, a little longer than the calyx. ♄. G. Ger. lácerum, Andr. ger. icon. Petals lilac, 2 superior ones striped with dark purple.

Pendulous-branched Stork's-bill. Fl. May, Aug. Clt.? Pl. hanging.

* * * * *Flowers with 7 anthers and 5 petals.*

105 P. quina'tum (Curt. bot. mag. 547.) stem shrubby, flexuous; leaves pubescent, palmately 5-cleft; lobes cuneated, 3-toothed at the apex; peduncles 1-2-flowered; stamens pilose at the base; nectariferous tube twice the length of the large calyx; superior petals emarginate. ♄. G. Ger. præmórsum, Andr. bot. rep. 150. Jenkinsònia quinàta, Sweet, ger. t. 79. Flowers large, cream-coloured, the 2 superior petals marked with dark, simple veins.

Quinate-leaved Stork's-bill. Fl. May, Aug. Clt. 1793. Sh. 1 to 2 feet.

Sect. IX. Chorísma (from χωρισμος, *chorismos*, a separation; in allusion to the 2 lower fertile stamens being free and separate from the rest). Sweet, ger. no. 79. Petals 4, rarely 5, 2 superior ones with long claws, large, 2 lower ones much smaller. Stamens connate into a long, declinate tube, which is jointed in the middle, 7 of which are fertile, 2 lower ones of these free, the 3 sterile ones very short and awl-shaped, and about equal in length.

106 P. tetragònum (Lher. ger. t. 23.) branches tetragonal, fleshy; leaves cordate, obtusely lobed and rather toothed. ♄. G. Jacq. icon. rar. 1. t. 132. Curt. bot. mag. 136. D. C. pl. grass. t. 96. Jenkinsònia tetragòna, Sweet, ger. t. 99. Flowers pink.

Var. β, trigònum (Scop. del. 1. p. 12. t. 5.) branches trigonal. In the same plant the branches may be trigonal and tetragonal.

Var. γ, variegàtum (Sweet, ger. 99.) leaves variegated with white round the edges.

Tetragonal-stemmed Stork's-bill. Fl. May, Aug. Clt. 1774. Shrub 1 foot, with reclining branches.

Sect. X. Isope'talum (from ισος, *isos*, equal, and πεταλον, *petalon*, a petal). Sweet, ger. no. 126. Superior segment of calyx ending in a nectariferous foveola at the base, not in a tube. Petals 5, equal. Stamens 10, connate into a short tube, 5 or 6 of which are fertile, these are spreading and incurved at the apex; the rest sterile, unequal, and incurved.—Shrubs with fleshy stems.

107 P. cotyle'don (Lher. ger. t. 27.) stem thick, fleshy, branched; leaves cordate, rather peltate, wrinkled, pubescent, but tomentose beneath, and reticulately veined. ♄. S. Native of St. Helena. Ger. cotylédonis, Lin. mant. 569. Isopétalum cotylédonis, Sweet, ger. 126. Petals white, ovate.

Cotyledon-leaved Stork's-bill. Fl. May, Aug. Clt. 1765. Shrub 1 to 4 feet.

108 P. díscipes (Sweet, hort. brit. p. 85.). This plant is a native of St. Helena; it has not yet flowered in the gardens. It grows tall, with 1 single stem, with the leaves crowded at the top of the stem, they are hairy and kidney-shaped. ♃. G.

Central-stalked Stork's-bill. Clt. 1808. Shrub 6 feet.

Sect. XI. Cicònium (from *cicònia*, a stork, the same meaning as *Pelargònium*, which see). Sweet, ger. no. 13. in a note, and at no. 9. Pelárgium, series 1. Cicònium, D. C. prod. 1. p. 658. sect. Cynosbàta, D. C. prod. 1. p. 654. Petals 5, 2 superior ones approximate, short, and narrow, or nearly equal between themselves. Stamens 10, 7 or 5 of which bear anthers, 2 upper ones of these very short, 3 or 5 sterile.—Stems shrubby, erect.

* *Petals suboval, nearly equal. Stamens* 10, 5 *of which are sterile and* 5 *fertile. Cynosbàta, D. C. l. c.*

109 P. malvæfòlium (Jacq. fil. ecl. 1. p. 145. t. 97.) stem shrubby at the base; branches divaricate, diffuse, puberulous; leaves cordate, rather orbicular, 7-9-lobed, coarsely serrated, pubescent on both surfaces; umbels 5-8-flowered. ♄. G. Petals flesh-coloured, reticulated with darker veins. Nectariferous tube obsolete.

Mallow-leaved Stork's-bill. Fl. May, Sept. Clt. 1812. Shrub 2 feet.

110 P. laterítium (Willd. enum. suppl. p. 47.) stem shrubby at the base; leaves cordate, 5-lobed, hairy, zonate; lobes acutely toothed at the apex; umbels 4-5-flowered. ♄. G. Jacq. fil. ecl. 1. t. 97. the last figure. Petals brick-coloured.

Brick-coloured-flowered Stork's-bill. Fl. May, Sept. Clt. 1800. Shrub 2 feet.

111 P. cynosbatifòlium (Willd. hort. berl. t. 78.) stem shrubby, branched; leaves cordate, 3-lobed, toothed, pilose; middle lobe 3-lobed; peduncles 2-flowered; nectariferous tube very short. ♄. G. Flowers of a deep rose-colour, according to the colour given in the figure, but lilac according to the description; the lower petals are striped with darker branched veins.

Gooseberry-leaved Stork's-bill. Fl. May, Aug. Shrub 2 ft.

* * *Petals of one colour, 2 superior ones very short and narrow. Stamens short, erect, 2 lower ones very short, with the anthers nearly sessile. Stems shrubby, fleshy. Sect. Pelárgium, series* 1. *Cicònia, D. C. prod.* 1. *p.* 658.

112 P. acetòsum (Ait. hort. kew. 2. p. 430.) leaves quite smooth, obovate, crenated, rather fleshy; peduncles few-flowered; petals linear. ♄. G. Curt. bot. mag. 103. Ger. acetòsum, Lin. spec. 947. Cav. diss. 4. t. 104. f. 3. Petals pale-rose coloured. Stamens usually 5, fertile.

Sorrel-leaved Stork's-bill. Fl. May, Sept. Clt. 1710. Sh. 2 ft.

113 P. sca'ndens (Ehrh. beitr. 7. p. 161. Willd. spec. 3. p. 666.) leaves roundish, obsoletely lobed, crenated, smooth, zonate; peduncles many-flowered; petals linear, about the breadth of the segments of the calyx. ♄. G. Stem not climbing, but the branches are flexuous. Ger. acetòsum ròseum, Dum. Cours. bot. cult. 5. p. 16. Petals rose-coloured.

Climbing Stork's-bill. Fl. May, Sept. Clt. 1800. Shrub flexuous.

114 P. pu'milum (Willd. enum. 704.) leaves roundish, kid-

ney-shaped, obsoletely lobed, crenate, younger ones somewhat zonate; peduncles usually many-flowered; petals linear; nectariferous tube 4-5-times longer than the calyx, nearly sessile. ♄. G. Ger. zonàle mínimum, Andr. ger. icone. Very like *P. scándens*, but the stem is hardly a foot high. Petals pale-scarlet.

Dwarf Stork's-bill. Fl. May, Sept. Clt. 1800. Shrub 1 ft.

115 P. STENOPE'TALUM (Ehrh. beitr. 7. p. 161. Willd. spec. 3. p. 666.) leaves roundish, obsoletely lobed, crenated, pubescent, zonate; peduncles many-flowered; petals linear, narrower than the calycine lobes. ♄. G. Petals deep-scarlet. P. ribifòlium, Dum. Cours. bot. cult. ed. 2. no. 58.

Narrow-petalled Stork's-bill. Fl. May, Aug. Clt. 1800. Shrub 3 feet.

116 P. LEPTOPE'TALUM (Sweet, hort. brit. p. 84.) leaves cordate, obsoletely 5-lobed, slightly crenated, fleshy; umbels many-flowered; petals linear, about half as long again as the calyx; nectariferous tube 4-times longer than the calyx. ♄. G. Ger. stenopétalum, Andr. ger. with a figure. Petals scarlet.

Slender-petalled Stork's-bill. Fl. May, Aug. Clt. 1800. Shrub 3 feet.

117 P. HY'BRIDUM (Ait. hort. kew. 2. p. 424.) leaves roundish, obsoletely lobed, crenated, smooth, spotless; peduncles many-flowered; petals linear-wedge-shaped, broader than the segments of the calyx. ♄. G. Ger. hýbridum, Lin. mant. 97. Cav. diss. 4. t. 105. f. 2. P. coccíneum, Ehrh. beitr. 7. p. 162. Ger. miniàtum, Andr. ger. with a figure. Cicònium hýbridum, Sweet, ger. 1. t. 63. This is a proper species, not a hybrid. Petals scarlet.

Var. β,ròseum (Ehrh. beitr. 7. p. 161.) leaves cordately-kidney-shaped; petals rose-coloured.

Hybrid Stork's-bill. Fl. May, Oct. Clt. 1732. Sh. 3 to 4 ft.

118 P. ZONA'LE (Willd. spec. 3. p. 667.) leaves cordate, orbicular, obsoletely lobed, toothed, zonate above; peduncles many-flowered; petals wedge-shaped. ♄. G. G. zonàle, Lin. spec. 947. Cav. diss. 4. t. 98. f. 2. Flowers variable in colour, red, scarlet, rose, pale, and white.

Var. β, marginàtum (Cav. diss. 4. p. 230.) leaves curled and wrinkled, not zonate, but white around the edge; branches stiff, erect. Flowers scarlet.

Horse-shoe Stork's-bill. Fl. April, Dec. Clt. 1710. Shrub 3 to 6 feet.

119 P. ÍNQUINANS (Ait. hort. kew. 2. p. 424.) leaves orbicular, kidney-shaped, tomentosely viscid; peduncles many-flowered; petals obovate-wedge-shaped. ♄. G. Ger. ínquinans, Lin. spec. 945. Cav. diss. 4. t. 106. f. 2. Andr. ger. icon.—Dill. hort. elth. t. 125. f. 151. The leaves stain the hands of a brown colour. Flowers bright-crimson or scarlet.

Staining Stork's-bill. Fl. May, Sept. Clt. 1714. Sh. 4 to 6 ft.

120 P. HETERO'GAMUM (Lher. ger. t. 18.) leaves cordate, orbicular, deeply lobed, pubescent on both surfaces; peduncles many-flowered; petals oblong-wedge-shaped. ♄. G. Ger. quinquélobum, Lam. dict. 2. p. 671. Said to be a hybrid between *P. zonàle* and *P. alchimilloìdes*. Flowers rose-coloured or lilac. Stamens 6, fertile.

Heterogamous Stork's-bill. Fl. May, Aug. Clt. 1786. Shrub 4 to 6 feet.

121 P. CE'RINUM (Sweet, ger. t. 176. under *Cicònium*,) leaves roundish-kidney-shaped, obsoletely crenated, nerved, pubescent, very soft; stipulas cordate, toothed; stem erect; umbels many-flowered; petals obovate, upper ones smallest; nectariferous tube twice the length of the calyx. ♄. G. Petals pink, hardly lined at the base. Stamens 10, short, erect, sometimes all fertile. Perhaps a hybrid.

Wax Stork's-bill. Fl. May, Dec. Shrub 3 to 4 feet.

122 P. MÓNSTRUM (Ait. hort. kew. 2. p. 424.) leaves orbicularly kidney-shaped, obsoletely lobed, slightly zonate, complicated, curled, pubescent on both surfaces; peduncles many-flowered; flowers aggregate; petals linear-cuneated. ♄. G. Cicònium mónstrum, Sweet, ger. 13. Flowers deep rose-coloured, of the 7 fertile stamens 2 are very short. Perhaps a hybrid.

Monstrous Stork's-bill. Fl. May, Oct. Clt. 1784. Shrub 2 to 4 feet.

123 P. MICRA'NTHUM (Sweet, ger. 295. under *Cicònium*,) stem shrubby, fleshy; leaves cordately-kidney-shaped, orbicular, sharply 5-lobed, crenated, pubescent; stipulas cordate, ciliated; umbels many-flowered; petals roundish-ovate, somewhat emarginate, half as long again as the calyx; nectariferous tube twice the length of the calyx. ♄. G. Flowers small, bright scarlet.

Small-flowered Stork's-bill. Fl. May, Oct. Clt.? Shrub 1 to 3 feet.

124 P. BENTINCKIA'NUM (D. C. prod. 1. p. 664.) leaves cordate, orbicular, bluntly 5-7-lobed, crenated, soft, velvety on both surfaces; umbels many-flowered, velvety; petals obovate, nearly equal; nectariferous tube 5-times longer than the calyx. ♄. G. Petals of an intense scarlet colour. Cicònium Bentinckiànum, Sweet, hort. brit. 85. Ger. crenàtum, var. mollifoliàtum, Andr. ger. icon.

Bentinck's Stork's-bill. Fl. May, Oct. Clt.? Sh. 2 to 4 ft.

125 P. FOTHERGÍLLII (Sweet, ger. t. 266. under *Cicònium*,) stem nearly erect, branched; leaves kidney-shaped, 5-lobed, crenated, zonate; stipulas cordate, oblong, acute, ciliated; peduncles very long; umbels many-flowered; petals obovate, veiny; nectariferous tube 3-times longer than the calyx. ♄. G. Petals striped with dark purple.

Var. α, coccíneum (Sweet, l. c. f. a.) flowers scarlet.

Var. β, purpùreum (Sweet, l. c. f. b.) flowers of a purplish rose-colour.

Fothergill's Stork's-bill. Fl. May, Oct. Clt.? Sh. 2 to 4 ft.

126 P. CRENA'TUM (Sweet, ger. t. 345. under *Cicònium*,) leaves broad, kidney-shaped, obsoletely lobed, coarsely crenated, pubescent; stipulas large, with wavy reflexed margins; umbels many-flowered; bracteas numerous, variable; petals wedge-shaped, upper ones much the smallest; nectariferous tube short, pedicellate, twice the length of the reflexed calyx. ♄. G. Ger. crenàtum, Andr. ger. icon. Petals bright-scarlet.

Crenate-leaved Stork's-bill. Fl. May, Oct. Sh. 2 to 4 feet.

A list of garden Hybrids belonging to the present section Cicònium.

1 *P. reticulàtum* (Sweet, ger. t. 143.) Flowers scarlet.
2 *P. æqualiflòrum* (Sweet, hort. brit. 84.) Flowers scarlet.
3 *P. oxyphýllum* (Sweet, hort. brit. 84.). Ger. miniàtum, var. álbum, Andr. ger. icon. Flowers white.
4 *P. bracteòsum* (D. C.) Flowers scarlet.
5 *P. glabrifòlium* (Sweet, ger. 363.) Flowers scarlet.

SECT. XII. POLYA'CTIUM (from πολυ, *poly*, many, and ακτιον, *action*, a ray; in allusion to the numerous flowers. D. C. prod. 1. p. 655.) Segments of calyx nearly equal, revolute. Petals 5, nearly equal, obovate. Stamens 10, 5 of which are antheriferous, the 4 lower ones are long and awl-shaped, the superior one broad and spatulate, reflexed at the apex, the fertile ones short and incurved at the apex. Petals all marked with a large dark-brown spot, hardly margined with yellow.

127 P. MULTIRADIA'TUM (Wendl. coll. with a figure) almost stemless; lower leaves pinnate, hairy, with pinnatifid segments; lobes oblong, obtuse, deeply toothed; upper leaves smoothish, bipinnatifid; umbels 20-30-flowered; nectariferous tube 4-times longer than the calyx. ♃. G. Root tuberous, Sweet, ger. 145. Petals black.

Many-rayed Stork's-bill. Fl. May, Ju. Clt. 1820. Pl. 1 ft.

Sect. XIII. Peri'stera (from *περιστερα, peristera*, a pigeon; leaves of most of the species resembling those of the Common Dove's-foot, *Ger. columbìnum*). D. C. prod. 1. p. 655. Petals nearly equal between themselves, and about the length of the calyx or a little longer. Stamens 10, the 5 longest ones nearly equal, antheriferous, the 5 alternate ones very short and sterile, toothformed. Caulescent herbs with the habit of *Geràmium* and *Eròdium*.

128 P. columbìnum (Jacq. schoenbr. 2. p. 4. t. 133.) many-stemmed, diffuse, procumbent; leaves cordate, roundish, many-parted; lobes trifid; lobules linear; peduncles many-flowered; flowers 4-anthered. 4. G. Ger. alceoìdes, Lin. spec. 948.? Petals purple, oblong-linear.

Dove's-foot-leaved Stork's-bill. Fl. June, Dec. Clt. 1795. Pl. procumbent.

129 P. procu'mbens (Pers. ench. 2. p. 229.) plant procumbent; leaves cordate, rather lobed, crenate, toothed; peduncles usually 2-flowered; flowers 4-anthered. 4. G. Ger. procúmbens, Andr. bot. rep. 254. Petals small, 2 superior ones white, 3 lower ones purple; all spotted in the middle.

Procumbent Stork's-bill. Fl. April, May. Clt. 1801. Pl. procumbent.

130 P. humifu'sum (Willd. enum. suppl. 47.) many-stemmed, procumbent; leaves cordate, somewhat 3-parted, or 5-lobed, toothed; peduncles 3-5-flowered; flowers 4-5-anthered. ⊙. H. Native of the Canary Islands. Jacq. ecl. 1. t. 99. Sweet, ger. t. 42. Ger. decúmbens, Balb. cat. hort. taur. 1813. app. 1. p. 11. Petals small, all spotted in the centre, 2 superior ones white, 3 inferior ones purplish.

Trailing Stork's-bill. Fl. April, Oct. Pl. trailing.

131 P. chamædryfòlium (Jacq. icon. rar. 3. t. 523.) much branched, procumbent; leaves elliptic, obtuse, covered with hoary pubescence, toothed; peduncles usually 2-flowered; flowers 5-anthered. 4. G. Petals white, length of calyx, marked with a blood-coloured patch in the middle.

Chamædrys-leaved Stork's-bill. Fl. May, June. Clt. 1812. Pl. procumbent.

132 P. austra'le (Willd. spec. 3. p. 657.) diffuse, procumbent; leaves cordate, rather lobed, villous beneath; peduncles many-flowered; flowers 5-anthered. 4. G. Native of New Holland. Jacq. ecl. 1. p. 149. t. 100. Petals rose-coloured, 2 superior ones spotted.

Southern Stork's-bill. Fl. May, Aug. Clt. 1792. Pl. procumbent.

133 P. glomera'tum (Jacq. ecl. 1. p. 146. t. 98.) stem suffruticose, diffuse; leaves cordate, ovate, obsoletely lobed, obtusely crenated, villous beneath; umbels many-flowered, crowded, petals rather larger than the calyx, nearly equal between themselves; nectariferous tube very short, nearly obsolete. 4. G. Native of New Holland. P. austràle, Sweet, ger. 68. but not of Willd. Ger. glomeràtum, Andr. ger. *icon.* P. austràle β, Willd. enum. 707. Petals white, 2 upper ones spotted with red.

Glomerate-flowered Stork's-bill. Fl. May, Aug. Clt. 1792. Pl. diffuse.

134 P. althæoìdes (Lher, ger. t. 10.) diffuse, procumbent; leaves cordate, ovate, villous, 3-lobed, toothed, upper ones sinuated; umbels many-flowered; flowers 5-anthered. 4. G. Jacq. coll. 4. p. 185. t. 21. f. 2. Ger. althæoìdes, Cav. diss. 4. t. 123. f. 2. Petals white, spotted with red in the middle, wedge-shaped, equal in length with the calyx.

Hollyhock-like Stork's-bill. Fl. April, June. Clt. 1724. Pl. procumbent.

Sect. XIV. Pela'rgium (from *πελαργος, pelargos*, a stork, see genus. D. C. prod. 1. p. 658. Pelargònium, Sweet, ger. no. 41.). Petals 5, unequal, 2 upper ones approximate. Stamens 10, unequal, 7 of which are antheriferous, 3 sterile ones awl-shaped.

Series I. *Isopetaloìdea* (from *ισος, isos*, equal, and *πεταλον, petalon*, a petal). D. C. prod. 1. p. 659. Petals nearly the same size and length.

* *Alchimilloìdea* (*plants with the habit of Alchimilla*). *D. C. prod. 1. p. 659. Stems herbaceous. Leaves cordate, palmately lobed. Petals small.*

135 P. inodòrum (Willd. hort. berl. t. 34.) stems herbaceous, diffuse; leaves cordately-ovate, obsoletely lobed, bluntly toothed, ciliated; umbels many-flowered, capitate; petals equal with the calyx as well as with each other. 4. G. Native of New Holland. Sweet, ger. t. 56. Lag. nov. spec. no. 272. Petals pale-purple, 2 superior ones marked with intense spots. Stamens all fertile, as in the rest of the New Holland species.

Scentless Stork's-bill. Fl. Mar. Aug. Clt. 1796. Pl. diffuse.

136 P. odoratíssimum (Ait. hort. kew. ed. 1. vol. 2. p. 419.) stem fleshy, short; branches herbaceous, long, diffuse; leaves roundish, cordate, soft; umbels usually 5-flowered. 4. G. Ger. odoratíssimum, Cav. diss. 4. t. 103. f. 1. Andr. ger. with a figure. Petals small, pale rose-coloured.

Very-sweet-scented Stork's-bill. Fl. May, Oct. Clt. 1724. Pl. diffuse.

137 P. grossularioìdes (Ait. hort. kew. 2. p. 42.) stems prostrate, tetragonal, very smooth; leaves cordate, roundish, deeply toothed; peduncles usually 2-flowered. 4. G. Ger. grossularioìdes, Lin. spec. 948. Cav. diss. 4. t. 119. f. 2. Flowers minute, pale flesh-coloured.

Gooseberry-like Stork's-bill. Fl. April, Aug. Clt. 1731. Pl. prostrate.

138 P. a'nceps (Ait. hort. kew. 2. p. 40.) stems decumbent, triquetrously 2-edged, smooth; leaves cordate, roundish, obsoletely lobed, toothed; umbels many-flowered. 4. G. Jacq. coll. 4. p. 184. t. 22. f. 3. Flowers small, larger than those of the foregoing species, reddish.

Two-edged-stemmed Stork's-bill. Fl. May, July. Clt. 1788. Pl. decumbent.

139 P. Acugna'ticum (Pet. Th. fl. acugn. p. 44. t. 13.) stems herbaceous, erect; leaves smooth, kidney-shaped, obsoletely lobed, dentately crenated; umbels many-flowered, capitate; petals length of the pilose, acuminated calyx. 4. G. Native of the island of Tristan d'Acugna. Petals wedge-shaped, red. P. clandestìnum of Lher. ger. ined. a native of New Zealand, is perhaps the same.

D'Acugna Stork's-bill. Fl. May, July. Clt. 1818. Pl. 1 ft.

140 P. clava'tum (Lher. ger. ined. no. 32.) stems herbaceous, erect, puberulous; leaves kidney-shaped, nearly undivided, pubescent, crenate-toothed; umbels many-flowered; nectariferous tube clavate, twice the length of the acuminated lobes of the calyx. 4. G.

Clavate-tubed Stork's-bill. Pl. 1 foot.

141 P. parviflòrum (Andr. ger. with a figure, under *Geràmium*,) plant prostrate; branches very slender; leaves cordate, slightly 5-lobed, crenated, obtuse, hairy; umbels many-flowered; petals all sublinear, nearly equal; nectariferous tube about the length of the calyx. 4. G. Flowers small, purplish-red.

Small-flowered Stork's-bill. Fl. May, July. Clt. 1800. Pl. prostrate.

142 P. di'stans (Lher. ger. ined. no. 35.) stems herbaceous, erect, tetragonal, smooth; leaves remote, roundish, 5-lobed, smooth, upper ones deeply jagged; umbels many-flowered, crowded, on long peduncles. 4. G.

Distant Stork's-bill. Pl. 1 foot.

143 P. tabula're (Lher. ger. t. 9.) stem ascending, pilose; leaves kidney-shaped, 3-5-lobed, obtuse, toothed at the apex,

smoothish; peduncles elongated, 2-4-flowered. ♃. G. Ger. tabulàre, Lin. spec. 947. but not of Burm. Ger. elongàtum, Cav. diss. 4. p. 233. t. 101. f. 3. Petals white, a little longer than the calyx. Leaves zonate.

Tabular Stork's-bill. Fl. May, Aug. Clt. 1775. Pl. diffuse.

144 P. PA'RVULUM (D. C. prod. 1. p. 660.) herbaceous, many-stemmed, erect; leaves pubescent, villous, cordate, 3-parted; lobes cut; peduncles usually 3-flowered; segments of calyx acute, pubescent. ⊙? H. P. nànum, Lher. ger. no. 41. but not of Sweet. Flowers small. Plant with the habit of *Erodium marítimum*.

Small Stork's-bill. Pl. ½ foot.

145 P. SENECIOÌDES (Lher. ger. t. 11.) stem herbaceous, erect; leaves bipinnatifidly jagged, smooth; peduncles generally 3-flowered; involucre and calyxes obtuse. ⊙. H. Flowers white, 2 superior petals spotted at the base.

Senecio-like Stork's-bill. Fl. June, Jul. Clt. 1775. Pl. ½ ft.

146 P. ALCHIMILLOÌDES (Willd. spec. 3. p. 656.) stem diffuse, villous; leaves cordate, palmately 5-lobed, villous; peduncles few-flowered; stigmas sessile. ♃. G. Ger. alchimilloìdes, Lin. vir. 345. Cav. diss. 4. t. 98. f. 1.

Alchimilla-like Stork's-bill. Fl. May, Oct. Clt. 1693. Pl. diffuse.

* * *Athamanthoídea (plants with the habit of Athamántha). D. C. prod. 1. p. 660. Stem suffruticose. Leaves pinnate or ternate; leaflets multifid.*

147 P. MI'NIMUM (Willd. spec. 3. p. 664.) stem hardly shrubby, erect; branches smooth; leaves pinnate; lower segments pinnatifid, upper ones linear-oblong, entire, and lobed; umbels many-flowered. ♄? G. Ger. minimum, Cav. diss. 4. p. 260. t. 121. f. 3. P. capnoìdes, Lher. ger. ined. no. 46.

Least Stork's-bill. Pl. ½ foot.

148 P. ATHAMANTHOÌDES (Lher. ger. ined. no. 47.) stem erect, hardly shrubby; branches rather herbaceous, angular; leaves clothed with cinereous tomentum, bipinnate, jagged; lobules linear-awl-shaped, acute; umbels compound. ♃? G.

Athamantha-like Stork's-bill. Pl. ½ foot.

149 P. ABROTANIFÒLIUM (Jacq. schœnbr. 2. t. 136.) stem suffruticose; leaves clothed with cinereous tomentum, palmately ternate; leaflets linear, trifid; umbels few-flowered; calyxes rather hispid. ♄. G. Ger. abrotanifòlium, Lin. fil. suppl. 304. Cav. diss. 4. p. 256. t. 117. f. 1. Corolla purplish.

Southernwood-leaved Stork's-bill. Fl. May, Aug. Clt. 1791. Shrub 1 foot.

150 P. FRUTICÒSUM (Willd. spec. 3. p. 689.) stem shrubby; leaves smooth, bipinnately decompound; lobes linear, acute; peduncles 2-flowered; nectariferous tube twice or thrice longer than the calyx. ♄. G. Ger. fruticòsum, Cav. diss. 4. p. 163. t. 122. f. 2. Petals oblong-cuneated, pale-violet, 2 superior ones largest.

Shrubby Stork's-bill. Shrub 1 foot.

151 P. INCÌSUM (Willd. spec. 3. p. 686.) stem shrubby; leaves ternate, dark-green; leaflets distant, 3-parted, and jagged; umbels 6-7-flowered; petals linear, flaccid; upper ones longest. ♄. G. Sweet, ger. 93. Ger. incìsum, Andr. bot. rep. 67. Petals white, 2 upper ones with a blood-coloured spot in the middle. Nectariferous tube nearly sessile.

Cut-leaved Stork's-bill. Fl. May, Aug. Clt. 1791. Shrub 1 to 3 feet.

152 P. CANE'SCENS (Sweet, ger. no. 93. in a note) stem shrubby; leaves ternate, canescent; segments aggregate, tripartitely-jagged, obtuse; petals linear, stiff, upper ones shortest; nectariferous tube pedicellate, 4-times the length of the calyx. ♄. G. Ger. incìsum, Andr. bot. rep. 67.? Very like the preceding. Petals white, upper ones spotted.

Canescent Stork's-bill. Fl. May, Aug. Clt.? Sh. 1 to 3 ft.

153 P. ARTEMISIÆFÒLIUM (D. C. prod. 1. p. 661.) stem shrubby; leaves smooth, bipinnately-decompound; lobes linear, acute; peduncles 1-2-flowered; nectariferous tube 5 times longer than the calyx. ♄. G. Petals linear, white, 2 superior ones marked with a linear red line. Burch. cat. afr. no. 2710. Very like *P. fruticòsum*.

Wormwood-leaved Stork's-bill. Fl. May, Aug. Clt. 1817. Shrub 1 foot.

154 P. RAMOSI'SSIMUM (Willd. spec. 3. p. 688.) stem shrubby, much branched; leaves pubescent, pinnate; leaflets distant, deeply-pinnatifid; umbels few-flowered; calyxes obtuse. ♄. G. Burm. afr. t. 34. f. 2. Ger. ramosíssimum, Cav. diss. 4. p. 260. Petals pale, 2 upper ones reflexed, as in *Hoárea*.

Much-branched Stork's-bill. Shrub 2 feet.

155 P. TENUIFÒLIUM (Lher. ger. t. 12.) stem fleshy, naked, erect; leaves hairy, bipinnately-decompound; lobes linear, awl-shaped; umbels many-flowered. ♄. G. Peduncles elongated, slender. Petals obovate-oblong, purple, 2 upper ones of a deeper colour.

Fine-leaved Stork's-bill. Fl. May, Aug. Clt. 1768. Shrub 1 to 2 feet.

156 P. HI'RTUM (Jacq. icon. rar. 3. t. 536. coll. 5. p. 144.) stem fleshy, scaly, decumbent; leaves hairy, bipinnately-decompound; segments linear, obtuse; umbels many-flowered. ♄. G. Sweet, ger. t. 113. Ger. hírtum, Cav. diss. 4. p. 258. t. 117. f. 2. Petals rose-coloured, 2 upper ones broadest, and spotted with purple. This species differs from *P. tenuifòlium* in the stem being decumbent, and in the lobes of the leaves being shorter.

Hairy Stork's-bill. Fl. April, Oct. Clt. 1768. Shrub decumbent.

157 P. CONFU'SUM (D. C. prod. 1. p. 661.) stem shrubby; leaves glaucous, smooth, decompound; segments wedge-shaped, deeply-toothed, lower ones divaricate; involucre many-leaved, and is ciliated, as well as the calyx. ♄. G. P. sanguíneum, Willd. enum. suppl. 48. but not of Sweet.

Confused Stork's-bill. Fl. June, Aug. Shrub 1 foot.

158 P. TRIPARTI'TUM (Sweet, ger. 115.) stem shrubby; leaves ternate, fleshy, deeply-toothed, glaucous; segments nearly sessile, wedge-shaped, middle one 3-parted and elongated; umbels many-flowered; nectariferous tube length of pedicel, but 3 times longer than the calyx. ♄. G. Petals cream-coloured, narrow, the two superior ones marked with an elongated purple spot at the base.

Var. α; umbels 3-flowered. P. tripartìtum, Willd. spec. 3. p. 683. P. trífidum, Jacq. schœnbr. 2. t. 134.

Var. β; umbels 5-6-flowered. P. frágile, Willd. spec. 3. p. 686. Ger. frágile, Andr. bot. rep. t. 37. G. tripartìtum, Sweet, ger. t. 115.

Three-parted-leaved Stork's-bill. Fl. May, Aug. Clt. 1789. Shrub 1 to 2 feet.

159 P. SPINÒSUM (Willd. spec. 3. p. 681.) stem shrubby; leaves wedge-shaped, trifid, toothed; petioles and stipulas permanent, spinescent; umbels compound, few-flowered. ♄. G. Paters. itin. ed. gall. t. 10. Flowers almost like those of the preceding species.

Spiny Stork's-bill. Fl. May, June. Clt. 1795. Shrub 1 to 2 feet.

* * * *Gibbòsa. Stem shrubby, fleshy. Leaves ternate or pinnate. Petals of dirty-yellowish brown.*

160 P. GIBBÒSUM (Willd. spec. 3. p. 684.) stem shrubby, fleshy, with tumid knots; leaves pinnate, with 1-2 pairs of segments and an odd one, obtuse, cuneated, deeply-toothed, terminal one trifid; umbels many-flowered. ♄. G. Sweet, ger. t. 61.

Ger. gibbòsum, Lin. spec. 946. Cav. diss. 4. t. 109. f. 1. Petals of a dirty greenish-yellow colour, sweet-scented in the evening.

Gibbous-stemmed Stork's-bill. Fl. May, Oct. Clt. 1712. Shrub 1 to 2 feet.

161 P. apiifòlium (Jacq. ecl. 1. t. 27.) stem shrubby, fleshy, thick; leaves pinnate, with wedge-shaped, pinnatifid leaflets, and jagged lobes; umbels many-flowered. ♄. G. Petals with a dirty-yellow margin, and dark-brown disk. Anthers 7, with the nectariferous tube hardly conspicuous.

Celery-leaved Stork's-bill. Shrub 1 to 2 feet.

* * * * *Trístia* (from *tristis*, sad; colour of flowers). *Plants almost stemless. Roots tuberous and fasciculately-tuberous. Leaves decompound, jagged, or undivided and lobed. Petals from yellow to dirty-brown.*

162 P. fla'vum (Ait. hort. kew, ed. 1. vol. 2. p. 418.) subcaulescent; leaves bipinnately-decompound, jagged, hairy; segments linear; umbels many-flowered. ♃. G. Sweet, ger. 254. Ger. daucifòlium, Murr. comm. goett. 1780. p. 13. t. 4. Cav. diss. 4. t. 120. f. 2. Ger. flàvum, Lin. fil. suppl. 257. Petals dirty-yellow, smelling at night.

Var. β. daucoìdes (Jacq. icon. rar. 3. t. 522.) lobes of leaves rather lanceolate; flowers pale-yellow, marked with red lines.

Yellow-flowered Stork's-bill. Fl. Jul. Oct. Clt. 1724. Pl. 1 ft.

163 P. millefolia'tum (Sweet, ger. 230.) plant nearly stemless; leaves decompound, smooth; leaflets jagged, with channelled, linear segments; umbels many-flowered; calyxes reflexed; nectariferous tube almost sessile, and 5 times longer than the calyx. ♃. G. Root tuberous, branching out into many tubers of different sizes and shapes. Petals of a dingy-brown colour, and darker in the centre.

Milfoil-leaved Stork's-bill. Fl. June, Oct. Pl. ½ foot.

164 P. appendicula'tum (Willd. spec. 3. p. 651.) stemless; leaves bipinnate, villous; lobes linear; stipulas adnate to the petioles, dilated and ovate at the apex; umbels many-flowered, hairy. ♃. G. Ger. appendiculàtum, Cav. diss. 4. p. 262. t. 121. f. 2. Corolla violet.

Appendiculate Stork's-bill. Pl. ½ foot.

165 P. filipendulifòlium (Sweet, ger. t. 85.) nearly stemless; leaves hairy, pinnate; leaflets bipinnate, with ovate-toothed, acutish segments; umbels many-flowered, rather hairy. ♃. G. P. tríste β, Sims, bot. mag. 1641. The flowers are the colour of those of *P. tríste*.

Dropwort-leaved Stork's-bill. Fl. May, Oct. Clt. 1812. Pl. 1 ft.

166 P. heracleifòlium (Sweet, ger. t. 211.) stemless; umbels many-flowered; lower leaves oblong, entire, and jagged; upper ones pinnatifid and pinnate, clothed with a kind of powdery pubescence, with the segments and leaflets oblong, obtuse, sinuately lobed, and with unequal, blunt teeth; nectariferous tube 3 times longer than the reflexed calyx. ♃. G. Root a hard woody tuber. Petals of a dull-greenish straw-colour, marked near the centre with 2 obscure, purplish spots.

Cow-Parsnip-leaved Stork's-bill. Fl. May, Oct. Clt. 1820. Pl. 1 foot.

167 P. tri'ste (Ait. hort. kew, 2. p. 418.) nearly stemless; leaves hairy, pinnate; leaflets pinnatifid, with linear, acute segments; umbels many-flowered. ♃. G. Delaun. herb. amat. t. 27. Ger. tríste, Corn. can. t. 110. Cav. diss. 4. t. 107. f. 1. Petals obovate-oblong, pale greenish-yellow, spotted with brown, fragrant in the evening.

Sad-flowered Stork's-bill. Fl. May, Oct. Clt. 1632. Pl. 1 ft.

168 P. schizope'talum (Sweet, ger. 232.) stem scaly; leaves ternate or trifid, obtuse, waved, hairy; lateral leaflets 2-lobed, intermediate ones large, hardly lobed, all toothed; umbels many-flowered; petals nearly equal, 2-parted, with the segments multifid; nectariferous tube 3 times longer than the calyx. ♄. G. Petals upper ones pale-yellow, lower ones brownish-purple. Root tuberous. Stem short.

Cut-petalled Stork's-bill. Fl. June, Oct. Clt. 1821. Pl. ½ ft.

169 P. loba'tum (Willd. spec. 3. p. 650.) nearly stemless; leaves cordate, tomentose beneath, bluntly 3-5-lobed, sinuately-toothed; scape subdivided; umbels many-flowered. ♃. G. Sweet, ger. 51. Ger. lobàtum, Cav. diss. 4. p. 250. t. 114. f. 2. Petals obovate-oblong, blackish, with the base and margins yellow. Stamens usually 6, rarely 9-10.

Lobed-leaved Stork's-bill. Fl. May, Oct. Clt. 1710. Pl. 1 ft.

170 P. pulverule'ntum (Sweet, ger. 3. t. 218.) nearly stemless; umbels many-flowered; scape rather branched; leaves roundish-cordate, somewhat lobed, crenated, clothed with powdery tomentum, fleshy; superior petals smallest, with 2 spots each. ♃. G. Root a tuber, covered with rough cracked skin. Petals 3, lower ones dark-velvety, with a yellowish margin; upper ones yellowish, with 2 dark velvety marks near the apex.

Powdery-leaved Stork's-bill. Fl. May, Aug. Clt. 1822. Pl. ½ foot.

171 P. pedicella'tum (Sweet, ger. 3. t. 250.) nearly stemless; leaves smooth, ciliated, fleshy, 5-7-lobed, toothed, reflexed at the apex; stipulas cordate, acute; umbels many-flowered; flowers on long pedicels; calyxes reflexed; petals nearly equal; nectariferous tube 5 times longer than the calyx. ♃. G. Root a tuber, covered with brown bark. Petals lower ones dark-purple, edged with pale-yellow, 2 upper ones pale greenish-yellow, marked with a bifid, purplish spot.

Pedicellate-flowered Stork's-bill. Fl. May, Aug. Clt. 1822. Pl. 1 foot.

172 P. lu'ridum (Sweet, ger. 3. t. 281.) leaves ovate, bluntly toothed or cut, smooth, or slightly pubescent; scape simple; umbels many-flowered, on very long pedicels; petals nearly equal, obovate, at length reflexed; nectariferous tube 5-times longer than the calyx; root large, tuberous, covered with wrinkled scaly bark. ♃. G. Ger. lùridum, Andr. ger. icon. P. huræfòlium, Sweet, in colv. cat. Petals straw-coloured, of a brownish-copper colour towards the apex.

Lurid-flowered Stork's-bill. Fl. Jul. Dec. Clt. 1811. Pl. 1 ft.

* * * * * *Fúlgido* (from *fulgido*, to be shining; brilliancy of flowers) *Stem short and rather fleshy. Leaves divided, cut, and toothed. Petals scarlet or blood-coloured.*

173 P. a'rdens (Sweet, ger. 45.) nearly stemless; leaves clothed with soft villi, cordate, ovate-oblong, ternate, or 3-5-lobed; lobes obtuse, sinuately-toothed; scape branched; umbels many-flowered. ♄. G. Lodd. bot. cab. 139. Ger. árdens, Andr. ger. icon. Petals obovate, fire-coloured. Nectariferous tube very long. Stamens usually 6. Said to be a hybrid between *P. lobàtum* and *P. fúlgidum*.

Glowing Stork's-bill. Fl. Mar. Aug. Clt. 1810. Sh. 1 to 2 ft.

174 P. sanguíneum (Wendl. coll. 2. p. 53. Sweet, ger. t. 76. but not of Willd.) stem fleshy, thick; leaves pilose, pinnate, with jagged, pinnatifid, decurrent leaflets, and linear-lanceolate lobes; umbels many-flowered; petals obovate, rather oblong. ♄. G. Flowers of an intense purplish-scarlet colour, on long pedicels.

Blood-coloured-flowered Stork's-bill. Fl. April, Aug. Sh. 1 ft.

175 P. fu'lgidum (Ait. hort. kew. 2. p. 422.) stem shrubby, fleshy; leaves ternate; leaflets sessile, wedge-shaped, deeply toothed, middle one largest, pinnatifid; umbels many-flowered, usually jointed; pedicels rather refracted after flowering. ♃. G. Sweet, ger. 69. Ger. fúlgidum, Lin. spec. 945. Cav. diss. 4. t. 116. f. 2. Flowers scarlet.

Shining-flowered Stork's-bill. Fl. Mar. Oct. Clt. 1723. Sh. 1 to 2 feet.

* * * * * * *Bicolòra. Stem suffruticose. Leaves lobed, hairy. Petals marked with a broad purple spot in the middle.*

176 P. BÍCOLOR (Ait. hort. kew. 2. p. 425.) stem suffruticose; leaves cordate, trifid, waved, hairy, obtuse, toothed; lateral segments 3-lobed, middle ones 5-lobed; stipulas kidney-shaped, entire; umbels crowded, many-flowered; calyx reflexed. ♄. G. Sims, bot. mag. 201. Sweet, ger. 97. Ger. bícolor, Jacq. hort. vind. 3. t. 39. Cav. diss. 4. t. 111. f. 1. Petals cuneate-oblong, distinct, sometimes pale, sometimes dark-purple. Sweet, ger. l. c. f. 2. with white margins.

Two-coloured-flowered Stork's-bill. Fl. July, Aug. Clt. 1778. Shrub 2 to 3 feet.

177 P. ELE'CTUM (Sweet, ger. 238.) stem much branched; branches slender, flexuous; leaves cordate, profoundly 3-lobed, smooth, serrately toothed; lobes cuneated, divaricate, spreading; intermediate one 3-lobed; stipulas cordate, acute; peduncles usually 3-flowered; nectariferous tube very rough, twice the length of the calyx. ♄. G. Ger. grandiflòrum, var. parvifoliàtum, Andr. ger. icon. Petals white, with 2 red spots at the apex of each, and with 2 branched lines at the base.

Elect Stork's-bill. Fl. May, Oct. Clt.? Shrub 1 to 3 feet.

178 P. IMBRICA'TUM (Sweet, ger. t. 65.) stem suffruticose; leaves cordate, waved, hairy, subtrifid; lobes obtuse, toothed, lateral ones bifid, terminal one lobed; stipulas kidney-shaped, toothed; umbels crowded, many-flowered. ♄. G. Petals obovate, imbricate, of the same colour as *P. bicolor.* Perhaps a hybrid.

Imbricate-petalled Stork's-bill. Fl. May, Aug. Clt. 1800. Shrub 1 to 3 feet.

* * * * * * * *Cortùsina (from the shape of the leaves being like those of Cortùsa). Stem suffruticose, fleshy. Leaves oblong, or usually cordate, rather cut. Stipulas lanceolate, spreading, acute. Roots tuberously fasciculate. Stamens 7-6, rarely 5.*

179 P. PA'LLENS (Sweet, ger. t. 148.) stem suffruticose, fleshy, decumbent; floriferous branches erect; leaves 3-parted, pilose, lateral segments smallest, lobately toothed, terminal one elongated, deeply toothed; umbels 4-5-flowered; petals spreading, lower ones oblong, upper ones somewhat spatulate; nectariferous tube very long. ♄. G. Ger. pállens, Andr. ger. icon. Petal from white to a cream-colour.

Pale Stork's-bill. Fl. May, Sept. Clt. 1800. Shrub 2 ft.

180 P. PULCHE'LLUM (Curt. bot. mag. t. 524. but not of Willd.) stem suffruticose, rather pilose; scape divided; leaves oblong, lobately-pinnatifid; umbels many-flowered; nectariferous tube slender, 3-times longer than the calyx. ♄. G. Sweet, ger. t. 31. Petals obovate, white, 2 upper ones with a small roundish spot in the middle, 3 lower ones lined with red.

Neat Stork's-bill. Fl. Mar. May. Clt. 1795. Shrub 2 ft.

181 P. PI'CTUM (Pers. ench. 2. p. 227.) nearly stemless; leaves cordate, oblong, rather runcinate, toothed, tomentose; scape branched; umbels many-flowered; involucre leafy. ♄. G. Ger. pictum, Andr. bot. rep. 168. Petals white, with a long red spot in the centre of each.

Painted-flowered Stork's-bill. Shrub 2 to 3 feet.

182 P. ECHINA'TUM (Curt. bot. mag. t. 309.) stem thick, fleshy; leaves ovate, cordate, rather lobed, crenated, villous beneath; stipulas permanent, spiny; umbels many-flowered; nectariferous tube slender, twice the length of the calyx. ♄. G. Sweet, ger. 154. P. hamàtum, Jacq. schoenbr. 2. t. 138. Petals oblong, somewhat cuneated, white; 2 superior ones with a red patch in the centre. Anthers 6.

Echinated-stemmed Stork's-bill. Fl. June, Oct. Clt. 1789. Shrub 1 to 2 feet.

183 P. ARMA'TUM (Sweet, ger. 3. t. 214.) umbels many-flowered, panicled; leaves cordate, 5-7-lobed, crenated, smooth above and shining, tomentose and many-nerved beneath; stipulas awl-shaped, permanent, spinescent, straight; stem straight, thick, and fleshy. ♄. G. Petals of a bright purple-colour, with a darker spot in the centre of each, upper ones obcordate, lower ones oblong and narrower.

Armed-stemmed Stork's-bill. Fl. March, July. Clt. 1789. Shrub 1 to 2 feet.

184 P. CRASSICAU'LE (Lher. ger. t. 26.) stem fleshy, branched, smooth; leaves kidney-shaped, rather acuminate, toothed, silky on both surfaces; umbels many-flowered: bracteas 4-times shorter than the pedicels; petals hardly emarginate. ♄. G. Anthers 5. Petals white (Sweet, ger. 2. t. 192. f. *a.*) or the 2 superior ones are spotted with red (Sweet, ger. 2. t. 192. f. *b.*)

Thick-stemmed Stork's-bill. Fl. Ju. Oct. Clt. 1786. Shrub 1 to 3 feet.

185 P. PRIMU'LINUM (Sweet, ger. no. 14. in a note) stem fleshy, branched, smooth; leaves kidney-shaped, rather acuminated, toothed, silky on both surfaces; umbels many-flowered; bracteas one-half shorter than the pedicels; petals obcordate. ♄. G. P. crassicaúle, Curt. bot. mag. t. 477. Anthers 7. Petals white, each with a blood-coloured spot in the middle. Flowers smelling like the primrose.

Primrose-scented Stork's-bill. Fl. Ju. Aug. Clt.? Sh. 2 ft.

186 P. CORTUSÆFÒLIUM (Lher. ger. t. 25.) stem thick, fleshy; leaves cordate, deeply lobed, waved, obtusely-toothed, pubescent; umbels many-flowered; nectariferous tube 4-times longer than the calyx. ♄. G. Sweet, ger. t. 14. G. cortusæfòlium, Andr. bot. rep. 121. Petals obovate, rather obcordate, from white to reddish; 2 superior ones lined at the base, 3 lower ones rather spotted in the middle.

Cortusa-leaved Stork's-bill. Fl. Ju. Oct. Clt. 1786. Sh. 2 ft.

187 P. RENIFÓRME (Curt. bot. mag. t. 493.) stem shrubby, flexuous, rather fleshy; leaves kidney-shaped, crenate-toothed, tomentose; umbels 3-6-flowered; stipulas permanent, dilated at the base; nectariferous tube nearly sessile, 3-times longer than the calyx. ♄. G. Sweet, ger. t. 48. Ger. renifórme, Andr. bot. rep. 108. Petals purple, rather spotted in the centre, obovate, retuse.

Kidney-shaped-leaved Stork's-bill. Fl. Jan. Dec. Clt. 1791. Shrub 1 to 2 feet.

* * * * * * * * *Pinguifòlia* (from *pinguis*, fat, and *folium*, a leaf; leaves fleshy;) *stem shrubby, fleshy, rather climbing; leaves peltate or cordate, 5-lobed, fleshy. Nectariferous tube length of pedicel. Stipulas broad-ovate.*

188 P. PINGUIFÒLIUM (Sweet, ger. t. 52.) stem shrubby; branches fleshy, diffuse, rather angular; leaves kidney-shaped, cordate, 5-lobed, rather crenate, fleshy, puberulous; lobes obtuse, mutic; umbels many-flowered. ♄. G. Ger. hederìnum flòre álbo, Andr. ger. icon. Petals obovate-oblong, pale rose-coloured, 2 superior ones spotted with purple. Perhaps a hybrid from *P. peltàtum* and *P. latéripes.*

Fat-leaved Stork's-bill. Fl. May, Oct. Clt.? Sh. straggling.

189 P. LATE'RIPES (Lher. ger. t. 24.) stem shrubby; branches fleshy, terete; leaves cordate, 5-lobed, rather toothed, fleshy, smooth; umbels many-flowered. ♄. ◡. G. Petals pale-purple, 2 upper ones marked with deeper lines oblongly-ovate.

Var. α, viridifòlium (Sweet, hort. brit. 83.) leaves green. Andr. ger. icon.

Var. β, zonàtum (Sweet, l. c.) leaves zonate.

Var. γ,ròseum (Sweet, l. c.) flowers rose-coloured.

Var. δ, albomarginàtum (D. C. prod. 1. p. 666.) leaves rather curled, edged with white.

Var. ε, Walnèri (D. C. prod. 1. p. 666.) leaves bluntly lobed;

umbels few-flowered. An intermediate plant between *P. latéripes* and *P. peltàtum*.

Side-stalked or Ivy-leaved Stork's-bill. Fl. June, Aug. Clt. 1787. Shrub straggling.

190 P. PELTA'TUM (Ait. hort. kew. 2. p. 427.) stem shrubby; branches fleshy, angular; leaves peltate, 5-lobed, quite entire, fleshy; umbels few-flowered. ♄. ◡. G. Ger. peltàtum, Lin. spec. 947. Cav. diss. 4. p. 232. t. 100. f. 1. P. peltàtum, Curt. bot. mag. t. 20. Flowers pale-purple.

Var. β, zonàtum (D. C. prod. 1. p. 666.) leaves zonate. Haw. pl. succ. p. 307.

Var. γ, variegàtum (Andr. ger. icon.) leaves edged with white or yellow.

Peltate-leaved Stork's-bill. Fl. May, Oct. Clt. 1701. Sh. cl.

191 P. SCUTA'TUM (Sweet, ger. t. 95.) stem shrubby; branches angular, puberulous, as well as the petioles; leaves fleshy, rather peltate, 5-lobed, glandularly-crenated, pubescent; umbels 7-8-flowered; petals spreading; antheriferous filaments 7, 2 of which are very short; nectariferous tube nearly sessile, 3-times longer than the calyx. ♄. ◡. G. Flowers white, 2 superior petals marked each with 2 branched lines of purple.

Saucer-leaved Stork's-bill. Fl. May, Oct. Clt. 1701. Sh. cl.

Series II. *Platypétala* (from πλατυς, *platys*, broad, and πεταλον, *petalon*, a petal). *The 2 superior petals are broader and shorter than the lower ones, very blunt.*

192 P. OVA'LE (Lher. ger. t. 28. but not of Burm.) stem suffruticose, twisted, slender, prostrate; branches, petioles, and peduncles hispid; leaves oval, acute, toothed, canescent; umbels usually 5-flowered, on long peduncles; nectariferous tube shorter than the calyx. ♄. G. Petals purplish, oblong-obovate, nearly equal, 2 superior ones broadest, lined with more intense purple. Stamens 7, fertile.

Oval-leaved Stork's-bill. Fl. May, Aug. Clt. 1774. Sh. 2 ft.

193 P. E'LEGANS (Willd. spec. 3. p. 655.) stem shrubby, erect; leaves elliptic-roundish, sharply serrated, obtuse, stiff, smooth; umbels usually 5-flowered; petals all obovate; nectariferous tube shorter than the calyx. ♄. G. Ger. élegans, Andr. bot. rep. t. 28. P. élegans, Sweet, ger. t. 36. Petals white, 2 superior ones marked at the base with intense branched lines. Stamens 7, fertile, with puberulous filaments.

Var. α, màjor (Sweet, ger. 36. f. *a*.).

Var. β, minor (Sweet, ger. t. 36. f. *b*.).

Elegant Stork's-bill. Fl. May, Aug. Clt. 1795. Sh. 1-2 ft.

Series III. *Anisopétala* (from ανισος, *anisos*, unequal, and πεταλον, *petalon*, a petal). *The 2 upper petals are longer and broader than the lower ones. Stems shrubby.*

§ 1. *Glaucescéntia. Leaves smooth or smoothish, and more or less glaucous.*

* *Petals white, the 2 superior ones usually spotted or lined with red.*

194 P. GLAU'CUM (Lher. ger. t. 29.) plant quite smooth and glaucous; leaves lanceolate, entire, acuminated; peduncles 1-2-flowered; nectariferous tube 5-times longer than the calyx. ♄. G. Sweet, ger. t. 57. Ger. glaúcum, Andr. ger. icon. Ger. lanceolàtum, Cav. diss. 4. t. 102. f. 2. Curt. bot. mag. t. 56. but not of Andr. Petals white, 2 superior ones roundish, with blood-coloured bases.

Glaucous Stork's-bill. Fl. Ju. Aug. Clt. 1775. Sh. 1 to 2 ft.

195 P. LANCEOLA'TUM (Andr. ger. icon. under *Geránium*,) smooth, branched, spreading, purplish; leaves oblong-lanceolate, or lanceolate, acuminated, green, quite entire; peduncles 1-flowered, axillary; nectariferous tube about 3-times longer than the calyx; petals obovately emarginate, lower ones rather spatulate. ♄. G. Petals white, upper ones marked with a branched, large purple spot, lower ones with 2 faint lines.

Lanceolate-leaved Stork's-bill. Fl. July, Aug. Clt. 1775. Shrub 1 foot.

196 P. DIVERSIFÒLIUM (Wendl. obs. p. 51.) smooth, glaucous; leaves lanceolate, quite entire or trifid, lower ones toothed; peduncles usually 1-flowered, panicled. ♄. G. Flowers like those of the preceding species. Leaves rather bearded at the apex.

Diverse-leaved Stork's-bill. Fl. June, Aug. Clt. 1794. Sh. 1 to 2 feet.

197 P. TRIFOLIA'TUM (Andr. ger. icon. under *Geránium*,) plant quite smooth, glaucous; leaves trifoliate; leaflets quite entire, linear, acuminated at both ends, lateral ones shortest; pedicels 1-flowered; stipulas linear-awl-shaped. ♄. G. P. lævigàtum, Lher. herb. and ger. ined. no. 91. but not of Willd. P. oxyphýllum, D. C. prod. 1. p. 667.

Trifoliate Stork's-bill. Shrub 1 to 2 feet.

198 P. CUSPIDA'TUM (Willd. enum. suppl. 47.) plant quite smooth, and glaucescent; leaves ovate, acute, glaucous, rather deeply and remotely serrated; peduncles usually 3-flowered. ♄. G. Very nearly allied to *P. glaúcum*, according to Willd. Flowers pale-red, 2 superior petals with 2 deep-purple branched lines at the base.

Cuspidate-leaved Stork's-bill. Fl. June, Aug. Shrub 1 to 3 feet.

199 P. SORÒRIUM (Willd. enum. suppl. 48.) plant quite smooth and glaucous; leaves deeply 3-parted, with hatchet-shaped segments, deeply serrated; peduncles 3-flowered. ♄. G. Said to be a hybrid between *P. grandiflòrum* and *P. glaúcum*. Petals pale-flesh-coloured, 2 upper ones painted with 2 branched, blood-coloured lines.

Sister Stork's-bill. Fl. June, Aug. Clt.? Shrub 1 to 2 ft.

200 P. LÆVIGA'TUM (Willd. spec. 3. p. 685.) plant quite smooth and glaucous; leaves trifid or ternate; segments trifid; wedge-shaped, with linear lanceolate lobes; peduncles usually 2-flowered. ♄. G. Ger. lævigàtum, Lin. fil. suppl. 306. Cav. diss. 4. t. 121. f. 1. Flowers white, with red lines.

Var. β, compósitum (Lher. ger. ined. no. 92.) leaves ternate, lateral segments undivided, middle ones 3-parted and somewhat pinnatifid; upper leaves trifid; nectariferous tube very long.

Smooth-trifid-leaved Stork's-bill. Fl. June, Aug. Clt.? Shrub 1 to 2 feet.

201 P. GRANDIFLÒRUM (Willd. spec. 3. p. 674.) plant smooth and glaucous; leaves 5-lobed, palmatifid, cordate at the base; lobes toothed towards the apex; peduncles 3-flowered; nectariferous tube 4-times longer than the calyx; petals 4-times longer than the calyx. ♄. G. Sweet ger. 29. Ger. grandiflòrum, Andr. bot. rep. t. 12. but not of Lin. Calyx and peduncles rather pilose. Petals white, 2 superior ones cuneately-obovate, striped with blood-colour at the base.

Var. β; flowers rose-coloured. This variety sometimes occurs in the gardens under the name of *P. nóbilis*.

Great-flowered Stork's-bill. Fl. May, Oct. Clt. 1794. Shrub 1 to 3 feet.

202 P. VARIEGA'TUM (Willd. spec. 3. p. 674.) plants smooth and glaucous; leaves 3-5-lobed, palmate-parted, with trifid toothed segments; stipulas ovate, cordate, acute; peduncles usually 2-flowered; nectariferous tube 5-times longer than the calyx; petals 3-times longer than the calyx. ♄. G. Ger. variegàtum, Lin. fil. suppl. 305. Cav. diss. 4. p. 251. t. 118. f. 3. The 2 superior petals are marked with branched, blood-coloured lines, the rest whitish.

Variegated-flowered Stork's-bill. Fl. May, Oct. Clt. 1812. Shrub 1 to 3 feet.

203 P. ALBIFLÒRUM (Spin. cat. 1818. p. 30.) plants smooth and glaucous; leaves 3-lobed; lobes obovate, acutely toothed at the apex; petioles, pedicels, and calyxes puberulous; peduncles 2-flowered; nectariferous tube as well as the upper petals about 3-times longer than the calyx. ♄. G. P. pàtulum, Spin. cat. Petals white, 2 upper ones striated, with blood-coloured lines. Perhaps a hybrid.

White-flowered Stork's-bill. Shrub 1 to 3 feet.

204 P. CÓLLÆ (Spin. cat. hort. 1818. p. 31.) plant glaucous and puberulous; leaves cuneated at the base, trifid; lobes acutely toothed; peduncles 4-5-flowered, and are, as well as the branches, hispid; nectariferous tube one-half shorter than the calyx; petals twice the length of the calyx. ♄. G. Petals white, 2 superior ones marked with branched, blood-coloured lines. Perhaps a hybrid.

Colla's Stork's-bill. Fl. June, Aug. Clt.? Sh. 1 to 3 feet.

205 P. BELLA'RDII (Spin. cat. hort. 1818. p. 30.) plant glaucous and hispid; leaves palmately 5-7-cleft; lobes acutely toothed; peduncles 4-10-flowered; nectariferous tube one-half shorter than the calyx; petals narrow, about twice the length of the calyx. ♄. G. Petals white, spotless.

Bellardi's Stork's-bill. Fl. June, May. Clt.? Sh. 1 to 2 ft.

** *Petals rose-coloured or violet, the 2 upper ones usually striped.*

206 P. PA'TULUM (Jacq. icon. rar. 3. t. 541. coll. 4. p. 187.) plant smooth and glaucous; leaves on very long petioles, cordately kidney-shaped, 3-5-cleft, toothed; peduncles 2-flowered; nectariferous tube 3-times longer than the calyx; petals lanceolate-wedge-shaped, 2 upper ones rather emarginate. ♄. G. Stamens 6, fertile. Petals rose-coloured, 2 upper ones marked with a blood-coloured circle.

Spreading Stork's-bill. Fl. April, July. Clt. 1812. Shrub 1 to 3 feet.

207 P. SANICULÆFÒLIUM (Willd. spec. 6. p. 673.) plant smooth and glaucous; leaves on long stalks, roundish, cordate, 5-cleft, toothed, zonate above; peduncles 4-5-flowered; nectariferous tube length of calyx; petals twice the length of the calyx. ♄. G. P. cortusæfòlium, Jacq. icon. rar. 3. t. 539. Ger. tabulàre, Burm. ger. t. 1. Cav. diss. 4. t. 100. f. 2. Ger. hederæfòlium, Dum. Cours. bot. cult. 4. no. 62. P. Hippocrèpis, Lher. ger. ined. no. 94. The 2 upper petals obovate, large, violet, striped with purple. The 3 lower ones pale rose-coloured, nearly linear.

Sanicle-leaved Stork's-bill. Fl. June, Sept. Clt. 1806. Shrub 1 to 3 feet.

208 P. HEPATICIFÒLIUM (Spreng. nov. prov. p. 31.) plant smooth and glaucescent; leaves deeply 3-lobed, concave, zonate above, rough beneath; lobes wedge-shaped, deeply-toothed; peduncles usually 2-flowered. ♄. G. Petals pale rose-coloured, 2 superior ones 3-lobed, 3 lower ones linear and whitish.

Hepatica-leaved Stork's-bill. Fl. May, Aug. Clt. 1791. Shrub 1 to 3 feet.

209 P. FUSCA'TUM (Jacq. icon. rar. 3. t. 340. coll. 4. p. 186.) plant glabrous and rather glaucous; leaves cordate, 5-lobed, toothed, glaucous beneath, younger ones zonate on the upper surface; uppermost ones somewhat 3-5-parted; peduncles 4-flowered; nectariferous tube length of calyx. ♄. G. Two superior petals obovate, broad, of an intense rose-colour, striped with purple, the 3 lower ones linear and pale rose-coloured.

Clouded-petalled Stork's-bill. Fl. May, Aug. Clt. 1812. Shrub 1 to 3 feet.

210 P. GHILÌNI (Spin. cat. 1818. p. 31.) plant rather glaucous and smooth; leaves somewhat wedge-shaped, 3-5-cleft; lobes ovate, acutely serrated, stiff; peduncles 4-flowered; nectariferous tube nearly equal in length to the calyx. ♄. G. Petals of a purple rose-colour, 2 upper ones lined.

Ghilini's Stork's-bill. Shrub 1 to 2 feet.

§ 2. *Lineàta. Flowers white or very pale rose-coloured. Two upper petals marked with intense red lines. Leaves ovate, undivided.*

211 P. BETU'LINUM (Ait. hort. kew. 2. p. 429.) leaves ovate, unequally serrated, smoothish; stipulas ovate-lanceolate; peduncles 2-4-flowered; nectariferous tube shorter than the calyx. ♄. G. Ger. betùlinum, Lin. spec. 964.—Burm. afr. t. 33. f. 1. and 2. Curt. bot. mag. 148. Petals white or rose-coloured, striped with blood-coloured veins.

Birch-leaved Stork's bill. Fl. May, Oct. Clt. 1759. Shrub 1 to 4 feet.

212 P. FORMOSÍSSIMUM (Pers. ench. 2. p. 231. Sweet, ger. 215.) umbels of several flowers; leaves ovate, acute, concave, stiff, rather lobed, unequally and cartilaginously toothed, truncate, many-nerved; bracteas ovate, rather shorter than the pedicels; nectariferous tube 3-times shorter than the calyx. ♄. G. P. formòsum, Desf. arbr. 2. p. 459. P. speciòsum, Andr. ger. icon. Petals all white, 2 upper ones sometimes furnished with 2 branched lines at the base of each.

Very-shewy Stork's-bill. Fl. My. Oct. Clt. 1800. Sh. 1 to 3 ft.

§ 3. *Tomentòsa. Petals white, narrow. Leaves cordate, tomentose. Stipulas spreading.*

213 P. TOMENTÒSUM (Jacq. icon. rar. 3. t. 537.) stem shrubby, fleshy; branches, leaves, and peduncles hairy-tomentose; leaves cordate, hastately 5-lobed, very soft; umbels many-flowered. panicled; nectariferous tube 3-times shorter than the calyx. ♄. G. Sweet, ger. 168. Petals white, coloured with short blood-coloured lines. Leaves smelling strong of peppermint.

Var. β, bicolòrum (D. C. prod. 1. p. 671.) 2 superior petals lilac, and marked with a branched spot, lower ones white, with a purple stripe in the middle.

Tomentose Stork's-bill. Fl. May, Aug. Clt. 1790. Shrub 1 to 3 feet.

214 P. RIBIFO'LIUM (Jacq. icon. rar. 3. t. 538. coll. 5. p. 141.) stem shrubby, fleshy; branches and peduncles pilosely-hispid; leaves cordate, hastately 5-lobed, scabrous; umbels many-flowered; nectariferous tube length of calyx. ♄. G. Petals and filaments white. Anthers orange-coloured.

Currant-leaved Stork's-bill. Fl. May, Aug. Clt. 1798. Shrub 1 to 3 feet.

215 P. ODORÍFERUM (Andr. ger. icon. under *Gerànium*,) very hairy and rough; leaves cordate, lobed unequally, and acutely toothed; umbels 2-3-flowered; nectariferous tube rather longer than the calyx; petals obcordate. ♄. G. Plant sweet-scented. Petals white, upper ones with red branched veins.

Odoriferous Stork's-bill. Fl. May, Oct. Shrub 1 to 3 feet.

§ 4. *Papilionàcea. Leaves cordate, flat, toothed, rarely lobed. Lower petals linear, upper ones purplish, streaked with darker lines.*

216 P. PAPILIONA'CEUM (Ait. hort. kew. 2. p. 423.) branches, leaves, and peduncles rather pilose; leaves cordate, roundish, angularly-toothed; umbels panicled, many-flowered; lower petals awl-shaped, linear, shorter than the calyx. ♄. G. Ger. papilionàceum, Lin. spec. 945. Cav. diss. 4. t. 112. f. 1.—Dill. hort. elth. 128. f. 155. P. papilionàceum, Sweet, ger. t. 27. Superior petals purplish, white at the base, and brownish in the middle; lower petals whitish.

Butterfly Stork's-bill. Fl. April, July. Clt. 1724. Shrub 1 to 3 feet.

217 P. staphysagroìdes (Sweet, ger. new series, t. 98.) stems erect, shrubby, rather branched; the whole plant villously pilose; leaves cordate, very soft, deeply 3-5-lobed, acute; lobes divaricate, unequally and sinuately-toothed; upper ones 3-lobed, with the lobes nearly entire; umbels many-flowered; petals cut at the apex; style pilose. ♄. G. Upper petals purple, with a darker patch near the apex, lower ones darkish-lilac.

Staves acre-like Stork's-bill. Fl. May, Aug. Clt. 1825. Shrub 1 to 2 feet.

218 P. corda'tum (Ait. hort. kew. 2. p. 427.) leaves cordate, acute, toothed, flat, hoary-pubescent beneath; branches and peduncles rather pilose; umbels many-flowered, panicled; lower petals awl-shaped, linear, acute, longer than the calyx; nectariferous tube a little shorter than the calyx. ♄. G. Ger. cordifòlium, Cav. diss. 4. t. 117. f. 3. P. cordàtum, Lher. ger. t. 22. P. cordifòlium, Curt. bot. mag. t. 165. Two lower petals pale-purple, with deeper branched lines, red at the claws, 3 upper ones whitish.

Cordate-leaved Stork's-bill. Fl. March, Aug. Clt. 1774. Shrub 1 to 3 feet.

§ 5. *Purpurascéntia. Leaves cordate or cuneated, toothed, undivided or lobed; lobes obtuse, never divided so far as the middle. Flowers purplish; lower petals oblong or obovate.*

219 P. cucylla'tum (Ait. hort. kew. 2. p. 426.) leaves kidney-shaped, cucullate, toothed, pubescent; branches and peduncles rather hispid; umbels 5-flowered; lower petals oblong; nectariferous tube shorter than the calyx. ♄. G. Seb. mus. 1. t. 26. f. 2. Ger. cucullàtum, Lin. spec. 946. Cav. diss. 4. p. 241. t. 106. f. 1. Flowers purplish-red, with darker veins.

Var. β, striatiflòrum (Sweet, hort. brit. 79.) petals striped. This variety is called *Prince Regent* in the gardens.

Var. γ, màjor (Sweet, l. c.) This is a fine variety. It is called *Royal George* in the gardens.

Var. δ, grandiflòrum (Sweet, l. c.) A fine large-flowered variety.

Hooded-leaved Stork's-bill. Fl. April, Nov. Clt. 1690. Shrub 2 to 4 feet.

220 P. cochlea'tum (Willd. enum. suppl. 48.) leaves orbicularly-ovate, rather cordate, concave, somewhat angular, serrated, pubescent; umbels 5-flowered; nectariferous tube length of calyx. ♄. G. P. concavifòlium, Hortul. Flowers purplish.

Shell-leaved Stork's-bill. Fl. April, Nov. Shrub 2 to 3 ft.

221 P. cardiifòlium (Sweet, ger. t. 15.) leaves cuneate, cucullate and plaited, somewhat 5-lobed, cartilaginously-toothed, many-nerved, pubescent; branches puberulous; umbels many-flowered; nectariferous tube twice the length of the calyx. ♄. G. Flowers pale-purple. The 2 superior petals are hardly larger than the rest, marked with a dark-purple spot in the middle of each, and rather lined.

Cockle-leaved Stork's-bill. Fl. April, Sept. Clt. 1816. Shrub 2 to 3 feet.

222 P. Broadle'yæ (Andr. ger. icon. under *Geràmium,*) pilose; lower leaves 5-lobed, upper ones 3-lobed; umbels many-flowered; nectariferous tube longer than the calyx; lower petals lanceolately-spatulate. ♄. G. Petals purple, upper ones with a dark centre.

Broadley's Stork's-bill. Fl. May, Aug. Shrub 2 to 3 feet.

223 P. acerifòlium (Lher. ger. t. 21. but not of Cav.) leaves cuneated at the base and entire, palmately 5-lobed at the apex, toothed, many-nerved, rather villous; branches and peduncles hairy; umbels usually 5-flowered; stipulas cordate, ovate; nectariferous tube a little shorter than the calyx. ♄. G. Ger. citriodòrum, Cav. icon. 1. p. 6. t. 8. Flowers pale-purplish.

Maple-leaved Stork's-bill. Fl. April, July. Clt. 1784. Shrub 2 to 3 feet.

224 P. macula'tum (Andr. ger. icon. under *Geràmium,*) leaves cuneated at the base, obsoletely 5-lobed, unequally-toothed, hairy; umbels several-flowered; nectariferous tube about the length of the calyx; petals nearly equal. ♄. G. Petals blush, 2 upper ones with a dark-purple centre.

Spotted-petalled Stork's-bill. Fl. May, Oct. Clt. 1796. Shrub 1 to 3 feet.

225 P. angulòsum (Ait. hort. kew. 2. p. 426.) leaves truncate at the base, rather cucullate, roundish, obtusely 5-lobed, toothed, pubescent; stipulas cordate, ovate, acuminated; branches and peduncles hispid; umbels numerous, 4-6-flowered; nectariferous tube one-half shorter than the calyx. ♄. G. Ger. acerifòlium, Cav. diss. 4. t. 112. f. 2. but not of Lher.—Dill. hort. elth. t. 129. f. 156. Flowers pale-purplish.

Angular-leaved Stork's-bill. Fl. June, Sept. Clt. 1724. Shrub 1 to 3 feet.

226 P. rugòsum (Andr. ger. icon. under *Geràmium,*) leaves cordate, 5-7-lobed, plicately-wrinkled, very hairy, of a brownish-colour, unequally-toothed; umbels 4-flowered; nectariferous tube shorter than the calyx; upper petals emarginate, lower ones ovate. ♄. G. Petals dirty-red, upper ones with 3 branched lines, and a spot at the end of these branched lines; lower petals with 3 simple lines.

Wrinkled-leaved Stork's-bill. Fl. May, Aug. Clt. 1800. Shrub 1 to 3 feet.

227 P. erube'scens (Spin. cat. 1809. p. 27.) leaves on long footstalks, rather villous, lobed, denticulated, rounded at the base, with the margins and nerves red; branches villous; umbels 4-5-flowered. ♄. G. Flowers like those of *P. acerifòlium*. Perhaps a hybrid.

Reddish-leaved Stork's-bill. Shrub 1 to 3 feet.

228 P. Barringto'nii (Willd. enum. 706.) leaves kidney-shaped, obtuse, cucullate, denticulated, pilose on both surfaces; umbels many-flowered. ♄. G. P. Tormánni, Dietr. beschr. gaertn. 3. Aug. 235. Flowers of a deep violet-colour.

Barrington's Stork's-bill. Fl. April, Oct. Shrub 1 to 3 ft.

229 P. ri'gidum (Willd. spec. 3. p. 681.) leaves roundish, truncate at the base, 3-lobed, obtuse, flat, rather scabrous, with curled denticulated margins; umbels many-flowered. ♄. G. Shrub stiff. Petals whitish, oblong, 2 superior ones coloured with 2 violet lines at the base.

Stiff-leaved Stork's-bill. Fl. May, Aug. Clt. 1790. Shrub 1 to 3 feet.

230 P. deco'rum (Sweet, ger. new series. t. 15.) leaves subcordate, rather trifid, stiff, sharply-serrated, glandularly-pilose both beneath and on the margins, reflexed at the apex, with acutely-lobed segments; stipulas ovate-lanceolate, acuminated, subcordate; umbels 2-3-flowered; petals obcordate; nectariferous tube about equal in length to the calyx. ♄. G. Petals pale-lilac, with a bright dark-purple patch in the centre, below which are some lines.

Shewy Stork's-bill. Fl. May, Aug. Clt. 1825. Shrub 1 to 3 feet.

231 P. semitri'lobum (Jacq. schœnbr. t. 130.) leaves truncate at the base, and somewhat cuneated, trifid, flat, hairy; lobes divaricate, serrated at the apex; peduncles usually 2-flowered; lower petals linear. ♄. G. Petals pale flesh-coloured, 2 superior ones striped with blood-colour at the base.

Half-three-lobed-leaved Stork's-bill. Fl. May, Aug. Clt. 1800. Shrub 1 to 3 feet.

232 P. vitifòlium (Ait. hort. kew. 2. p. 425.) leaves cordate, 3-lobed, rather scabrous, obtuse, toothed; stipulas broad-cordate; stem erect; umbels many-flowered; nectariferous tube 3 times shorter than the calyx. ♄. G. Ger. vitifòlium, Lin. spec. 947. Cav. diss. 4. t. 111. f. 2. Petals rose-coloured, 2 superior ones striped with dark-purple.

Vine-leaved Stork's-bill. Fl. April, Aug. Clt. 1724. Shrub 1 to 3 feet.

233 P. CAPITA'TUM (Ait. hort. kew. 2. p. 425.) leaves cordate, lobed, waved, villous, toothed; stipulas broad-cordate; stems diffuse; umbels many-flowered, capitate; nectariferous tube 3-times shorter than the calyx. ♄. G. Ger. capitàtum, Lin. spec. 947. Cav. diss. 4. p. 105. f. 1. Ger. ròsa, Hortul. Leaves smelling like the rose. Petals pale-purple, 2 superior ones lined.

Capitate-flowered Stork's-bill. Fl. April, Aug. Clt. 1690. Shrub 1 to 3 feet.

234 P. RU'BIDUM (Sweet, hort. brit. p. 87.) lower leaves cordate, and shortly 5-lobed, hairy; upper ones 3-lobed, rather cuneated at the base; umbels 4-flowered; nectariferous tube rather shorter than the calyx. ♄. G. Petals reddish-purple, upper ones streaked at the base. P. rùbens, Andr. ger. icon.

Reddish-flowered Stork's-bill. Fl. May, Oct. Shrub 1 to 2 ft.

235 P. RU'BENS (Willd. enum. suppl. 48.) leaves rather cordate, acute, 5-lobed, serrated; umbels 5-flowered, subcapitate; pedicels hardly longer than the involucre; nectariferous tube 4 times shorter than the calyx. ♄. G. Petals pale-violet, 3 lower ones bifid, marked with a simple blood-coloured line, 2 upper ones marked with 4 branched lines.

Red-flowered Stork's-bill. Fl. April, Oct. Shrub 1 to 3 ft.

§ 6. *Crîspa. Leaves lobed; lobes acutely-toothed at the apex.*

236 P. TRICUSPIDA'TUM (Lher. ger. t. 30.) leaves cuneated at the base, trifid; middle lobe stretched out, serrated, with the rib muricated beneath; peduncles 2-flowered; nectariferous tube length of calyx. ♄. G. Petals white, 2 superior ones spotted with purple. Perhaps a hybrid.

Tricuspidate-leaved Stork's-bill. Fl. April, Aug. Clt. 1780. Shrub 1 to 3 feet.

237 P. SCA'BRUM (Ait. hort. kew. 2. p. 430.) leaves cuneated at the base, trifid, scabrous; lobes lanceolate, loosely-serrated; peduncles 1-4-flowered; nectariferous tube shorter than the calyx. ♄. G. Jacq. icon. rar. 3. t. 542. Lher. ger. t. 31. Ger. scàbrum, Lin. spec. 946. Cav. diss. 4. t. 108. f. 1. Petals rose-coloured, 2 upper ones lined. Lateral lobes of leaves bifid.

Scabrous Stork's-bill. Fl. April, Oct. Clt. 1775. Shrub 1 to 3 feet.

238 P. HERMANNIFO'LIUM (Jacq. icon. rar. 3. p. 545.) leaves wedge-shaped, distich, scabrous, plicate, truncate at the apex, deeply-toothed; peduncles 2-flowered, short; nectariferous tube a little longer than the calyx. ♄. G. Ger. hermannifòlium, Lin. mant. 569. Berg, cap. 177. Petals white, hardly flesh-coloured, 2 superior ones lined at the base with 2 purple stripes.

Hermannia-leaved Stork's-bill. Fl. April, June. Shrub 1 to 3 feet.

239 P. CITRIODO'RUM (Andr. ger. icon. under *Gerànium*,) much branched, very slender; leaves small, cordate, lower ones 5-lobed, upper ones 3-lobed, with stiffer hairs on the margins and nerves; flowers solitary, terminal; nectariferous tube about the length of the calyx; upper petals obcordate. ♄. G. Petals white, 2 upper ones marked with red at the base.

Citron-scented Stork's-bill. Fl. May, Aug. Shrub 1 to 2 ft.

240 P. CRI'SPUM (Ait. hort. kew. 2. p. 430.) leaves distich, roundish, fleshy, rather cuneated at the base, trifid, wavedly-plicate, scabrous, toothed; peduncles usually 2-flowered; nectariferous tube length of calyx. ♄. G. Lher. ger. t. 33. Ger. crîspum, Lin. mant. 257. Cav. diss. 4. t. 109. f. 2. Leaves with the scent of balm. Petals purplish, 2 superior ones lined.

Curled-leaved Stork's-bill. Fl. June, Nov. Clt. 1774. Shrub 2 to 3 feet.

241 P. UNIFLO'RUM (Spreng. nov. prov. p. 32.) leaves 3-lobed, toothed, rather glaucous, shining above; peduncles 1-flowered, elongated; superior petals emarginate. ♄. G. Perhaps only a variety of *P. crîspum*.

One-flowered Stork's-bill. Fl. April, Aug. Shrub 1 to 3 ft.

242 P. EXSTIPULA'TUM (Ait. hort. kew. 2. p. 431.) leaves truncately-cordate, 3-lobed, toothed, hoary-velvety; stipulas almost wanting; peduncles 3-4-flowered; nectariferous tube 3 times longer than the calyx. ♄. G. Ger. exstipulàtum, Cav. diss. 4. t. 123. f. 1. Ger. suavèolens, Andr. ger. icon.—Lher. ger. t. 35. Petals pale-violet, upper ones lined.

Exstipulate-leaved Stork's-bill. Fl. May, Oct. Clt. 1779. Shrub 1 to 3 feet.

243 P. TERNA'TUM (Jacq. icon. rar. 3. t. 544.) leaves ternate, cucullate, scabrous; lobes wedge-shaped, deeply-serrated at the apex, middle one trifid; peduncles 1-2-flowered; nectariferous tube a little longer than the calyx. ♄. G. Sweet, ger. 165. Curt. bot. mag. 428. Ger. ternàtum, Lin. suppl. 306. Cav. diss. 6. t. 107. f. 2. Plant rather glaucous. Petals rose-coloured, 2 superior ones marked with blood-coloured lines.

Ternate-leaved Stork's-bill. Fl. May, Aug. Clt. 1789. Shrub 1 to 3 feet.

§ 7. *Rádula. Leaves parted beyond the middle; with the lobes either cut, toothed, or pinnatifid.*

244 P. QUERCIFO'LIUM (Ait. hort. kew. 2. p. 420. Lher. ger. t. 14.) leaves cordate, pinnatifid, with roundish recesses; lobes obtuse, crenated; branches and petioles hispid; umbels many-flowered; nectariferous tube rather longer than the calyx. ♄. G. Ger. quercifòlium, Lin. suppl. 306. Cav. diss. 4. t. 119. f. 1. Ger. terebinthinàceum, Murr. comm. goett. 1785. t. 4. Petals purplish rose-coloured; the upper ones lined. Leaves with a heavy scent.

Var. β, bipinnatîfidum (Lher. ger. t. 15.) leaves twice pinnatifid.

Oak-leaved Stork's-bill. Fl. March, Aug. Clt. 1774. Shrub 2 to 4 feet.

245 P. GRAVE'OLENS (Ait. hort. kew. 2. p. 423.) leaves palmately 7-lobed; lobes oblong, obtuse, toothed, with revolute margins; umbels many-flowered, rather capitate; nectariferous tube shorter than the calyx. ♄. G. Lher. ger. t. 17. Ger. terebinthinàceum, Cav. diss. 4. p. 250. t. 114. f. 1.

Var. β, variegàtum (Sweet, hort. brit. 82.) leaves striped. Ger. capitàtum var. Andr. ger. icon. Petals pale-purple.

Strong-scented or Odour of Rose Stork's-bill. Fl. April, Aug. Clt. 1774. Shrub 1 to 3 feet.

246 P. GLUTINO'SUM (Ait. hort. kew. 2. p. 426.) leaves cordate, hastately 5-angled, toothed, clammy, smoothish; umbels 2-4-flowered; nectariferous tube a little longer than the calyx. ♄. G. Lher. ger. t. 20. Curt. bot. mag. 143. Jacq. icon. rar. t. 131. Ger. glutinòsum, Cav. diss. 4. t. 108. f. 1. Ger. cratægifòlium, Roth, abh. t. 9. but not of Thunb. Petals pale rose-colour or white, with purple lines, superior ones marked with long spots. There is a variety with the leaves marked with black in the middle.

Clammy Stork's-bill. Fl. May, July. Clt. 1777. Shrub 1 to 3 feet.

247 P. VISCOSI'SSIMUM (Sweet, ger. t. 118.) leaves palmately 5-7-lobed, and are, as well as the stem, clammy; segments flat, sinuated or toothed, recurved at the top; umbels capitate, many-flowered; petals oblong, obtuse; calyxes very blunt; nectariferous tube a little longer than the calyx. ♄. G. Petals white and flesh-coloured, 2 upper ones lined with red.

Very-viscid Stork's-bill. Fl. March, Aug. Clt. 1820. Shrub 1 to 3 feet.

248 P. HI'SPIDUM (Willd. spec. 3. p. 677.) leaves palmatifid, tomentose, hispid; lobes acuminated, deeply-toothed; umbels panicled, many-flowered; nectariferous tube one-half shorter

than the calyx. ♄. G. Ger. híspidum, Lin. suppl. 303. Cav. diss. 4. t. 110. f. 1. Flowers small.

Hispid Stork's-bill. Fl. May, Sept. Clt. 1790. Shrub 1 to 3 ft.

249 P. RA'DULA (Ait. hort. kew. 2. p. 423.) leaves palmately-parted, scabrous; lobes narrow, pinnatifid, with revolute margins; segments linear; umbels few-flowered; nectariferous tube 3 times shorter than the calyx. ♄. G. Lher. ger. t. 16. Ger. Rádula, Cav. diss. 4. t. 101. f. 1. Ger. revolùtum, Jacq. icon. rar. t. 133. Petals pale-red, lined with darker veins.

Var. β, ròseum (Willd. spec. 3. p. 679.) segments of leaves linear-lanceolate. Leaves smelling like the rose. A hybrid between *P. Rádula* and *P. gravèolens*.

Rasp-leaved Stork's-bill. Fl. March, July. Clt. 1774. Shrub 2 to 4 feet.

250 P. BALSA'MEUM (Jacq. icon. rar. 3. t. 543.) leaves palmate-parted, rather scabrous, cuneated at the base; lobes lanceolate, remotely toothed; umbels few-flowered; nectariferous tube very short. ♄. G. Petals flesh-coloured, oblong, 2 superior ones rather spotted at the base.

Balsam-scented Stork's-bill. Fl. May, Sept. Clt. 1790. Shrub 1 to 3 feet.

251 P. A'SPERUM (Willd. spec. 3. p. 678.) leaves rather palmately-lobed, scabrous; lobes 5-7, oblong, obtuse, with curled denticulated margins; umbels usually 5-flowered, capitate; nectariferous tube shorter than the calyx. ♄. G. Ger. Rádula, Roth. abh. p. 51. t. 10. Bracteas of involucre large, ovate, acute. Petals flesh-coloured, 2 upper ones lined with red.

Rough-leaved Stork's-bill. Fl. May, Sept. Clt. 1795. Shrub 1 to 3 feet.

252 P. DENTICULA'TUM (Jacq. schœnb. 2. t. 135.) leaves palmate-parted, clammy, smooth; lobes linear, pinnatifid, repandly-toothed, flattish; umbels few-flowered; nectariferous tube very short; superior petals bifidly-emarginate. ♄. G. Petals oblong-cuneated, flesh-coloured, two superior ones spotted with red.

Toothletted-leaved Stork's-bill. Fl. May, Aug. Clt. 1789. Shrub 1 to 3 feet.

† *Species of Pelargònium not sufficiently known.*

* *Acaúlia. Stemless plants referable to Sections Hoárea and Dimàcria.*

253 P. ANGUSTIFO'LIUM (Thunb. fl. cap. ed. Schult. 2. p. 514. under *Geránium*,) stemless; leaves elliptic, entire, smooth, marginated; scape hairy, umbelliferous. 4. G. Petals linearly-obovate. Like *P. longifòlium*.

Narrow-leaved Stork's-bill. Pl. ½ foot.

254 P. ENSA'TUM (Thunb. l. c. under *Geránium*,) stemless; leaves ensiformly-obovate, hairy; umbel compound. 4. G. Petals white, obovately-lanceolate.

Sword-leaved Stork's-bill. Pl. ½ foot.

255 P. SETI'FERUM (D. C. prod. 1. p. 680.) stemless; leaves roundish, doubly serrated, pubescent beneath; umbel 2-flowered. 4. G. Ger. setòsum, Thunb. l. c. 517.

Bristle-bearing Stork's-bill. Pl. ½ foot.

256 P. SIDOI'DES (D. C. prod. 1. p. 680.) stemless; leaves cordate, orbicular, tomentose; scape bifid, umbelliferous. 4. G. Ger. sidæfòlium, Thunb. l. c. 518. Petals blackish-purple.

Sida-like Stork's-bill. Pl. ½ foot.

257 P. HETERO'LOBUM (D. C. prod. 1. p. 680.) stemless; leaves trifid and pinnate, beset with bristles beneath; scape bifid, furrowed; umbels many-flowered. 4. G. Ger. heterophýllum, Thunb. l. c. p. 515. Petals obovate, white.

Various-lobed-leaved Stork's-bill. Pl. ½ foot.

258 P. ARENA'RIUM (D. C. prod. 1. p. 680.) stemless; root long, perpendicular; leaves pinnatifid; lobes oblong, deeply-toothed; scapes 2-3, longer than the leaves; umbels 4-5-flowered. 4. G. Ger. arenàrium, Burm. ger. no. 65.—Cav. diss. 4. t. 259. Flowers reddish-purple.

Sand Stork's-bill. Pl. ½ foot.

259 P. TRI'LOBUM (Thunb. l. c. p. 519. under *Geránium*,) stemless; leaves pinnate, with 5 ovate, ciliated leaflets; umbels proliferous. 4. G. Petals obovate, blood-coloured.

Three-lobed-leaved Stork's-bill. Pl. ½ foot.

260 P. PLICA'TUM (Thunb. l. c. p. 526. under *Geránium*,) stemless; leaves tomentose, pinnate, with plicate leaflets; scape umbelliferous. 4. G. Petals pale flesh-coloured, larger ones marked with purple.

Plicate-leaved Stork's-bill. Pl. ½ foot.

261 P. ACAU'LE (Thunb. l. c. p. 526. under *Geránium*,) stemless; leaves somewhat bipinnatifid, hairy; scape umbelliferous. 4. G. Petals white.

Stemless Stork's-bill. Pl. ½ foot.

262 P. TOMENTE'LLUM (D. C. prod. 1. p. 680.) stem very short, shrubby; leaves bipinnate, tomentose; umbels somewhat 3-flowered. 4. G. Ger. tomentòsum, Thunb. fl. cap. 2. p. 527.

Tomentose Stork's-bill. Shrub ½ foot.

263 P. VILLI'FERUM (D. C. prod. 1. p. 680.) stem very short; leaves tripinnatifid, villous; umbels many-flowered. 4. G. Ger. villòsum, Thunb. l. c. p. 528. Like *P. hírtum*.

Villi-bearing Stork's-bill. Pl. ½ foot.

** *Herbaceous plants.*

264 P. APHANOI'DES (Thunb. l. c. p. 514.) leaves 5-parted, tomentose; lobes cut; peduncles elongated; umbels 4-5-flowered. 4. G. Allied to *P. alchimilloìdes*.

Aphanes-like Stork's-bill. Pl. ½ foot.

265 P. DONDIÆFO'LIUM (Link. enum. 1. p. 187.) stem and petioles hairy; leaves 5-lobed, acutely-crenated in front; pedicels very long; bracteas linear. 4. G. Lower leaves lobed, upper ones parted. Allied to *P. tabulàre*.

Dondia-leaved Stork's-bill. Pl. ½ foot.

266 P. EUPHRA'SEUM (Horn. hort. hafn. 2. p. 634.) leaves cordate, trifid, cut, crenated; petioles very long; peduncles few-flowered. 4. G.

Euphrasia-like Stork's-bill. Pl. ½ foot.

267 P. ACUMINA'TUM (Thunb. l. c. p. 526.) stem herbaceous, trigonal; leaves deeply-pinnatifid, smooth; peduncles 2-flowered. 4. G. Petals white or flesh-coloured, larger ones spotted with purple.

Acuminated-leaved Stork's-bill. Pl. ½ foot.

268 P. FLEXUO'SUM (Thunb. l. c. p. 526.) stem suffrutescent, erect; leaves trifid, tomentose; umbels somewhat trifid. ♄. G. Petals white, larger ones spotted with purple.

Flexuous-stemmed Stork's-bill. Pl. 1 foot.

*** *Shrubs with fleshy stems.*

269 P. TE'CTUM (Thunb. l. c. p. 525.) stem shrubby, fleshy; leaves deeply triternate, woolly; umbels many-flowered. ♄. G. Petals deep-purple.

Covered Stork's-bill. Shrub 1 foot.

270 P. PI'NGUE (Thunb. l. c. p. 527.) stem shrubby, fleshy; leaves pinnatifid, hairy; umbels many-flowered. ♄. G. Petals white.

Fat Stork's-bill. Shrub 1 foot.

**** *Shrubby species.*

271 P. ERYTHRÆ'UM (D. C. prod. 1. p. 681.) leaves oblong, serrated, tomentose; stem frutescent; peduncles alternate, usually 1-flowered. ♄. G. Ger. rùbens, Thunb. l. c. p. 515.

Red-flowered Stork's-bill. Shrub 1 to 3 feet.

272 P. ELLI'PTICUM (Thunb. l. c. p. 525.) stem shrubby; leaves elliptic, hoary; umbels usually 3-flowered. ♄. G. Petals blood-coloured.

Elliptic-leaved Stork's-bill. Shrub 1 to 2 feet.

273 P. SERRA'TUM (Thunb. l. c. p. 517.) caulescent, flexuous; leaves roundish, serrated, with scabrous veins; peduncles usually 1-flowered. ♄. G. Petals obovate, blood-coloured.

Serrated-leaved Stork's-bill. Shrub 1 foot.

274 P. LANA'TUM (Thunb. l. c. p. 518.) stem shrubby, hairy; leaves cordate, ovate, serrated, clothed with woolly tomentum beneath. ♄. G. Petals obovate, flesh-coloured, with a purple patch in the centre of each.

Woolly Stork's-bill. Shrub 1 to 2 feet.

275 P. SIDÆFO'LIUM (Willd. enum. 706.) leaves roundish-cordate, rather angular, mucronately-toothed; umbels usually 4-flowered. ♄. G. Flowers pale-violet. Allied to *P. speciòsum.*

Sida-leaved Stork's-bill. Shrub 1 to 2 feet.

276 P. TO'TTUM (Thunb. fl. cap. 2. p. 523.) stem shrubby, villous; leaves 5-parted, scabrous; lobes lacerately-toothed; umbels usually 4-flowered. ♄. G. Petals flesh-coloured, larger ones spotted with purple.

Hottentot Stork's-bill. Shrub 1 to 2 feet.

277 P. SPU'RIUM (Willd. enum. 709.) leaves kidney-shaped, rather distich, 3-lobed, obtuse, unequally-toothed, waved; peduncles 3-4-flowered. ♄. G. Corolla violaceous, the 2 superior petals lined. Nectariferous tube longer than the peduncle. Perhaps the same as *P. scàbrum.*

Spurious Stork's-bill. Fl. April, July. Shrub 1 to 3 feet.

278 P. PANICULA'TUM (Horn. suppl. 76. but not of Jacq.) leaves kidney-shaped, pubescent, 9-lobed; lobes rounded, mucronately-toothed; umbels many-flowered, in crowded panicles.

Panicled-flowered Stork's-bill. Shrub 1 to 3 feet.

279 P. SUAVE'OLENS (Desf. arbr. 2. p. 465.) villous; leaves cordate, roundish, curled, 5-lobed, sharply denticulated; peduncles many-flowered; pedicels short, and are, as well as the calyxes, very villous. ♄. G. Flowers purple. Allied to *P. crìspum.* Perhaps *P. suavèolens* of Horn. hort. hafn. 2. p. 640. is different from this.

Sweet-scented Stork's-bill. Shrub 2 to 4 feet.

280 P. HORNEMA'NNI (D. C. prod. 1. p. 681.) leaves cordately kidney-shaped, trifid, sharply-toothed, smooth, fleshy, cucullate; umbels 4-flowered. ♄. G. P. blándum, Horn. suppl. 76. but not of Sweet. Allied to *P. tricuspidàtum.*

Hornemann's Stork's-bill. Shrub 1 to 3 feet.

281 P. CASTELLIA'NUM (Spin. cat. 1818. p. 30.) leaves cuneated at the base, cucullate, angular, toothed, scabrous; branches and petioles hairy; umbels many-flowered. ♄. G. Petals pale rose-coloured, 2 upper ones roundish, with a dark-purple, branched mark at the base of each, lower ones linear, obtuse.

Castellian Stork's-bill. Shrub 1 to 3 feet.

282 P. GRA'TUM (Willd. enum. 710.) leaves trifid, unequally and acutely toothed, undulated, pilose; peduncles 2-4-flowered. ♄. G. Plant smelling like peppermint. Petals flesh-coloured, 2 upper ones obovate, retuse, painted with dark-purple lines, 3 lower linearly-cuneated.

Grateful-scented Stork's-bill. Fl. May, Aug. Shrub 1 to 3 ft.

283 P. NO'THUM (Willd. enum. p. 710.) leaves roundish-ovate, obtuse, rather trifid, conduplicate, undulately-toothed, rather pilose beneath; peduncles usually 2-flowered; segments of calyx erect. ♄. G. Very like *P. gràtum*, and allied to *P. crìspum.*

Counterfeit Stork's-bill. Fl. May, Aug. Shrub 1 to 3 feet.

284 P. CONSANGUI'NEUM (Willd. enum. 710.) leaves 3-lobed, flat, obtuse; lobes divaricate, unequally and sharply-toothed; peduncles usually 3-flowered. ♄. G. Like *P. gràtum*, but the leaves are scentless. Flowers flesh-coloured.

Kindred Stork's-bill. Fl. May, Aug. Shrub 1 to 3 feet.

285 P. PUBE'SCENS (Spin. cat. 1818. p. 32.) leaves 3-lobed, deeply toothed, pilose, with ciliated margins; branches, petioles, peduncles, and calyxes pilosely-pubescent; peduncles usually 5-flowered. ♄. G. Leaves smelling like the citron. Petals flesh-coloured, upper ones roundish, painted with purple, branched lines, lower ones linear.

Pubescent Stork's-bill. Shrub 1 to 3 feet.

286 P. CUNEA'TUM (Spin. cat. 1818. p. 32.) leaves rather villous, cuneated, 3-lobed, serrated; umbels few-flowered; petals about equal in length to the calycine lobes. ♄. G. Petals purple, upper ones roundish, lined with dark-purple, lower ones linear, obtuse.

Wedge-leaved Stork's-bill. Shrub 1 to 3 feet.

287 P. WILLDENÒWII (Link. enum. 2. p. 190. but not of Dietr.) leaves roundish, cuneated, 3-lobed, undulately-toothed; branches, petioles, and peduncles villous; umbels 3-4-flowered; nectariferous tube longer than the calyx. ♄. G. P. pulchéllum, Willd. suppl. 47. but not of Ait. Petals white, 3 lower ones oblong, 2 upper ones painted with a blood-coloured spot and lined with red.

Willdenow's Stork's-bill. Fl. May, Aug. Shrub 1 to 3 feet.

288 P. UNICOLÒRUM (Willd. enum. suppl. 48.) leaves roundish, cuneated, 3-lobed, acutely and undulately-toothed; branches, petioles, and peduncles pilose; umbels 4-flowered; nectariferous tube one-half shorter than the reflexed calyx. ♄. G. Flowers blood-coloured, 2 superior petals with darker veins.

One-coloured-flowered Stork's-bill. Fl. May, Aug. Shrub 1 to 3 feet.

289 P. ALNIFÒLIUM (Willd. enum. 710.) leaves elliptic, obtuse, floral ones obsoletely-trifid, unequally-toothed, rather cuneated at the base, quite entire; peduncles 1-4-flowered. ♄. G. Perhaps allied to *P. betulìnum.* Corolla flesh-coloured, the two superior petals broadest, and painted with dark-purple lines at the base.

Alder-leaved Stork's-bill. Fl. May, Aug. Shrub 1 to 3 ft.

290 P. AMPLI'SSIMUM (Willd. enum. suppl. p. 48.) leaves flat, quite smooth, semiorbicular, 7-lobed, serrated, cordate at the base; peduncles 2-5-flowered; nectariferous tube twice the length of the reflexed calyx. ♄. G. Corolla size and colour of *P. speciòsum.* Allied to *P. grandiflòrum.*

Very ample-flowered Stork's-bill. Fl. May, Aug. Shrub 1 to 3 feet.

291 P. EGRE'GIUM (Hort. belved. 71. Link. enum. 2. p. 195.) leaves ternate; leaflets pinnatifid, pubescent; stipulas ovate; umbels 3-flowered; nectariferous tube length of calyx. ♄. G. Petals scarlet.

Egregious Stork's-bill. Shrub 1 to 3 feet.

292 P. FRAGRANTI'SSIMUM (Link. enum. 2. p. 192.) leaves rounded at the base, lobed; middle lobes rounded, lateral ones acutish, all acutely-serrated; nectariferous tube 4 times shorter than the calyx. ♄. G. Petals purplish, marked with deeper branched lines. Stipulas ovate, reflexed.

Very-fragrant Stork's-bill. Shrub 1 to 2 feet.

293 P. LADA'NOMA (Hoffmans. in Dietr. nachr. 6. p. 68. ex Link. enum. 2. p. 192.) leaves roundish, somewhat lobed, acutely crenated; corolla lilac. ♄. G.

Ladanoma Stork's-bill. Shrub 1 to 3 feet.

294 P. MUNI'TUM (Burch. cat. geogr. no. 1240. voy. 1. p. 225.) smooth; leaves bipinnatifid; panicle dichotomous, furnished with lignescent spines. ♄. G.

Fenced Stork's-bill. Shrub 2 to 3 foot.

295 P. DIVARICA'TUM (Thunb. fl. cap. 2. p. 525.) stem shrubby, erect, smooth; leaves multifidly-pinnatifid, smooth; peduncles 1-flowered. ♄. G. Petals flesh-coloured, larger ones spotted with purple.

Divaricate Stork's-bill. Shrub 1 to 3 feet.

Cult. The tuberous rooted kinds, or those belonging to sections *Hoárea*, *Dimàcria*, and *Seymoúria* thrive best in an equal mixture of light turfy loam, peat, and sand; and when in a dormant state, require to be kept quite dry, which commences as soon as they have done flowering, and have ripened their seeds; after which time they require to be kept in a cool situation, out of the reach of frost, but as soon as they begin to push afresh, all the old mould should be shaken out of the pots, and from their roots; they should then be potted afresh in new mould. In potting them care must be taken not to bury the heart of the plants; after this they require a little water, and, as they grow, watered whenever they are dry, and if the pots get filled with roots they must be shifted into larger ones. The best method of increasing them is by the little tubers, which issue from the old bulbs, planted singly in small pots, with their tops above the surface, and kept dry until they begin to grow, when they should be watered. The commoner, free growing, shrubby kinds will thrive well in a rich loamy soil, or a mixture of loam and decayed leaves. The dwarfer woody kinds, as *P. tricolor*, *élegans*, and *ovàle*, thrive best in a mixture of loam, peat, and sand; the pots should be well drained with potsherds. The fleshy stemmed sorts succeed best in rather more than one-third of fine sand, the same quantity of turfy loam, and the remainder of peat; the pots also require to be well drained with pot-sherds, very little water is requisite when they are not in a vigorous state. Young cuttings of all the shrubby kinds strike root freely under hand-glasses, in the same kind of soil recommended for the plants, or in pots without being covered by glasses, placed in a shady situation. Many of the kinds may be increased by slips from the roots. No genus is more liable to sport into hybrids than *Pelargònium* by promiscuous impregnation. All the fine hybrid varieties in the gardens have been obtained by impregnating one sort with the pollen of another, by cutting out the anthers of the plant intended for the female parent before they burst, and impregnating the stigmas with the pollen of another. The object of this should be to obtain a superior variety; therefore particular attention should be paid to those plants intended for the parents, and more so to that intended for the male parent; for it has been observed that seedlings approach nearer to the male than the female parent. To grow geraniums in rooms, they require as much air and light as can possibly be given them, and watered regularly when dry; and when the leaves get dusty, to clean them well with a sponge and water.

VII. GRIE'LUM (from γραια, *graia*, old, grey; hoary aspect of plants). Lin. gen. 1235. Gært. fruct. 1. p. 180. t. 36. Sweet, ger. 171. D. C. prod. 2. p. 549.

Lin. syst. *Monadélphia*, *Decándria*. Calyx permanent, 5-cleft, with a short tube, rather concrete to the carpels. Petals 5, inserted in the tube of the calyx. Stamens 10, connate at the base; filaments permanent. Styles 5-10, short, capitate. Capsule of 5-10 closely concrete carpels, depressed at the apex; carpels verticillate, 1-celled, 1-seeded. Seeds inverse. Cotyledons leafy. Radicle oblique, superior.—Suffrutescent herbs, natives of the Cape of Good Hope, with dissected leaves, and large, solitary, axillary flowers. It is doubtful whether this genus really belongs to *Geràniàceæ*; the habits of the plants are like those of *Monsònia*, but the structure of the fruit and the seeds come nearer to *Neuràda*; both genera perhaps more properly belong to *Malvàceæ*, but De Candolle has placed them in *Rosàceæ*, where they form a separate section, called *Neuràdeæ*.

1 G. tenuifòlium (Lin. gen. 578.) leaves bipinnatifid, hoary, with linear, acutish, channelled segments; stem branched, diffuse. ♃. G. Native of the Cape of Good Hope. Gerànium grandiflòrum, Lin. spec. 2. p. 958. Cav. diss. 4. t. 75. f. 1. Monsònia tenuifòlia, Spreng. syst. 3. Grielum tenuifòlium, Burm. ger. 1. Sweet, ger. 171. Thunb. fl. cap. 509.—Burm. afr. 53. Petals obovate, crenated at the margins, yellow, with green bases. Root succulent.

Fine-leaved Grielum. Fl. Apr. May. Clt. 1790. Pl. prostrate.

2 G. humifu'sum (Thunb. fl. cap. 509.) leaves bipinnatifid,

tomentose, with linear, oblong segments; calyx tomentose. ♃. G. Native of the Cape of Good Hope. Flowers one-half smaller than those of the first species.

Trailing Grielum. Fl. April, May. Clt. 1825. Pl. prostrate.

3 G. LACINIA'TUM (Gært. fruct. 1. p. 180. t. 36.) stem tomentose; leaves unequally jagged, smooth above and shining, but tomentose beneath; segments linear-oblong, obtuse, channelled above; stipulas linear, acuminated, longer than the petioles; calyx densely tomentose, with acute segments. ♃. G. Native of the Cape of Good Hope. Root succulent. Flowers not half the size of those of the first species. Sweet, ger. t. 306. G. sinuàtum, Licht. ex Burch. voy. 1. p. 286.

Jagged-leaved Grielum. Fl. May, Aug. Clt. 1825. Pl. prostrate.

Cult. Mr. Sweet says the species of this genus thrive best in sandy gravel, and the pots must be well drained with potsherds, as nothing injures them more than too much wet; cuttings will root in the same kind of soil without glasses, in a shaded situation.

ORDER LV. TROPÆO'LEÆ (plants agreeing with *Tropæ'olum* in important characters). Juss. mem. mus. 3. p. 447. D. C. prod. 1. p. 683.

Calyx 5-parted, coloured, superior segment furnished with a free spur at the base; lobes sometimes free, sometimes joined together more or less. Petals 5, inserted in the calyx, and alternating with its lobes, unequal, irregular, 2 superior ones sessile and remote, fixed in the mouth of the spur, 3 lower ones unguiculate, smaller, sometimes abortive. Stamens 8; filaments free, closely girding the ovary, inserted in the disk; anthers terminal, oblong, erect, 2-celled, bursting by a double chink. Carpels 3, closely joined into a trigonal ovary. Styles 3, connected together into one, which is 3-furrowed. Carpels 3, adnate to the base of the style or axis of the fruit, 1-celled, 1-seeded. Seed large, without albumen, filling the cell, and conforming to the cavity. Embryo large; cotyledons 2, straight, thick, younger ones distinct, but at length closely connected together, and also adhering to the spermoderm, but rather distinct at the base; radicle lying within the process of the cotyledons, bearing 4 tubercles, which at length become radicles. Gært. fruct. 1. p. 380. t. 79. Rich. ann. p. 90. St. Hil. ann. mus. 18. p. 461. t. 24.—American herbs, with a hot taste like the cress, smooth, tender, diffuse and climbing. Leaves alternate, without stipulas, stalked, peltate, entire, lobed, or 5-7-parted. Peduncles axillary, 1-flowered. This order agrees with *Geraniàceæ* in the structure of the petals and calyx, but differs in the stamens being free, in not agreeing in number with the petals, as well as in the flowers being axillary, and in the structure of the fruit and seeds. It is curious that this is the only order in which the peculiar acrid flavour of *Cruciferæ* is found to exist. All the species are powerfully antiscorbutic. The flowers of all are handsome.

Synopsis of the Genera.

1 TROPÆ'OLUM. Calyx 5-parted, upper lobe furnished with a spur. Petals 5, 3 lower ones smallest or vanished. Stamens 8, free.

2 MAGALLA'NA. Calyx 5-lobed, spurred, 2 of the lobes deeply parted, the other 3 connected into a 3-toothed lobe. Petals 5, unequal. Stamens 8, connected at the base.

I. TROPÆ'OLUM (from τροπαιον, *tropaion*, which the Latins have changed to *tropæ'um*, a trophy; the leaves are of the form of a buckler, and the flowers resemble an empty helmet). Lin. gen. no. 466. D. C. prod. 1. p. 683.

LIN. SYST. *Octándria, Monogýnia.* Calyx 5-parted, upper lobe furnished with a spur. Petals 5, unequal, 3 lower ones smallest or vanished altogether. Stamens 8, free from the base. Carpels 3, somewhat erose, kidney-shaped, indehiscent, furrowed, roundish. Seed large, filling the cell.

§ 1. *Leaves peltate-nerved, entire or lobed.*

1 T. MINUS (Lin. spec. 490.) leaves peltate-nerved, orbicular, somewhat repand; nerves mucronate at the apex; petals each ending in a bristle-like point. ⊙. H. or ♃. G. Native of Peru. Curt. bot. mag. t. 98. Schkuhr. handb. t. 105. Nastúrtium I'ndicum, Dod. pempt. 397. Flowers deep-yellow, streaked with orange and red; these may be eaten in salads, as well as the leaves, and the fruit may be pickled and used like capers. Calyx coloured like the petals.

Var. β, *flòre-plèno;* flowers double. ♃. G. This is a beautiful plant.

Small Indian-cress. Fl. June, Oct. Clt. 1596. Pl. trailing and climbing.

2 T. MA'JUS (Lin. spec. 490.) leaves peltate-nerved, orbicular, somewhat 5-lobed; nerves not mucronate at the apex; petals obtuse. ⊙. H. or ♃. G. Native of Peru. Curt. bot. mag. t. 23.—Hern. mex. 161. with a figure.—Plench. icon. t. 294. Flowers larger than those of the foregoing species, yellow, darker on the inside at the base, and streaked with red and orange; these are frequently eaten in salads, as well as the leaves; they have a warm taste like the garden-cress, and hence the plant has its common name of *Nastúrtium;* they are likewise used for garnishing dishes. The seeds when green are pickled, and by some are preferred to most pickles for sauce, under the false name of capers. Elisabeth Christina, daughter of the celebrated Linnæus, we are informed by her father, observed the flowers of the great Indian-cress to emit spontaneously, at certain intervals, sparks like electric ones, visible only in the evening. If this be the case in this plant, it is probable the whole possess the property more or less.

Var. β, *flòre-plèno;* flowers double. ♃. G. This is a beautiful plant.

Great Indian-cress. Fl. June, Oct. Clt. 1686. Pl. trailing or climbing.

3 T. HY'BRIDUM (Lin. mant. 64.) leaves peltate-nerved, wedge-shaped, somewhat cucullate, 5-lobed; petals variable. ♃. G. A hybrid raised from the seeds of *T. màjus* in a garden at Stockholm. Flowers yellow, never perfect, therefore this plant has always been propagated from cuttings.

Hybrid Indian-cress. Fl. June, Oct. Clt.? Pl. trailing or climbing.

4 T. ADU'NCUM (Smith, tour, 1. p. 158.) leaves peltate-nerved, somewhat kidney-shaped, with 5-7-lobed, mucronate lobes; 2 upper petals lobed, mucronate, 3 lower ones smaller, fringed; spur hooked, about the length of the upper petals. ⊙. H. or ♃. ◡. G. Native of Peru and Mexico. T. peregrinum, Jacq. schœnbr. t. 98. Andr. bot. rep. t. 617. Ker. bot. reg. 718. Sims, bot. mag. t. 1351. H. B. et Kunth, nov. gen. amer. 5. p. 252. but not of Lin. Petals yellow, hardly longer than the calyx. This species is cultivated at Gibraltar in the open air, where it is called *Canary-bird* flower.

Hooked-spurred or Fringed-flowered Indian-cress. Fl. June, Oct. Clt. 1775. Pl. climbing.

5 T. Smi'thii (D. C. prod. 1. p. 684.) leaves peltate-nerved, palmate, deeply 5-lobed; petals all lobed and fringed; spur straight, twice as long as the corolla. ♃. G. Native of New Granada. T. peregrìnum, Lin. exclusive of the synonyme of Feuille, according to Smith in Rees' cycl. no. 4. Flowers yellow.

Smith's Indian-cress. Pl. cl.

6 T. dipe'talum (Ruiz et Pav. fl. per. 3. p. 77. t. 313.) leaves rather peltate-nerved, 5-7-lobed; lobes ovate, rather mucronate, glaucous beneath; petals 2, spatulate, crenulated. ♃. G. Native of Peru on the Andes, and of Brazil. St. Hil. pl. usu. bras. no.—Feuille, per. 2. t. 42? and hence this is probably the true T. peregrìnum of Linnæus, spec. 940. Flowers yellow. Root tuberous.

Two-petalled Indian-cress. Pl. cl.

7 T. bicolòrum (Ruiz et Pav. fl. per. 3. p. 77. t. 313.) leaves peltate-nerved, 7-lobed, transversely truncate at the base; petals cut, ciliated. ♃. ◡. G. Native of the Andes of Peru, in humid groves. The 2 upper petals small and yellow, the 3 lower ones larger, of a fine vermilion scarlet-colour. This is a very shewy species. Root tuberous.

Two-coloured-flowered Indian-cress. Pl. cl.

8 T. pube'scens (H. B. et Kunth, nov. gen. amer. 5. p. 251.) leaves peltate-nerved, obsoletely and acutely 5-lobed, truncate at the base, smoothish above, and pubescently-pilose beneath; petals lobately 2-awned, about equal in length to the calyx. ⊙. H. Native of Peru in woods, near Loxa. Flowers yellow.

Pubescent-leaved Indian-cress. Fl. June, Oct. Pl. cl.

9 T. cilia'tum (Ruiz et Pav. fl. per. 3. p. 77.) leaves peltate-nerved, 5-7-lobed; stipulas and bracteas ciliated; petals quite entire, about equal in length to the calyx. ♃. or ⊙. F. Native of Chili in woods. Flowers yellow.

Ciliated-stipuled Indian-cress. Pl. cl.

10 T. tuberòsum (Ruiz et Pav. fl. per. 3. t. 314.) leaves peltate-nerved, 5-lobed, transversely-truncate at the base, smooth; petals almost the length of the calyx. ♃. ◡. F. Native of Peru, among decayed rocks. Roots tuberous, depressed; these are eatable when boiled. Petals toothed according to Ruiz and Pavon, but according to H. B. et Kunth, nov. gen. amer. 5. p. 251. they are entire and yellow.

Tuberous-rooted Indian-cress. Clt. 1827. Pl. cl.

11 T. brachy'ceras (Hook. bot. Beech. voy. p. 14.) leaves peltate; segments 6-7, oblong-obovate, entire, sessile; petals cuneiform; segments of the calyx obtuse; spur very short and very blunt. ♃. F. Native of Chili. Common in bushy places on the mountains about Valparaiso. Root tuberous, fusiform? Plant weak.

Short-horned Indian-cress. Clt. 1828. Pl. cl.

12 T. tricolòrum (Sweet, fl. gard. 3. t. 270.) root tuberous; stem slender, climbing, branched; leaves peltately divided; segments 6-7, obovate, entire, cuspidate; petioles cirrhose; petals unguiculate, a little longer than the rather closed permanent calyx, obtuse, quite entire. ♃. F. Native of Chili at Coquimbo. Root tuberous, depressed. Calyx permanent, of an orange-scarlet colour, tipped with black, with a long straight spur. Petals yellow. This is the most shewy of all the species.

Three-coloured-flowered Indian-cress. Fl. June, Oct. Clt. 1828. Pl. cl.

13 T. pinna'tum (Andr. bot. rep. 8. t. 535.) leaves somewhat peltate; lobes obsolete; flowers pinnate; petals 5, wedge-shaped, toothed at the apex. ♃. G. Native of? Flowers yellow. This is a hybrid plant raised from the seeds of *T. màjus* in 1800.

Pinnate-flowered Indian-cress. Fl. June, Nov. Clt. 1800. Pl. cl.

§ 2. *Leaves peltately cut into leaflets to the base.*

14 T. pentaphy'llum (Lam. dict. 1. p. 605. ill. t. 277.) leaflets 5, ovate or ovate-lanceolate, entire, stalked; petals 2, sessile, acute, quite entire, shorter than the calyx. ♃. ◡. F. Native of Monte Video, Buenos Ayres, and Brazil in the province of Cisplatine. Root tuberous. Flowers yellow.

Five-leaved Indian-cress. Clt. 1826. Pl. cl.

15 T. tene'llum; leaves peltate; leaflets 5-6, obovate, mucronate; spur shorter than the calyx; petals 5, cuneiform, on long claws, all longer than the calyx, the segments of which are obovate. ♃. F. Native of Chili. Root tuberous. Petals pale-yellow, upper ones striped with dark streaks. A very slender plant. (v. s. herb. Lamb.)

Tender Indian-cress. Pl. cl.

16 T. leptophy'llum; leaves peltate; leaflets 7, linear, mucronate; segments of calyx ovate, acute; petals 5, bifid or trifid, crenulate, longer than the calyx; spur slender, tapering. ♃. F. Native of Chili at Santiago. Root tuberous. Stems slender. Petals yellow. (v. s. herb. Lamb.)

Slender-leaved Indian-cress. Pl. cl.

17 T. polyphy'llum (Cav. icon. 4. p. 65. t. 395.) leaflets 5-10, oblong or obovate, a little toothed, cuneated at the base; petals unguiculate, rather longer than the calyx, obtuse, quite entire. ⊙. ◡. G. Native of Chili on the Cordilleras. Flowers yellow.

Many-leaved Indian-cress. Fl. July, Oct. Clt. 1827. Pl. cl.

18 T. e'legans; leaves peltately and deeply 5-lobed; lobes obovate, lower ones smallest; segments of the calyx ovate-lanceolate, acute; petals spatulate, not much longer than the calyx. ♃. F. Native of Chili. Calyx apparently purple or red. Petals yellow. Root tuberous.

Elegant Indian-cress. Pl. cl.

Cult. All the species of *Indian-cress* are very shewy, therefore they are desirable plants in every collection. The greenhouse and frame species will thrive in any light rich soil, and cuttings will root freely if planted in the same kind of soil, under a hand-glass. The annual kinds should be sown in the open ground in April. In fact, all the species may be either increased by seeds or cuttings, whether said to be annual or perennial, because those species said to be annual are permanent, when protected from the frost in winter. The species are all climbing when supported, but if not they are prostrate. All the tuberous rooted kinds will grow well in a light soil in the open air, in a sheltered situation, all the summer, and in winter the roots may be taken up and kept in dry sand, until the spring, when they may again be planted out into the open ground.

II. MAGALLA'NA (in honour of the celebrated circumnavigator Ferdinand Magellan, or Magallanes in Portuguese, who was the first discoverer of Magellan). Cav. icon. 4. p. 50. D. C. prod. 1. p. 684.

Lin. syst. *Octándria, Monogýnia.* Calyx 5-lobed, spurred, 2 of which are profoundly parted, the other 3 are joined together into a 3-toothed one. Petals 5, unequal. Stamens 8, a little joined together at the base. Fruit 3-winged, 1-celled, and 1-seeded from abortion. Seed not sufficiently known. —A climbing annual plant, with ternate leaves, and yellow flowers.

1 M. porrifòlium (Cav. icon. 4. p. 51. t. 374.) ⊙. F. Native of South America at Port Desideratum. Climbing in hedges. Leaves divided into 3 linear entire leaflets.

Leak-leaved Magallana. Pl. cl.

Cult. The seeds should be sown in a pot of fine, light, rich earth in spring, and placed in a moderate hot-bed, and when the

plants are of sufficient size, they should be planted out into the open border, in a sheltered situation, where they will no doubt ripen their seed.

Order LVI. BALSAMI'NEÆ (plants agreeing with *Balsamìna* in important characters). A. Rich. dict. class. 2. p. 173. D. C. prod. 1. p. 685.—Impàtiens, Lin. gen. no. 1008.—Balsamìna, Tourn. inst. 418. t. 235. Juss. gen. 270. Gært. fruct. 2. p. 151. t. 113.

Calyx of 2 sepals; sepals small, deciduous, opposite, usually mucronate, imbricate in æstivation. Petals 4, hypogynous, cruciate, 2 outer ones alternating with the sepals, ending in a callous tip, upper one arched and emarginate, lower one entire, drawn out into a spur at the base; 2 inner petals alternating with the outer ones, more petal-like and equal with each other, usually bifid or appendiculate. Stamens 5, hypogynous, closely girding the ovary; filaments short, thickened at the apex; anthers rather connate, 3 lower ones opposite the petals, ovate, 2-celled, 2 superior ones rising in front of the upper petal; these are sometimes 1-celled, sometimes 2-celled. Anthers bursting lengthwise. Ovary 1. Style wanting; stigmas 5, distinct or connected into 1, sessile and short. Capsule oblong or ovate, 5-valved; valves separating with elasticity; central placenta ending in a slender thread, which adheres to the stigmas as in *Caryophýlleæ*, 5-angled; angles membranous, touching the intervalvular sutures, and therefore the young capsule is 5-celled, but 1-celled above the placenta. Seeds fixed to the placenta, pendulous, many in each cell, ovate-oblong, exalbuminous. Embryo straight, with a superior radicle. Cotyledons flat on the inside and convex on the outside. Tender herbs, with alternate or opposite, exstipulate, feather-nerved, toothed leaves. Peduncles axillary. M. de Candolle remarks that the flowers are those of *Fumariàceæ*, the capsules of *Oxalis*, the seeds of *Lìnum*, and the habit peculiar. The well-known elastic spring with which the seeds are ejected, constitutes a principal character of this order. It differs from *Tropæòleæ* in the calyx being of 2 sepals, in the structure of the corolla and capsule, and from *Oxalideæ* in the structure of flowers. All the species are remarkable for the singularity and varied colours of their blossoms.

Synopsis of the genera.

1 Balsami'na. Anthers 5, 2-celled. Stigmas 5, distinct. Valves of capsule bending inwards elastically at the apex. Peduncles 1-flowered.

2 Tytònia. Anthers and stigmas as in *Impàtiens*. Berry almost globular, 5-grooved, succulent, smooth, containing 5 hard, nut-like seeds, lapping over each other at both ends. Peduncles axillary, 1-3-flowered.

3 Impa'tiens. Anthers 5, 3 of which are 2-celled, and the 2 in front of the upper petal 1-celled. Stigmas 5, joined. Valves of capsule revolute, inwardly from the base to the apex. Peduncles axillary, branched, many-flowered.

I. BALSAMI'NA (from *balsamum*, balsam; Fuchs says this name is given because a balsam is made from the plant which is said to cure wounds; it is, however, called *balassan* by the Arabs, which is most likely to be the primitive of *Balsamìna*). Riv. irr. tetr. with a figure. D. C. prod. 1. p. 685.

Lin. syst. *Pentándria, Monogýnia.* Anthers 5, all 2-celled. Stigmas 5, distinct. Capsules ovate; valves at maturity bending inwards elastically at the apex. Cotyledons thick.—Pedicels always 1-flowered, solitary, or aggregate. Capsules puberulous. Flowers easily changed to double in the gardens.

§ 1. *Pedicels twin or aggregate. Leaves alternate.*

1 B. horte'nsis (Desp. dict. sc. nat. 3. p. 485.) pedicels aggregate; leaves lanceolate, serrated, lower ones opposite; spur shorter than the flower. ⊙. F. Native of the East Indies, China, Cochin-china, and Japan. Impàtiens balsamìna, Lin. spec. 1328. Mill. fig. t. 59. Blackw. t. 583. The varieties of this elegant plant, which cultivation has produced, are numerous, white, rose-coloured, red, purple, striped, and variegated with these colours, single and double of each. Mr. Miller speaks particularly of two remarkable varieties, which probably belong to one or other of the species. The first he calls the *Immortal Eagle*, a most beautiful plant, from the East Indies; the flowers of it are double, and much larger than those of the common kind, scarlet and white or purple and white, very numerous. The second kind he calls the *Cockspur*, introduced from the West Indies, which has single flowers as large as the other, but never more than semidouble, striped with red and white; this is apt to grow to a great size before it flowers, which is very late in the autumn, so that in bad seasons there will be hardly any flowers, and the seeds seldom ripen. Dr. Wallich found this species, or one very closely allied to it, on Chundrugiri and at Thankote in the East Indies. The Japanese are said to use the juice with alum for dyeing their nails red.

Common *Garden* Balsam. Fl. July, Oct. Clt. 1596. Pl. 1 to 2 feet.

2 B. coccínea (D. C. prod. 1. p. 685.) pedicels aggregate; leaves oblong-oval, serrated; petioles with many glands; spur incurved, about equal in length to the flower. ⊙. F. Native of the East Indies. Impàtiens coccínea, Sims, bot. mag. t. 1256. Flowers scarlet, streaked with white.

Scarlet-flowered Balsam. Fl. June, Sept. Clt. 1808. Pl. 1 to 2 feet.

3 B. cornu'ta (D. C. prod. 1. p. 686.) pedicels aggregate; leaves lanceolate, serrated; spur much longer than the flower. ⊙. F. Native of Ceylon and Cochin-china. Burm. zeyl. 41. t. 16. f. 1. Impàtiens cornùta, Lin. spec. 1328. Leaves dusky green, sweet smelling. Flowers purple or white, with the spur somewhat bowed. Capsules ovate, hispid. The Ceylonese call this species *Kudaelu-kola*, from *kudaelu*, a swallow, *kola*, a leaf. The inhabitants of Cochin-china use a decoction of the leaves as a wash to their head and hair, to which it gives a very sweet odour.

Horned Balsam. Fl. July, Sept. Clt. 1826. Pl. 1 foot.

4 B. Mysore'nsis (D. C. prod. 1. p. 686.) pedicels twin; leaves oblong-lanceolate, remotely-toothed; stem simple, filiform; spur straight, shorter than the flower. ⊙. F. Native of Mysore in the East Indies. Impàtiens Mysoréns is, Roth. in Rœm. et Schult. syst. 5. p. 348. Flowers small, red.

Mysore Balsam. Fl. July, Sept. Clt. 1820. Pl. $\frac{1}{2}$ to 1 ft.

5 B. scabriu'scula; plant villous; leaves cuneately-lanceolate, acute, with pointed serratures, tapering to the base; flowers axillary, twin, villous, spurless. ⊙. F. Native of the East Indies. Impàtiens scabriúscula, Heyne, in Roxb. fl. ind. 2. p. 404. This is a small branching species.

Roughish Balsam. Pl. 1 foot.

§ 2. *Pedicels aggregate. Leaves opposite.*

6 B. oppositifòlia (D. C. prod. 1. p. 686.) pedicels aggregate; leaves lanceolate, serrated; spur shorter than the flower. ⊙. F. Native of Ceylon, in sandy places. Impàtiens oppositifòlia, Lin. spec. 1328. Rheed. mal. 9. t. 31. Flowers small, purplish-blue.

Opposite-leaved Balsam. Pl. 1 foot.

7 B. heterophy'lla; pedicels aggregate; leaves linear, very long, rounded at the base, remotely and cuspidately serrated; spur much longer than the flower. ⊙. F. Native of the East Indies, bordering on the district of Silhet. Impàtiens heterophýlla, Wall. fl. ind. 2. p. 458. Leaves 6 inches long. Flowers large, purplish, with the 2 lateral petals 2-lobed, outer lobe extremely large.

Variable-leaved Balsam. Pl. 2 feet.

8 B. fasciula'ta (D. C. prod. 1. p. 686.) pedicels aggregate, shorter than the leaves; leaves lanceolate. ⊙. F. Native of Malabar. Impàtiens fasciculàta, var. *α*. Lam. dict. 1. p. 359.—Rheed. mal. 9. p. 93. t. 47. Flowers pale-red, with an awl-shaped, green spur.

Fascicled-flowered Balsam. Pl. 1 *to 2 feet.*

9 B. Tìlo (D. C. prod. 1. p. 686.) pedicels aggregate, truly deflexed after flowering, 3-times shorter than the leaves; leaves ovate-lanceolate, acute, tapering to the base; spur incurved. ⊙. F. Native of Malabar. Impàtiens fasciculàta *β*, Rœm. et Schult. syst. 5. p. 349.—Tìlo, Rheed. mal. 9. p. 93. t. 49. Flowers pale, with an incurved, green spur.

Tilo Balsam. Pl. 1 to 2 feet.

10 B. mi'nor (D. C. prod. 1. p. 686.) pedicels aggregate, truly deflexed after flowering, 4-times shorter than the leaves, about the length of the spur; lower leaves ovate, stalked, upper ones ovate-lanceolate, tapering to the base. ⊙. F. Native of Malabar. Impàtiens fasciculàta, var. *γ* and *δ*, Rœm. et Schult. syst. 5. p. 349.—Rheed. mal. 9. t. 50. and 51. Flowers whitish, with a straight greenish spur.

Smaller Balsam. Fl. July, Sept. Clt. 1817. Pl. $\frac{1}{2}$ to 1 foot.

§ 3. *Pedicels solitary. Leaves alternate.*

11 B. latifòlia (D. C. prod. 1. p. 686.) pedicels usually solitary, shorter than the leaves; leaves ovate, crenated, rather pilose; spur longer than the flower. ⊙. F. Native of the East Indies. Impàtiens latifòlia, Lin. spec. 1328.—Rheed. mal. 9. t. 48. Flowers pale-red, about the same size as those of the common balsam.

Broad-leaved Balsam. Fl. Jul. Sept. Clt. 1818. Pl. 1 to 2 ft.

12 B. Leschenau'ltii (D. C. prod. 1. p. 686.) pedicels shorter than the leaves; leaves smooth, oval, taper-pointed at both ends, crenated, lower teeth acute, glandular; spur about the length of the flower. ⊙. F. Native of Ceylon. Flowers red, about the size of those of the last species.

Leschenault's Balsam. Pl. 1 foot.

13 B. bífida (D. C. prod. 1. p. 686.) pedicels solitary; leaves oblong, serrated, stalked; spur very long, bifid. ⊙. F. Native of the Cape of Good Hope. Impàtiens bífida, Thunb. fl. cap. 2. p. 54. Flowers red?

Bifid-spurred Balsam. Fl. June, Sept. Clt. 1820. Pl. 1 ft.

14 B. Cape'nsis (D. C. prod. 1. p. 686.) pedicels capillary; leaves stalked, ovate, crenated, with the notches bearing hairs; spur longer than the flower. ⊙. F. Native of the Cape of Good Hope in woods. Impàtiens Capénsis, Thunb. fl. cap. 2. p. 54. Flowers red?

Cape Balsam. Fl. June, Sept. Clt. 1818. Pl. 1 foot.

15 B. móllis; upper part of plant soft, villous; pedicels filiform, half the length of the leaves; leaves lanceolate, acuminated, with gibbous, cuspidate serratures; spur length of flower, with the end incurved. ⊙. F. Native of the East Indies on Sheopore, in rich moist shady situations. Impàtiens móllis, Wall. fl. ind. 2. p. 461. Flowers large, purple, nodding.

Soft Balsam. Fl. July, Aug. Pl. 2 to 3 feet.

§ 4. *Pedicels solitary. Leaves opposite.*

16 B. rosmarinifòlia (D. C. prod. 1. p. 686.) pedicels shorter than the leaves; leaves linear; spur short, rather recurved at the end. ⊙. F. Native of Ceylon. Impàtiens rosmarinifòlia, Retz. obs. 5. p. 29. no. 79. Bert. amœn. p. 20. Leaves with spinulose serratures. Flowers small, purplish.

Rosemary-leaved Balsam. Pl. 1 foot.

17 B. mu'tila (D. C. prod. 1. p. 686.) pedicels usually solitary; leaves lanceolate, serrated; spur cucullate, blunt, mutilated. ⊙. F. Native of and cultivated in Cochin-china. Impàtiens mùtila, Lour. cochin. 512. Flowers scarlet.

Mutilated-spurred Balsam. Pl. $1\frac{1}{2}$ foot.

18 B. cochlea'ta (D. C. prod. 1. p. 686.) pedicels usually solitary, elongated; leaves oblong, somewhat serrated; spur twisted, compressed; root creeping. ⊙. F. Native of China, and cultivated about Canton. Impàtiens cochleàta, Lour. fl. cochin. 512. Flowers beautiful scarlet. Stem red, almost destitute of branches.

Twisted-spurred Balsam. Pl. 1 foot.

19 B. Chine'nsis (D. C. prod. 1. p. 686.) pedicels longer than the leaves; leaves ovate; spur greatly arched; stem branched. ⊙. F. Native of China. Impàtiens Chinénsis, Lin. spec. 1328. Stem red. Flowers reddish-purple.

Chinese Balsam. Fl. July, Sept. Clt. 1824. Pl. 1 foot.

20 B. pube'rula; peduncles 1-flowered, deflexed after flowering; leaves elliptical, pointed at both ends, serrated, younger ones as well as the stem rather scabrous, from rough down. ⊙. F. Native of Nipaul. Impàtiens pubérula, D. C. prod. 1. p. 687. Flowers large, purplish.

Puberulous Balsam. Pl. 1 to $1\frac{1}{2}$ foot.

Cult. The seeds of these plants should be sown on a moderate hot-bed in spring, and when the plants are about 2 or 3 inches high they should be planted into separate small pots, taking care to shade them until they have taken fresh root, replacing them in the hot-bed, after which they should have a moderate share of free air admitted to them when the weather is favourable, to prevent their being drawn up tall and weak; they should then be shifted from size to size of pots, until the plants have grown the size required, and when in flower, they may be placed in the greenhouse, where they will make a very shewy appearance, and seed freely. Some may be planted out, when young, in the open border in a sheltered situation, where they will flower, if the summer proves favourable. A light, rich soil, or a mixture of loam, peat, and sand, suits them best. Balsams are all shewy flowering plants, and are worth cultivating for the sake of decorating greenhouses when the greenhouse plants are set out in the open air. Those grown in pots require to be often refreshed with water.

II. TYTO'NIA (in honour of Arthur Tyton, F.L.S. by whose care many of the oldest inhabitants of our gardens are preserved, and more particularly many of those plants which were cultivated by Miller, which do not now exist in any collection but his own).

Lin. syst. *Pentándria, Monogýnia.* Anthers 5, 3 of which are 2-celled, and the 2 in front of the upper petal 1-celled. Stigmas 5, joined together. Flowers with a remarkable gibbous spur. Berry almost globular, 5-grooved, succulent, smooth, red, size of a cherry, containing 5 hard, nut-like, obliquely-oblong seeds, lapped over each other at both ends. Peduncles axillary, solitary, 1-3-flowered. Leaves opposite and alternate.

1 T. na'tans; peduncles 3-flowered; leaves alternate, linear-

lanceolate, serrated; spur very short, gibbous. ⊙. S. W. Native of the East Indies, in ponds and ditches, &c. of sweet water. Stem piped, all the parts that grow in or float on the water bending in various directions, the parts above the water are erect and branchy, the former is jointed and emit roots from the joints. Flowers large, very beautifully variegated with red, white, and yellow. When in flower this is one of the most elegant water-plants. Impàtiens nàtans, Willd. spec. 1. p. 1175.

Floating Tytonia. Fl. July, Sept. Clt. 1810. Pl. floating in water.

2 T. MADAGASCARIE'NSIS; pedicels solitary, much shorter than the leaves; leaves opposite, oval, crenated; spur gibbous, almost wanting; stem simple. ⊙. S. W. Native of Madagascar, in ditches and ponds. Balsamìna Madagascariénsis, D. C. prod. 1. p. 686. Flowers small, float.

Madagascar Tytonia. Fl. July, Sept. Clt. 1824. Pl. float.

Cult. This is a beautiful genus of water-plants, worth cultivating in every collection. They should be grown in large pots or pans of water in a rich loamy soil, and placed in a warm part of the stove or in a hot-bed. The seeds should be sown in spring.

III. IMPA'TIENS (from *impatiens*, impatient; a metaphorical name given to these plants because of the elasticity of the valves of the capsule when touched, which throw out the seed with great force). Riv. irr. tetr. with a figure. D. C. prod. 1. p. 687.

LIN. SYST. *Pentándria, Monogýnia.* Anthers 5, 3 of which are 2-celled, and the 2 in front of the upper petal are only 1-celled. Stigmas 5, joined together. Capsules prismatically terete, elongated, with the valves curling inwards from the base to the top, and expelling the seeds when touched.—Peduncles axillary, branched, many-flowered. Capsules smooth. Leaves alternate, very rarely opposite.

§ 1. *Peduncles bearing from 2-5, but usually 3 flowers, axillary.*

1 I. TRIFLÒRA (Willd. spec. 1. p. 1175.) peduncles 3-flowered, very short; leaves linear-lanceolate, very long; spur arched, longer than the flower and pedicel. ⊙. F. Native of Ceylon, in dry sandy places.—Burm. zeyl. p. 41. t. 16. f. 2. Flowers large, pale-red.

Three-flowered Touch-me-not. Fl. June, Sept. Clt. 1818. Pl. 1 foot.

2 I. FU'LVA (Nutt. gen. amer. 1. p. 146.) peduncles 2-4-flowered; leaves rhomboid-ovate, blunt, mucronately-toothed: the petal bearing the spur is longer than the rest. ⊙. H. Native of North America from Canada to Carolina, in wet shady places. Im. biflòra, Willd. spec. 1. p. 1175. Sweet, fl. gard. t. 43. Im. nóli-tángere β, Michx. Flowers dark-yellow, with red spots on the inside; spur emarginate.

Fulvous-flowered Touch-me-not. Fl. June, July. Clt. 1818. Pl. 1 to 2 feet.

3 I. PA'LLIDA (Nutt. gen. amer. 1. p. 146.) peduncles 3-4-flowered; leaves rhomboid-ovate, rather acute, mucronately toothed; spurred petal dilated, shorter than the rest; spur recurved, very short. ⊙. H. Native of North America from New England to Carolina near springs and rivulets in shady places. Im. nóli-tángere, Pursh, fl. sept. amer. 1. p. 171. Flowers pale-yellow. Plant glaucous.

Pale-flowered Touch-me-not. Fl. June, July. Clt. 1817. Pl. 1 to 2 feet.

4 I. NÓLI-TA'NGERE (Lin. spec. 1328.) peduncles 3-4-flowered, shorter than the leaves, and spreading under them; flowers pendulous; spur recurved at end; leaves ovate, coarsely toothed; joints of stem swollen. ⊙. H. Native of Europe and Siberia, in shady humid places; in Britain, in several parts of Westmoreland; also in Yorkshire, Lancashire, and Wales; on the banks of Wynandermere, in little brooks and watery places, near Rudall-hall, plentifully. Smith, engl. bot. t. 937. Oed. fl. dan. t. 582. Schkuhr. handb. t. 270. Flowers large, yellow, spotted internally with red. Ray says this plant is dangerously diuretic. Dodonæus speaks of its pernicious qualities. The seeds of this, as well as all the other species are thrown out with considerable force when ripe, upon being touched. Hence the specific name *Noli-me-tangere*, and the English names of *Quick-in-hand* and *Touch-me-not*. The elasticity of the capsules has furnished names for this plant in most European languages. In German it is called *Spring-same, Springkraut*, &c.; in Swedish, *Springkorn*; in Danish, *Springkorn* or *Springurt*; in French, *Impatiente, Ne me touchez pas*, and also *Balsamine-jaune*; in Italian, *Erba impaziente, Balsamìna gialla*; in Spanish, *No quieras tocarme, Balsamina amarilla*; in Portuguese, *Melindre nao me toquis*. The leaves are said by Villars to hang pendant at night; we have not observed this. The whole plant is considerably acrid, and no quadruped, except perhaps goats, are said to eat it. Notwithstanding this, it was formerly used as a diuretic and vulnerary, and was given to relieve the hæmorrhoids and the strangury. Boerhaave regarded it as poisonous.

FIG. 120.

Common *Touch-me-not*. Fl. Jul. Aug. Brit. Pl. 1 to 1½ ft.

5 I. PARVIFLÒRA (D. C. prod. 1. p. 687.) peduncles 3-6-flowered, and are as well as the flowers erect; leaves ovate, acuminated, serrated; serratures mucronate; spur straight. ⊙. H. Native on the Upper Irtisch, without the limits of Russia. Flowers pale-yellow, 3-times smaller than those of *I. nóli-tángere*. Leaves more blistered and larger.

Small-flowered Touch-me-not. Fl. June, Sept. Clt. 1820. Pl. 2 to 3 feet.

6 I. TRIPE'TALA (Roxb. hort. beng. p. 18.) peduncles short, 1-4-flowered, sometimes more; pedicels elongated, but much shorter than the petioles; leaves broad-lanceolate, acuminated, serrated, with the lower serratures cilia-like; corolla 3-petalled; spur hooked. ⊙. F. Native of the East Indies on the mountains of Silhet. Lower leaves opposite and tern. This species has a pretty appearance when in full blossom, the flowers being numerous, large, and of a lively red colour, with the nectary deeply tinged with yellow.

Three-petalled Touch-me-not. Fl. July, Sept. Clt. 1825. Pl. 1 foot.

7 I. HAMILTONIA'NA (D. Don, prod. fl. nep. p. 204.) peduncles dichotomous, 2-flowered, shorter than the petioles; leaves ovate, stalked, serrated, acuminated, tapering to the base; lateral petals horned on the back. ⊙. H. Native of Nipaul at Narainhetty. Flowers yellow. Im. nóli-tángere, Hamilt. mss. but not of Lin.

Hamilton's Touch-me-not. Fl. July, Aug. Pl. 1 foot.

8 I. TRILOBA'TA (Colebr. ex Spreng. syst. append. p. 99.) peduncles usually 4-flowered, spreading, about equal in length to the leaves; leaves oblong-lanceolate, serrated, smooth; spur conical, acuminated, incurved. ⊙. F. Native of Silhet. Flowers yellow.

Three-lobed-petalled Touch-me-not. Pl. 1 foot.

9 I. SCA'BRIDA (D. C. prod. 1. p. 687.) peduncles 3-4-flow-

ered, erect, shorter than the leaves; leaves oval, taper-pointed at both ends, serrated, younger ones on both surfaces, as well as the stem beset with scabrous down, adult ones smooth; spur very long. ⊙. H. Native of Nipaul. Flowers yellow.

Rough Touch-me-not. Fl. July, Aug. Pl. 1 foot.

10 I. DÍSCOLOR (D. C. prod. 1. p. 687.) peduncles 3-flowered or sometimes only 1-flowered from abortion, shorter than the leaves; leaves smooth, glaucous beneath, and green above, rather pilose, ovate, acute, mucronately-toothed; lower ones tapering much at the base. ⊙. H. Native of Nipaul. Flowers yellow.

Two-coloured-leaved Touch-me-not. Fl. July, Aug. Clt. 1820. Pl. 1 foot.

11 I. CRISTA'TA (Wall. fl. ind. 2. p. 456,) peduncles 2-4-flowered, equal in length to the petioles; leaves lanceolate, cuspidately-serrated, acuminated, pubescent; upper petal with a sharp keel; spur longer than the pedicel, incurved at the end. ⊙. H. Native of Hungtoo in Bissepur, on the confines of Chinese Tartary. Stem purplish. Flowers yellow, with minute purple dots. Stem pubescent, slightly angular, hardly jointed.

Crested-petalled Touch-me-not. Fl. July, Aug. Clt. 1827. Pl. 2 to 3 feet.

12 I. URTICIFÒLIA (Wall. fl. ind. 2. p. 457.) peduncles very long, filiform, 4-5-flowered; leaves ovate, acuminated, tapering to the base, coarsely and bluntly serrated, with bristly gland-bearing crenatures; spur equal in length to the pedicel, ample, conical, ending rather abruptly in a cylindrical horn. ⊙. H. Native of Nipaul at Gosainsthan, in the Himalaya mountains. Stem jointed, smooth. Peduncles bearing 4-5, alternate, longish, slender, 1-flowered pedicels, each having a bractea at the base. Flowers large, yellow, nodding.

Nettle-leaved Touch-me-not. Fl. July, Aug. Pl. 1 foot.

13 I. CALYCI'NA (Wall. fl. ind. 2. p. 463.) peduncles 2-flowered, equal in length to the petioles; leaves ovate, acuminated, acutely serrated; stipulas alternate, glandular; calyx large, ovate; spur long, cylindrical, ascending, exceeding the length of the peduncles; capsule cylindrical. ⊙. H. Native of Nipaul on Chitlong and on Chundrugiri. Plant erect, branching, jointed, villous. Flowers large, yellow, netted with purple veins.

Large-calyxed Touch-me-not. Pl. 1 foot.

14 I. GRA'NDIS (Heyne, mss. in Roxb. fl. ind. 2. p. 465.) peduncles 3-flowered; leaves ovate, acuminated, on long petioles, with 2 oblong glands below the base; spur very long. ⊙. H. Native of the East Indies. The flowers appear to be yellow, and are by far the largest of any of the species.

Great-flowered Touch-me-not. Pl. 1 to 2 feet.

15 I. FRUTICÒSA (Leschen. herb. D. C. prod. 1. p. 687.) peduncles 3-4-flowered, equal in length to the leaves; leaves oval, acuminated at both ends, serrulated; lower serratures glandular, somewhat scabrous above from scattered down, velvety-pubescent beneath; stem suffruticose. ♄. S. Native of the East Indies on the mountains, where it is commonly called *Kavegueda*. Flowers yellow?

Shrubby Touch-me-not. Shrub 2 feet.

§ 2. *Peduncles many-flowered, from* 6-20, *axillary and terminal, seldom radical.*

16 I. SULCA'TA (Wall. fl. ind. 2. p. 458.) peduncles axillary, many-flowered, shorter than the leaves; leaves opposite, with cuspidate serratures, somewhat rounded at the base on glandular slender petioles; stem branched, smooth, and deeply furrowed; nectary ample, ending abruptly in a slender curved spur. ⊙. H. Native of Nipaul at Gosainsthan. Flowers large yellow.

Furrowed-stemmed Touch-me-not. Pl. 2 feet.

17 I. BRACTEA'TA (Colebr. mss. in Roxb. fl. ind. 2. p. 459.) racemes terminal, oblong, many-flowered, fringed with the innumerable long coloured hairs of the lanceolate bracteas; leaves lanceolate, serrulated, almost opposite; lower lip of flower very large. Spur long, ascending. ⊙. F. Native of Silhet in the East Indies, as well as among rubbish at Narainhetty of Nipaul. Im. insígnis, D. C. prod. 1. p. 688. Im. racemòsa, D. Don, prod. fl. nep. p. 203. Im. fimbriàta, Hook. exot. fl. 146. This is a charming plant. Stem jointed, purplish. Leaves opposite and alternate. Racemes from 2-6 inches long, before expansion globular and capitate, afterwards oblong, beautifully decorated with numerous, pink-coloured, large flowers, interspersed with the dense pink hairs of the bracteas.

Bracteate-flowered Touch-me-not. Pl. 2 feet.

18 I. BICORNU'TA (Wall. fl. ind. 2. p. 460.) peduncles long, axillary, corymbose, crowded together towards the top of the stem and branches; leaves ample, approximate, ovate, acuminated, coarsely serrated, a little hairy above; nectary very large, conical, ending abruptly in a filiform spur; its mouth furnished with a long horn-like point; capsule cylindrical. ⊙. H. Native of Nipaul on Chundrugiri and Sheopore, as well as on the mountains towards Gosainsthan. Plant erect, branching. Stem jointed, angular towards the top, with several thick, cylindrical, purple glands scattered along the angles, otherwise smooth. Flowers large, variegated with purple dots, disposed in axillary corymbose racemes; pedicels filiform, fascicled, or whorled, leaning to one side, supported by 3 spreading, lanceolate, bractlets, which are at length reflexed.

Two-horned-flowered Touch-me-not. Pl. 2 to 3 feet.

19 I. LEPTO'CERAS (D. C. prod. 1. p. 688.) racemes axillary, panicled; flowers on long pedicels; leaves linear-lanceolate, elongated, tapering to both ends, with bristly serratures; spur exceedingly long, filiform. ⊙. H. Native of Nipaul, on the western part; also of Shreenugur, and among rubbish at Narainhetty. Im. odoràta, D. Don, fl. nep. p. 203. Balsamìna odoràta, Hamilt. mss. Im. longicórnu, Wall. fl. ind. 2. p. 462. A large, erect, branched, smooth, and fleshy species, with scattered leaves, crowded towards the top. Peduncles very slender, 3-6 inches long, naked; pedicels approximate, an inch long, supported by ovate-lanceolate, 3-nerved bracteas. Flowers yellow, fragrant, with the upper petal concave, a little ciliated, lateral petals 2-lobed. Stem with swollen joints.

Slender-horned Touch-me-not. Pl. 1 to 2 feet.

20 I. UMBELLA'TA (Heyne, mss. in Roxb. fl. ind. 2. p. 464.) umbels several, terminal, on long peduncles; leaves crowded towards the apex of the stem, ovate, obtuse, broadly-crenated, acute, tapering to the base, equal in length to the petioles; spur very long. ⊙. F. Native of the East Indies. Stem simple. Flowers probably yellow.

Umbelled-flowered Touch-me-not. Pl. 1 foot.

21 I. RACEMÒSA (D. C. prod. 1. p. 688.) peduncles 7-8-flowered, racemose, about the length of the leaves; leaves smooth, oblong, coarsely-toothed, acuminated at both ends; spur recurved, slender, rather longer than the flower. ⊙. H. Native of Nipaul. Flowers small, yellow.

Racemose-flowered Touch-me-not. Pl. 1 foot.

22 I. MICRA'NTHA (D. Don, prod. fl. nep. p. 203.) racemes corymbose, one-half the length of the leaves; leaves elliptical, acuminated, stalked, coarsely-crenated, tapering much to the base; spur equal in length to the pedicel; lateral petals appendiculate. ⊙. H. Native of Nipaul. Flowers rose-coloured, smaller than the rest.

Small-flowered Touch-me-not. Pl. 2 feet.

23 I. SCAPIFLÒRA (Heyne, mss. in Roxb. fl. ind. 2. p. 404.) scape radical, bearing a raceme of long-stalked flowers; leaves roundish, cordate, many-nerved, entire; spur longer than the

pedicel. ⊙? ♃? S. Native of the East Indies. This singular species appears to have tuberous roots. Leaves radical, almost kidney-shaped. Flowers large, apparently purplish.

Scape-bearing Touch-me-not. Pl. ½ foot.

Cult. *Impàtiens* is a genus of beautiful and singular plants. The seeds of the hardy annual kinds only require to be sown in the open ground in a shady situation; those of the frame and stove kinds should be raised on a moderate hot-bed in spring, and when the plants are about 2 inches high, they may be planted out in the open border in a warm sheltered situation, but a few of them may be kept in pots separately, and placed in a greenhouse stove or hot-bed, to secure a sufficient quantity of seeds, these should be planted in a light rich soil. The *Impàtiens scapiflòra*, if perennial, should be kept in the stove, and care should be taken not to give it too much water in the winter, as from its succulent nature it will be apt to rot at that season.

ORDER LVII. OXALI'DEÆ (plants agreeing with *O'xalis* in important characters). D. C. prod. 1. p. 689.

Calyx of 5 sepals (f. 122. *a.*), or 5-parted (f. 121. *a.*) permanent, equal. Petals 5 (f. 121. *b.* f. 122. *b.*), hypogynous, equal, sometimes cohering to each other at the very base, unguiculate; with straight claws and spreading limbs, spirally twisted in æstivation (f. 121. *a.*). Stamens 10 (f. 121. *d. c.* f. 122. *c.*); filaments awl-shaped, erect, usually monadelphous at the base, 5 of which are opposite the petals, inner ones longest (f. 122. *c.*). Anthers 2-celled (f. 122. *c.*), not adnate. Ovary free, 5-angled, 5-celled. Styles 5 (f. 122. *d.*), filiform, sometimes all shorter than the stamens (f. 122. *d.*); these are called very short (f. 122. *d.*) in the specific characters, sometimes longer than the outer stamens, and shorter than the interior ones, these are called intermediate in the specific characters; sometimes all longer than the stamens, these are called very long, or longer than the stamens in the specific characters. Stigmas usually pencil-formed (f. 122. *d.*), also capitate and somewhat bifid. Capsule ovate or oblong, somewhat pentagonal, membranous, 5-celled, 5-10-valved, bursting lengthwise at the angles. Seeds few, fixed to the central axis (f. 121. *g.*) of the cells, ovate, striated, younger ones inclosed in a fleshy aril, but at length bursting elastically from the aril at the apex, and the seeds are, therefore, thrown out at one end. Albumen cartilaginously-fleshy. Embryo inverse, length of the albumen, with leafy cotyledons, and a long superior radicle.—Subshrubs or herbs, rarely trees. Leaves alternate, rarely opposite or in whorls, simple and variously compound. This order was formerly confounded with *Geraniàceæ*, but it is the opinion of Jussieu and De Candolle that the species are more nearly allied to *Rutàceæ* and *Zygophýlleæ*, and that their character and peculiar habit are quite sufficient to distinguish them. The beauty of most of the species of *O'xalis* is very great, and of easy cultivation. Their properties are well known. All of them are slightly acid, whence some have been employed as salads. Their acidity is very agreeable, and depends upon the presence of a small quantity of oxalate of potass. In some South American species, oxalic acid exists in great abundance. Several species are employed in Brasil as a remedy for certain fevers of that country.

Synopsis of the Genera.

1 AVERRHÒA. Calyx 5-cleft (f. 121. *a.*). Berries large, oblong, 5-celled (f. 121. *g.*). Trees with impari-pinnate leaves.

2 BIO'PHYTUM. Sepals 5. Stamens nearly free. Stigmas emarginately bifid at the apex. Capsule ovate-globose. Subshrubs or herbs with abruptly-pinnate leaves.

3 O'XALIS. Sepals 5 (f. 122. *a.*), free, or connected at the base. Stamens monadelphous at the base. Stigmas pencil-formed (f. 122. *d.*), rarely capitate or bifid. Capsule oblong or cylindrical. Subshrubs or herbs. Roots tuberous or fibrous. Leaves simple or 3-4-5-foliate (f. 122.).

4 LEDOCA'RPUM. Calyx 5-parted, girded by 10 linear bracteas. Stamens permanent, free. Styles thickened. Small branching shrubs with opposite, 3-parted, linear leaves.

I. AVERRHO'A (in honour of Averrhoes of Corduba, a celebrated Arabian physician, who resided in Spain during the domination of the Moors; he lived towards the middle of the 12th century, and translated Aristotle into Arabic). Lin. gen. no. 576. Lam. ill. t. 385. Corr. ann. mus. 8. p. 71. t. 2. D. C. prod. 1. p. 689.

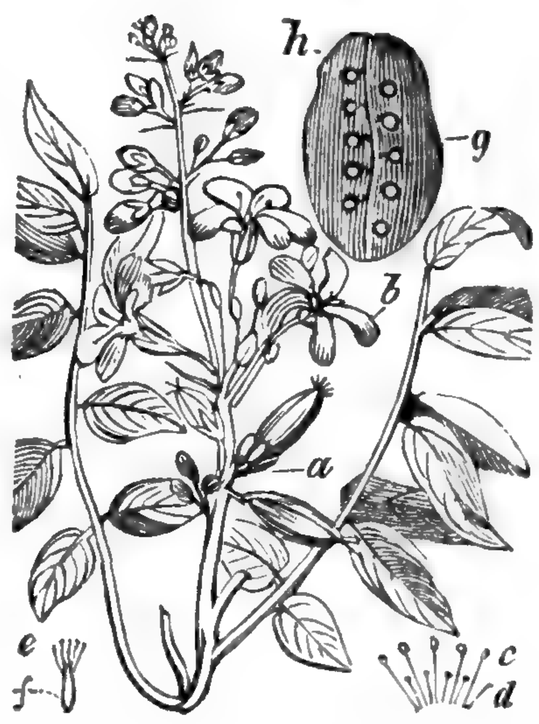
LIN. SYST. *Decándria, Pentagýnia.* Calyx of 5 sepals (f. 121. *a.*), which are more or less joined together at the base. Petals 5 (f. 121. *b.*). Stamens 5 (f. 121. *c.*), alternating with the petals, or 10 (f. 121. *c. d.*) alternate ones, smaller, joined together at the base into a short ring. Ovary angular. Styles 5, permanent. Berry large, oblong (f. 121. *g.*), 5-furrowed, 5-celled, with a few seeds in each cell, adhering to the central angle (f. 121. *g.*). Embryo straight, in a fleshy albumen.—East Indian trees, with alternate, impari-pinnate leaves, with alternate leaflets, racemose panicles of flowers, and eatable fruit. The leaves of *A. Bilimba* are irritable to the touch, as in *Biophytum sensitìvum.*

1 A. CARAMBÒLA (Lin. spec. 613.) calyxes smooth; limb of petals roundish; stamens 5; fruit with 5 acute angles; seeds arillate. ♄. S. Native of the East Indies and all the warmer parts of Asia, and is now cultivated in many parts of South America.—Rumph. amb. 1. p. 115. t. 35.—Rheed. mal. 3. p. 51. t. 43. and 44.—Cav. diss. 7. t. 220. Tree with a spreading head. Leaves have about 4-5 pairs of ovate, acuminated, entire, stalked leaflets, the outer ones largest. Flowers lateral, scattered, disposed in short racemes, usually rising from the smaller branches, but sometimes from the larger ones or the trunk itself. Calyx red. Corolla small, bell-shaped, with oblong-ovate petals, which are variegated with purple and yellow. Fruit the size of a hen's egg, acutely 5-cornered, with a yellow, thin, smooth rind, and a clear watery pulp, in many sweet, in others acid, with hardly any smell. Seeds small, oblong, angular, flatted, and brown. The stamens are in 5 pairs, each pair placed in the angles of the germ, only one stamen is fertile or furnished with an anther; the filaments are curved, adapted to the shape of the ovary, they may be pressed down gently so as to remain, and then when moved a little upwards rise with a spring. Dr. Bruce gives a curious detailed account of the sensitive qualities of the petioles, and even branches of this tree. Rheede says the *Carambola* is a tree about 14 feet high, and hardly a foot in girth, with a brown bark; that it bears fruit 3 times a year, from the age of 3 to 50 years, that the root, leaves, and fruit are used medicinally, either alone or with *Areca* or *Betel* leaves; that the latter, when ripe, are esteemed delicious; unripe are pickled; and that they are also used in dyeing and for other economical purposes. Burman says that the acid

juice of this is not so pleasant as that of *A. Bilímba*, that the fruit is rather larger, and is used for the same purposes, and that it is a very beautiful tree. In Bengal the tree is called *Camruc* and *Camrunga;* in Malabar, *Tamara-tonga;* the Bramins and Portuguese call it *Carambolas*.

Carambola Averrhoa. Clt. 1793. Tree 14 to 20 feet.

FIG. 121.



2 A. BILI'MBI (Lin. spec. 613.) calyxes pubescent; limb of petals oval-oblong; stamens 10; fruit obtuse-angled; seeds without aril. ♄. S. Native of Goa and many other parts of the East Indies, both within and without the Ganges, and is now cultivated in many parts of South America.—Cav. diss. 7. t. 219.—Rumph. amb. 1. p. 115. t. 35.—Rheed. mal. 3. p. 51. t. 45 and 46. This is a small tree, with a few reclining branches. The leaves have from 5-10-pairs of ovate-lanceolate, entire, smooth leaflets on short stalks. The flowers are reddish-purple, disposed in racemes, rising from the trunk. The fruit is oblong, somewhat resembling a small cucumber, with a thin, smooth, green rind, filled with a grateful acid juice, and the substance and seeds not unlike that of a cucumber. A syrup is made of the juice and a conserve of the flowers, which are esteemed excellent in fevers and bilious disorders. The tree is called *Bilimbi* in Malabar.

Bilimbi or Cucumber-tree. Fl. May, July. Clt. 1791. Tree 8 to 15 feet.

Cult. These are very pretty trees, and will thrive well in a light sandy loam. Ripe cuttings will strike root freely in sand under a hand-glass, in heat.

II. BIO'PHYTUM (from *βιος*, *bios*, life, and *φυτον*, *phyton*, a plant; the leaves of *B. sensitívum* are sensitive to the touch). D. C. prod. 1. p. 689.

LIN. SYST. *Decándria, Pentagýnia.* Calyx of 5 sepals. Stamens 10, free, the 5 outer ones are smaller than the inner 5, alternating with each other. Stigmas 5, emarginately-bifid and capitate. Capsules ovate, globose, somewhat pentagonal.—Annual or suffruticose herbs, with a naked stem, bearing at the apex, a fascicled whorl of abruptly-pinnate leaves; leaflets many, opposite. Peduncles many-flowered, umbellate. St. Hilaire does not consider this genus distinct from the following; indeed there is no character yet discovered that would separate them, but the peculiar habit of the plants is sufficient.

1 B. SENSITÍVUM (D. C. prod. 1. p. 690.) almost stemless; peduncles thick, bearing many flowers at the apex, about equal in length to the leaves; leaflets 14 pairs, oblong, obtuse, mucronate. ☉. S. Native of the East Indies and China, in gardens and meadows. O'xalis sensitìva, Lin. spec. 622. Jacq. oxal. no. 21. t. 78. f. 4.—Garc. in phil. trans. 1730. p. 379. t. 2.—Rumph. amb. 5. p. 301. t. 104. f. 2.—Rheed. mal. 9. p. 33. t. 19. The leaves of this plant contract on the slightest touch, like those of *Mimòsa pudìca*. It is a beautiful plant, with umbels of small yellow flowers. Stigmas emarginately bifid.

Sensitive Biophytum. Fl. May, July. Clt. 1824. Pl. ¼ to ½ foot.

2 B. DENDROÌDES (D. C. prod. 1. p. 690.) stem woody, simple, leafy at the apex; petioles of leaves with a fascicle of long hairs between each pair of leaflets; leaflets of 12 pairs, oblong, unequal-sided, acute, ciliated, outer ones largest; peduncles 1-flowered. ♄. S. Native of New Granada between Guaduas and Quebrada de la Carbonera. O'xalis dendroìdes, H. B. et Kunth, nov. gen. amer. 5. p. 250. Flowers violaceous. Cells of ovary containing only one seed.

Tree-like Biophytum. Shrub ½ to 1 foot.

3 B. MIMOSOÌDES (St. Hil. fl. bras. 1. p. 107. t. 21. under *O'xalis*,) stem shrubby, hardly branched at the apex; leaves corymbose, abruptly-pinnate; leaflets linear, obliquely-truncate both at the apex and the base, puberulous, veinless above; peduncles shorter than the leaves, villous, very much thickened at the apex, bracteate, 3-4-flowered; pistils much longer than the stamens; cells of ovary 4-seeded. ♄. S. Native of Brazil in the province of Rio Janeiro. Flowers white, resembling those of *Stellària Holóstea*. Filaments rather monadelphous at the base. Stigmas laciniately-jagged, capitate.

Mimosa-like Biophytum. Fl. Nov. Shrub ½ foot.

4 B. CA'STA; stem shrubby, umbellately branched; leaves abruptly-pinnate, of many pairs of leaflets, smoothish; leaflets adnate, somewhat rhomboid; fascicles of flowers subsessile, bracteate; stamens exceeding the styles in length. ♄. S. Native of Brazil. O'xalis cásta, Zucc. in act. acad. monach. 9. t. 6.

Chaste Biophytum. Shrub ½ foot.

5 B. DO'RMIENS; stem suffruticose, simple; leaves abruptly-pinnate, with many pairs of pubescent, nearly sessile leaflets, which are angular at the base, oblong, obtuse; pedicels aggregate, 1-flowered, rising from the bracteas. ♄. S. Native of Brazil. O'xalis dórmiens, Zucc. in act. acad. monach. 9. t. 5.

Dormant Biophytum. Shrub ½ foot.

6 B. SO'MNIANS; stem shrubby, simple; leaves abruptly-pinnate, with about 6 pairs of leaflets, outer ones largest, obovate-oblong, obtuse, lower ones rather cordate, acute; heads of flowers on long peduncles, bracteate; styles exceeding the stamens in length. ♄. S. Native of Brazil. O'xalis sómnians, Mart. mss. Zucc. in act. acad. monach. 9. t. 4.

Sleeping Biophytum. Shrub ½ foot.

Cult. These singular and beautiful little plants will thrive best in a mixture of loam and peat. The seeds of the first species should be sown in spring on a hot-bed, and after the plants are of sufficient size, they should be separated and planted singly in pots shaded until the plants have taken fresh root, they may then be removed to the stove. The rest of the species, being suffruticose plants, may be either increased by cuttings or seeds.

III. O'XALIS (from *οξυς*, *oxys*, acid; the leaves have an acid taste). Lin. gen. no. 582. D. C. prod. 1. p. 690. O'xys, Tourn. inst. t. 19.

LIN. SYST. *Decándria, Pentagýnia.* Sepals 5, (f. 122. *a.*) free, or joined together at the base. Petals 5. (f. 122. *b.*) Stamens 10, (f. 122. *c. c.*) with the filaments connected together a little way at the base, 5 of which are exterior, and are shorter than the other 5. Styles 5, usually crowned by pencil-like, (f. 122. *d.*) rarely capitate, or bifid stigmas. Capsules pentagonal, oblong, or cylindrical.—Permanent, caulescent, stipitate, or stemless herbs. Leaves various, but never abruptly-pinnate, full of an acid juice. Flowers of various hues.

§ 1. *Hedysaroídeæ* (plants with the habit of *Hedýsarum*). *D. C. prod.* 1. *p.* 690. *Peduncles bifid, or bifidly-umbelliferous, with one flower in the fork, bearing the other flowers on the inside of the divisions, with usually petinated bracteas; flowers secund, intermixed with the bracteas. Stems leafy, usually suffruticose. Leaves trifoliate; leaflets ovate, lanceolate, or rhomboid, rarely obcordate, with the middle one on a long stalk. Cells of ovary* 1-5-*seeded.—Species natives of South America.*

1 O. PENTA'NTHA (Jacq. ox. no. 1. t. 1.) stem erect, branched, leafy; peduncles umbelliferous, about the length of the leaves;

leaves pilose; lateral leaflets roundish, emarginate, middle one obovate, blunt; styles shorter than the outer stamens. ♄. S. Native of Caraccas and Brazil. P. divaricàta, Mart. Flowers small, spreading, yellow.

Var. β, Humbóldtii (D. C. prod. 1. p. 690.) styles twice as long as the stamens. ♄. S. Native of South America. O. pentántha, H. B. et Kunth, nov. gen. amer. 5. p. 247. Flowers spreading, yellow. Probably a distinct species.

Five-flowered Wood-sorrel. Shrub 1½ foot.

2 O. psoraleoìdes (H. B. et Kunth, nov. gen. amer. 5. p. 246. t. 470.) stem erect, leafy; branches downy; peduncles longer than the petioles, bifid at the apex, 6-8-flowered; leaves downy, silky or silvery beneath; calyxes downy, hairy; styles intermediate. ♄. S. Native of South America, near Santa-Fé de Bogota? Flowers yellow.

Psoralea-like Wood-sorrel. Shrub ½ to 1 foot.

3 O. Plumie`ri (Jacq. ox. no. 3.) stem erect, leafy; peduncles umbelliferous, 4-6-flowered, length of leaves; leaflets entire, ovate, bluntish. ♄. S. Native of South America, particularly in the Caribbee Islands, Guiana, and La Vera Cruz. Lindl. bot. reg. t. 810. O. frutéscens, Lin. spec. 624.—Plum. ed. Burm. t. 213. f. 1. Flowers yellow. Capsules smooth.

Plumier's Wood-sorrel. Fl. year. Clt. 1769. Shrub 1½ foot.

4 O. Neæ`i (D. C. prod. 1. p. 690.) stem erect, leafy; peduncles umbelliferous, 4-flowered, length of leaves; leaflets villous, lateral ones oval, emarginate, middle one ovate-lanceolate; styles intermediate. ♄. S. Native of Mexico about Acapulca. Flowers yellow. This is apparently an intermediate species between the two preceding.

Nees's Wood-sorrel. Shrub 1½ foot.

5 O. Barrelie`ri (Jacq. ox. no. 4. t. 3.) stem erect, branched, leafy; peduncles bifid, racemose, length of leaves; leaflets ovate-lanceolate; styles length of inner stamens. ♄. S. Native of Guiana, Brazil, and the Caraccas. P. campéstris, Mart.—Barrel. icon. t. 1169. Petals of a pale flesh-colour, with the 3 superior ones marked with yellow at the base. Stem, petioles, and peduncles hairy. Stigmas capitate.

Barrelier's Wood-sorrel. Fl. May, Nov. Clt. 1796. Sh. 1-2 ft.

6 O. Pavònii; stem erect; leaflets obovately-roundish, pubescent; pedicels dichotomous, about the length of the leaves; cells of ovary many-seeded. ♄. S. Native of Peru. (v. s. herb. Lamb.) Flowers yellow.

Pavon's Wood-sorrel. Shrub 1 to 2 feet.

7 O. lespedezoìdes; hairy; lateral leaflets nearly sessile, obovately-lanceolate, all pendulous; peduncles axillary, rather longer than the petioles; flowers capitate, crowded. ♄. S. Native of Peru. (v. s. herb. Lamb.) Flowers yellow.

Lespedeza-like Wood-sorrel. Shrub 2 to 3 feet.

8 O. hedysarifòlia (Raddi. mem. bras. add. p. 22.) stem erect, leafy; peduncles terminal, few-flowered; leaflets ovate, acute at both ends, and are, as well as the petioles, hairy. ♄? S. Native of Brazil in grassy places, near Rio Janeiro. Flowers yellow.

Hedysarum-leaved Wood-sorrel. Shrub 1 to 2 feet.

9 O. hedysaroìdes (H. B. et Kunth, nov. gen. amer. 5. p. 247.) stem leafy, smooth; peduncles bifid at the apex, many-flowered; leaflets ovate-oblong, emarginate, smooth, rather glaucous beneath, lateral ones smallest, remote; calyxes smooth. ♄. S. Native of South America on the Andes about Quito, and at Santa-Fe de Bogota in cold and temperate places. Flowers pale-pink? This species is nearly allied to *O. Barrelièri*.

Hedysarum-like Wood-sorrel. Shrub 1 to 2 feet.

10 O. glau`ca (H. B. et Kunth, nov. gen. amer. 5. p. 247. t. 471.) stem leafy, smooth; peduncles bifid at the apex, 7-9-flowered, length of leaves; leaflets ciliated, smooth, glaucous, lateral ones roundish, remote, terminal one elliptic-ovate; sepals smooth, each marked with a spot at the apex; styles intermediate. ♄. S. Native of South America in shady places, on the banks of the river Amazon, not far from Tomependa. Flowers white.

Glaucous Wood-sorrel. Shrub 1 to 2 feet.

11 O. Borje´nsis (H. B. et Kunth, nov. gen. amer. 5. p. 247.) stem leafy, smooth; peduncles bifid at the apex, many-flowered, length of petioles; leaflets rounded at the apex, smooth, glaucous, lateral ones obovate-elliptical, remote, terminal one somewhat obovate-elliptical; sepals puberulous, spotless. ♄. S. Native of South America, on the banks of the river Orinoco, in shady humid places, near St. Borja. Flowers yellow.

Borja Wood-sorrel. Shrub 1 to 2 feet.

12 O. angustifòlia (H. B. et Kunth, nov. gen. amer. 5. p. 247.) stem leafy, smoothish; peduncles 3-4-flowered, longer than the petioles; leaflets oblong-linear, smooth, glaucous, lateral ones smaller, remote; calyx smooth, spotless. ♄. S. Native of New Spain, on the western declivities near La Venta del Peregrino. Flowers yellow.

Narrow-leaved Wood-sorrel. Shrub 1 to 2 feet.

13 O. cytisoìdes (Mart. et Zucc. in act. acad. monach. 9. ex Spreng. syst. append. 186.) branches tomentose; leaflets ovate, tapering to both ends, hoary-villous; peduncles many-flowered, exceeding the leaves in length; styles longer than the stamens. ♄. S. Native of Brazil. Flowers yellow.

Cytisus-like Wood-sorrel. Shrub 1 to 2 feet.

14 O. densifòlia (Mart. l. c.) stem twiggy, densely clothed with leaves; leaflets obcordately 2-lobed, hairy; peduncles elongated, usually 8-flowered; styles exceeding the stamens. ♄. S. Native of Brazil. Flowers yellow.

Dense-leaved Wood-sorrel. Shrub 1 foot.

15 O. rhombifòlia (Jacq. ox. no. 2. t. 2.) stem erect, branched, leafy; peduncles umbelliferous, 3-flowered, length of leaves; leaflets pubescent, ovate-rhomboid, sessile; styles longer than the stamens. ♄. S. Native of Caraccas. Flowers yellow. Inner filaments hispid.

Rhomb-leaved Wood-sorrel. Shrub 1½ foot.

16 O. rho´mbeo-ova`ta (St. Hil. fl. bras. 1. p. 108.) stem suffruticose, nearly simple, leafy; leaves spreading, trifoliate; leaflets large, stalked, rhomb-ovate, acuminated, ciliated, intermediate one much larger, and on a longer petiole; peduncles shortly 2-cleft at the apex, many-flowered; stamens all longer than the pistils; cells of ovary 1-seeded. ♄. S. Native of Brazil, in the provinces of Minas Geraes and Rio Janeiro. Petals yellow, emarginate. Stigmas capitate.

Rhomb-ovate-leafletted Wood-sorrel. Fl. Oct. Shrub 1 to 2 ft.

17 O. rosella`ta (St. Hil. fl. bras. 1. p. 109. t. 22.) nearly stemless, suffruticose; leaves rosellate, trifoliate; leaflets unequal, intermediate one ovate, acutish, stalked, lateral ones sessile, smaller, ovate, obtuse at the apex, very blunt and oblique at the base; peduncles filiform, 2-cleft, many-flowered; calyx hispid; stamens all shorter than the pistil; cells of ovary 5-seeded. ♄. S. Native of Brazil in the province of Minas Geraes. O. puberula, Mart. Petals yellow. Stigmas capitate.

Rosellate-leaved Wood-sorrel. Fl. June. Shrub ¼ foot.

18 O. insi´pida (St. Hil. fl. bras. 1. p. 109.) stem shrubby, simple, pubescent, leafy at the apex; leaves trifoliate; leaflets unequally stalked, lanceolate-oblong, acuminated, rather narrow, pubescent beneath; peduncles axillary, 2-cleft, many-flowered; cells of ovary 1-seeded. ♄. S. Native of Brazil in the province of Rio Janeiro. Petals yellow. Stigmas capitate, 2-lobed.

Insipid Wood-sorrel. Fl. Oct. Shrub 1 foot.

19 O. frute´scens (Ruiz et Pav. mss. in herb. Lamb.) leaflets 3, middle leaflet on a long footstalk, ovate, tapering to the apex, all hairy beneath; peduncles many-flowered, about the

length of the common petiole, and are, as well as the stem and branches, hairy. ♄. S. Native of Peru. Flowers yellow.

Frutescent Wood-sorrel. Shrub 1 to 2 feet.

20 O. SPIRA'LIS (Ruiz et Pav. mss. in herb. Lamb.) stem hairy; leaflets 3, all sessile, wedge-shaped, præmorse; peduncles very long, hairy; umbels bifid; flowers secund; capsule many-seeded; stigmas capitate. ♄. S. Native of Peru.

Spiral Wood-sorrel. Shrub 1 foot.

21 O. CAJANIFÒLIA (St. Hil. fl. bras. 1. p. 110.) pubescent; stem shrubby, leafy; leaflets unequally stalked, ovate-lanceolate, acuminated, acute, pubescent above, villous beneath; peduncles longer than the petioles, bifid; flowers racemose; stamens all longer than the pistils; cells of capsule 1-2-seeded. ♄. S. Native of Brazil in the province of Rio Janeiro. Petals rose-coloured, yellow at the base. Stigmas capitate, 2-parted.

Pigeon-pea-leaved Wood-sorrel. Shrub 1 to 2 feet.

22 O. SE'PIUM (St. Hil. fl. bras. 1. p. 111.) stem suffruticose, leafy; leaves solitary, and appearing in whorls; leaflets unequally stalked, ovate, bluntish, smooth; petioles rather pilose; peduncles bifid; flowers racemose; calyxes obtuse, quite smooth; stamens all longer than the pistils; ovary 15-seeded. ♄. S. Native of Brazil in hedges near Rio Janeiro. Petals yellow. Stigmas capitate.

Hedge Wood-sorrel. Shrub 2 feet.

23 O. UMBRATI'COLA (St. Hil. fl. bras. 1. p. 111.) stem suffruticose, leafy, pubescent; leaflets unequally stalked, rhomb-ovate, obtuse, emarginate, acute at the base, with the margins and middle nerve hardly puberulous, soft; peduncles shorter than the leaves, 2-cleft, umbelliferous, pubescent; petals emarginate; cells of ovary 1-seeded. ♄. S. Native of Brazil in the provinces of Minas Geraes and Rio Janeiro. Petals yellow or whitish. Stigmas capitate. Like *O. Plumièri.*

Shaded Wood-sorrel. Fl. Feb. Shrub 1 to 2 feet.

24 O. MELILOTOI'DES (St. Hil. fl. bras. 1. p. 112.) stem suffruticose, erect, rather pilose; leaflets unequally stalked, ovate, obtuse, pilose on both surfaces; peduncles bifid, much longer than the leaves; flowers racemose; stamens all longer than the pistils; cells of ovary 2-seeded. ♄. S. Native of Brazil in the province of Minas Geraes. Petals yellow. Stigmas capitate.

Melilot-like Wood-sorrel. Shrub 1 foot.

25 O. EUPHORBIOÌDES (St. Hil. fl. bras. 1. p. 113.) stem suffruticose, pubescent, clammy; leaflets unequally stalked, smooth, obtuse, usually retuse, lower ones ovate, the rest linear; peduncles bifid, 7-flowered; styles intermediate; cells of ovary 3-seeded. ♄. S. Native of Brazil in the province of Minas Geraes. Petals orange-yellow. Stigmas capitate, 2-lobed.

Euphorbia-like Wood-sorrel. Shrub 1 foot.

26 O. NIGRE'SCENS (St. Hil. fl. bras. 1. p. 113.) stem suffruticose, leafy, flattened at the apex, rather pilose; leaflets unequally stalked, very smooth, lower ones ovate or ovate-oblong, upper ones oblong, uppermost ones usually linear; petioles pubescent above; peduncles bifid; flowers racemose; cells of ovary 3-seeded. ♄. S. Native of Brazil in that part of the province of Minas Geraes called Minas Novas. Roots black, horizontal. Margins of leaflets usually blackish. Petals orange-yellow. Stigmas capitate. Styles intermediate.

Var. β, linearifòlia (St. Hil. l. c.) stem 4 inches high; leaflets all linear, narrow, channelled, with the middle nerve usually pilose.

Blackish-leaved Wood-sorrel. Fl. May, Sept. Shrub ½ to 1 foot.

27 O. SAXA'TILIS (St. Hil. fl. bras. 1. p. 114.) stem shrubby, leafy; leaves in whorls, trifoliate; leaflets unequally stalked, small, obovately-orbicular, very obtuse; peduncles nearly equal in length with the leaves, shortly bifid, 5-flowered; stamens all longer than the pistils; cells of ovary 1-seeded. ♄. S. Native of Brazil in the province of Rio Janeiro, on the banks of the river Parahyba among rocks, not far from Villa Uba. Petals yellow. Stigmas capitate.

Rock Wood-sorrel. Fl. Feb. Oct. Shrub 1 to 2 feet.

28 O. DI'STANS (St. Hil. fl. bras. 1. p. 115.) stems suffruticose, ascending, leafy; leaves in fascicled-whorls at intervals; leaflets unequally stalked, obovate, obtuse, somewhat emarginate, villous, ciliated; peduncles umbelliferous; larger stamens a little longer than the pistils; cells of ovary 3-seeded. ♄. S. Native of Brazil in the province of Minas Geraes. Petals yellow. Stigmas hardly capitate, bifid.

Distant-leaved Wood-sorrel. Fl. July. Shrub ascending.

29 O. CORDA'TA (St. Hil. pl. usu. bras. t. 45. fl. bras. 1. p. 115.) stem suffruticose, leafy; leaflets cordate, with puberulous margins, lateral ones sessile, intermediate one stalked; peduncles axillary, flattened, pubescent, subbifid, umbelliferous; cells of ovary 5-seeded. ♄. S. Native of Brazil in the province of Goyaz. Petals yellow. Styles intermediate.

Cordate-leafletted Wood-sorrel. Fl. June. Shrub 1 foot.

30 O. FU'LVA (St. Hil. pl. usu. bras. t. 44. fl. bras. 1. p. 115.) stem suffruticose, leafy, very hairy; leaflets obovately-orbicular, unequally stalked, very obtuse, villous, ciliated, lateral ones sessile, intermediate one stalked; peduncles subbifid, umbelliferous; umbels involucrated; stamens all longer than the pistils; cells of ovary 2-seeded. ♄. S. Native of Brazil in the province of Minas Geraes. Petals yellow.

Fulvous-flowered wood-sorrel. Fl. year. Shrub 1 foot.

31 O. CAMPE'STRIS (St. Hil. fl. bras. 1. p. 116.) stem suffruticose, nearly simple; leaves scattered, small, nearly erect, hairy; leaflets 3, obcordate, intermediate one stalked, lateral ones sessile; peduncles axillary, longer than the leaves, usually exceeding the stems, bifid, umbelliferous; petals obcordate; stamens all longer than the pistils; cells of ovary 1-seeded. ♄. S. Native of Brazil in the province of Minas Geraes. Petals golden-yellow. Stigmas capitate.

Var. β, violàcea (St. Hil. l. c.) leaves violaceous and less hairy.

Field Wood-sorrel. Fl. May, Oct. Shrub ½ foot.

32 O. STENOPHY'LLA (Zucc. in act. acad. monach. 9. ex Spreng. syst. append. p. 186.) stem simple, suffruticose; leaflets linear, acutish, hairy; peduncles terminal, solitary, elongated, many-flowered; styles longer than the stamens. ♄. S. Native of Brazil. O. lineàris, Zucc. in act. acad. monach. vol. 9.

Narrow-leafletted Wood-sorrel. Shrub 1 foot.

§ 2. *Subaphýllæ. Petioles dilated, flat, but nearly leafless.*

33 O. LEPTÓPODES; petioles dilated, linear, sometimes terminated by a small leaflet; peduncles long; umbels bifid. ♄. S. Native of Peru. (v. s. in herb. Lamb.)

Narrow-petioled Wood-sorrel. Shrub ½ foot.

34 O. FRUTICÒSA (Radi. mem. ital. vol. 18. p. 401.) stem suffruticose, branched; petioles dilated, flat, lanceolate-linear, acute at both ends, nearly leafless; peduncles axillary, very short, bifid; pedicels subfasciculate; stamens all longer than the pistils; cells of ovary 1-seeded. ♄. S. Native of Brazil in woods near Rio Janeiro. Petals yellow. Stigmas capitate.

Shrubby Wood-sorrel. Shrub 1 to 2 feet.

35 O. SALICIFÓRMIS (Mik. ex Spreng. syst. append. 184.) stem much branched; branches twiggy; petioles leafy, scattered; peduncles elongated, bifid, racemose; styles very short. ♄. S. Native of Brazil. Flowers yellow.

Willow-formed Wood-sorrel. Shrub ½ foot.

36 O. BUPLEURIFÒLIA (St. Hil. fl. bras. 1. p. 117.) stem suffruticose, simple, densely leafy at the apex; petioles usually leafless, dilated, flat, oblong-lanceolate, acute, tapering at the base; peduncles axillary, flattened, bifid; stamens smooth, much

longer than the pistils; styles hispid; cells of ovary 1-seeded. ♄. S. Native of Brazil, not far from Rio Janeiro, in woods at a place called Mato. Petals yellow. Stigmas capitate.

Bupleurum-leaved Wood-sorrel. Shrub ½ foot.

§ 3. *Corniculàtæ* (from *corniculàtus*, horned; shape of pods). *D. C. prod.* 1. *p.* 691. *Stems not bulbous at base, herbaceous, rarely suffruticose, leafy. Peduncles 2 or many-flowered, rarely 1-flowered. Leaves trifoliate; leaflets sessile or subsessile, usually obcordate.*

* *Stems erect.*

37 O. PEDUNCULA'RIS (H. B. et Kunth, nov. gen. 5. p. 239.) stem simple, fleshy, leafy; peduncles very long, trifid at apex, many-flowered; leaflets roundish, or ovate-elliptical, pubescent beneath; styles intermediate. ♃. S. Native of South America on the mountains about Quito, in temperate places near Mira, and in the valley of the river Chambo. Peduncles 7 or 8 inches long. Flowers orange or copper-coloured. Roots fibrous.

Long-peduncled Wood-sorrel. Pl. ¾ foot.

38 O. LA'XA (Hook. bot. Beech. voy. p. 13.) stem simple, leafy, short; leaflets broad, obcordate, ciliated, with a few hairs above, but densely clothed beneath; petioles pilose; peduncles pilose, twice the length of the petioles, bearing a loose panicle of flowers at the apex; sepals pilose, very narrow-lanceolate. ♃. F. Native of Chili at Conception.

Loose-panicled Wood-sorrel. Pl. ¼ foot.

39 O. PUBE'SCENS (H. B. et Kunth, nov. gen. amer. 5. p. 239.) stem erect, branched at the base, clothed with soft pubescence; peduncles bifid at the apex, many-flowered, longer than the petioles; leaflets roundish-obovate, emarginate, pubescent on both surfaces, as well as the calyxes and petioles; styles longer, or equal in length to the stamens. ♃. G. Native of Peru on the mountains. Root fibrous. Flowers yellow? Peduncles 3 or 4 inches long.

Pubescent Wood-sorrel. Pl. ½ foot.

40 O. LEPTOPHY'LLA; shrubby, erect, hairy; lateral leaflets distant, sessile, lanceolate, and emarginate, middle one lanceolate, on a long petiole; peduncles axillary, 1-2-flowered, about the length of the leaves. ♄. F. Native of Chili. O. radìcans, Ruiz et Pav. mss. in herb. Lamb. Root creeping.

Slender-leaved Wood-sorrel. Pl. ½ foot.

41 O. CRENA'TA (Jacq. ox. no. 7.) stem erect, leafy; peduncles umbelliferous, 5-6-flowered, longer than the leaves; leaflets obovate; petals crenated. ☉. F. Native of Peru.—Feuill. per. 3. p. 49. t. 24. Flowers yellow, striped with purple. This plant is cultivated about Lima in gardens, and is used as sorrel. Root spindle-shaped.

Crenated-petalled Wood-sorrel. Pl. 2 feet.

42 O. PERE'NNANS (Haw. misc. 181.) stem erect, leafy, flexuous; peduncles 2-3-flowered, rather longer than the petioles; leaflets obcordately 2-lobed, ciliated; styles a little longer than the inner stamens. ♃. G. Native of New Holland. Flowers fulvous outside, yellow inside.

Perennial Wood-sorrel. Fl. May, Sept. Clt.? Pl. 2 feet.

43 O. VERTICILLA'TA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 691.) stem erect, simple, smooth; leaves 3 or 4 in a whorl; leaflets obcordate; peduncles 2-3-flowered, length of petioles. ♃. G. Native of Mexico? Cultivated in the gardens of St. Angelo. Flowers yellow.

Whorled-leaved Wood-sorrel. Pl. 1 foot.

44 O. DILLE'NII (Jacq. ox. no. 8.) stem erect, leafy, rather hairy; peduncles umbelliferous, usually twin, 5-6-flowered, longer than the leaves; leaflets obcordate; petals emarginate; styles longer than the stamens. ☉. H. Native of Carolina. O. flòrida, Sal. prod. 322.—Dill. elth. 2. t. 221. Flowers yellow, a little larger than those of *O. stricta*, with which it is generally confounded.

Dillenius's Wood-sorrel. Fl. May, Aug. Clt. 1798. Pl. ½ ft.

45 O. STRÍCTA (Lin. spec. 624.) stem erect, leafy; peduncles umbelliferous, 2-6-flowered, rather shorter than the leaves; leaflets obcordate; petals entire; styles about the length of the inner stamens. ♃. H. Native of North America in cultivated grounds, from Pennsylvania to Carolina. Jacq. oxal. no. 9. t. 4. O. ambígua, Sal. in Lin. trans. 2. p. 242. t. 23. f. 4. Root creeping. Flowers yellow, about the size of those of *O. corniculàta*. Browne says this plant is also a native of Jamaica; he recommends it as a pleasant cooler and diuretic, and says that it was formerly administered in inflammatory cases, but has been little used since the more agreeable acid fruit-trees have been so much cultivated in the West Indies. Plant hairy.

Strict Wood-sorrel. Fl. June, Oct. Clt. 1658. Pl. ½ foot.

46 O. TORTUÒSA (Lindl. bot. reg. 1249.) stem fleshy, scaly; leaflets linear, obtuse, pilose beneath; flowers umbellate; pedicels and petioles twisted, fleshy. ♃. G. Native of Chili. Petals yellow, usually bordered with red. Styles and stamens equal. Ovary many-seeded.

Twisted Wood-sorrel. Fl. June. Clt. 1826. Pl. ½ foot.

47 O. HAENKEA'NA (Spreng. syst. app. p. 186.) stem erect, leafy; leaflets obovate, emarginate, smooth; peduncles bifid, many-flowered, racemose, longer than the leaves; styles shorter than the stamens. ♃? G. Native of Peru. O. melilotoìdes, Zuccar. in act. monac. ex Spreng. Flowers yellow? This plant probably belongs to section 1. *Hedysaroìdeæ*.

Haenk's Wood-sorrel. Pl. 1½ foot.

48 O. ARRACA'CHA; leaves trifoliate; leaflets præmose, on long footstalks; stipulas large; peduncles few-flowered. ♄. G. Native of Chili. Petals yellow, small.

Arracacha Wood-sorrel. Fl. Sept. Shrub 2 to 3 feet.

49 O. CONORHÌZA (Jacq. ox. no. 6.) stem erect, leafy; peduncles longer than the leaves, 2-flowered; leaflets obcordate; roots turbinate. ♃. S. Native of Paraguay in South America in the vast plains to the northward of the River Plate.—Feuill. per. 2. p. 723. t. 24. Flowers large, yellow.

Cone-rooted Wood-sorrel. Pl. ¾ foot.

50 O. RÒSEA (Jacq. ox. no. 5.) stem erect, fleshy, leafy; peduncles bifid, corymbosely-racemose at the apex, 4-times longer than the leaves; leaflets obcordate. ♃. F. Native of Chili in moist places about Conception. Feuill. obs. 2. p. 23. O. racemòsa, Savig. in Lam. dict. 4. p. 684. O. floribúnda, Lindl. bot. reg. 1123. but not of Lehm. Petals rose-coloured, crenated at the apex. Styles longer than the stamens.

Var. β; flowers smaller; petals hardly lined, red, entire at the apex. Sims, bot. mag. 2415.

Rose-coloured-flowered Wood-sorrel. Fl. Mar. April. Clt. 1823. Pl. ½ to 1 foot.

51 O. CÆSPITÒSA (St. Hil. fl. bras. 1. p. 122.) stem suffruticose, very short, leafy; leaves tufted; leaflets unequally and shortly stalked, obcordate, ciliated; petioles rather dilated at the base, pilose; peduncles pubescent, 1-flowered, longer than the leaves; stamens all shorter than the styles, which are very long, joined together beyond the middle; cells of ovary 4-seeded. ♄. S. Native of Brazil in the southern part of the province of St. Paul. Stems erect or ascending, hardly 2 inches high. Petals yellow, entire, or emarginate. Stigmas small, capitate.

Tufted Wood-sorrel. Fl. Jan. Shrub 3 inches.

52 O. HÍSPIDA (Zucc. et Mart. act. mon. 9. ex Spreng. syst. append. p. 186.) stem erect, very short; leaflets obovate, emarginate, hispid, as well as the stem; peduncles equal in length to the leaves, usually 3-flowered; styles shorter than the stamens. ♃? S. Native of Brazil. Flowers yellow.

Hispid Wood-sorrel. Pl. $\frac{1}{4}$ foot.

53 O. CINERA'CEA (St. Hil. fl. bras. 1. p. 123.) stem suffruticose, very short, leafy; leaves much crowded, cinereous; leaflets nearly sessile, small, obcordate, pilose on both surfaces; petioles dilated at the base, villous as well as the peduncles, which are 1-flowered, and longer than the leaves; petals emarginate; stamens all shorter than the pistils; styles very long, connected at the base: cells of ovary 5-seeded. ♄. S. Native of Brazil in the province of Cisplatine. Stem scaly at the base. Petals yellow. Stigmas oblong, obtuse.

Grey Wood-sorrel. Fl. Jan. Shrub 2 inches.

54 O. SQUAMA'TA (Zucc. in act. monach. ex Spreng. syst. append. p. 186.) stem erect, leafy, dwarf, scaly; leaflets obcordately 2-lobed, smooth; peduncles axillary, dichotomous, many-flowered. ♃. F. Native of Chili. Flowers yellow.

Scaly Wood-sorrel. Pl. $\frac{1}{4}$ foot.

* * *Stems ascending, prostrate, or diffuse.*

55 O. CRASSICAU'LIS (Zucc. in act. monach. ex Spreng. syst. append. p. 186.) stem ascending, fleshy; leaflets obcordate, pubescent beneath; stipulas lanceolate, acute, ciliated; peduncles elongated, umbelliferous, few-flowered. ♃. G. Native of Peru. Flowers yellow.

Thick-stemmed Wood-sorrel. Pl. $\frac{1}{2}$ foot.

56 O. LATERIFLÒRA (Jacq. hort. schoenbr. 2. p. 41. t. 204.) stem ascending, a little branched, naked at the base; peduncles lateral, umbellate at top; leaflets cuneated, emarginately 2-lobed; styles shorter than the outer stamens. ♃. G. Native of the Cape of Good Hope. Flowers purple; filaments hispid.

Lateral-flowered Wood-sorrel. Fl. Mar. April. Clt. 1824. Pl. $\frac{1}{2}$ foot.

57 O. REFRA'CTA (St. Hil. fl. bras. 1. p. 119.) stem diffuse, pilose; leaflets hairy, obcordate, sessile, ciliated, acute at the base; peduncles hairy, exceeding the length of the leaves, 2-3-cleft, umbelliferous; fruit-bearing pedicels refracted; stamens all longer than the pistils; cells of ovary 4-seeded. ♃. S. Native of Brazil on the mountains called Serra-Aspro near the town of Rocha. Petals yellow. Stigmas jagged.

Var. β, *débilis* (St. Hil. l. c.) stems weaker; hairs slenderer and less numerous.

Refracted-pedicelled Wood-sorrel. Pl. diffuse.

* * * *Stems decumbent.*

58 O. LYÒNI (Pursh, fl. sept. amer. 1. p. 323.) the whole plant clothed with silky villi; stem branched, decumbent; peduncles 2-3-flowered, longer than the petioles; leaflets obcordately 2-lobed; petals wedge-shaped; capsules downy, twice the length of the lanceolate calyx. ♃. H. Native of North America on Cumberland Island, Georgia. Flowers yellow.

Lyon's Wood-sorrel. Fl. Ju. Jul. Clt. 1816. Pl. decumb.

59 O. MICROPHY'LLA (Poir. suppl. 4. p. 248.) smoothish; stems procumbent; peduncles 2-flowered, longer than the petioles; leaflets 2-lobed, obcordate; petals wedge-shaped; siliques puberulous; styles length of inner stamens. ⊙. H. Native of New Holland. O. rùbens, Haw. misc. p. 183. Flowers small, yellow.

Small-leaved Wood-sorrel. Clt.? Pl. procumbent.

60 O. MYRIOPHY'LLA (St. Hil. fl. bras. 1. p. 121.) stem suffruticose, prostrate, leafy; leaves small, in fascicles; leaflets sessile, deeply obcordate, villous; peduncles solitary, 1-flowered, and are as well as the petioles covered with soft hairs; larger stamens villous, all shorter than the styles; cells of ovary 1-seeded. ♄. S. Native of Brazil in the province of St. Paul. Petals denticulated, yellow. Stigmas tuberculately capitate.

Thousand-leaved Wood-sorrel. Fl. Jan. Feb. Sh. prostrate.

61 O. STERNBE'RGII (Zucc. in act. monach. 9. ex Spreng. syst. append. p. 185.) stem short, erect, hairy; leaflets obcordately 2-lobed, hairy; peduncles exceeding the length of the leaves; styles very long. ♃. G. Native of Brazil.

Sternberg's Wood-sorrel. Pl. $\frac{1}{2}$ foot.

62 O. CONFERTÍSSIMA (St. Hil. fl. bras. 1. p. 122. t. 24.) stem suffruticose, decumbent; branches erect, leafy; leaves small, very much crowded; leaflets sessile, obovately elliptical, hardly emarginate, pilose on both surfaces, with very villous margins; peduncles axillary, 1-flowered; flowers usually nodding; stamens shorter than the pistils; cells of ovary 5-seeded. ♄. S. Native of Brazil in the province of Minas Geraes, on the mountains called Serra do Propagaio. Petals entire, yellow. Stigmas bifid, pencilled. Stems sometimes rooting under-ground.

Very-crowded Wood-sorrel. Fl. Mar. Shrub decumbent.

63 O. LOTOÌDES (H. B. et Kunth, nov. gen. amer. 5. p. 241.) stems procumbent; branches clothed with long hairs; peduncles longer than the petioles, 3-4-flowered; leaflets roundish-obovate, emarginate, beset with close-pressed hairs, margins villous, rather glaucous beneath; petioles pilose; calyxes pubescent; styles intermediate. ♃. G. Native of South America on Mount Quindiu. Flowers yellow?

Lotus-like Wood-sorrel. Pl. procumbent.

64 O. PALUDÒSA (St. Hil. fl. bras. 1. p. 121.) stem suffruticose, prostrate, angularly compressed, very smooth; leaves ternately-verticillate and solitary; leaflets sessile, smoothish, obcordate; petioles stipulaceously-dilated at the base; peduncles axillary, 1-flowered; styles intermediate; cells of ovary 3-seeded. ♄. S. Native of Brazil in the province of Rio Grande do Sul in marshes. Petals entire, yellow, marked each with 6 dark-purple lines at the base. Styles hairy. Stigmas capitate.

Marsh Wood-sorrel. Fl. Jan. Shrub prostrate.

65 O. MEDICAGÍNEA (H. B. et Kunth, nov. gen. amer. 5. p. 241.) stems branched, procumbent, smooth; peduncles very long, bifid at apex, 4-12-flowered; leaflets obovate, emarginate, ciliated, smooth above, pubescent beneath; petioles smoothish; calyx smooth; styles intermediate. ♃. S. Native of New Granada. Flowers white.

Medik-like Wood-sorrel. Pl. procumbent.

66 O. AMA'RA (St. Hil. fl. bras. 1. p. 119.) hairy; stem suffruticose, prostrate; leaflets sessile, obcordate, villous, hispidly ciliated; peduncles axillary, 1-2-flowered, longer than the leaves; flowers large; stamens all longer than the pistils; cells of ovary 1-seeded. ♄. S. Native of Brazil in the province of Rio Grande do Sul. Petals yellow, denticulated. Stigmas small, capitate.

Bitter Wood-sorrel. Fl. spring. Shrub prostrate.

67 O. LUPULÍNA (H. B. et Kunth, nov. gen. amer. 5. p. 241.) stems filiform, procumbent, a little branched, smoothish; peduncles 1-3-flowered; leaflets roundish-obovate, emarginately 2-lobed, and are as well as the calyxes smooth; styles very long. ♃. S. Native of New Granada in cold places near Almaguer. Flowers yellow.

Wolf Wood-sorrel. Pl. procumbent.

* * * * *Stems creeping or reptant.*

68 O. VILLÒSA (Bieb. fl. taur. 1. p. 355.) plant villous; stem creeping, branched; peduncles 2-flowered, longer than the petioles; leaflets obcordate; styles length of inner stamens. ⊙. H. Native of Iberia. This species is very like *O. corniculàta*, and probably only a variety. Flowers yellow.

Villous Wood-sorrel. Pl. creeping.

69 O. CORNICULA'TA (Lin. spec. 624.) stem decumbent, branched, rooting; peduncles somewhat umbellate, shorter than the petioles; leaflets obcordate; petals emarginate; styles length of inner stamens. ♃. H. Native of Europe, particularly in Spain, Sicily, Italy, Greece, Austria, Switzerland, and England

in Devonshire, as well as of Japan, Teneriffe, Bourbon, Caribbee Islands, Mexico, and of North America from Canada to Carolina, in cultivated ground. Smith, engl. bot. t. 1726. Jacq. ox. no. 10. t. 5. O. pusílla, Sal. in Lin. trans. 2. p. 243. t. 23. f. 5. Stipulas united to the base of the petioles. Flowers yellow, those of the North American plant are larger than the European.

Horned Wood-sorrel. Fl. May, Oct. Brit. Pl. decumbent.

70 O. móllis (H. B. et Kunth, nov. gen. amer. 5. p. 241.) stems branched, creeping, and are as well as the petioles clothed with soft villi; peduncles bifid at apex, few-flowered, longer than the petioles; leaflets obovate, emarginate, pubescent, hoary beneath; calyxes puberulous; styles intermediate. ♃. S. Native of South America on the Andes about Popayan near Almaguer. Flowers yellow.

Soft Wood-sorrel. Pl. creeping.

71 O. a'lbicans (H. B. et Kunth, nov. gen. amer. 5. p. 241.) stems tufted, branched, creeping, puberulous; peduncles 1-2-flowered, equal in length with the petioles; leaflets obcordately 2-lobed, a little glaucous, edged with violet, puberulous beneath as well as the calyxes and petioles; styles very long. ♃. G. Native of Mexico near Moran. O. cinèrea, Zucc. Flowers yellow.

Var. β, sericea (D. C. prod. 1. p. 693.) whole plant silky and hoary. ♃. G. Native of Quito near Llactagunga.

Whitish Wood-sorrel. Pl. creeping.

72 O. pilosiu'scula (H. B. et Kunth, nov. gen. amer. 5. p. 241.) stems branched, creeping at the base, and are as well as petioles pilose; peduncles pubescent, 1-flowered; leaflets obcordate, ciliated, clothed with close-pressed hairs beneath; calyxes puberulous. ♃. S. Native of New Spain near the town of Caraccas. Flowers yellow.

Pilose Wood-sorrel. Pl. creeping.

73 O. filifórmis (H. B. et Kunth, nov. gen. amer. 5. p. 245. t. 469.) stems filiform, creeping, branched, smooth; peduncles 1-flowered, longer than the petioles; leaflets roundish-obovate, emarginately 2-lobed, with pilose edges, puberulous beneath; petioles pubescent; calyx ciliated; styles very long. ♃. S. Native of New Granada on the Andes near Guada. O. nematòdes, Spreng. syst. 2. p. 429. Flowers yellow.

Filiform Wood-sorrel. Pl. creeping.

74 O. parvifòlia (D. C. prod. 1. p. 693.) stems branched, creeping, smooth; branchlets leafy; peduncles 1-flowered, leaflets roundish-obovate, emarginately 2-lobed, ciliated, covered with close-pressed hairs on both surfaces; petioles and calyxes pubescent; styles very long. ♃. S. Native of South America in the kingdom of Quito and at Conception in Chili. O. microphýlla, H. B. et Kunth, nov. gen. amer. 5. p. 245. but not of Poir. This species is very like *O. filifórmis*. Flowers yellow.

Small-leaved Wood-sorrel. Pl. creeping.

75 O. re'pens (Thunb. ox. no. 11. t. 1. f. 5.) stem leafy, branched, prostrate, rooting; peduncles usually 2-flowered, length of petioles, pilose; leaflets obcordate, nearly sessile, ciliated; styles intermediate; stamens smooth; capsule pubescent. ♃. S. Native of Ceylon, Madagascar, Brazil, and the Cape of Good Hope. Jacq. ox. no. 11. t. 78. f. 1. O. stricta, Houtt. pfl. syst. 6. t. 51. f. 2. Flowers yellow.

Repent Wood-sorrel. Fl. Mar. April. Clt. 1793. Pl. creeping.

76 O. se'rpens (St. Hil. fl. bras. 1. p. 120.) stem filiform, creeping, leafy; leaflets sessile, obcordate, hardly emarginate, rather villous, ciliated; peduncles 1-flowered, longer than the leaves, smoothish; styles shorter than the stamens; cells of ovary 5-seeded. ♃. S. Native of Brazil in the province of St. Paul. Petals entire, deep yellow. Stigmas many-parted. Capsule globose, rather villous.

Creeping Wood-sorrel. Pl. creeping.

* * * * * *Stem climbing.*

77 O. sca'ndens (H. B. et Kunth, nov. gen. amer. 5. p. 241.) stem branched, climbing; peduncles elongated, dichotomously 4-cleft, many-flowered; leaflets obovate, emarginate, smooth above, hairy-pubescent beneath; petioles villous; calyxes smooth; styles very long. ♃. ◡. S. Native of South America on Mount Quindiu. Flowers yellow, larger than those of *O. acetosélla*.

Climbing Wood-sorrel. Pl. climbing.

§ 4. *Sessilifòlia* (from *sessilis*, sessile, and *folium*, a leaf; leaves sessile). *D. C. prod.* 1. *p.* 693. *Stems bulbous at the base, elongated, with scattered leaves, villous. Leaves sessile, trifoliate, villous, never bearing glands. Peduncles axillary, 1-flowered.*

78 O. macro'stylis (Jacq. ox. no. 22. t. 9.) stem erect, leafy, branched; peduncles much longer than the leaves; bracteas approaching the calyx; leaflets linear-cuneated, emarginate; styles longer than the inner stamens. ♃. G. Native of the Cape of Good Hope. Flowers with a long tube, purplish, with dirty-yellow claws, and yellowish on the under side. Bulb the size of a hazel-nut.

Long-styled Wood-sorrel. Fl. Oct. Nov. Clt. 1793. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

79 O. tubiflòra (Jacq. ox. no. 23. t. 10.) stem erect, rather branched; peduncles 4-times longer than the leaves; bracteoles pressed to the calyx; leaflets linear-wedge-shaped, blunt; styles shorter than the outer stamens. ♃. G. Native of the Cape of Good Hope. Flowers with a long tube, purplish, yellowish outside as well as the claws. Bulb the size of a hazel-nut, brown.

Tube-flowered Wood-sorrel. Clt. 1790. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

80 O. cane'scens (Jacq. ox. no. 24. t. 11.) stem erect, a little branched, leafy; peduncles twice as long as the leaves; bracteas approximating the calyx; leaflets wedge-shaped, somewhat emarginate; styles shorter than the outer stamens. ♃. G. Native of the Cape of Good Hope. Flowers with a long tube, pale-purplish, with yellowish claws. Bulb from the size of a pea to that of a hazel-nut.

Hoary Wood-sorrel. Fl. Jan. Sept. Clt. 1821. Pl. $\frac{1}{3}$ foot.

81 O. secu'nda (Jacq. ox. 68. t. 12.) stem declinate, branched, leafy; branches leaning to one side; leaflets linear-wedge-shaped; pedicels hardly exceeding the leaves in length; styles intermediate. ♃. G. Native of the Cape of Good Hope. Flowers with a long tube, lilac. Filaments smooth. Bulb brown, size of a hazel-nut.

Secund-branched Wood-sorrel. Fl. Oct. Nov. Clt. 1790. Pl. 1 foot long.

82 O. hi'rta (Lin. spec. 628.) stem erect, a little branched, leafy; leaflets linear-wedge-shaped, retuse; peduncles much longer than the leaves; bracteoles remote from the calyx; styles longer than the inner stamens; stamens toothless and glandless. ♃. G. Native of the Cape of Good Hope. Flowers lilac, with a yellow bottom, and a short tube. Jacq. ox. no. 26. t. 13.—Burm. afr. 70. t. 28. f. 1. Bulb brown, about the size of a hazel-nut.

Var. β, brévipes (D. C. prod. 1. p. 694.) peduncles hardly longer than the leaves.

Hairy-stemmed Wood-sorrel. Fl. Oct. Nov. Clt. 1787. Pl. $\frac{3}{4}$ foot.

83 O. hirte'lla (Jacq. ox. no. 27. t. 14.) stem erect, a little branched, leafy; leaflets linear-lanceolate, acutish; peduncles very long; bracteoles remote from the calyx; styles longer than the inner stamens; outer stamens with gibbous toothlets; hairs of stamens glandular. ♃. G. Native of the Cape of Good Hope. Flowers pale-lilac, with a yellow bottom, outside dirty-

yellow, with a short tube. O. sessilifòlia, Lin. mant. 241. O. hírta β, Willd. spec. 2. p. 705. Bulb brown, about the size of a hazel-nut.

Hirsute-stemmed Wood-sorrel. Fl. March, April. Clt. 1823. Pl. ½ to ¾ foot.

84 O. multiflòra (Jacq. ox. no. 28. t. 15.) stem erect, leafy, much branched; leaflets linear wedge-shaped, blunt; peduncles much longer than the leaves; bracteoles remote from the calyx; styles shorter than the outer stamens. 4. G. Native of the Cape of Good Hope. Jacq. icon. rar. t. 472. Corolla lilac, campanulate, yellowish outside, as well as the claws. Bulb brown, larger than a hazel-nut.

Many-flowered Wood-sorrel. Fl. Feb. March. Clt. 1789. Pl. ¼ to ½ foot.

85 O. rube'lla (Jacq. ox. no. 29. t. 16.) stem erect, leafy, branched; leaflets linear-cuneated; peduncles much longer than the leaves; bracteas rather remote from the calyx; styles intermediate. 4. G. Native of the Cape of Good Hope. Corolla purplish, campanulate, with yellowish claws. Jacq. icon. rar. t. 471. Sims, bot. mag. t. 1031.—Burm. afr. 71. t. 28. f. 2. Bulb brown, about the size of a hazel-nut.

Reddish-flowered Wood-sorrel. Fl. Sept. Nov. Clt. 1791. Pl. ½ foot.

86 O. fu'lgida (Lindl. bot. reg. 1073.) stem short, decumbent, branched; leaflets linear, sessile, acute; peduncles much higher than the leaves; bracteas approaching the calyx; styles very long. 4. G. Native of the Cape of Good Hope. Petals beautiful, purple. This plant is very like *O. rubélla*, but differs in being smooth.

Fulgid Wood-sorrel. Fl. Sept. Nov. Pl. ¼ foot.

87 O. rosa'cea (Jacq. ox. no. 30. t. 17.) stem decumbent, simple, leafy; leaflets oblong, wedge-shaped; peduncles much longer than the leaves; bracteas distant from the flower; styles intermediate. 4. G. Native of the Cape of Good Hope. Sims, bot. mag. t. 1698. Plant canescent. Corolla deep red, but pale outside, with yellowish claws. Bulb brown, smaller than a hazel-nut.

Rose-coloured-flowered Wood-sorrel. Fl. Sept. Nov. Clt. 1793. Pl. prostrate.

§ 5. *Cauliflòræ* (from *caulis*, a stem, and *flos*, a flower). *D. C. prod.* 1. *p.* 694. *Stems elongated, with scattered leaves. Leaves, only upper ones stalked, with* 3-5-*leaflets. Peduncles axillary,* 1-*flowered. The species of this section are very dissimilar in habit. Roots bulbous.*

88 O. virgi'nea (Jacq. hort. schœnbr. 3. t. 275.) stem erect, leafy, a little branched; leaves stalked; leaflets 3, lateral ones oblong, middle one obovately-cuneated; pedicels shorter than the leaves; styles intermediate; filaments toothless, hispid. 4. G. Native of the Cape of Good Hope. Flowers white.

Virgin Wood-sorrel. Fl. Nov. Dec. Clt. 1820. Pl. ½ foot.

89 O. repta'trix (Jacq. ox. no. 33. t. 20.) stem erect, short, leafy; leaves on long stalks; leaflets 3, obovate-roundish; peduncles longer than the leaves; styles very short; filaments toothed, glandular. 4. G. Native of the Cape of Good Hope. Flowers with a pale flesh-coloured border, and yellowish tube. Root creeping, emitting bulbs.

Crawling-rooted Wood-sorrel. Fl. Nov. Dec. Clt. 1795. Pl. ½ foot.

90 O. incarna'ta (Lin. spec. 622.) stem erect, branched, smooth, leafy; leaves stalked, several at remote distances, in whorls; leaflets 3, obcordate; peduncles length of leaves; styles very long; stamens toothed. 4. G. Native of the Cape of Good Hope. Jacq. hort. vind. t. 71. O'xys. Comm. hort. 1. p. 43. t. 22. Flowers pale flesh-coloured. Root of 2 or 3 fusiform legs. Stem weak, purple.

Flesh-coloured-flowered Wood-sorrel. Fl. April, June. Clt. 1739. Pl. ½ foot.

91 O. di'sticha (Jacq. ox. no. 31. t. 18.) stem branched at the base, ascending, smooth, leafy; leaves scattered, stalked; petioles with winged stipulas; leaflets 3, obcordate; peduncles longer than the leaves; styles intermediate; filaments toothed. 4. G. Native of the Cape of Good Hope. Flowers pale-yellow, but of a dusky-yellow within. Bulb brown, an inch long, tapering.

Distich-leaved Wood-sorrel. Fl. Jan. Sept. Clt. 1818. Pl. ½ foot.

92 O. venòsa (Sav. in Lam. dict. 4. p. 681.) stem erect, hairy, simple, leafy; lower leaves on short stalks, scattered, upper ones on long stalks, somewhat whorled; leaflets cuneated, emarginate, hispid beneath; stipulas awl-shaped; peduncles longer than the leaves. 4. G. Native of the Cape of Good Hope. Corolla veined, violet, with a yellow tube. Root bulbous.

Veiny-flowered Wood-sorrel. Fl. Oct. Nov. Pl. ½ foot.

93 O. ebractea'ta (Sav. in Lam. dict. 4. p. 682.) stem simple, erect, hairy, leafy at the top; leaves stalked; leaflets 3? oblong, obcordate, with the margin and rib beset with glandular hairs; peduncles without bracteas, length of petioles. 4. G. Native of the Cape of Good Hope. Flowers yellow. This is probably the same as *O. dísticha*.

Bractless Wood-sorrel. Pl. ½ foot.

94 O. heterophy'lla (D. C. prod. 1. p. 694.) villous; stem erect, branched at the base; lower leaves sessile; leaflets 3, obcordate, upper ones on long stalks, with 2-parted leaflets; peduncles longer than the petioles, with 2 bracteas in the middle; styles very short; root fibrous. 4. G. Native of the Cape of Good Hope? Flowers purple.

Variable-leaved Wood-sorrel. Pl. ½ foot.

95 O. quina'ta (Sav. in Lam. dict. 4. p. 688.) stem ascending, leafy on the upper part, on long stalks; leaflets 5, wedge-shaped, somewhat emarginate; peduncles longer than the petioles, with 2 bracteas on the middle of each. 4. G. Native of the Cape of Good Hope. Flowers purplish, with a yellow tube.

Quinate-leaved Wood-sorrel. Pl. ½ foot.

§ 6. *Caprìnæ* (from *caprinus*, of a goat; some species have bifid leaflets, which have been compared to the foot of a goat). *D. C. prod.* 1. *p.* 675. *Stemless or with a naked stipe, furnished with a few leaves at the top. Scape many-flowered, rarely* 1-2-*flowered. Leaves radical, with the number of leaflets variable, but usually* 3, *with the leaflets sessile or subsessile, obcordate or subobcordate. Cells of ovary* 4-12-*seeded. Roots bulbous or tuberous.*

* *Leaflets above three.*

96 O. decaphy'lla (H. B. et Kunth, nov. gen. amer. 5. p. 238. t. 468.) stemless; leaflets 8-10, wedge-shaped, bifid at the apex, a little ciliated, smooth; scapes 5-14-flowered, longer than the leaves; sepals blunt, with two spots at the top of each; stamens equal among themselves, but one-half longer than the styles. 4. G. Native of Mexico, near the rock called El Peñon. Flowers violaceous, about the size of those of *O. stricta*.

Ten-leafletted Wood-sorrel. Pl. ½ foot.

97 O. Hernade'sii (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 695.) stemless; leaflets 9-11, oblong, villous; scape umbelliferous, 6-flowered, longer than the leaves. 4. G. Native of Mexico.—Hern. mex. 386. f. 3. Flowers erect, pale-violet.

Hernadez's Wood-sorrel. Pl. ¼ foot.

98 O. Burma'nni (Jacq. ox. no. 20.) stem very short, leafy at the top; leaflets 5-6, lanceolate, smooth; scape umbelliferous,

7-8-flowered, longer than the leaves. ♃. G. Native of the Cape of Good Hope.—Burm. afr. t. 29. Flowers yellow.

Burmann's Wood-sorrel. Fl. Oct. Nov. Clt. 1820. Pl. ¼ ft.

99 O. TETRAPHY'LLA (Cav. icon. 3. t. 237.) stemless; leaflets 4, rarely 3, obcordate, smooth, rather glaucous beneath; peduncles umbelliferous, 3-10-flowered; styles very long. ♃. G. Native of Mexico. Corolla of a purplish-violet colour.

Four-leaved Wood-sorrel. Fl. June, July. Clt. 1823. Pl. ¼ ft.

100 O. DE'PPEI (Lodd. bot. cab. 1500. Sweet, fl. gard. n. s. 96.) stemless; leaflets 4, large, obcordate, pilose, glaucous beneath, on short petioles; petioles densely pilose; umbels many-flowered; scape and petioles loosely pilose; styles intermediate, villous; stamens unequal, alternate ones each with an appendage. ♃. F. Native of Mexico. Bulb large, scaly, like those of a *Lílium*. Petals of a coppery-red colour.

Deppe's Wood-sorrel. Fl. June, Aug. Clt. 1827. Pl. ¼ ft.

* * *Leaflets 3, obcordate or emarginate.*

101 O. SERI'CEA (Lin. fil. suppl. 245.) stemless; leaflets 3, obcordate, clothed with silky down; scape umbelliferous, longer than the leaves; flowers nodding; styles intermediate. ♃. G. Native of the Cape of Good Hope.—Jacq. ox. no. 13. t. 77. f. 1. Corolla yellow.

Silky-leaved Wood-sorrel. Fl. April, May. Clt. 1794. Pl. ¼ ft.

102 O. FLORIBU'NDA (Lehm. cat. sem. hort. hamb.) leaflets 3, roundish-obovate, deeply emarginate, hairy, leprous beneath on the margins; scape many-flowered; sepals obtuse, canescent; styles longer than the stamens, crowned by capitate stigmas. ♃. S. Native of Brazil. Root tuberous. Leaves radical. Flowers reddish, and painted with darker veins. Filaments and styles bearded. Lehm. in act. bonn. 14. p. 813.

Bundle-flowered Wood-sorrel. Clt. 1827. Pl. ½ foot.

103 O. BIPUNCTA'TA (Graham mss. in Hook. bot. mag. 2781.) stemless; leaflets 3, sessile, broadly obcordate, pubescent beneath, smooth above; scape compressed, paniculately many-flowered, and are as well as the petioles pilose; sepals bluntish, bimaculate at the apex; styles intermediate; stigmas capitate; petals truncate, unequally crenate. ♃. S. Native of Brazil, about Rio Janeiro. Flowers lilac, with deeper veins.

Two-spotted-sepalled Wood-sorrel. Fl. April, May. Clt. 1826. Pl. ½ foot.

104 O. ARTICULA'TA (Sav. in Lam. dict. 4. p. 686.) stemless; leaflets 3, sessile, obcordate, somewhat truncate at the sides, and angularly-rounded at the apex, ciliated; petioles pilose; scape villous, umbelliferous, 5-6-flowered; involucre very short, few-leaved; calyxes bimaculate at the apex; cells of ovary 7-seeded; styles intermediate. ♃. S. Native of Monte Video, and of Brazil in the provinces of Rio Grande do Sul and St. Catharine. Root tuberous, granular. Petals crenulated, purple.

Jointed-rooted Wood-sorrel. Pl. ¼ foot.

105 O. MEGALORHÌZA (Jacq. ox. no. 12.) stemless; leaflets 3, obcordate, violaceous on the under surface; scape umbelliferous, shorter than the leaves; root thick, many edged. ♃. G. Native of Peru. O. bícolor, Sav. in Lam. dict. 4. p. 687.—Feuille, per. 2. p. 734. t. 25. Flowers yellow, with 3 red lines at the base of each petal. Root 8 inches long, divided below into branching legs full of forks.

Large-rooted Wood-sorrel. Pl. ¼ foot.

106 O. AUTUMNA'LIS (St. Hil. fl. bras. 1. p. 128.) stemless, dwarf; bulb scaly, very woolly; leaves small; leaflets 3, sessile, obovately-cuneated, smooth; scape 1-flowered, longer than the leaves, smooth; sepals linear, bluntish; stamens shorter than the styles, very smooth; cells of ovary 9-seeded. ♃. S. Native of Brazil in the province of Rio Grande do Sul, upon the confines of the province of St. Catharine. Petals entire, yellow. Stigmas capitate.

Autumnal Wood-sorrel. Fl. autumn. Pl. ½ foot.

107 O. NUDIFLÒRA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 695.) stemless; scapes and petioles pilose; leaflets 3, obcordate; flowers 5-6 umbellate, destitute of an involucre. ♃. G. Native of Mexico in fields. Flowers erect, violaceous, but when in bud nodding.

Naked-flowered Wood-sorrel. Pl. ¼ foot.

108 O. VIOLA'CEA (Lin. spec. 621.) stemless; leaflets 3, obcordate, smooth, red underneath; scape umbelliferous, 3-9-flowered; flowers erectish, with a short involucre; styles shorter than the outer stamens; sepals callose at the apex. ♃. H. Native of North America from New England to Carolina, in shady woods on the sides of hills in fertile soil. Jacq. hort. vind. t. 180. ox. no. 14. t. 80. f. 2. Flowers pink-coloured. Stamens hairy. Bulb fusiform, black.

Violet-coloured-flowered Wood-sorrel. Fl. May, Sept. Clt. 1772. Pl. ¼ foot.

109 O. BI'LOBA; stemless; leaflets 3, 2-lobed; lobes spreading; scape umbellate; flowers nodding. ♃. G. Native of Peru. Petals apparently purplish. Root bulbous.

Two-lobed-leafletted Wood-sorrel. Pl. ¼ foot.

110 O. E'LEGANS (H. B. et Kunth, nov. gen. amer. 5. p. 234. t. 466.) stemless; leaflets 3, broad, roundish-obovate, emarginate, violet-coloured on the under surface, and are, as well as the petioles, smooth; scapes very long, 2-6-flowered; sepals acuminated, with two spots at the top of each; styles very long. ♃. G. Native of Peru near Loxa. Flowers large, of a violet colour. Bulb solitary.

Elegant Wood-sorrel. Pl. ½ foot.

111 O. JACQUINIA'NA (H. B. et Kunth, nov. gen. amer. 5. p. 234.) stemless; leaflets 3, broad, roundish-obovate, somewhat emarginately 2-lobed, and are, as well as the petioles, quite smooth; scape 3-6-flowered; sepals with two spots at the top of each; styles very long. ♃. G. Native of Mexico, near Real-del-Monte. Flowers violet-coloured. Bulb solitary.

Jacquin's Wood-sorrel. Pl. ¼ foot.

112 O. DE'BILIS (H. B. et Kunth, nov. gen. amer. 5. p. 234.) stemless; leaflets 3, subrotund, deeply emarginate, puberulous beneath; scapes 6-flowered, bifid, and are as well as the petioles hairy; sepals bluntish, each marked at the top with a spot; styles very long. ♃. S. Native of New Spain between La Venta Grande and the city of Caraccas. Flowers violet-coloured, about the size of those of *O. acetosélla*. Bulbs tufted.

Weak Wood-sorrel. Pl. ¼ foot.

113 O. SCHRADERIA'NA (H. B. et Kunth, nov. gen. amer. 5. p. 234.) stemless; leaflets 3, broad, roundish-obovate, emarginate, smooth; petioles rather pilose; scapes smooth, 9-11-flowered; sepals blunt, each marked with a spot at the apex; styles equal in length to the shorter stamens. ♃. G. Native of South America on mount Quindiu. Flowers violet-coloured, about the size of those of *O. stricta*.

Schrader's Wood-sorrel. Pl. ¼ foot.

114 O. MI'NIMA (Ruiz et Pav. mss. in herb. Lamb,) root a bulb, scaly; plant hairy; leaflets 3, sessile, triangularly emarginate; peduncles 1-flowered, not so long as the leaves. ♃. G. Native of Peru. Flowers rather large, apparently purple.

Least Wood-sorrel. Pl. 1 to 2 inches.

115 O. CARNÒSA (Mol. chil. ex Lindl. bot. reg. 1063.) stem short, scaly; leaves trifoliate; leaflets nearly sessile, obcordate, fleshy, marked beneath with chrystalline dots; scape 2-3 or many-flowered; sepals triangular, flat. ♃. F. Native of Chili at Conception. Hook. bot. mag. 2866. Root fusiform. Petals obtuse, emarginate, sometimes denticulated, yellow. Mr. Collie says, that this is a very succulent plant, and is powerfully antiscorbutic.

Fleshy Wood-sorrel. Fl. Ap. Sep. Clt. 1825. Pl. 3-6 inches.

116 O. LATIFÒLIA (H. B. et Kunth, nov. gen. amer. 5. p. 234. t. 467.) stemless; leaflets 3, broad, somewhat deltoid, emarginately 2-lobed, ciliated, smooth; petioles puberulous; scapes 6-7-flowered; sepals bluntish, each marked at the apex by a spot; styles intermediate. 4. G. Native of Mexico near Campeachy. Flowers violet-coloured, a little smaller than those of the preceding. Bulb solitary.

Broad-leaved Wood-sorrel. Pl. $\frac{1}{4}$ foot.

117 O. GRANDIFÒLIA (D. C. prod. 1. p. 696.) stemless; leaflets 3, roundish-obovate, deeply emarginate, ciliated, puberulous above, pubescent beneath; petioles pilose; scapes many-flowered; sepals obtuse, each marked with a spot at the apex; styles very long. 4. S. Native of New Andalusia, in humid shady places on mount Cocollar. O. macrophýlla, H. B. et Kunth, nov. gen. amer. 5. p. 234. but not of Hornem. Bulbs tufted. Flowers white, about the size of those of *O. stricta*.

Great-leaved Wood-sorrel. Pl. $\frac{1}{4}$ foot.

118 O. LASIOPE'TALA (Zuccar. in act. monach. ex Spreng. syst. append. p. 184.) stemless; leaflets 3, obcordately 2-lobed, smooth above, pubescent beneath; scape usually 3-flowered; petals pilose on the outside, as well as the margins; styles longer than the stamens. 4. S. Native of Monte Video.

Woolly-petalled Wood-sorrel. Pl. $\frac{1}{2}$ foot.

119 O. RU'BRA (St. Hil. fl. bras. 1. p. 124.) stemless; leaflets 3, obcordate, smoothish, full of blackish dots; scape smoothish, umbelliferous, 6-12-flowered; umbel simple, with a very short involucre; styles longer than the stamens; cells of ovary 4-5-seeded. 4. S. Native of Brazil, in the southern parts of the province of St. Paul, on the banks of rivulets. Flowers fine red. Petals smooth, entire. Stigmas small, capitate. Root tuberous, obovate or cylindrical.

Red-flowered Wood-sorrel. Fl. March. Pl. $\frac{1}{4}$ foot.

120 O. RUPE'STRIS (St. Hil. fl. bras. 1. p. 126.) stemless; leaflets 3, obcordate, sessile, pilose, ciliated, with rounded sides; petioles hairy; scape hairy, umbelliferous; umbels simple, involucrated; sepals linear, acutish, spotted at the apex; petals pilose; styles shorter than the stamens; cells of ovary 6-seeded. 4. G. Native of Brazil, on rocks in the mountains called Serra de Villa Rica, in the province of Minas Geraes. Flowers rose-coloured. Stigmas capitate. Root a bulb, about the size of a hazel-nut.

Rock Wood-sorrel. Fl. Jan. Pl. $\frac{1}{4}$ foot.

121 O. U'RBICA (St. Hil. fl. bras. 1. p. 126.) stemless; leaflets 3, obcordate, pilose; petioles hairy; scape hairy; umbels compound, involucrated, many-flowered; sepals pilose, acutish, bimaculate at the apex; styles intermediate; cells of ovary 8-seeded. 4. S. Native of Brazil, very frequent on road sides and on moist walls about Rio Janeiro. O. violàcea, Savign. ency. 4. p. 686. but not of Lin. Jacq. nor Michx. O. Martiàna, Zucc. in act. monach. ex Spreng. syst. append. p. 185. Flowers purple, with entire petals. Bulb about the size of a hazel-nut, and bearing small bulbs in the axils of the lower leaves.

City Wood-sorrel. Pl. $\frac{1}{4}$ foot.

122 O. TRIANGULA'RIS (St. Hil. fl. bras. 1. p. 128.) stemless; leaflets 3, on short petioles, large, triangular, hardly retuse, silky-villous on both surfaces; petioles villous; scape villous, umbelliferous, many-flowered; sepals oblong-linear, pilose; styles very villous, shorter than the stamens; stigmas capitate, laciniately many-parted. 4. S. Native of Brazil, in the province of Rio Janeiro, among rocks on the banks of the river Uba. Flowers rose-coloured, with entire, smooth petals. Root a bulb.

Triangular-leaved Wood-sorrel. Fl. Oct. Pl. $\frac{1}{4}$ foot.

123 O. PALU'STRIS (St. Hil. fl. bras. 1. p. 127.) stemless; leaflets 3, truncately triangular, smoothish, with rounded sides; petioles villous at the apex; scape umbelliferous, smoothish, many-flowered; sepals smooth, linear, bluntish, spotted; styles length of the stamens, or shorter; cells of ovary 7-seeded. 4. S. Native of Brazil, in the western part of the province of Minas Geraes, in marshes. O. papilionàcea, Willd. herb. Lodd. bot. cab. icon. Flowers purple, with nearly entire, smooth petals. Stigmas subcapitate. Bulb ovate or oblong.

Marsh Wood-sorrel. Pl. $\frac{1}{4}$ foot.

124 O. BIPARTI'TA (St. Hil. fl. bras. 1. p. 125. t. 25.) stemless; leaflets 3, sessile, 2-parted, smoothish, with the divisions linear and diverging; scape dichotomously umbelliferous, many-flowered; involucre small, 2-cleft; sepals linear, obtuse, bimaculate at the base; styles intermediate; cells of ovary 12-seeded. 4. S. Native of Brazil, in the province of Rio Grande do Sul, frequent. Flowers red, with obtuse petals. Styles angular, hairy, joined at the base. Root an obovate bulb.

Two-parted-leaved Wood-sorrel. Pl. $\frac{1}{4}$ foot.

125 O. CAPRÌNA (Lin. spec. 622.) stemless; leaflets 3, obcordately 2-lobed, smooth, somewhat ciliated; scape umbelliferous, 2-3-flowered; flowers erect; styles very short. 4. G. Native of the Cape of Good Hope. Flowers of a bluish flesh-colour, with a yellow bottom. O. erécta, Savig. in Lam. dict. 4. p. 685. O. pes-càpræ, Lin. spec. 622. Bulb ovate, triangular.

Goat's-foot Wood-sorrel. Fl. March, June. Clt. 1757. Pl. $\frac{1}{4}$ foot.

126 O. CE'RNUA (Thunb. diss. ox. no. 12. t. 2. f. 2.) stemless or with a short stem; leaflets 3, obcordately 2-lobed, smooth, or a little ciliated; scape umbelliferous, many-flowered; flowers at first drooping; styles very short. 4. G. Native of the Cape of Good Hope.—Mill. icon. t. 195. f. 1. Jacq. ox. no. 16. t. 6. O. pes-càpræ, Savign. in Lam. dict. 4. p. 685. Corolla yellow. Stamens smooth. This species is to be found frequently in gardens under the name of *O. caprìna*. O. caprìna, Curt. bot. mag. t. 237. Bulbs issuing from the axils of the leaves.

Drooping-flowered Wood-sorrel. Fl. Feb. May. Clt. 1757. Pl. $\frac{1}{2}$ foot.

127 O. COMPRE'SSA (Jacq. ox. no. 19. t. 78. f. 3.) stemless; petioles flattish; leaflets 3, obcordate, puberulous; scape umbelliferous, 2-flowered; sepals entire; styles very long. 4. G. Native of the Cape of Good Hope. Flowers yellow.

Compressed-petioled Wood-sorrel. Fl. year. Clt. 1794. Pl. $\frac{1}{4}$ foot.

128 O. DENTA'TA (Jacq. ox. no. 17. t. 7.) nearly stemless; leaflets 3, obcordate, smooth, a little ciliated; scape umbelliferous, 2-4-flowered; sepals 3-toothed at the apex, beset with glands; styles very long. 4. G. Native of the Cape of Good Hope. Flowers pale flesh-coloured or pale purplish. Leaves purple beneath.

Toothed-sepalled Wood-sorrel. Fl. Nov. Dec. Clt. 1793. Pl. $\frac{1}{4}$ foot.

129 O. LI'VIDA (Jacq. ox. no. 18. t. 8.) stemless: leaflets 3, obcordately 2-parted, of a livid-violet colour beneath; scape umbelliferous, 2-flowered; styles intermediate. 4. G. Native of the Cape of Good Hope. Flowers flesh-coloured, with yellowish claws.

Livid-leaved Wood-sorrel. Fl. Oct. Nov. Clt. 1793. Pl. $\frac{1}{4}$ ft.

130 O. BÒWII (Ait. mss.) stemless, hoary-pubescent; leaflets 3, obtuse; peduncles about equal in length to the leaves, umbelliferous. 4. G. Native of the Cape of Good Hope. Root bulbous. Flowers large, red. An elegant plant.

Bowie's Wood-sorrel. Fl. April, Aug. Clt. 1824. Pl. $\frac{1}{4}$ ft.

131 O. PURPURA'TA (Jacq. hort. schœnb. t. 356.) almost stemless; leaflets 3, obcordate, ciliated, blood-coloured beneath; scape umbelliferous, 5-7-flowered; styles very long. 4. G. Native of the Cape of Good Hope. Flowers white, or rather pale flesh-coloured. Stamens hardly connate. Petioles round.

Purplish-leaved Wood-sorrel. Fl. Oct. Nov. Clt. 1822. Pl. $\frac{1}{2}$ foot.

132 O. MACROPHY'LLA (Horn. hort. hafn. 1. p. 428.) stemless; leaflets 3, obcordate, smooth; scape bifid, rather pilose, longer than the leaves; flowers drooping after expansion; styles intermediate. ♃. G. Native of the Cape of Good Hope.

Long-leaved Wood-sorrel. Fl. Jan. Sept. Clt. 1820. Pl. $\frac{1}{4}$ ft.

133 O. LI'BYCA (Viv. fl. lib. ex Spreng. syst. 2. p. 426.) stemless; leaflets 3, obcordate, hairy; scape umbelliferous, many-flowered, longer than the leaves; flowers drooping? styles intermediate. ♃. G. Native of Cyrenaica. Flowers yellow?

Libyan Wood-sorrel. Pl. $\frac{1}{4}$ foot.

134 O? GLOMERA'TA (Hook. bot. Beech. voy. p. 13.) stemless; leaves trifoliate; leaflets linear; scape twice the length of the elongated petioles; umbel many-flowered, capitate. ♃. F. Native of Chili, at Coquimbo. Flowers yellow. Sepals somewhat 3-toothed, about equal in length to the petals. Stamens 10. Stigmas 5.

Glomerate Wood-sorrel. Pl. $\frac{1}{4}$ foot.

135 O. CORYMBÒSA (D. C. prod. 1. p. 696.) stemless; leaflets 3, smoothish, very broad, obcordate, rounded at both sides; scapes bifid, branched, many-flowered. ♃. S. Native of the islands of Bourbon and the Mauritius. Flowers double, small, pale-red. Scape 7-10 inches long.

Corymbose-flowered Wood-sorrel. Pl. $\frac{1}{2}$ to 1 foot.

* * * *Leaflets 3, ovate.*

136 O. VIRGÒSA (Savig. in Lam. dict. 4. p. 685.) stemless; leaflets 3, ovate; scapes many-flowered; flowers in whorls. ♃. G. Native of Chili.—Mol. chil. p. 110. Flowers yellow? Scapes 5 feet high.

Twiggy Wood-sorrel. Pl. 5 feet.

§ 7. *Simplicifòlia* (from *simplex*, simple, and *folium*, a leaf; leaves simple). *D. C. prod.* 1. *p.* 696. *Plants stemless and caulescent. Leaves simple, pubescent; petioles naked. Scapes and peduncles one or many-flowered.*

137 O. MANDIOCCA'NA (Raddi, mem. bras. p. 21.) caulescent, erect, or prostrate; leaves rosulate, somewhat ovate, acuminated, with the margins and middle nerve pubescent; petioles with a winged margin, as well as the many-flowered peduncles, which are flattened; stamens shorter than the styles; cells of ovary 1-seeded. ♃. S. Native of Brazil, in woods on the mountain called Mandiocca, near Rio Janeiro. O. alièna, Spreng. neuw. entd. 3. p. 58. Flowers yellow. Stigmas capitate.

Var. α, Raddiàna (St. Hil. fl. bras. 1. p. 118.) leaves exactly ovate, very obtuse at the base; petioles with winged margins, ciliated.

Var. β, rhombifòlia (St. Hil. fl. bras. 1. p. 188.) leaves rhomb-ovate; petioles scarcely winged, pubescent.

Mandiocca Wood-sorrel. Pl. $\frac{1}{2}$ foot.

138 O. OVA'TA (Zucc. in act. monach. 9. ex Spreng. syst. append. 184.) stem suffruticose, almost simple; leaves ovate, acutish, smooth; peduncles many-flowered; stamens exceeding the styles. ♄. S. Native of Brazil. Flowers yellow.

Ovate-leaved Wood-sorrel. Shrub 1 foot.

139 O. ALA'TA (Mart. et Zucc. in act. monach. 9. ex Spreng. syst. append. p. 184.) stem suffruticose; leaves ovate, acute, pubescent; peduncles elongated, winged, many-flowered; styles exceeding the stamens in length. ♄. S. Native of Brazil.

Winged-peduncled Wood-sorrel. Shrub 1 foot.

140 O. CILIA'TA (Spreng. syst. 2. p. 423.) caulescent; leaves cordate, orbicular, obtuse, ciliated; petioles and many-flowered peduncles hairy; styles longer than the stamens. ♃. S. Native of Brazil.

Ciliated-leaved Wood-sorrel. Pl. $\frac{1}{2}$ foot.

141 O. VILLÒSA; villous; stem shrubby, erect; leaves simple, oblong-obovate, or cordate, mucronate; petioles terete; pedicels 1-flowered. ♄. G. Native of Mexico. Sepals acute.

Villous Wood-sorrel. Shrub $\frac{1}{2}$ foot.

142 O. PRIMULÆFÒLIA (Raddi, mem. bras. add. p. 21.) stemless; leaves oblong, obtuse, tapering to the base; scapes many-flowered, filiform, erectish. ♃. S. Native of Brazil, in woods on the mountain called Mandiocca, near Rio Janeiro. This is an intermediate plant between sections *Simplicifòlia* and *Caprìna*.

Primrose-leaved Wood-sorrel. Pl. $\frac{1}{4}$ foot.

143 O. MONOPHY'LLA (Lin. mant. 241.) stemless; leaves elliptical, obtuse; scape 1-flowered; filaments smooth; styles intermediate, bearing glandular hairs. ♃. G. Native of the Cape of Good Hope. Jacq. ox. no. 35. t. 79. f. 3. Thunb. ox. no. 1. t. 1. f. 1. Flowers about the size of those of *O. acetosélla*, pale-purple, with yellowish claws. Root bulbous, hairy.

One-leaved Wood-sorrel. Fl. Oct. Nov. Clt. 1774. Pl. $\frac{1}{8}$ ft.

144 O. LE'PIDA (Jacq. ox. no. 34. t. 21.) stemless; leaves obovate, somewhat retuse; scape 1-flowered; styles very long, and bear glandular hairs, as well as the stamens. ♃. G. Native of the Cape of Good Hope. Flowers pale-purple, with yellow claws. Root bulbous, hairy.

Pretty Wood-sorrel. Fl. Jan. Nov. Clt. 1823. Pl. $\frac{1}{4}$ foot.

145 O. ROSTRA'TA (Jacq. ox. no. 36. t. 22.) stemless; leaves obovate, retuse; scape 1-flowered; styles very short; filaments bearing glandular hairs, inner ones with a beak at the top on the back of each, and bearing an anther at the end of the beak. ♃. G. Native of the Cape of Good Hope. Flowers of a lilac colour.

Beaked-stamened Wood-sorrel. Fl. Oct. Nov. Clt. 1795. Pl. $\frac{1}{8}$ foot.

§ 8. *Pterópodæ* (from πτερον, *pteron*, a wing, and πους ποδος, *pous podos*, a foot; petioles winged). *D. C. prod.* 1. *p.* 697. *Stemless. Leaves smooth, with 2-3 leaflets. Petioles winged. Scapes 1-flowered.*

146 O. CRI'SPA (Jacq. ox. no. 37. t. 23.) stemless; leaflets 2, roundish-obovate, emarginate, with waved margins; styles very long, and are, as well as the filaments, beset with glandular hairs. ♃. G. Native of the Cape of Good Hope. Flowers large, white, or pale-lilac, with yellow claws.

Curled-leaved Wood-sorrel. Fl. Oct. Nov. Clt. 1793. Pl. $\frac{1}{4}$ ft.

147 O. LEPORÌNA (Jacq. ox. no. 39. t. 25.) stemless; leaflets 2, elliptical, emarginate, with ciliately and cartilaginous toothletted edges; styles very long, and are, as well as the filaments, beset with glandular hairs. ♃. G. Native of the Cape of Good Hope. Flowers white, with reddish edges, and yellow claws.

Hare's-foot Wood-sorrel. Fl. Jan. Nov. Clt. 1795. Pl. $\frac{1}{4}$ ft.

148 O. ASINÌNA (Jacq. ox. no. 38. t. 24.) stemless; leaflets 2, lanceolate, with cartilaginous toothletted edges; styles intermediate; filaments beset with glandular hairs. ♃. G. Native of the Cape of Good Hope. Flowers yellow.

Ass's-ear-leaved Wood-sorrel. Fl. Nov. Dec. Clt. 1792. Pl. $\frac{1}{4}$ foot.

149 O. LANCEÆFÒLIA (Jacq. ox. no. 40. t. 26.) stemless; leaflets 2-3, with cartilaginous scabrous margins; styles very long; filaments smooth. ♃. G. Native of the Cape of Good Hope. Flowers yellow.

Lance-leaved Wood-sorrel. Fl. Oct. Nov. Clt. 1795. Pl. $\frac{1}{4}$ foot.

150 O. FABÆFÒLIA (Jacq. ox. no. 41. t. 27.) stemless; leaflets 3, obovate, emarginate, mucronated; styles intermediate, and are, as well as the filaments clothed with glandular hairs. ♃. G. Native of the Cape of Good Hope. Flowers yellow.

Bean-leaved Wood-sorrel. Fl. Oct. Nov. Clt. 1794. Pl. $\frac{1}{4}$ ft.

§ 9. *Acetoséllæ* (a dim. of *acetosus*, sour; taste of leaves). *D. C. prod.* 1. *p.* 697. *Stemless and somewhat stipitate. Leaves stalked, trifoliate. Petioles without margins. Leaflets not glandular beneath. Scapes* 1*-flowered. Roots bulbous.*

* *Leaves oblong or lanceolate. Stemless, or almost so.*

151 O. LABURNIFÒLIA (Jacq. ox. no. 42. t. 28.) stemless, pubescent; lateral leaflets obliquely oblong, middle one somewhat lanceolate; scapes longer than the petioles, with 2 bracteas in the middle; styles very long. ♃. G. Native of the Cape of Good Hope. Petioles red. Leaves purple beneath. Flowers yellow. This species has the habit of those species belonging to section *Pteropòdæ*, but the petioles are half round and wingless.

Laburnum-leaved Wood-sorrel. Fl. Sept. Oct. Clt. 1793. Pl. $\frac{1}{4}$ foot.

152 O. SANGUÍNEA (Jacq. ox. no. 43. t. 29.) stemless, pubescent; leaflets oblong, obtuse, middle one cuneated at the base; scapes length of petioles, with 2 bracteas below the middle; styles intermediate. ♃. G. Native of the Cape of Good Hope. This is very like the preceding species, but the petioles and under surface of the leaves are of a blood-colour. Flowers yellow.

Bloody-leaved Wood-sorrel. Fl. Oct. Dec. Clt. 1795. Pl. $\frac{1}{4}$ foot.

153 O. RU'BRO-FLA'VA (Jacq. ox. no. 65. t. 50.) almost stemless, hairy; leaflets lanceolate-oblong, obtuse, middle one cuneated; scapes longer than the petioles, with 2 bracteas under the middle; styles very short. ♃. G. Native of the Cape of Good Hope. Corolla yellow, but red outside, as well as margins.

Red-and-yellow-flowered Wood-sorrel. Fl. Jan. Nov. Clt. 1823. Pl. $\frac{1}{4}$ foot.

154 O. TRI'COLOR (Jacq. ox. no. 63.) stemless, pubescent; leaflets oblong, obtuse, middle one somewhat cuneated; scapes longer than the petioles; styles intermediate; filaments clothed with glandular hairs. ♃. G. Native of the Cape of Good Hope.

Var. α, flàva (D. C. prod. 1. p. 698.) petals yellow, red outside, as well as margins. Jacq. ox. t. 47.

Var. β, álba (D. C. prod. 1. p. 698.) petals white, red on the outside, as well as margins.

Three-coloured-flowered Wood-sorrel. Fl. Oct. Dec. Clt. 1794. Pl. $\frac{1}{4}$ foot.

155 O. FERRUGINA'TA (Jacq. hort. schœnbr. 3. t. 274,) almost stemless, pubescent; leaflets obovate, retuse, middle one cuneated; peduncles a little shorter than the leaves, with 2 bracteas in the middle; styles intermediate. ♃. G. Native of the Cape of Good Hope. Flowers white. Leaves marked with rusty spots.

Rusty-spotted-leaved Wood-sorrel. Fl. June, July. Clt. 1790. Pl. $\frac{1}{4}$ foot.

156 O. EXALTA'TA (Jacq. ox. no. 64. t. 49.) almost stemless, puberulous; leaflets emarginate, lateral ones elliptical, middle one obovately-cuneated; peduncles twice as long as the leaves, with 2 bracteas in the middle; styles very short. ♃. G. Native of the Cape of Good Hope. Corolla whitish, red on the outside and margins.

Exalted Wood-sorrel. Pl. $\frac{1}{2}$ foot.

157 O. FUSCA'TA (Jacq. oxal. no. 61. t. 45.) almost stemless, puberulous; leaflets obtuse, lateral ones ovate, middle one wedge-shaped; peduncles twice as long as the leaves, with 2 bracteas in the middle; styles very long, clothed with subglandular spreading hairs, as well as the filaments. ♃. G. Native of the Cape of Good Hope. Leaves blood-coloured beneath, but spotted with brown above. Flowers white, with a yellow bottom, and reddish on the outside.

Brown-spotted-leaved Wood-sorrel. Fl. May, June. Clt. 1795. Pl. $\frac{1}{2}$ foot.

** *Leaflets oblong or lanceolate. Stipitate or substipitate.*

158 O. CILIA'RIS (Jacq. ox. no. 45. t. 30.) stipitate, pubescent; stem naked below; leaflets oblong, obtuse, somewhat emarginate; peduncles longer than the petioles, with 2 bracteas immediately under the calyx; styles very long. ♃. G. Native of the Cape of Good Hope. Flowers purplish-red, with a yellow bottom. Petioles and leaves ciliated.

Ciliary Wood-sorrel. Fl. Oct. Nov. Clt. 1793. Pl. $\frac{1}{2}$ ft.

159 O. ARCUA'TA (Jacq. ox. no. 46. t. 31.) stipitate, pubescent; stem naked at the base, decumbent; leaflets lanceolate, emarginate; peduncles length of petioles, with 2 bracteas immediately under the calyx; styles very short. ♃. G. Native of the Cape of Good Hope. Flowers violaceous, with dirty yellow claws. Leaflets recurved.

Arched-leaved Wood-sorrel. Fl. Oct. Nov. Clt. 1795. Pl. decumbent.

160 O. FLA'CCIDA (Jacq. ox. no. 66. t. 51.) substipitate; decumbent, pubescent; leaflets oblong, retuse, middle one cuneated; peduncles twice as long as the leaves, with 2 bracteas in the middle; styles very short; filaments with glandular hairs. ♃. G. Native of the Cape of Good Hope. Petals white, red on the outside as well as the margins, with yellow claws. Peduncles flaccid.

Flaccid-peduncled Wood-sorrel. Fl. Oct. Nov. Clt. 1812. Pl. $\frac{1}{4}$ foot.

161 O. AMBÍGUA (Jacq. ox. no. 59. t. 43.) substipitate, rather hairy; leaflets obovate-oblong, obtuse; peduncles equal in length to the leaves, or longer, with 2 bracteas in the middle; styles very long, covered with subglandular hairs. ♃. G. Native of the Cape of Good Hope. Corolla white, with a yellow bottom, red on the outside as well as the margins. Sepals each with 2 red glands under the top.

Ambiguous Wood-sorrel. Fl. Sep. Dec. Clt. 1790. Pl. $\frac{1}{4}$ ft.

162 O. UNDULA'TA (Jacq. ox. no. 60. t. 44.) stipitate, erect, rather hairy; leaflets obovate-oblong, obtuse; peduncles longer than the petioles, with 2 bracteas under the middle; styles very long, hairy. ♃. G. Native of the Cape of Good Hope. Petals white, with yellow claws, dotted with red on the outside. Sepals and ovaries bearing many glands. Leaflets wavy.

Wavy-leaved Wood-sorrel. Fl. Oct. Nov. Clt. 1795. Pl. $\frac{1}{2}$ ft.

163 O. GLANDULÒSA (Jacq. ox. no. 61. t. 46.) substipitate, puberulous; leaflets oblong, obtuse, with the middle one somewhat cuneated; peduncles length of petioles, with 2 glands in the middle; styles intermediate; filaments, peduncles, and calyxes beset with glandular hairs. ♃. G. Native of the Cape of Good Hope. Corolla white, with a yellow bottom. Leaves brownish on the under surface.

Glandular Wood-sorrel. Pl. $\frac{1}{4}$ foot.

*** *Leaves roundish or somewhat rhomboid.*

164 O. TRUNCA'TULA (Jacq. ox. no. 76. t. 62.) stemless, hairy; leaflets triangular, truncate; scapes 3-times longer than the petioles, with 2 bracteas in the middle; styles very long, and are as well as the filaments beset with glandular hairs. ♃. G. Native of the Cape of Good Hope. Corolla lilac, with yellow claws. Leaflets violet-coloured beneath, hairy, soft to the touch, like *Marsh-mallow*.

Truncate-leaved Wood-sorrel. Pl. $\frac{1}{4}$ foot.

165 O. SULPHU'REA (Jacq. ox. no. 77. t. 63.) stemless, puberulous; leaflets roundish; peduncles length of petioles, with 2 bracteas at the base; styles very short; sepals reflexed at the apex, fringed with club-shaped hairs. ♃. G. Native of the

Cape of Good Hope. Corolla pale-yellow. Leaves blood-coloured beneath and spotted with white, and the veins are white above.

Sulphur-coloured-flowered Wood-sorrel. Fl. 1795. Pl. $\frac{1}{4}$ ft.

166 O. BREVÍSCAPA (Jacq. ox. no. 72. t. 58.) stemless, puberulous; leaves roundish; petioles flattish; pedicels one-half shorter than the leaves, with 2 bracteas beneath the middle; styles intermediate; filaments glandular. ♃. G. Native of the Cape of Good Hope. Corolla white, with a yellow bottom. Leaves red beneath and dotted.

Short-scaped Wood-sorrel. Pl. $\frac{1}{4}$ foot.

167 O. SPECIÒSA (Willd. spec. 2. p. 779.) stemless; puberulous; leaflets roundish; scapes about equal in length to the petioles, with 2 bracteas under the middle; styles very long, bearing simple and glandular hairs mixed, as well as the filaments. ♃. G. Native of the Cape of Good Hope.

Var. α, purpùrea (Lin. spec. 621.) leaves blood-coloured beneath; corollas rose-purple. O. speciòsa, Jacq. ox. no. 74. t. 60.

Var. β, sugillàta (Jacq. ox. no. 75. t. 61.) adult leaves livid beneath as well as on the margins above; corollas white, but flesh-coloured outside.

Var. γ, rigídula (Jacq. ox. no. 73. t. 59.) leaves green on both surfaces; corollas white, with a yellow bottom.

Shewy Wood-sorrel. Fl. Sept. Nov. Clt. 1690. Pl. $\frac{1}{4}$ ft.

168 O. VARIA'BILIS (Jacq. ox. no. 67.) stemless, puberulous; leaflets roundish, middle one cuneated at the base; pedicels equal or longer than the leaves, with 2 bracteas under the middle; styles very short; filaments with glandular hairs. ♃. G. Native of the Cape of Good Hope.

Var. α, longíscapa (D. C. prod. 1. p. 699.) scape twice as long as leaves; corolla white, or somewhat flesh-coloured. Jacq. ox. t. 52.

Var. β, rùbra (Jacq. ox. t. 53.) scapes a little longer than the leaves; corolla rose-purple.

Var. γ, grandiflòra (Jacq. ox. no. 68. t. 54.) scapes length of petioles; corolla large, white; leaves blood-coloured beneath.

Var. δ, Símsii (D. C. prod. 1. p. 699.) scapes length of petioles; corolla large, white; leaves green on both surfaces. Sims, bot. mag. t. 1683. This, with var. γ, will probably constitute a distinct species.

Variable Wood-sorrel. Fl. Oct. Dec. Clt. 1795. Pl. $\frac{1}{4}$ ft.

169 O. PURPU'REA (Willd. spec. 2. p. 778.) stemless; puberulous; leaflets roundish, wedge-shaped; scapes longer than the leaves, with 2 bracteas under the middle; styles intermediate; filaments with glandular hairs. ♃. G. Native of the Cape of Good Hope. Jacq. ox. no. 70. t. 56. Flowers purple.

Var. β, láxula (Jacq. ox. no. 71. t. 57.) scapes length of petioles; corolla white.

Purple-flowered Wood-sorrel. Fl. Oct. Nov. Clt. 1812. Pl. $\frac{1}{4}$ foot.

170 O. CONVE'XULA (Jacq. ox. no. 69. t. 55.) smooth; stipe declinate, naked below; leaflets roundish, dotted; stipulas dilated, acuminated; peduncles longer than the leaves; bracteoles alternate; styles intermediate; filaments with glandular hairs. ♃. G. Native of the Cape of Good Hope. Flowers rose-coloured, with a yellow bottom.

Small-convex Wood-sorrel. Fl. Jan. Nov. Clt. 1789. Pl. $\frac{1}{2}$ ft.

171 O. HU'MILIS (Thunb. prod. app. 190.) stemless; leaflets roundish, ciliated; scapes 1-flowered. ♃. G. Native of the Cape of Good Hope. Bulb ovate. Petioles pubescent, prostrate. Scape a little longer than the leaves, with 2 bracteas in the middle. Corolla with an ample yellowish tube, and a purple limb. Thunb. fl. cap. ed. Schult. 2. p. 535. is said to be the same as *O. purpùrea* of Lin.

Humble Wood-sorrel. Pl. $\frac{1}{4}$ foot.

172 O. LÆVIGA'TA (Willd. enum. suppl. 26.) almost stemless, quite smooth; leaflets roundish, intermediate one wedge-shaped; scape about the length of the petioles; styles very short. ⊙. H. Native of? Corolla purple. Link. enum. 439.

Smooth Wood-sorrel. Fl. June, July. Clt. 1818. Pl. $\frac{1}{4}$ ft.

* * * * *Leaflets obcordate. Stemless, or almost so.*

173 O. PUNCTA'TA (Lin. fil. suppl. 243.) stemless; leaflets roundish, obcordate, dotted beneath, smooth; petioles and scapes puberulous; scapes longer than the leaves, with 2 bracteas above the middle; styles very short; filaments with glandular hairs. ♃. G. Native of the Cape of Good Hope. Flowers pale flesh-coloured, red on the outside as well as the margins. Jacq. ox. no. 82. t. 66. Thunb. diss. no. 3. t. 1. Leaves bright-purple beneath, with shining golden dots.

Dotted-leaved Wood-sorrel. Pl. $\frac{1}{4}$ foot.

174 O. STRUMÒSA (Jacq. ox. no. 79. t. 64.) stemless, puberulous; leaflets obcordate; pedicels length of petioles, with 2 bracteas beneath the middle; styles very short, with a swelling under the top of each; filaments with glandular hairs. ♃. G. Native of the Cape of Good Hope. Petals white, but red on the outside as well as the margins, with yellow claws. Leaves brownish beneath, and with brown spots above.

Swelled-styled Wood-sorrel. Pl. $\frac{1}{4}$ foot.

175 O. MARGINA'TA (Jacq. ox. no. 85. t. 68.) stemless, puberulous; leaflets obcordate, roundish; scapes one-half shorter than the petioles, with 2 bracteas in the middle; calyxes ciliated, with club-shaped hairs, reflexed at the top; styles intermediate. ♃. G. Native of the Cape of Good Hope. Flowers large, white. Leaves blood-coloured on the under surface and edged with cinereous villi.

Marginate-leaved Wood-sorrel. Fl. Sept. Dec. Clt. 1812. Pl. $\frac{1}{4}$ foot.

176 O. PULCHE'LLA (Jacq. ox. no. 86. t. 69.) stemless, puberulous; leaflets obcordate, roundish; scapes 3-times shorter than the petioles, with 2 bracteas in the middle; calyxes ciliated with club-shaped hairs, reflexed at the apex; styles very long, and are as well as the filaments beset with glandular hairs. ♃. G. Native of the Cape of Good Hope. Leaves blood-coloured beneath; veins white above. Flowers white, with a blush of carnation within above the base.

Neat Wood-sorrel. Fl. Oct. Nov. Clt. 1795. Pl. $\frac{1}{4}$ foot.

177 O. OBTU'SA (Jacq. ox. no. 83. t. 79. f. 1.) stemless, densely puberulous; leaflets obcordate; scape longer than the leaves, with 2 bracteas above the middle; sepals obtuse; styles intermediate. ♃. G. Native of the Cape of Good Hope. O. lanàta *α*, Thunb. Flowers red. Filaments smooth.

Blunt-sepalled Wood-sorrel. Fl. Oct. Nov. Clt. 1812. Pl. $\frac{1}{4}$ ft.

178 O. LANA'TA (Lin. fil. suppl. 244. exclusive of the synonyms) stemless, villously-woolly; leaflets obcordate; scape longer than the leaves, with 2 bracteas in the middle; sepals acute; styles very short. ♃. G. Native of the Cape of Good Hope. Jacq. ox. no. 81. t. 77. f. 2. O. lanàta *β*, Thunb. Flowers white. Filaments hairy.

Woolly Wood-sorrel. Fl. Oct. Nov. Clt. 1791. Pl. $\frac{1}{4}$ foot.

179 O. LUTE'OLA (Jacq. ox. no. 80. t. 65.) stemless, hairy; leaflets obcordate, somewhat retuse; scapes length of leaves, with 2 bracteas a little above the middle; styles very short; inner filaments with glandular hairs; sepals obtuse. ♃. G. Native of the Cape of Good Hope. Flowers yellow.

Yellow-flowered Wood-sorrel. Fl. Jan. Sept. Clt. 1823. Pl. $\frac{1}{4}$ foot.

180 O. FA'LLAX (Jacq. ox. no. 84. t. 67.) stemless, pilose; leaflets obcordate, somewhat retuse; scapes longer than the leaves, with 2 bracteas a little above the middle; styles intermediate, beset with glandular hairs; inner stamens with glan-

dular hairs, about the length of the styles. ♃. G. Native of the Cape of Good Hope. Flowers yellow. This species is very like the preceding.

Fallacious Wood-sorrel. Pl. $\frac{1}{4}$ foot.

181 O. MACROGÒNIA (Jacq. ox. no. 87. t. 70.) almost stemless, rather pilose; leaflets obcordate, roundish; scape shorter than the leaves, with 2 bracteas a little above the middle; styles very long, and are as well as the filaments covered with glandular hairs. ♃. G. Native of the Cape of Good Hope. Flowers yellow. Sepals each with 2 red glands at the top.

Long-angled Wood-sorrel. Pl. $\frac{1}{4}$ foot.

182 O. PIÓTTÆ (Coll. hort. rip. p. 98. t. 1.) stemless, tufted, smooth; leaflets small, obcordate, sessile; scape twice the length of the leaves, with 2 bracteas above the middle; styles longer than the stamens, glandular; filaments smooth; sepals acute, reflexed at the apex. ♃. G. Native of the Cape of Good Hope. Flowers large, rose-coloured.

Piotta's Wood-sorrel. Fl. Jan. Sept. Clt. 1816. Pl. $\frac{1}{4}$ ft.

183 O. MEGAPOTA'MICA (Spreng. syst. app. p. 184.) stemless, pilose; leaflets obcordate; scape longer than the leaves, with 2 bracteas above the middle; sepals bluntish; inner stamens longer than the styles. ♃. S. Native of Brazil, on the banks of the Rio Grande. Flowers yellow?

Rio Grande Wood-sorrel. Pl. $\frac{1}{4}$ foot.

184 O. HISPÍDULA (Zucc. in act. monach. 9. ex Spreng. syst. append. p. 184.) stemless, hispid; leaflets obcordate, ciliated; glaucous beneath; scape longer than the leaves, with 2 bracteas; sepals acute, with 2 glands at the top of each; styles longer than the longest stamens. ♃. S. Native of Brazil.

Hispid Wood-sorrel. Pl. $\frac{1}{4}$ foot.

185 O. ERIORHÌZA (Zucc. in act. monach. 9. ex Spreng. syst. append. p. 184.) stemless: leaflets obcordately 2-lobed, smooth; petioles hairy; scape longer than the leaves, with 2 bracteas; styles shorter than the stamens. ♃. S. Native of Brazil. Bulb woolly.

Woolly-rooted Wood-sorrel. Pl. $\frac{1}{4}$ foot.

186 O. LOBA'TA (Sims, bot. mag. t. 2386.) stemless, smooth; scapes longer than the leaves, with 2 bracteas; leaflets obcordate, rather glaucous beneath; sepals acute; root tuberous. ♃. G. Native of Chili. Flowers yellow, but spotted with red.

Lobed-leaved Wood-sorrel. Fl. Oct. Nov. Clt. 1823. Pl. $\frac{1}{4}$ ft.

187 O. NA'NA (St. Hil. ex Spreng. syst. append. 184.) stemless, smooth; leaflets obovate; scape longer than the leaves, with 2 bracteas; styles longer than the stamens. ♃. S. Native of Brazil, at Rio Grande.

Dwarf Wood-sorrel. Pl. $\frac{1}{4}$ foot.

188 O. TE'NERA (Spreng. syst. 2. p. 424.) stemless, smooth; leaflets sessile, obcordate; scape villous, flaccid, 1-2-flowered, longer than the leaves, with 2 bracteas in the middle; sepals awl-shaped; styles longer than the stamens. ♃. G. Native of Monte Video. Bulb fusiform. Flowers yellow. Lindl. bot. reg. 1046.

Tender Wood-sorrel. Fl. May. Clt. 1826. Pl. $\frac{1}{8}$ foot.

189 O. MAGELLA'NICA (Forst. comm. goet. 9. p. 33.) stemless; leaflets obcordate, roundish, fleshy, smooth; scape shorter than the leaves, with 2 bracteas at the top. ♃. G. Native of Terra del Fuego in wet places. Flowers white, about the size of those of *O. acetosélla*.

Magellan Wood-sorrel. Pl. $\frac{1}{4}$ foot.

190 O. ACETOSE'LLA (Lin. spec. 620.) stemless; root of many scaly joints, creeping; leaflets obcordate, puberulous; scapes longer than the leaves, with 2 bracteas above the middle; petals oval, obtuse; styles equal or longer than the inner stamens. ♃. H. Native throughout Europe, in shady places; plentiful in Britain. Smith, engl. bot. t. 762. Œd. fl. dan. t. 980. Jacq. ox. no. 91. t. 80. f. 1. Woodv. med .bot. p. 56. t. 20. Curt. fl. lond. fasc. 2. t. 31. Mill. fig. 195. f. 2. O'xys acetoséla, Hall. helv. no. 928. Flowers white, beautifully veined with purple. Mr. Curtis remarks that the leaves are frequently purplish beneath, that the capsules dart forth their seeds at the slightest touch when ripe. This plant, says Gerarde, is called *Wood-sour Trefoil*, *Stubwort*, and *Sorrel de Bois*; by herbalists *Alleluja* and *Cuckoo's meat*, because it springs forth and flowers with the singing of the cuckoo, at which time Alleluja also was wont to be sung in churches. The names *Alleluja* and *Lujula* are, however, corrupted from the Calabrian name *Juliola*. It is probably called Stubwort from its covering the ground among the stubs in coppices, when they are cut down. In French it is called *La petite oseille* or *Surelle* and *Pain à coucou*.

Wood-sorrel has a grateful acid taste, more grateful than common sorrel, and therefore proper to be used in salads; its acid approaches near to that of the juice of lemons, or the acid of tartar, with which it also corresponds in its medical effects, being esteemed refrigerant, antiscorbutic, and diuretic. An infusion of the leaves, or a whey made by boiling the plant in milk, was formerly used in ardent fevers to allay inordinate heat, and to quench thirst. The London College directs a conserve of the leaves and petals to be made by beating them, with thrice their weight of fine sugar and orange-peel, which has the taste of green tea. It is called *Conserva Lujulæ*. The expressed juice depurated, properly evaporated, and set in a cool place, affords a crystalline acid salt in considerable quantity, which may be used wherever vegetable acids are wanted. It is employed to take iron-moulds and ink-stains out of linen, and is sold under the name of Essential Salt of Lemons. This salt, when genuine, which it seldom is, consists of the vegetable alkali, and a peculiar acid, which, according to Bergman, seems more allied to the acid of sugar than that of tartar. What is sold for it in this country, appears sometimes to consist of cream of tartar with the addition of a small quantity of vitriolic acid. For taking out spots in linen, the stained part is dipped in water, sprinkled with a little of the salt powdered, then rubbed on a pewter plate, after which the spot is washed out with warm water. Dr. Beddoes informs us, that the leaves and stalks, wrapped up in a cabbage-leaf, and macerated in warm ashes until reduced to a pulp, have been successfully applied to scrofulous ulcers. This poultice should remain on the sore for twenty-four hours, and be repeated four times. Afterwards the ulcer is to be dressed with a poultice made of the roots of *Meadow-sweet* (*Spiræ'a ulmària*), bruised and mixed up with the scum of sour butter-milk: doubtless many of the foreign species may be used in the same way. There is no doubt but a salt may be prepared from all the species. Thunberg says that a good salt was prepared from *O'xalis cérnua* at the Cape, which grows in great abundance there; but he does not inform us in what quantity. Twenty pounds of fresh leaves of our *Wood-sorrel* yielded, according to Newman, six pounds of juice, from which two ounces, two drachms, and one scruple of salt, besides two ounces and six drachms of an impure saline mass were procured. Oxalic acid is a vegetable acid naturally formed in *O'xalis acetoséla*, from which it takes its name. It has been discovered by Scheele that this acid can be formed by the action of nitric acid upon sugar and several other vegetable substances. The merit of this discovery was formerly given to Bergman, who first published the method of preparing it in this way.

Var. β, *cærùlea* (D. C. prod. 700.) flowers bluish.—Tourn. inst. 88.

Var. γ, *subpurpuráscens* (D. C. prod. 1. p. 700.) flowers pale-rose or purplish. ♃. H. This is a less plant than the species, and flowers later. It is to be found in England in a lane between Owram and Halifax.

Common *Wood-sorrel*. Fl. April, May. Brit. Pl. $\frac{1}{4}$ foot.

191 O. PARVIFLÒRA (Lejeune, fl. spa. 2. p. 307.) stemless; root toothed, jointed, creeping; leaflets obcordate, puberulous; scapes longer than the leaves, with 2 bracteas above the middle; stamens 5, not 10, equal or shorter than the styles. ♃. H. Native of France, in hedges about Malmedy. O. acetoséllа, var. δ, parviflòra, D. C. prod. 1. p. 700. Flowers white, veined with purple. 4-times smaller than those of *O. acetoséllа*.

Small-flowered Wood-sorrel. Fl. April, May. Pl. ¼ foot.

192 O. AMERICA'NA (Bigl. in litt. D. C. prod. 1. p. 700.) stemless; root toothed, jointed, creeping; leaflets obcordate, puberulous; scape longer than the leaves, with 2 bracteas above the middle; petals oblong, unequally emarginate; styles hardly longer than the inner stamens. ♃. H. Native of North America, in shady woods, round the roots of old trees. Canada (Michx.). On the high mountains of Pennsylvania and New York. O. acetoséllа, Michx. Pursh, and Nutt. Flowers large, white, veined with red, and with a yellow bottom. This plant differs from the European *O. acetoséllа* in the petals being cuneate, emarginate, and narrower, not oval and blunt. It possesses the same qualities.

American Wood-sorrel. Fl. April, May. Clt.? Pl. ¼ ft.

* * * * *Leaflets obcordate. Substipitate, or with a stem.*

193 O. TENE'LLA (Jacq. ox. no. 32. t. 19.) plant substipitate, smoothish; leaflets obcordate; scape longer than the leaves, with 2 bracteas above the middle; styles very short; filaments with glandular hairs. ♃. G. Native of the Cape of Good Hope. Corolla pale lilac. Sepals with 2 red glands at the top of each, on the outside.

Delicate Wood-sorrel. Fl. Nov. Dec. Clt. 1793. Pl. ¼ ft.

194 O. NA'TANS (Lin. fil. suppl. 243.) stem declinate, naked at the base; leaflets obcordate, smooth; peduncles length of leaves, with 2 bracteas under the middle; styles very short. ♃. G. Native of the Cape of Good Hope, floating in water. Thunb. ox. no. 4. t. 1. f. 4. Jacq. ox. no. 78. t. 76. f. 2. Flowers white. Leaves and flowers floating on the water.

Floating Wood-sorrel. Fl. Sept. Dec. Clt. 1795. Pl. fl.

195 O. CRUENTA'TA (Jacq. fil. ecl. 1. p. 66. t. 45.) plant substipitate, rather hairy; leaflets obcordate; peduncles a little longer than the leaves, with 2 bracteas above the middle; styles intermediate. ♃. G. Native of the Cape of Good Hope. Flowers purple. Filaments smooth, outer ones toothed.

Bloody Wood-sorrel. Pl. ¼ foot.

196 O. FILICAU'LIS (Jacq. hort. schoenbr. 2. t. 205.) stem naked at the base, decumbent, a little branched; leaflets obcordately 2-lobed, smooth; peduncles longer than the leaves, with 2 bracteas in the middle; styles intermediate. ♃. G. Native of the Cape of Good Hope. Flowers violaceous. Filaments smooth, outer ones toothed.

Thread-stemmed Wood-sorrel. Fl. Sept. Oct. Clt. 1815. Pl. decumbent.

197 O. BÍFIDA (Thunb. ox. no. 16. t. 1. f. 2.) stem erect, branched a little; leaflets obcordately 2-lobed, smooth; peduncles longer than the leaves, with 2 bracteas a little above the middle. ♃. G. Native of the Cape of Good Hope. Jacq. ox. no. 89. t. 79. f. 4. Flowers violaceous, with a yellow bottom. Styles very long, hairy as well as the stamens.

Bifid-leaved Wood-sorrel. Fl. Sept. Oct. Clt. 1791. Pl. ½ ft.

* * * * * *Leaflets linear, somewhat cuneated, emarginate, or retuse at the apex. Stems usually declinate.*

198 O. CUNEA'TA (Jacq. ox. no. 55. t. 40.) stem declinate, naked at the base; leaflets cuneated, emarginate, pilose; pedicels length of petioles, with 2 bracteas at the apex; styles very long; filaments with glandular hairs at the apex. ♃. G. Native of the Cape of Good Hope. Flowers white, with a yellow bottom.

Cuneated-leaved Wood-sorrel. Fl. Jan. Sept. Clt. 1822. Pl. decumbent.

199 O. CUNEIFÒLIA (Jacq. ox. no. 56. t. 41.) stem declinate, naked at the base; leaflets cuneated, emarginate, pilose; pedicels length of petioles, with 2 bracteas at the top; styles very short; filaments with glandular hairs. ♃. G. Native of the Cape of Good Hope. Flowers white, with the bottom hardly yellow. This species is very like the preceding.

Wedge-leaved Wood-sorrel. Fl. April, May. Clt. 1793. Pl. decumbent.

200 O. PUSI'LLA (Jacq. ox. no. 57. t. 42.) stem short, naked at the base, somewhat declinate; leaflets linear-cuneated, emarginate, smooth; pedicels length of petioles, with 2 bracteas at the top; styles intermediate; filaments smooth. ♃. G. Native of the Cape of Good Hope. Plant hardly a finger in length. Flowers of a pale flesh-colour.

Small Wood-sorrel. Fl. Jan. Sept. Clt. 1823. Pl. declinate.

201 O. LINEA'RIS (Jacq. ox. no. 47. t. 32.) stem declinate, naked at the base, and is as well as the leaves puberulous; leaflets linear, emarginate; pedicels shorter than the petioles, with 2 bracteas at the top; styles very long. ♃. G. Native of the Cape of Good Hope. Corolla violet. Filaments smooth, toothless.

Linear-leaved Wood-sorrel. Fl. Sept. Nov. Clt. 1795. Pl. declinate.

202 O. RECLINA'TA (Jacq. ox. no. 49. t. 34.) stem reclinate, naked at the base, branched a little; leaflets linear, somewhat cuneated, emarginate; pedicels longer than the petioles, with 2 bracteas above the middle, and are as well as the petioles puberulous; styles intermediate. ♃. G. Native of the Cape of Good Hope. Flowers of a pale vermilion-colour. Filaments a little hairy.

Reclinate-stemmed Wood-sorrel. Pl. decumbent.

203 O. GRA'CILIS (Jacq. ox. no. 48. t. 33.) stem declinate, naked at the base, and is as well as the leaves smooth; leaflets linear, rather callose at the top; pedicels longer than the petioles, with 2 bracteas above the middle; styles very long, and are as well as the filaments covered with glandular hairs. ♃. G. Native of the Cape of Good Hope. Flowers of a pale vermilion-colour. O. versícolor, var. γ, Willd. spec. 2. p. 792.

Slender Wood-sorrel. Pl. decumbent.

204 O. MINIA'TA (Jacq. ox. no. 50. t. 35.) stem declinate, naked at the base, and is as well as the leaves smooth; leaflets linear, a little emarginate at the apex; pedicels a little longer than the leaves, with 2 bracteas above the middle. ♃. G. Native of the Cape of Good Hope. Flowers of a vermilion-colour. Styles very short. Filaments toothless, smooth. O. elongàta, Willd. spec. 2. p. 793.

Vermilion-flowered Wood-sorrel. Fl. Jan. Sept. Clt. 1819. Pl. prostrate.

205 O. MACROMÍSCHOS (Spreng. syst. app. p. 185.) stem declinate, naked at the base, and is as well as the leaves hoary-villous; leaflets linear, somewhat emarginate; peduncles very long, at length refracted; styles very short. ♃. G. Native of the Cape of Good Hope.

Long-pedicelled Wood-sorrel. Pl. prostrate.

§ 10. *Adenophýllæ* (from αδην, *aden*, a gland, and φυλλον, *phyllon*, a leaf; leaves furnished with glands at the tip). *D. C. prod.* 1. *p.* 701. *Stems sometimes sparingly leafy, sometimes very leafy at the top, sometimes almost wanting. Leaves stalked, with 3-5 linear leaflets, bearing at the top beneath red callose glands. Peduncles* 1*-flowered.*

206 O. MINU'TA (Thunb. diss. no. 2. t. 2. f. 3.) stemless;

leaflets 3, linear-lanceolate, acute; scape longer than the leaves; styles very long. ⊙. H. Native of the Cape of Good Hope. Jacq. ox. no. 44. t. 79. f. 2. The leaves are probably glandular. Flowers white.

Minute Wood-sorrel. Pl. $\frac{1}{8}$ foot.

207 O. GLA'BRA (Thunb. ox. no. 17. t. 2. f. 1.) stem very short, naked at the base, erect; leaflets 3, linear-wedge-shaped, emarginate, ciliated, with many glands beneath; peduncles longer than the leaves; styles very long. 4. G. Native of the Cape of Good Hope. Jacq. ox. no. 58. t. 76. f. 3. Flowers purple.

Smooth Wood-sorrel. Fl. May, June. Clt. 1795. Pl. $\frac{1}{8}$ ft.

208 O. VERSÍCOLOR (Lin. spec. 622.) stem declinate, naked at the base; leaflets 3, linear, emarginate, with 2 red glands beneath; peduncles longer than the leaves; styles very long, and are as well as the filaments beset with glandular hairs. 4. G. Native of the Cape of Good Hope. Jacq. ox. no. 51. t. 36. Curt. bot. mag. t. 155. Smith, icon. rar. 7. t. 7. Corolla white inside and reddish outside. Filaments toothed.

Various-coloured-flowered Wood-sorrel. Fl. Jan. Mar. Clt. 1774. Pl. $\frac{1}{4}$ foot.

209 O. SYLVE'STRIS (Jacq. ox. t. 77. f. 4.) stem declinate, naked at the base; leaflets 3, linear, emarginate, with 2 red glands beneath; peduncles length of leaves; styles very long, hairy; filaments toothless, smooth. 4. G. Native of the Cape of Good Hope. Corolla white inside and red outside.

Wild Wood-sorrel. Fl. Jan. Mar. Clt.? Pl. declinate.

210 O. ELONGA'TA (Jacq. ox. no. 52. t. 37.) stem declinate, naked at the base; leaflets 3, linear, emarginate, with 2 red glands at the top of each; peduncles longer than the leaves; styles very short. 4. G. Native of the Cape of Good Hope. Petals white, hardly edged with red, a little emarginated at the top. Sepals with two red glands at the tip beneath.

Var. β, *amœ'na* (Jacq. hort. schoenbr. t. 206.) sepals blunt; petals obtuse, of a rose-purple colour.

Elongated Wood-sorrel. Fl. Sept. Oct. Clt. 1791. Pl. prostrate.

211 O. TENUIFÒLIA (Jacq. ox. no. 53. t. 38.) stem erect, sparingly leafy; leaflets 3, linear, emarginate, with many red glands beneath; peduncles longer than the leaves; styles very short; inner filaments with glandular hairs. 4. G. Native of the Cape of Good Hope. Lodd. bot. cab. t. 712. Corolla white, with reddish edges on the outside.

Fine-leaved Wood-sorrel. Fl. Oct. Nov. Clt. 1790. Pl. $\frac{1}{2}$ ft.

212 O. POLYPHY'LLA (Jacq. ox. no. 59. t. 39.) stem erect, a little branched, leafy at top; leaflets 3, linear, emarginate, with 2 red glands beneath; peduncles longer than the leaves; styles intermediate, and are as well as filaments beset with glandular hairs. 4. G. Native of the Cape of Good Hope. Corolla pale-red. O. versícolor, Jacq. icon. rar. t. 473.—Burm. afr. t. 27. f. 1.

Many-leaved Wood-sorrel. Fl. Jan. Sept. Clt. 1791. Pl. $\frac{1}{2}$ ft.

213 O. FILIFÒLIA (Jacq. hort. schoenbr. 3. t. 273.) stem declinate, naked at the base; leaflets 3, linear, entire at the apex, with callose glands; peduncles longer than the leaves; styles very long, and are as well as the inner filaments beset with glandular hairs. 4. G. Native of the Cape of Good Hope. Corolla rose-coloured.

Thread-leaved Wood-sorrel. Fl. Jan. Sept. Clt. 1822. Pl. prostrate.

214 O. PENTAPHY'LLA (Sims, bot. mag. t. 1549.) stem erectish, naked below; leaflets 5, linear, rather entire at the apex, with 1 or 2 callose glands beneath; peduncles longer than the leaves; styles intermediate. 4. G. Native of the Cape of Good Hope. O. digitàta, Poir. suppl. 4. p. 254. exclusive of the synonyms and var. β. Flowers rose-flesh-coloured. Petioles reddish and stem-clasping at the base.

Five-leaved Wood-sorrel. Fl. Feb. Nov. Clt. 1800. Pl. $\frac{1}{2}$ ft.

§ 11. *Palmatifòlia* (from *palmatus*, palmate, and *folium*, a leaf; leaves palmate). *D. C. prod.* 1. *p.* 702. *Stemless and with a short stipe, naked at the base. Leaves stalked, palmately or peltately divided into* 5-15 *leaflets, destitute of glands. Scapes* 1-*flowered.*

215 O. MALLOBO'LBA (Cav. icon. 4. p. 64. t. 393. f. 2.) stemless; bulb woolly; leaflets 5, ovate; scape bearing 2 awl-shaped bracteas in the middle. 4. G. Native of Buenos Ayres. Plant very small. Bulb clothed with beautiful rufous wool. Flowers yellow. Styles intermediate, villous.

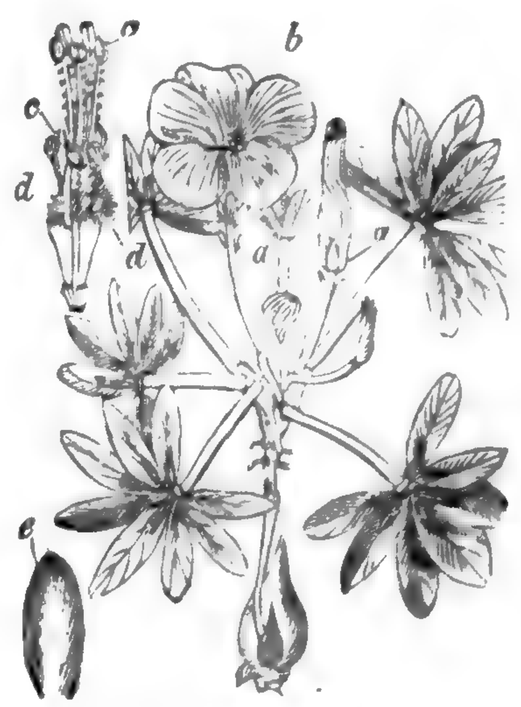
Soft-bulbed Wood-sorrel. Pl. $\frac{1}{8}$ foot.

216 O. COMMERSÒNII (Pers. ench. 1. p. 519.) stem very short, leafy; leaflets 6, ovate, clothed with close-pressed villi; scapes longer than the leaves, with 2 bracteas in the middle. 4. G. Native of Monte Video. O. sexenàta, Savign. in Lam. dict. 4. p. 687. Flowers yellow.

Commerson's Wood-sorrel. Pl. $\frac{1}{4}$ foot.

217 O. LUPINIFÒLIA (Jacq. ox. no. 92. t. 72.) almost stemless; leaflets 7-8, lanceolate, acutish, smooth, spotted at the base; petioles compressed; scape length of petiole; styles very short; filaments with glandular hairs. 4. G. Native of the Cape of Good Hope. Flowers yellow.

FIG. 122.



Lupine-leaved Wood-sorrel. Fl. Oct. Nov. Clt. 1775. Pl. $\frac{1}{4}$ ft.

218 O. FLA'VA (Lin. spec. 621.) stem erect, short, naked at the base; leaflets 6-7, smooth, linear, channelled, acute; peduncles rather longer than the petioles; styles very short; filaments with glandular hairs. 4. G. Native of the Cape of Good Hope. Jacq. ox. no. 93. t. 73. Burm. afr. t. 27. f. 4. Ker. bot. reg. t. 117. Flowers yellow.

Yellow-flowered Wood-sorrel. Fl. March, April. Clt. 1775. Pl. $\frac{1}{4}$ foot.

219 O. PECTINA'TA (Jacq. ox. no. 94. t. 74.) almost stemless; leaflets 7, smooth, linear-lanceolate, obtuse; peduncles length of leaves; sepals close-pressed; styles very long, and are, as well as the filaments, beset with glandular hairs. 4. G. Native of the Cape of Good Hope.—Burm. afr. t. 30. f. 1. Flowers yellow.

Pectinated-leaved Wood-sorrel. Fl. Sept. Nov. Clt. 1790. Pl. $\frac{1}{4}$ foot.

220 O. FLABELLIFÒLIA (Jacq. ox. no. 94. t. 74.) almost stemless; leaflets 6-7-9, smooth, linear, emarginate; peduncles hardly longer than the petioles; sepals reflexed at the apex; styles intermediate, and are, as well as the inner filaments, beset with glandular hairs. 4. G. Native of the Cape of Good Hope. Flowers yellow.

Fan-leaved Wood-sorrel. Fl. Sep. Nov. Clt. 1789. Pl. $\frac{1}{4}$ ft.

221 O. TOMENTÒSA (Lin. fil. suppl. 244.) almost stemless; leaflets 9-19, clothed with pubescent down on both surfaces, lanceolate-cuneated, emarginate; scapes length of petioles; styles very long. 4. G. Native of the Cape of Good Hope.—Jacq. ox. no. 96. t. 81.—Plum. t. 350. f. 3. Corolla whitish.

Tomentose Wood-sorrel. Fl. April, May. Clt. 1791. Pl. $\frac{1}{4}$ ft.

222 O. ENNEAPHY'LLA (Cav. icon. 5. p. 7. t. 411.) stipe creeping at the base, covered with interrupted scales; leaflets 9, smooth, obcordate, wedge-shaped, almost bifid; peduncles length of the leaves; styles very long. 4. G. Native of the Falk-

land Islands. Corolla rose-coloured, with yellow lines. Styles capitate and pencil-formed, like the following.

Nine-leaved Wood-sorrel. Pl. $\frac{1}{4}$ foot.

223 O. LACINIA'TA (Cav. icon. 5. p. 7. t. 412.) stipe creeping at the base, covered with scales; leaflets 11-13, linear, acute, smooth; scapes shorter than the petioles; styles very long. ♃. S. Native of South America. Corolla violaceous. This and the preceding species have creeping scaly stipes.

Jagged Wood-sorrel. Pl. $\frac{1}{4}$ foot.

Cult. *O'xalis* is a curious and beautiful genus. The hardy kinds require no care. If the roots are planted in a shady border, they will thrive and multiply. If the seeds of annual species are sown in the open border in spring, the plants will rise freely, and if they are permitted to scatter their seeds, there will be a plentiful supply of plants. The greenhouse kinds are mostly bulbs from the Cape of Good Hope; a mixture of sand, loam, and peat is best suited for these; they require no water after they have done flowering, until they begin to grow afresh, these are increased by offsets from the bulbs, and by seeds. The most of them may be grown in a frame, but care should be taken that they are protected from the frost during winter. The stove species should be grown in the same kind of soil recommended for the greenhouse kinds; the shrubby kinds of these may be increased by cuttings or seeds; the herbaceous fibrous-rooted ones by dividing the plants at the roots or by seeds; the bulbous-rooted ones by offsets from the roots. But some of the frame and greenhouse species are fibrous-rooted, therefore they should also be increased by dividing the plants at the root.

IV. LEDOCA'RPUM (from ληδον, *ledon*, cistus, and καρπος, *karpos*, a fruit; resemblance in fruit to that of a *Cistus*). Desf. mem. mus. 4. p. 250. D. C. prod. 1. p. 702.

Lin. syst. *Decándria*, *Pentagýnia*. Calyx permanent, 5-sepalled, girded by 10 linear bracteas. Petals 5. Stamens 10, 5 alternate ones shortest; filaments free, permanent. Ovary roundish. Stigmas 5, thickened. Capsules 5-valved, 5-celled, many-seeded.—Small branching shrubs, with opposite, ternate, grey, sessile leaves, linear, awl-shaped leaflets, and solitary, terminal, large, yellow flowers.

1 L. Chiloe'nse (Desf. mem. mus. 4. p. 250. t. 13.) canescent; leaves 3-parted, with linear segments; pedicels short. ♄. F. Native of Chiloe. Balbìsia verticillàta, Cav. icon. ined. in bibl. Balb. and annal. no. 19. p. 61.

Chiloe Ledocarpum. Shrub 2 feet.

2 L. pedunculà're (Lindl. bot. reg. 1392.) canescent; leaves 3-parted; leaflets linear; pedicels long. ♄. F. Native of Chili. Stamens nearly equal in length.

Long-*peduncled* Ledocarpum. Fl. July, Aug. Clt. 1825. Shrub 1 foot.

Cult. These pretty little shrubs will thrive in a mixture of loam and peat; and ripened cuttings will root in sand under a hand-glass, in a moderate heat.

Order LVIII. ZYGOPHY'LLEÆ (plants agreeing with *Zygophýllum* in important characters). R. Br. gen. rem. p. 13. D. C. prod. 1. p. 703.

Calyx of 5 distinct sepals, or hardly connected at the base. Petals 5, alternating with the sepals, and inserted into the receptacle. Stamens 10, distinct, hypogynous, 5 opposite the petals and 5 opposite the sepals. Ovary 1, 5-celled. Styles 5, joined into one, but sometimes they are distinct at the top. Carpels 5, constantly more or less adnate to each other, and to the central axis; cells opening at the upper angle, usually many-seeded, but sometimes 1-seeded, never cocculiferous nor arilliferous. Seeds albuminous, or exalbuminous. Embryo straight, with a superior radicle and leafy cotyledons.—Herbs, shrubs, and trees variable in habit. Leaves furnished with stipulas at the base, usually compound, in the *Zygophýlleæ veræ* opposite, but alternate in *Zygophýlleæ spuriæ*.—This order is intermediate between *Oxalídeæ* and *Rutàceæ*. It is distinguished from the former in the styles being joined into one, never free, and in the seeds being without aril, as well as in the leaves being opposite, and furnished with stipulas; and from the latter it differs in the structure of the carpels, but especially in the absence of elastic cocculum, which is truly notable in *Rutàceæ veræ*. At first sight it is distinguished from both in the twin stipulas at the base of the petioles. Many of the species of this order bear beautiful flowers, and enliven many an arid waste within the tropics, particularly the *Tríbulus cistoìdes*. The *Zygophýllum Fabàgo* is employed as an anthelmintic, but it is in *Guaíacum* that the great medical virtues of the order are to be found; it has been found to contain a particular substance, which is called Guaiacine, differing both from resin and gum.

Synopsis of the genera.

§ 1. *Zygophýlleæ veræ. Leaves opposite.*

1 Trí'bulus. Carpels 5, adnate to the triangular axis, indehiscent, 1-celled, 1-seeded, beset with prickles on the outside. Style none. Sepals and petals 5. Stamens 10.

2 Ehrenbe'rgia. This genus differs from *Tríbulus* in the capsule being of 10 1-seeded, indehiscent, crested carpels.

3 Fagònia. Capsule roundish, 5-angled, 5-celled; cells 2-valved, 1-seeded. Stigma 1. Sepals and petals 5. Stamens 10.

4 La'rrea. Capsule of 5 1-celled, 1-seeded carpels, closely connected. Style pentagonal. Filaments with an appendage at the base inside. Sepals and petals 5. Stamens 10.

5 Roepe'ra. Sepals and petals 4. Stamens 8. Capsule 4-angled, with the angles expanded into wings, 4-celled, 3 of which are usually abortive. Seed solitary. Style 4-furrowed.

6 Zygophy'llum. Capsule oblong, pentagonal, 5-celled, 5-valved; cells many-seeded. Style 1. Filaments with an appendage at the base inside. Sepals and petals 5. Stamens 10.

7 Guaíacum. Capsule substipitate, 5-angled, 5-celled, or only 2-3-celled from abortion. Seeds solitary in the cells. Style 1. Sepals and petals 5. Stamens 10.

8 Porlie'ria. Sepals and petals 4. Stamens 8. Style 1, crowned by a peltate stigma. Carpels 4, connate, drupaceous.

§ 2. *Zygophýlleæ spuriæ. Leaves alternate.*

9 Chitònia. Calyx 4-parted. Petals 4. Stamens 8. Style 1, crowned by a peltate stigma. Capsule 4-valved, 4-celled; valves keeled. Seeds 2 in each cell.

10 Bieberste'inia. Petals and sepals 5. Stamens 10. Styles 5, joined. Carpels 5, connate at the base, 1-seeded, arillate inside.

11 Trichanthe'ra. Sepals and petals 5. Stamens 5. Styles numerous. Capsule pentagonal, 5-celled, 5-valved, many-seeded,

12 Anatròpa. Sepals and petals 4. Stamens 4. Style short, clavate. Capsule quadrangular, depressed, 4-valved, 4-celled; cells 4-5-seeded.

13 Melia'nthus. Calyx 5-cleft, unequal; lower segment drawn out into a hollow gibbosity. Petals 5. Stamens 4, 2 of which are connate. Style 1, crowned by a 4-cleft stigma. Capsule 4-lobed, 4-celled; cells 1-seeded from abortion.

14 Balanìtes. Calyx 5-parted. Petals 5. Stamens 10. Ovary 5-celled, 5-seeded. Drupe 1-celled and 1-seeded from abortion.

§ 1. *Zygophýlleæ vèræ. D. C. prod.* 1. *p.* 703. *Leaves opposite.*

I. TRI'BULUS (from τρεις, *treis*, three, and βολος, *bolos*, a point; each carpel is armed with 3, sometimes 4, prickly points). Tourn. inst. t. 141. Lin. gen. no. 532. D.C. prod. 1. p. 703. Lin. syst. *Decándria, Monogýnia.* Calyx deeply 5-parted, usually permanent. Petals 5, spreading. Stamens 10. Style very short, with a broad stigma. Carpels 4-5, adhering to the axis, triangular, indehiscent, hard, covered on the outside with tubercles or spines, transversely many-celled inside, rarely 1-celled, with a solitary, horizontal, exalbuminous seed in each cell. Cotyledons thickish (Gært. fruct. 1. t. 69.)—Diffuse trailing herbs, with abruptly-pinnate leaves and membranous stipulas. Pedicels axillary, 1-flowered, solitary. Flowers usually yellow, rarely white.

1 T. cistoìdes (Lin. spec. 554.) leaves with 8 pairs of rather equal leaflets, which are silky beneath; pedicels length of petioles. ♃. S. Native of South America and the West Indies, in dry, sandy, barren places, also of the island of O Wahu. Jacq. hort. schoenb. t. 103. Ker. bot. reg.t. 791.—Herm. par. t. 136.—Pluk. phyt. t. 67. f. 4. The capsule, according to Kunth, is of 5 carpels, each divided into 2 or 3 transverse cells, armed outside with sharp spines. This is a beautiful species, with large yellow flowers, resembling those of some species of *Heliánthemum*. It is very common about Kingston in Jamaica, and is planted in many gardens there for the sake of its flowers, which are very shewy, and have an agreeable smell. Fowls are observed to feed much upon them, and it is thought to heighten their flavour, as well as to contribute to fatten them. Hence the plant is called *Turkey-blossom*.

Rock-rose-like-flowered Caltrops. Fl. July, Nov. Clt. 1752. Pl. trailing.

2 T. a'lbus (Poir. dict. 8. p. 44.) leaves with usually 8 pairs of rather equal leaflets, which are villous on both surfaces; pedicels shorter than the petioles. ♃. S. Native of Guinea, very common at Cape Coast, Acra, and Whidah, in sandy, barren places. Petals whitish, hardly longer than the calyx.

White-flowered Caltrops. Fl. Ju. Aug. Clt. 1826. Pl. trailing.

3 T. terre'stris (Lin. spec. 554.) leaves with usually 6 pairs of rather equal leaflets; pedicels shorter than the petioles; carpels 4-horned. ⊙. H. Native of the south of Europe, Barbary, Senegal, and the Mauritius, in barren, sandy places. Leaves villous and almost smooth. Lam. ill. t. 346. f. 1. Schkuhr. handb. 1. t. 115.—Lob. icon. 2. t. 84.—Mor. hist. sect. 2. t. 8. f. 9.—Barrel. icon. t. 558. Capsule of 5 carpels, each having 2 or 3 transverse cells. Flowers yellow. This is a very common species in the south of Europe, in arable land, and is troublesome to cattle by the prickly fruit running into their feet. The French name of this plant is *La Croix de Chevalier*. Our English appellation of Caltrops, is taken from the form of the fruit, which resembles the machines which are cast in the way to obstruct an enemy's cavalry.

Earth or Common Caltrops. Fl. Ju. Jul. Clt. 1596. Pl. tr.

4 T. subine'rmis (Fisch. cat. hort. gor. 1808. p. 94.) leaves usually with 6 pairs of rather equal leaflets, which are hairy on both surfaces; pedicels shorter than the petioles; capsules armless, but tubercled. ⊙. H. Native of Thibet. Flowers yellow.

Unarmed-capsuled Caltrops. Fl. June, July. Clt. 1820. Pl. trailing.

5 T. ala'tus (Del. ill. p. 44.) leaves with 5 or 6 pairs of rather equal leaflets, which are clothed on both surfaces with close-pressed villi; pedicels very short; capsules without horns but with winged margins. ⊙. H. Native of Egypt, in sandy, barren places. T. pentándrus, Forsk. descr. 38. which is said to have only 5 or 6 stamens. Capsule of 5 carpels, each having 2 transverse cells. Flowers yellow.

Winged-fruited Caltrops. Pl. trailing.

6 T. lanuginòsus (Lin. spec. 553.) leaves with 5 or 6 pairs of rather equal leaflets, which are covered with close-pressed pubescence; pedicels shorter than the leaves; carpels 2-horned. ⊙. S. Native of Ceylon.—Burm. zeyl. 265. t. 106. f. 1. Flowers yellow. Fruit angular, hairy.

Woolly Caltrops. Fl. June, July. Clt. 1822. Pl. trailing.

7 T. ma'ximus (Lin. spec. 553.) leaves of 3 or 4 pairs of leaflets, outer ones largest; pedicels shorter than the leaves; carpels unarmed, connected together into a 10-ribbed, 10-seeded fruit. ⊙. S. Native of Jamaica and St. Thomas, in sandy, arid places. Jacq. icon. rar. t. 462. Lam. ill. t. 346. f. 2. Capsule of 10 1-celled carpels. The flowers are pale yellow, and have an agreeable odour.

Greatest Caltrops. Fl. June, July. Clt. 1739. Pl. trailing.

8 T. trijuga'tus (Nutt. gen. amer. 1. p. 277.) leaves with 3 pairs of leaflets, outer ones largest; pedicels? carpels crested and muricated, 1-seeded. ⊙. H. Native of North America in Georgia about Savannah. Flowers yellow.

Three-paired-leaved Caltrops. Fl. June, July. Clt. 1819. Pl. trailing.

9 T. pube'scens; pubescent; leaves with 3 pairs of leaflets. ⊙. S. Native of Acra in Guinea. Flowers small, cream-coloured. Capsules prickly.

Pubescent Caltrops. Fl. June, July. Clt. 1822. Pl. trailing.

Cult. The annual species of this genus require to be sown in a moderate hot-bed in spring, and about the middle of May the plants may be planted out in a warm sheltered situation in the open border, where they will ripen their seeds. The perennial species will grow very well in a mixture of loam and peat, and they may be either increased by cuttings or seeds.

II. EHRENBE'RGIA (in honour of C. G. Ehrenberg, a traveller in Egypt, Lybia, and Arabia, author of Sylva Mycologicæ Berolinensis, and other works). Mart. fl. bras. 1. p. 72. t. 163.

Lin. syst. *Decándria, Monogýnia.* Calyx of 5-6 sepals. Petals 5-6, spreading. Stamens 10-12, alternate ones inserted in the claws of the petals; the others in the receptacle. Carpels usually 10, 1-seeded, disposed in a whorl around the central axis, crested on the back.

1 E. tribuloìdes (Mart. fl. bras. l. c.). ⊙. S. Native of Brazil. Tríbulus Brasiliénsis, Spreng. syst. app. p. 343. A branching, diffuse, pubescent herb, with abruptly-pinnate leaves, having 5-6 pairs of opposite or alternate leaflets, axillary, 1-flowered pedicels, bearing coppery, vermilion-coloured flowers.

Tribulus-like Ehrenbergia. Pl. trailing.

Cult. The seeds of this plant may be raised on a hot-bed, and when the plants have grown 2 or 3 inches, they may be planted out in the open border in a sheltered situation, in the month of May.

III. FAGO'NIA (in honour of M. Fagon, archiater to Louis XIV. who was a great patron of botany). Tourn. inst. t. 141. Lin. gen. no. 531. D. C. prod. 1. p. 704. Andr. Juss. ann. mus. 12. p. 453. t. 14. no. 2.

Lin. syst. *Decándria, Monogýnia.* Calyx deeply 5-parted, deciduous. Petals 5, unguiculate. Stamens 10; filaments naked at the base. Stigma 1, acute, 5-furrowed. Ovary acutely 5-angled, 5-celled, acuminated; cells 2-valved, 1-seeded. Embryo straight in the axis of a fleshy albumen (Gært. fruct. 2. p. 153. t. 113.).—Herbs or subshrubs, with simple or ternate leaves, usually with spiny twin stipulas at their base, and axillary, solitary, 1-flowered pedicels. Flowers purple or violet, seldom yellowish.

§ 1. *Leaves trifoliate.*

1 F. Cre'tica (Lin. spec. 553.) leaflets linear-lanceolate, smooth; stipulas spiny; ovaries smooth. ♄. G. Native of Candia, Mauritania, and Spain, on mountains, in places exposed to the sun. Lam. ill. t. 346. Curt. bot. mag. t. 241. F. erécta, Mill. dict. no. 1. Stem procumbent, rarely erect. Flowers purple, with yellow stamens.

Cretan Fagonia. Fl. June, Aug. Clt. 1739. Shrub 1 foot or trailing.

2 F. Hispa'nica (Lin. spec. 553.) leaflets linear-lanceolate; stipulas not spiny. ♂. F. Native of Spain. Mill. dict. no. 2. This is a doubtful species; it is probably only a variety of the preceding. Flowers purple, with yellow stamens.

Spanish Fagonia. Fl. June, Aug. Clt.? Pl. trailing.

3 F. Ara'bica (Lin. spec. 553.) leaflets linear, mucronate, convex beneath; stipulas spiny, elongated; ovaries villous. ♄. G. Native of Barbary, Egypt, and Arabia. Stem much branched. Spines very long. Flowers purple or violet.

Arabian Fagonia. Fl. June, Aug. Clt. 1759. Sh. 1½ foot.

4 F. glutino'sa (Delil. fl. ægyp. 86. t. 28. f. 2.) leaflets obovate, mucronate; stipulas spiny, shorter than the petioles; stems prostrate, dichotomous, and are, as well as the fruit, clammy. ♄. G. Native of the North of Africa in the desert of Cairo. F. scàbra, Forsk. descr. 88.? Flowers purple or violet.

Clammy Fagonia. Fl. May, Aug. Clt. 1820. Sh. prostrate.

5 F. mo'llis (Delil. fl. egyp. 76. t. 27. f. 2.) leaflets oval, mucronate, villous; stipulas spiny, length of petioles; stem shrubby, diffuse, villous at the apex; fruit hispid. ♄. G. Native along with the preceding. Flowers purplish.

Soft Fagonia. Shrub diffuse.

6 F. latifo'lia (Delil. fl. egyp. 86. t. 28. f. 3.) lateral leaflets lanceolate, acute, middle one larger and obovately orbicular; stipulas small, spiny. ⊙. G. Native of Egypt, near Cairo. Flowers purplish or violet.

Broad-leaved Fagonia. Pl. trailing.

§ 2. *Leaves simple.*

7 F. Mysore'nsis (Roth. nov. spec. 215.) leaves simple, linear, ending in a cartilaginous point; stipulas spiny, subulate, rough, longer than the leaves; pedicels twice as short as the leaves. ⊙? S. Native of Mysore in the East Indies. Flowers yellow?

Mysore Fagonia. Pl. ½ foot.

8 F. Pe'rsica (D. C. prod. 1. p. 704.) leaves simple, oval; stipulas spiny, awl-shaped, shorter than the leaves; pedicels rather longer than the leaves. ⊙. H. Native of Persia. F. I'ndica, Burm. fl. ind. p. 102. t. 34. f. 1. Flowers yellow.

Persian Fagonia. Pl. ½ foot.

9 F. Olive'rii (D. C. prod. 1. p. 704.) leaves simple, oblong-linear; stipulas spiny, hardly the length of the leaves; pedicels very short; fruit pubescent. ♄. G. Native between Bagdad and Aleppo. This species has the habit of *F. Pérsica*, but the spines are longer and the pedicels very short. Flowers yellow.

Olivier's Fagonia. Shrub 1 foot.

10 F. Bruguie'ri (D. C. prod. 1. p. 704.) leaves simple, oblong, pointed; stipulas spiny, longer than the leaves; branches tetragonal; pedicels very short; fruit pubescent. ♃. G. Native between Bagdad and Aleppo. Root woody. Stem branched from the base, hardly a finger high. Flowers probably yellow.

Bruguier's Fagonia. Pl. ¼ foot.

Cult. Fagònia is a genus of pretty little shrubby looking plants. They are only to be increased by seeds, which should be sown in pots in autumn, in a light rich soil; these should be placed under a frame in winter; in spring several of the plants may be potted off in separate pots and placed among the greenhouse plants, others may be planted out in the open border, in a warm sheltered situation, 10 inches apart; thus they will flower early and ripe seeds may be obtained. The shrubby species hardly last more than three years, therefore care should be taken to preserve their seeds.

IV. LA'RREA (in honour of John Anthony de Larrea, a Spanish promoter of the sciences). Cav. icon. 6. p. 36. D. C. prod. 1. p. 705. Andr. Juss. ann. du mus. 12. p. 456. t. 15. no. 5.

Lin. syst. *Decándria, Monogýnia.* Calyx deeply 5-parted, unequal. Petals 5, unguiculate. Stamens 10; filaments scaly at the base; anthers cordate. Ovary on a short stipe, 5-furrowed, 5-celled. Style 1, pentagonal, acute at apex, at length 5-cleft. Capsule of 5 1-celled carpels, constantly joined together, with a solitary seed in each cell from abortion. Albumen dense. Embryo straight.—Small shrubs with alternating distich branches, and pinnate, 2-lobed or 2-parted leaves, with 2 short, acute stipulas at their base. Pedicels solitary, axillary, 1-flowered. Flowers yellow.

1 L. ni'tida (Cav. icon. 6. t. 559.) leaves impari-pinnate, smooth, clammy, with 5 or 7 pairs of approximate linear leaflets. ♄. G. Native of Buenos Ayres near Mendoza. Ovary villous.

Shining-leaved Larrea. Fl. June, July. Clt. 1823. Sh. 8 ft.

2 L. divarica'ta (Cav. icon. 6. t. 560. f. 1.) leaves sessile, 2-lobed, villous; lobes deep, lanceolate, divaricate. ♄. G. Native along with the preceding. Ovary and fruit beset with long hairs.

Divaricate-lobed Larrea. Shrub 6 feet.

3 L. cuneifo'lia (Cav. icon. 6. t. 560. f. 2). leaves almost sessile, villous, cuneated, 2-lobed at the apex, with a prominent bristle between the lobes. ♄. G. Native along with the two preceding.

Wedge-leaved Larrea. Shrub 6 feet.

Cult. These pretty shrubs will thrive well in a mixture of loam, peat, and sand; and young cuttings, planted under a bell-glass, will strike root freely.

V. ROEPE'RA (J. Roeper, author of a monograph of German and Hungarian Euphorbias). Andr. Juss. in mem. mus. 12. p. 454. t. 15. no. 3.

Lin. syst. *Octándria Monogýnia.* Calyx permanent, deeply 4-parted. Petals 4, unguiculate. Stamens 8; filaments naked at the base. Ovary with 4 scales at the base, 4-ribbed, 4-celled. Style and stigma 4-furrowed. Capsule 4-angled, with the angles expanded into reticulately-veined wings, 4-celled, 3 of which are usually abortive. Seed solitary from abortion, ovate, acute, compressed, scabrous. Embryo slender.—Shrubs with twin leaflets and stipulas. Peduncles solitary or twin, axillary, 1-flowered. Flowers pale-yellow. This genus has the habit of *Zygophýllum.*

1 R. Billardie'rii (Andr. Juss. mem. mus. 12. p. 454.) leaves bifoliate, stalked; leaflets oblong, fleshy, flat; stem de-

cumbent. ♄. G. Native of New Holland. Zygophýllum Billardièrii, D. C. prod. 1. p. 705. Sepals reflexed. Flowers small, yellow.

La Billardier's Roepera. Shrub decumbent.

2 R. FRUTICULÒSA (Andr. Juss. l. c.) leaves bifoliate, stalked; leaflets oblong, fleshy, flat: pedicels very short; stem shrubby, erect. ♄. G. Native of New Holland, on the eastern coast. Zygophýllum fruticulòsum, D. C. prod. 1. p. 707. Flowers small, yellow.

Shrubby Roepera. Fl. July, Aug. Clt. 1820. Shrub 3 ft.

Cult. These pretty little shrubs will grow freely in a mixture of loam, peat, and sand; and young cuttings will strike root freely if planted in a pot of sand, under a hand-glass.

VI. ZYGOPHY'LLUM (from ζυγος, *zygos*, a yoke, and φυλλον, *phyllon*, a leaf; the leaves are conjugate). Lin. gen. no. 530. D. C. prod. 1. p. 705. Andr. Juss. mem. mus. 12. p. 455. t. 15. no. 4.—Fabàgo, Tourn. inst. t. 230.

LIN. SYST. *Decándria, Monogýnia.* Calyx unequal, deeply 5-parted. Petals 5, unguiculate. Stamens 10; filaments furnished with a scaly appendage at the base on their inside. Ovary seated on a short gynophore, which is sometimes convex or almost wanting, but usually concave or disk-like, glandular, hypogynous. Style 1, tapering into a minute stigma. Capsule oblong, 5-sided, 5-celled, 5-valved; valves at length separating. Seeds somewhat reniform, many in each cell, disposed in 2 rows, fixed to the inner angle, without albumen (Gært. fr. 2. t. 112.). Embryo slender.—Herbs and shrubs, with fleshy, simple, or binate, rarely pinnate leaves. Stipulas twin, membranous. Pedicels axillary, solitary, 1-flowered. Flowers red, white, but for the most part yellow, with a dark base.

* *Leaves simple.*

1 Z. SI'MPLEX (Lin. mant. 68.) leaves simple, sessile, cylindrical. ☉. F. Native of Egypt and Arabia in deserts, frequent. Z. portulacoìdes, Forsk. descr. 88. with a figure, t. 12. B. Flowers yellow. Capsules few-seeded. Scales of stamens 2-parted. This plant is called *Carmal* in Arabia, and is esteemed by the Arabs very good for removing specks in the eyes, for which purpose the bruised leaves are applied mixed with water.

Simple-leaved Bean-caper. Fl. July, Aug. Clt. 1825. Pl. trailing.

2 Z. CORDIFÒLIUM (Lin. fil. suppl. 232.) leaves simple, sessile, roundish, somewhat cordate. ♄. G. Native of the Cape of Good Hope. Ait. hort. kew. 2. p. 60. Flowers orange-yellow.

Heart-leaved Bean-caper. Fl. Oct. Clt. 1774. Shrub 2 ft.

3 Z. SPATULA'TUM; stem prostrate; leaves simple, spatulate, sessile; flowers sessile. ♃. S. Native of the Cape Verd Islands, particularly in St. Jago, in the date plantation below the Fort. Flowers small, yellow.

Spatulate-leaved Bean-caper. Fl. June, July. Clt. 1824. Pl. trailing.

** *Leaves bifoliate; leaflets flat, smooth.*

4 Z. FABA'GO (Lin. spec. 551.) leaves stalked; leaflets obovate; pedicels erect; calyxes smooth; petals undivided. ♃. H. Native of Syria, Tauria, and Mauritania. Lam. ill. t. 345. f. 1. Petals yellow, but of copper brick-colour at the base. Root thick, fleshy, striking deep into the ground.—Besl. eys. æst. 10. t. 1. f. 1.—Park. theatr. 1024. 5. icon. 1023. 5.

Common *Bean*-caper. Fl. July, Sept. Pl. 1 to 4 feet.

5 Z. FŒ'TIDUM (Schrad. et Wendl. sert. han. p. 17. t. 19.) leaves stalked; leaflets obovate; flowers nodding; calyx downy; petals reflexed, cut. ♄. G. Native of the Cape of Good Hope. Petals orange-yellow, each with a purple spot at the base.

Var. β, *insuàve* (Curt. bot. mag. t. 372.) petals oblong, with a heart-shaped, brown spot at the base of each; fruit bearing pedicels deflexed; petioles with a bristle at the apex. ♄. G. Native of the Cape of Good Hope.

Fetid Bean-caper. Fl. June, Aug. Clt. 1790. Shrub 4 ft.

6 Z. DECU'MBENS (Delil. fl. egyp. 77. t. 27. f. 3.) leaves stalked; leaflets oblong-obovate, fleshy, flat; pedicels erect; capsules turbinately-spherical, umbilicate at the apex. ♃. G. Native of Egypt. Stem decumbent. Flowers yellow. Floriferous branches dichotomous.

Decumbent Bean-caper. Pl. prostrate.

7 Z. MACULA'TUM (Ait. hort. kew. 2. p. 60.) leaves stalked; leaflets linear-lanceolate. ♄. G. Native of the Cape of Good Hope. Petals yellow, marked with a red cordate spot at the base of each, above which in the 3 upper ones is a transverse red line.

Spotted-petalled Bean-caper. Fl. Oct. Nov. Clt. 1782. Shrub 3 feet.

8 Z. MICROPHY'LLUM (Thunb. prod. 80.) leaves almost sessile; leaflets ovate, smooth, minute, obcordate; capsules of 5 compressed lobes, retusely emarginate. ♄. G. Native of the Cape of Good Hope. Peduncles capillary. Flowers small, yellow. Petals entire.

Small-leaved Bean-caper. Fl. July, Aug. Clt. 1816. Shrub 1 to 2 feet.

9 Z. MORGSA'NA (Lin. spec. 551.) leaves on short stalks; leaflets obovate; petiole ending in a spiny bristle; capsules somewhat inflated, 4-5-winged. ♄. G. Native of the Cape of Good Hope. Burm. afr. 7. t. 3. f. 2.—Dill. elth. t. 116. f. 141. Flowers nodding, yellow, each petal having a purple spot at the base. The plant is called *Morgsani* in Syria.

Morgsana Bean-caper. Fl. May, Sept. Clt. 1732. Shrub 2 to 6 feet.

10 Z. DE'BILE (Nees in Schlecht. Linnæa. 5. p. 46.) leaves slender, stalked; leaflets elliptic, acuminated. ♄. G. Native of Canga and Groenberg, at the Cape of Good Hope. Stems numerous from the root, weak, tetragonal. Stipulas triangular. Flowers yellow, with dark claws.

Weak Bean-caper. Shrub decumbent.

11 Z. HO'RRIDUM (Nees in Schlecht. Linnæa. 5. p. 46.) smooth, erect; stem strong, round, sometimes with the branches spinescent; petioles dilated; leaflets coriaceous, fleshy. ♄. G. Native of the Cape of Good Hope. Peduncles filiform. Stipulas triangular, acute, and white at the apex. Flowers yellow, with dark claws.

Horrid Bean-caper. Shrub 2 to 6 feet.

12 Z. PARVIFÒLIUM; stems woody, round; leaves stalked, fleshy; leaflets narrow, elliptical; stipulas membranous, shining, white; peduncles shorter than the leaves. ♄. G. Native of the Cape of Good Hope, on the banks of the Orange river. Z. microphýllum, Nees in Schlecht. Linnæa. 5. p. 46. Flowers yellow.

Small-leaved Bean-caper. Shrub 2 to 6 feet.

13 Z. LICHTENSTEINIA'NUM (Nees in Schlecht. Linnæa. 5. p. 47.) leaves coriaceous, stalked; leaflets oblique, arched on the outside, and cut on the inside, rounded at the top. ♄. G. Native of the Cape of Good Hope. Flowers solitary, yellow.

Lichtenstein's Bean-caper. Shrub 2 to 4 feet.

14 Z. DICHO'TOMUM (Nees in Schlecht. Linnæa. 5. p. 48.) branches many times dichotomous; leaves few, minute, on short stalks, coriaceous; leaflets obliquely-obcordate. ♄. G. Native of the Cape of Good Hope, at the Orange river. A tall tree.

Dichotomous-branched Bean-caper. Tree.

15 Z. FU'LVUM (Lin. spec. ed. 1st. p. 386.) leaves sessile; leaflets obovate, flat, smooth; capsule acutely 5-angled. ♄. G. Native of the Cape of Good Hope. Flowers yellow, with a large dark spot at the base of each petal.

Fulvous-flowered Bean-caper. Shrub 3 feet.

16 Z. RETROFRA'CTUM (Thunb. prod. 80.) leaves stalked; leaflets obovate, smooth; pedicels shorter than the leaves; ovary deeply 5-lobed. ♄. G. Native of the Cape of Good Hope. Branches spreading, recurved. Flowers very small. This species comes nearest to *Z. microphýllum*.

Retrograde-branched Bean-caper. Shrub 1 to 3 feet.

17 Z. SESSILIFÒLIUM (Lin. spec. 552.) leaves almost sessile; leaflets lanceolate-oval; petioles ending in a spiny bristle; capsules globose, depressed, wingless. ♄. G. Native of the Cape of Good Hope. Sims, bot. mag. t. 2184.—Dill. hort. elth. t. 116. f. 142.—Burm. afr. 4. t. 2. f. 1. Petals sulphur or orange-coloured, with a brown spot at the base of each, crenate at the tip. In some specimens the branches are much angled, in others round, therefore there are probably two species confused.

Sessile-leaved Bean-caper. Fl. July, Aug. Clt. 1713. Shrub 3 feet.

18 Z. SPINÒSUM (Lin. mant. 380.) leaves almost sessile; leaflets linear, fleshy, flattish; petioles ending in a spiny bristle. ♄. G. Native of the Cape of Good Hope.—Burm. afr. 5. t. 2. f. 2. exhibits spines along the branches, but in the specimens we have seen the only spines are those terminating the petioles. Flowers nodding, yellow.

Spiny-stipuled Bean-caper. Fl. July, Aug. Clt. 1820. Shrub 2 feet.

19 Z. CAPE'NSE (Lam. dict. 2. p. 443.) leaves sessile; leaflets obovate-roundish, fleshy. ♄. G. Native of the Cape of Good Hope. Flowers red.

Cape Bean-caper. Shrub 2 feet.

20 Z. Æ'STUANS (Lin. spec. 552.) leaves almost sessile; leaflets obovate, retuse; petioles ending in a little bristle; stipulas 5 at each joint, sometimes twin, sometimes solitary. ♃. S. Native of Surinam. Flowers and fruit unknown.

Stinging Bean-caper. Pl. 1 foot.

* * * *Leaves bifoliate; leaflets terete.*

21 Z. COCCI'NEUM (Lin. spec. 551.) leaves stalked; leaflets cylindrical, fleshy, smooth; pedicels erect; petals acuminated; capsules cylindrical. ♄. G. Native of Mauritania, in dry deserts; also of Egypt.—Shaw. afr. f. 231. Z. desertòrum, Forsk. descr. 87. icon. t. 11. Flowers scarlet. All kinds of cattle, and even camels, refuse to eat this plant.

Scarlet-flowered Bean-caper. Clt. 1823. Shrub 1 foot.

22 Z. A'LBUM (Lin. fil. dec. 1. t. 8.) leaves stalked; leaflets cylindrical, club-shaped, fleshy, cobwebbed; pedicels erect; petals blunt; capsules cylindrically-pentagonal. ♄. G. Native of Egypt, Barbary, and the Canary Islands. D. C. pl. grass. t. 154. Z. prolíferum, Forsk. descr. 87. icon. t. 12. A. Stem procumbent. Petals white, crenate.

White-flowered Bean-caper. Fl. Oct. Nov. Clt. 1779. Shrub trailing.

* * * * *Leaves bifoliate; leaflets scabrous.*

23 Z. PROSTRA'TUM (Thunb. prod. app. 189.) leaflets scabrous; stem decumbent; joints hairy. ♃. G. Native of the Cape of Good Hope. Flowers yellow?

Prostrate Bean-caper. Fl. July, Aug. Clt. 1810. Pl. prostrate.

24 Z. TRIDENTA'TUM (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 706.) leaves almost sessile; leaflets obovate, villous; petals and scales of stamens 3-toothed at the apex. ♄. G. Native of Mexico. Petals yellow. Filaments purple. Fruit very hairy, and perhaps 5-seeded.

Three-toothed-petalled Bean-caper. Shrub.

* * * * * *Leaves pinnate.*

25 Z. PINNA'TUM (Nees in Schlecht. Linnæa. 5. p. 48.) smooth; leaves pinnate, with 4-5 pairs of leaflets on a narrow-winged rachis, obliquely-lanceolate; stipulas small, triangular, with white jagged margins; flowers large, solitary or twin, on short pedicels. ♄. S. Native of Asia?

Pinnate-leaved Bean-caper. Shrub.

26 Z. MINIA'TUM (Nees in Schlecht. Linnæa. 5. p. 49.) like the preceding, but differs in the leaflets being 1-2 pairs, and in the leaflets being obovate and obtuse, as well as in the stipulas being larger and obtuse. ♄. G. Native of Asia, towards Bokhara on low hills, near Agetma.

Vermilion Bean-caper. Shrub.

27 Z. PORTULACOÌDES (Nees in Schlecht. Linnæa. 5. p. 50.) leaves pinnate, with 1-2 pairs of leaflets; flowers solitary at the wings of the bud; leaflets oblique, obovate, obtuse, and rather emarginate; stipulas large, semicircular; flowers apetalous; filaments with fringed scales, adnate to their base; peduncles longer than the petioles. ♄. G. Native of the Cape of Good Hope.

Portulaca-like Bean-caper. Shrub.

† *An anomalous 3-leaved species, which probably should be removed from the genus.*

28 Z.? LANA'TUM (Willd. spec. 2. p. 564.) leaves trifoliate; leaflets papillose beneath; stem flexuous, with woolly joints. ♃. S. Native of Sierra Leone. Filaments a little dilated at the base. Styles 5. Capsules opening at the base, 5-celled, 5-seeded. Therefore this plant is perhaps a proper genus.

Woolly Bean-caper. Pl.?

Cult. Zygophýllum is a genus of herbaceous plants and shrubs, bearing very pretty flowers. The greenhouse, stove, and frame species will thrive in a mixture of loam, peat, and sand; and cuttings of the perennial and shrubby kinds will root freely in a pot of sand under a hand-glass, but as a few of them ripen their seeds this will be unnecessary. The annual species should be sown in pots in the same kind of soil, and placed in a hot-bed, where they may remain until they have seeded, or they may be removed to the greenhouse. *Z. Fabàgo* is the only hardy herbaceous kind; it will grow well in any light soil, in a dry situation, otherwise it is apt to rot; it is only to be increased by seeds, which sometimes ripen in this country; these require to be sown in a pot, and placed in a frame, and when the plants are about 4 inches high, they may be planted out in the open border in a warm, dry, sheltered situation.

VII. GUAI'ACUM (*Guaiac* is the South American name of the tree). Plum. gen. t. 17. Lin. gen. no. 518. D. C. prod. 1. p. 706. Andr. Juss. in mem. mus. 12. p. 456. t. 15. no. 5.

LIN. SYST. *Decándria, Monogýnia.* Calyx deeply 5-parted into unequal segments. Petals 5, unguiculate. Stamens 10; filaments naked. Ovary tapering into a stipe at the base, 2-5-angled, 2-5-celled. Style 1, short, with an acute stigma. Capsule on a very short stipe, rather fleshy, 2-5-angled, 2-5-celled, containing only one seed in each cell from abortion, ovoid, smooth, fixed to the axis, pendulous. Albumen cartilaginous, chinky. Embryo almost straight, with thickish cotyledons.—Trees with very hard wood. Leaves abruptly-pinnate, with twin stipulas at their base. Peduncles axillary, 1-flowered. Flowers usually blue.

1 G. DU'BIUM (Forst. prod. no. 186.) leaves with one pair of oblong-lanceolate blunt leaflets. ♄. S. Native of the island of Tongatabu, in the South Seas.

Doubtful Lignum-vitæ. Tree.

2 G. officina'le (Lin. spec. 546.) leaves with 2 pairs of obovate or oval, blunt leaflets; peduncles twin; fruit 2-celled. ♄. S. Native of Jamaica and St. Domingo, in low lands. Woodv. med. bot. 43. t. 16.—Pluk. alm. 180. t. 35. f. 3.—Sloan. jam. 2. p. 133. t. 222. f. 3-6.—Seb. thes. 1. p. 86. t. 53. f. 2.—Blackw. t. 350. f. 1-2. Lam. ill. t. 342. Flowers blue. Capsules often 2-angled. A tree about 30 feet high, and near a foot in the diameter of its trunk, with a very smooth bark, variegated with green and white; the wood hard and ponderous, dark olive-brown within, whitish towards the bark, having a peculiar acid aromatic scent, and well known in England by the name of *Brazil-wood* or *Lignum-vitæ*. The wood and bark were celebrated remedies for syphilitic complaints before mercury came into use. The wood was first used in Spain in 1508 for the cure of syphilis, under the title of *Santo-Legno*. In 1517 in Italy, and 1518 in Germany. It is found in the shops only in a state of raspings or shavings, which are of a yellowish colour, but acquire a bluish-green colour on exposure to the fumes of nitrous acid, which is a characteristic of their being genuine. Its taste is bitterish, and when kindled it gives out a bitterish smell. As guaiac is used only in decoction, its virtues must depend upon principles soluble in water. The resin exudes spontaneously in drops, but is principally obtained by sawing the wood into short billets, and bored longitudinally with an auger, one end is then set on a fire, so that a calabash may receive the melted resin as it runs through the holes so bored. It may also be obtained by boiling the chips or raspings in water. The resin swims, and may be skimmed off. This resin is soluble in a moderate heat, but is not softened by the heat of the fingers; it is brownish externally, and the fracture bluish-green, when swallowed causing an insufferable burning and pricking in the throat. It is sometimes adulterated with common resin, but the fraud is easily detected by the smell of turpentine emitted when thrown on live coals. Guaiac taken internally commonly excites a sense of warmth in the stomach, a dryness of the mouth, with thirst; it increases the heat of the body, and quickens the circulation. If the patient be kept warm, it produces diaphoresis; if exposed freely to the air, an increased flow of urine. In large doses it is purgative.

Officinal or Common Lignum-vitæ, or Guaiacum. Fl. July, Sept. Clt. 1694. Tree 30 feet.

3 G. Bre'ynii (Spreng. syst. 2. p. 322.) leaves with 2 or 3 pairs of unequal leaflets, extreme ones oblong-elliptical, unequal-sided, middle pair obovate, lower ones roundish; peduncles umbellate. ♄. S. Native of South America, at the river Magdalena. Flowers blue.

Breynius's Lignum-vitæ. Tree 20 feet.

4 G. vertica'le (Ort. dec. 8. p. 93.) leaves with 3 or 6 pairs, but usually 5 pairs of oblong, coriaceous, mucronate leaflets, outer ones obovate, and are, as well as the branches, very smooth. ♄. S. Native of New Spain and St. Domingo. Pedicels usually twin. Flowers blue, with vertical petals.

Vertical-petalled Lignum-vitæ. Clt. 1820. Shrub 8 feet.

5 G. sa'nctum (Lin. spec. 546.) leaves with 5 or 7 pairs of oval, blunt, mucronulated leaflets: petioles and branchlets somewhat pubescent; pedicels twin; petals fringed; capsule 5-celled. ♄. S. Native of South America, particularly in the island of St. Domingo, New Spain, and Brazil.—Comm. hort. amst. 1. p. 171. t. 88.—Hern. mex. 63.—Pluk. phyt. t. 94. f. 4. A middle-sized knotty tree, whose wood, according to Hernandez, is internally blue. Flowers beautiful blue. It is called in some of the West India Islands *Bastard Lignum-vitæ*. The wood of this species was first introduced as a cure for the venereal disease by the Spaniards, and being carried to the East Indies fetched there an extravagant price, till it became more plentiful.

Holy Lignum-vitæ. Tree 20 feet.

6 G. arbòreum (D. C. prod. 1. p. 707.) leaves with 7-14 pairs of oval-oblong, blunt leaflets, which are unequal at the base, and are usually alternate; petioles and branchlets somewhat pubescent. ♄. S. Native of Carthagena, Guadaloupe, and near Barcelona of Cumana, in woods. H. B. et Kunth, nov. gen. amer. 6. p. 11. Zygophýllum arbòreum, Jacq. amer. 130. t. 83. pict. 35. t. 124. Racemes loose. Petals unguiculate, orange-coloured. Stamens with short appendages at their base. Capsules stipitate, 5-winged. This is a large tree, terminating in a beautiful head, with very hard wood, and is called by the natives of Cumana *Guaiacum*, but they give this name to all hard woods. They have a notion that if it be buried in the ground it will be converted into stone.

Tree Lignum-vitæ. Fl. July. Clt. 1816. Tree 40 feet.

Cult. These trees will grow well in a mixture of loam and peat, and ripened cuttings taken off at a joint will strike root, if planted thinly in a pot of sand, under a hand-glass in heat, but care should be taken when these have rooted not to break the fibres in potting them off, as they are truly brittle.

VIII. PORLIE'RIA (in honour of Anthony de Porlier de Baxamar, a Spanish promoter of botany). Ruiz et Pav. prod. fl. per. p. 55. t. 9. D. C. prod. 1. p. 707. Andr. Juss. in mem. mus. 12. p. 457. t. 16. no. 6.

Lin. syst. *Octándria*, *Monogýnia*. Calyx deeply 4-parted. Petals 4, somewhat unguiculate, connivent. Stamens 8; filaments scaly at the base. Ovary seated on a short gynophore, 4-furrowed, 4-celled. Fruit fleshy, globose, 4-lobed, 4-celled, nevertheless they are of 4 distinct carpels, with a solitary seed in each cell, which is egg-shaped, smooth, and pendulous. Embryo rather arched.—A shrub with spreading stiff branches and abruptly pinnate leaves, with twin spiny stipulas at their base. Peduncles axillary, 1-flowered in fascicles. An intermediate genus between *Guaiacum* and *Lárrea*.

1 P. hygrome'trica (Ruiz et Pav. syst. fl. per. p. 94.). ♄. G. Native of Peru. Leaves with 7 or 8 pairs of linear leaflets, these remain spread open in serene weather, but contract before rain. This shrub possesses the same virtues as those attributed to *Guaiacum*, which see.

Hygrometric Porlieria. Clt. 1823. Shrub 6 feet.

Cult. This shrub will thrive well in a mixture of loam and peat; and ripened cuttings will strike root if planted thinly in a pot of sand and placed under a hand-glass, in a moderate heat.

§ 2. *Zygophýlleæ spuriæ. D. C. prod.* 1. *p.* 707. *Andr. Juss. mem. mus.* 12. *p.* 458. *Leaves alternate.*

IX. CHITO'NIA (from χιτων, *chiton*, an outer covering; the seeds are covered with aril). Moc. et Sesse, fl. mex. ined. icon. D. C. prod. 1. p. 707. Andr. Juss. in mem. mus. 12. p. 518.

Lin. syst. *Octándria*, *Monogýnia*. Calyx 4-parted, deciduous. Petals 4, connivent, orbicular. Stamens 8. Ovary quadrangular. Style 1. Stigma peltate, hemispherical. Capsule 4-celled, 4-valved; valves keeled, winged, therefore the capsule is 4-winged. Seeds 2 in each cell, truncate at the apex, enclosed in fleshy aril.—Leaves alternate, and probably stipulaceous, impari-pinnate, with 6 pairs of ovate, stalked leaflets. Pedicels twin, 1-flowered.

1 C. Mexica'na (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 707.). ♄. S. Native of Mexico. Flowers large, of a rose-purple colour. Seeds black, covered with red aril.

Mexican Chitonia. Tree or shrub.

Cult. This plant will probably grow well in a mixture of

loam and peat; and ripened cuttings, planted under a hand-glass, will perhaps root. The above method may be tried if ever the plant be introduced.

X. BIEBERSTE'INIA (in honour of Frederic Marschall Bieberstein, counsellor of state of Russia, author of Flora Taurico-Caucasica, and other works). Steph. mem. nat. mosc. 1. p. 89. D. C. prod. 1. p. 707. Andr. Juss. in mem. mus. 12. p. 458.

Lin. syst. *Decándria, Pentagýnia.* Calyx deeply 5-parted, irregular. Petals 5, twisted in the bud, unguiculate. Stamens 10, hypogynous; filaments awl-shaped, rather villous, the 5 shortest opposite the petals, the alternate ones with a scale at the base of each on the outside; anther oscillatory. Ovaries 5, distinct at the apex, but connate at the base. Styles 5, simple, rising from the middle of the ovaries. Carpels 1-seeded, arillate inside.—Perennial herbs beset with glandular hairs. Leaves impari-pinnate, with cut leaflets. Stipulas adhering to the petioles. Racemes terminal, simple.

1 B. odòra (Steph. l. c.) leaflets roundish, deeply toothed; petals entire. ♃. F. Native of the Altaian mountains at the falls of Tschuia. Flowers probably yellow.

Sweet-scented Biebersteinia. Pl. ?

2 B. multífida (D. C. prod. 1. p. 708.) leaflets multifid into linear lobes; petals toothed. ♃. F. Native of Persia.

Multifid-leaved Biebersteinia. Pl. ?

Cult. These plants should be kept in pots in a mixture of loam, peat, and sand, and they may be increased by seeds.

XI. TRICHA'NTHE'RA (from τριξ τριχος, *trix trichos*, a hair, and ανθηρα, *anthera*, an anther; in allusion to the anthers being bristly). Ehrenberg, in Schlecht. Linnæa. 4. p. 401.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft. Petals 5, linear, hypogynous. Stamens 5, free; filaments flat; anthers setaceous. Disk glandless. Styles numerous, crowned by simple capitate stigmas. Capsule ovate, stipitate, bluntly pentagonal, 5-celled, 5-valved, many-seeded. Seeds naked, albuminous.

1 T. mode'sta (Ehrenb. l. c. p. 402.). ♃. or ☉. F. Native of Arabia near Djedda towards Mecca. A slender herb, 2 or 3 inches high. Leaves alternate, stipulate, setaceously linear, toothed at the apex. Flowers on long jointed peduncles, nodding. Petals twisted in the bud.

Modest Trichanthera. Pl. 2 to 3 inches.

Cult. A mixture of peat and sand will perhaps answer this little plant; and it may be increased by seeds or cuttings planted in mould under a hand-glass.

XII. ANATRO'PA (*ava, ana*, upwards, and τροπη, *trope*, turning; spike turned like that of *Heliotropium*). Ehrenberg, in Schlecht. Linnæa. 4. p. 403.

Lin. syst. *Tetrándria, Monogýnia.* Calyx 4-cleft, valvate in the bud. Petals 4, hypogynous, imbricate in the bud. Stamens 4, free. Style short, clavate, crowned by a simple stigma. Capsule fleshy, bluntly quadrangular, depressed, 4-valved, 4-celled; cells 4-5-seeded.

1 A. tene'lla (Ehrenb. in Schlecht. Linnæa. 4. p. 404.). ♃. F. Native of Arabia. A slender, fleshy, smooth plant; lower leaves entire, upper ones alternate and pinnatifid, auricled with stipulas. Flowers disposed in a spike, turned like that of *Heliotròpium*.

Tender Anatropa. Pl. 4 inches, ascending.

Cult. See *Trichanthèra* for cultivation and propagation.

XIII. MELIA'NTHUS (from μελι, *meli*, honey, and ανθος, *anthos*, a flower; flowers full of honey). Tourn. inst. t. 245. Lin. gen. no. 795. D. C. prod. 1. p. 708. Andr. Juss. in mem. mus. 12. p. 459. t. 28. no. 48.

Lin. syst. *Tetrándria, Monogýnia.* Calyx coloured, large, 5-cleft, permanent, unequal, lower segment smaller than the rest, bulged at the base on the outside, with a corresponding hollow inside, full of honey fluid. Petals 5, strap-formed, 4 lower ones declined, connected in the middle, the fifth very small. Stamens 4, hypogynous, with the two upper filaments distinct, but the two lower ones are joined together at the base. Ovary with 4 stripes. Style 1, terminated by a somewhat 4-cleft stigma. Capsule membranaceous, 4-lobed, 4-celled, winged, opening by the inner angle, each cell containing 2 ovulæ, but only one of them comes to maturity. Seed ovate, shining. Albumen fleshy. Embryo with small linear cotyledons longer than the radicle.—Shrubs with glandless, impari-pinnate leaves, with toothed leaflets, and distinct or joined stipulas. Racemes many-flowered, spike-formed. Leaves having a strong unpleasant scent when bruised.

1 M. ma'jor (Lin. spec. 892.) leaves smooth on both surfaces, glaucous; stipulas large, joined to the petiole. ♄. H. Native of the Cape of Good Hope. Lam. ill. t. 552. Ker. bot. reg. t. 45. Leaflets large. Flowers of a brown chocolate colour.—Herm. lugd. bat. t. 415.

Great Honey-flower. Fl. May, July. Clt. 1688. Sh. 6 ft.

2 M. mìnor (Lin. spec. 892. exclusive of the synonym of Comm.) leaves smooth above and hoary beneath; stipulas distinct. ♄. G. Native of the Cape of Good Hope. Curt. bot. mag. t. 301. Racemes axillary, elongated, drooping. Bracteas linear, attenuated. Flowers of a dark-brown colour in whorls; lower part of petals green, upper part saffron-coloured, and blush or fine red on the bulged part of the lower sepal. Leaves deep green on the upper surface, but hoary below.

Smaller Honey-flower. Fl. Aug. Clt. 1696. Shrub 5 feet.

3 M. comòsus (Vahl. symb. 3. p. 85.) leaves villous above, downy beneath; stipulas distinct. ♄. G. Native of the Cape of Good Hope. Comm. rar. t. 4. Racemes leafy beneath. Bracteas cordate. Flowers alternate, in pendent clusters, of a yellowish colour. Capsules hoary.

Tufted Honey-flower. Clt. 1820. Shrub 4 feet.

Cult. These shrubs will thrive well in any light rich soil, and cuttings will strike root freely under a hand-glass, or they may be increased by suckers, which are thrown out in plenty from the root. The *M. màjor* will grow and flower freely if planted against a wall in a warm situation, but it requires to be sheltered in winter by a mat.

XIV. BALANI'TES (meaning unknown). Delil. fl. egyp. 77. D. C. prod. 1. p. 708.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-parted. Petals 5. Stamens 10; filaments awl-shaped. Disk glandular, girding the ovary. Ovary 5-celled, 5-seeded. Drupe egg-shaped, acute, 1-celled, 1-seeded from abortion; nut woody, pentagonal. Seed pendulous, with a fibrous covering, and a thickened endopleura about the radicle. Radicle superior. Cotyledons semi-ovate. Plumule 2-leaved.—Trees with alternate bifoliate leaves and axillary spines. Pedicels 1-flowered, aggregate. Flowers small, whitish.

1 B. Ægypti'aca (Delil. l. c. t. 28. f. 1.). ♄. S. Native of tropical Africa, and is now cultivated in Egypt.—Agihalib, P. Alp. æg. 20. t. 11. Ximènia Ægyptìaca, Lin. spec. 1194. The seed of this tree is usually mixed with gum Senegal.

Egyptian Balanites. Clt. ? Tree 20 feet.

2 B. fe'rox (D. C. prod. 1. p. 708.) putamen more acute, narrower, and more furrowed; leaflets roundish; spines longer. ♄. S. Ximènia fèrox, Poir. dict. 8. p. 805. Native of St.

Domingo, where it has been most probably introduced by the negroes from Africa.

Fierce Balanites. Tree 20 feet.

Cult. These trees will grow in a mixture of loam, sand, and peat; and ripened cuttings will strike root freely, if planted in a pot of sand, and placed under a hand-glass, in a moderate heat.

Order LIX. RUTA'CEÆ (plants agreeing with *Rùta* in important characters). Juss. gen. 296. exclusive of the first section. Brown, gen. rem. p. 13. D. C. prod. 1. p. 709.—Fraxinéllæ, Diósmeæ, and Zanthoxýleæ, Nees et Mart. nov. act. bonn. xi. p. 149. 180. and 184.

Flowers of all hermaphrodite, except in Tribe *Zanthoxýleæ*. Calyx with 4-5, rarely 3 divisions, toothed (f. 123. *a.*), cleft or parted. Petals equal in number to the divisions of the calyx (f. 123. *b.*), and alternating with them, usually distinct (f. 123. *b.*), and longer than the calyx, rarely connected into a monopetalous corolla, as in many of the genera belonging to Tribe *Cusparièæ*, and in the genus *Corræ'a*, very rarely absent altogether. Stamens sometimes equal in number with the petals, and alternating with them; sometimes double that number (f. 123. *d.*), with the alternate ones shortest; sometimes these last are abortive, and of a different figure to the others. Filaments inserted in the gynophore, rarely beneath the hypogynous disk, and more rarely perigynous, or adhering to the bottom of the calyx, in consequence of the disk being joined with it; they are either naked or furnished with a scale at the base, free, very rarely connected at the base, or glued to the corolla, as in those with monopetalous flowers. Anthers 2-celled (f. 123. *c.*), bursting lengthwise. Ovary free, with the cells equal in number to the petals (f. 123. *g.*), and opposite them, rarely fewer, verticillate; sometimes fixed around the common axis; sometimes distinct to the base (f. 123. *f.*), sometimes joined together. Ovulæ fixed to the central placenta, usually 2 in each cell or carpel, rarely 1 or 4-20. Styles equal in number to the cells or carpels, usually connected together in one (f. 123. *e.*), or only connected at the base or top, rarely wholly distinct. Stigma of as many lobes or furrows as there are styles in those that are joined (f. 123. *d.*). Fruit sometimes simple, having as many valves (f. 123. *g.*) as there are styles, with a dissepiment in the middle of each valve, dehiscent, but more usually with an equal number of 2-valved, separable carpels (f. 123. *f.*), rarely indehiscent, composed of many drupes or carpels. Sarcocarp thin, or more or less fleshy. Endocarp thin or woody, closely adhering to the sarcocarp, or separable from it into a 2-valved elastic cocculum. Seeds fewer than the ovulæ from abortion, with a membranous or usually with a testaceous covering. Albumen fleshy or cartilaginously horny, rarely wanting. Embryo white or greenish, with a straight radicle pointing towards the top of the cells, rarely turned obliquely towards the hylum. Cotyledons of various forms.

This is an interesting and extensive order, but rather heterogeneous group of plants, natives of all countries and all situations. The species are either fetid northern herbaceous plants, as the *Garden Rue;* or neat heath-like southern shrubs, as the *Cape Diósmas;* broad or long-leaved Australian shrubs, covered with stellate pubescence, as *Phebàlium*, *Crònea*, and *Corræ'a;* or tropical trees, with panicles of palid flowers, as *Zanthóxylums*, and *Cuspàrias*. The medical properties of many genera are considerable. *Rùta* and *Péganum* are ammenagogue, anthelmintic, and sudorific. *Cape Diósmas* abounds in a volatile oil, with an agreeable smell, but acrid flavour; several of the species are reputed antispasmodics. The *Zanthóxylums* are said to possess acrid, stimulating, spasmodic, and tonic qualities. *Z. clàva Hérculis* and *Z. fraxíneum* are said in America to be powerful sudorifics and diaphoretics. According to Barton, they possess a remarkable power of exciting salivation, not only when applied to the mouth, but even when taken internally; they have both been found powerful remedies in paralysis of the mouth. *Z. caribæ'um* is regarded in Guiana as a detersive, vulnerary, and febrifuge. *Brùcea* is used as an astringent in dysenteries. The famous frebrifugal Angustura bark is the produce of *Galipea Cuspària*. The leaves of the plants contained in this order are of various kinds; they are opposite or alternate, simple, trifoliate, or abruptly and impari-pinnate, always without stipulas, which distinguishes it from the last and the foregoing order, *Zygophýlleæ* and *Simarùbeæ;* they have usually various glands, which contain oil of a very strong-scented odour.

Synopsis of the Genera.

Tribe I.

Ru'teæ. *Flowers regular. Stamens hypogynous. Ovary 3-5 lobed, 3-5 valved, 3-5 celled. Calyx of 4-5 divisions, with an equal number of petals. Albumen fleshy. Shrubs or herbs, with alternate leaves.*

1 Pe'ganum. Calyx 5-parted. Stamens 15, smooth. Style crowned by a trigonal stigma. Capsule substipitate, nearly round, 3-celled, 3-valved, many-seeded.

2 Ru'ta. Calyx 4-parted. Stamens 8. Styles 4, connected. Ovary substipitate. Capsule 4-lobed, 4-celled.

3 Aplophy'llum. Calyx 5-parted. Stamens 10. Styles 5, connected. Capsule 5-lobed, 5-celled.

4 Cyminòsma. Calyx 4-parted, unequal. Stamens 8. Style crowned by a 4-furrowed stigma. Berry 4-celled; cells 1-seeded.

Tribe II.

Dio'smeæ-Europæa'næ. *Flowers irregular. Stamens hypogynous. Disk wanting. Ovaries 5, distinct. Albumen fleshy. Petals equal in number with the divisions of the calyx.*

5 Dicta'mnus. Calyx 5-parted, unequal. Petals unequal. Stamens 10, declinate. Style 1. Capsule substipitate, composed of 5 2-seeded carpels.

Tribe III.

Dio'smeæ-Cape'nses. *Flowers regular. Calyx 5-parted. Petals 5. Disk adhering to the calyx. Stamens perigynous. Anthers 5. Ovaries 1-5, connected. Albumen very thin or wanting.*

6 Calode'ndron. Stamens 10, 5 of which are sterile and petaloid, terminating in a gland. Anthers terminated by a gland.

Style deflexed. Capsule 5-valved, 5-celled; cells 2-seeded. Leaves opposite.

7 Adena'ndra. Stamens 10, the 5 opposite the petals sterile, each ending in a globose or concave gland. Anthers terminated by a shell-like, rarely globose, pedicellate gland. Carpels 5, 1-2-seeded. Leaves alternate, rarely opposite.

8 Coleone'ma. Stamens 10, the 5 opposite the petals sterile, and adnate to their base, fitted into a channel, and terminating in a gland. Anthers terminated by a minute sessile gland. Capsule of 5 horned carpels. Leaves scattered.

9 Diósma. Stamens 5, alternating with the petals. Anthers round, terminated by a sessile gland. Style usually a little arched. Capsule of 5 horned carpels. Leaves scattered or opposite.

10 Euchæ'tis. Stamens 5, opposite the calycine segments. Anthers terminated by a minute globose gland. Capsule of 5 horned carpels. Petals bearded inside. Leaves scattered.

11 Acmade'nia. Stamens 10, the 5 opposite the petals sterile or almost wanting. Anthers furnished with a conical gland at the apex. Style crowned by a 5-furrowed stigma. Capsule of 5 compressed, horned carpels. Leaves opposite.

12 Baro'sma. Stamens 10, the 5 opposite the petals sterile, fringed, petaloid, obscurely glandular at the apex. Anthers egg-shaped, usually furnished with a minute gland at the apex. Capsule of 5 auricled carpels. Leaves opposite or scattered.

13 Agathósma. Stamens 10, the 5 opposite the petals sterile, spatulate, beset with glandular dots. Anthers terminated by a globular gland. Capsule of 5 joined, horned carpels. Leaves scattered.

14 Macróstylis. Stamens 5, alternating with the petals. Anthers globose, each furnished with a minute gland at the apex. Capsule of 3 horned carpels. Leaves scattered, rarely opposite.

15 Empleu'rum. Flowers monoecious or polygamous from abortion. Calyx 4-cleft. Disk and petals wanting. Stamens 4, with the anthers longer than the filaments, each terminated by an immersed gland. Carpels 1-2, legume-formed, 2-valved, 1-seeded, horned. Leaves alternate, serrulated.

Tribe IV.

Diósmeæ-Australa'sicæ. *Flowers regular* (f. 123. *b.*). *Petals* 4-5. *Stamens hypogynous, double the number of the petals* (f. 123. *d. c.*), *all fertile. Disk wanting. Ovaries distinct or connected. Styles joined, crowned by an equal number* (f. 123. *b.*) *of stigmas. Albumen dense. Shrubs, natives of New Holland.*

16 Corræ'a. Calyx 4-toothed. Petals 4, joined into a tube. Stamens 8. Ovary 8-lobed. Style 4-furrowed. Carpels 4, capsular; cells 2-3-seeded. Leaves opposite, entire.

17 Diplolæ'na. Involucre double, outer one 5-lobed, inner one 10-15-parted, containing many flowers. Calyx 5-parted. Petals none. Stamens 10, unequal, fringed at the base. Style 5-furrowed. Fruit of 5 carpels, 1-celled, 1-seeded. Leaves alternate.

18 Pheba'lium. Calyx 5-cleft (f. 123. *a.*). Petals 5 (f. 123. *b.*). Stamens 10 (f. 123. *d. c.*), unequal, smooth. Style (f. 123. *e.*) and stigma 5-furrowed (f. 123. *d.*). Fruit of 5 capsular, 2-valved, 1-seeded carpels (f. 123. *f.*), girded by the calyx. Leaves alternate, simple, entire.

19 Philothe'ca. Calyx 5-parted. Petals 5, unguiculate. Stamens 10, unequal, connate at the base, with the tube smooth, and the free part of the filaments hairy. Fruit of 5 1-seeded carpels. Leaves alternate, linear.

20 Cròwea. Calyx 5-parted. Petals 5, sessile. Stamens 10, unequal, fringed, lying close together. Anthers ending in a bearded appendage. Fruit of 5 1-seeded carpels. Leaves alternate, entire.

21 Erioste'mon. Calyx 5-parted. Petals 5, marcescent. Stamens 10, unequal, free, fringed, tapering into a thread which bears the anthers. Fruit of 5, rarely 1-2 carpels. Leaves entire, alternate.

22 Borònia. Calyx 4-parted. Petals 4, marcescent. Stamens 8, unequal, free. Anthers seated on the short threads which terminate the filaments. Fruit of 4 2-valved carpels. Leaves simple or impari-pinnate.

23 Zie'ria. Calyx 4-parted. Petals 4. Stamens 4, rarely 8, smooth, with a gland on the inside of each. Capsule 4-lobed, 4-celled, 4-seeded. Leaves trifoliate, seldom simple.

Tribe V.

Diósmeæ-America'næ. *Flowers regular. Petals free. Stamens twice the number of the ovaries. Disk surrounding the ovaries, or wanting. Styles connected, crowned by as many lobes as there are cells or carpels. Albumen fleshy, rarely wanting. Trees or shrubs, with opposite, alternate, simple, bifoliate, and trifoliate leaves. Flowers axillary or terminal, panicled, racemose or corymbose.*

24 Meli'cope. Calyx 4-parted. Petals 4, unguiculate, approximate. Stamens 8. Ovaries 4, surrounded by 4 large, didymous glands. Leaves opposite, ternate.

25 Evòdia. Calyx 4-parted. Petals 4. Stamens 4. Ovaries 4, surrounded by a cup-shaped, 4-lobed disk. Fruit of 4, rarely fewer, 2-valved, 1-seeded carpels. Leaves opposite, simple, and trifoliate.

26 Esenbe'ckia. Calyx 5-parted. Petals 5. Stamens 5. Ovary sessile, tubercled, 5-lobed, 5-celled, surrounded by a 5-lobed disk? Leaves alternate, simple, and trifoliate.

27 Metrodòrea. Calyx 5-cleft. Petals 5. Stamens 5. Ovary buried in the disk, and confused with its substance, tubercled, 5-lobed, 5-celled. Cells 1-2-seeded. Leaves opposite, simple, rarely bi-foliate.

28 Piloca'rpus. Calyx small, 5-toothed. Petals 5. Stamens 5. Fruit of 5 or fewer small, 1-seeded carpels, immersed in the base of the gynophore. Leaves alternate and opposite, simple, bifoliate, and trifoliate.

29 Hórtia. Calyx bluntly 5-toothed. Petals 5, bearded inside. Stamens 5. Ovary smooth, pentagonal, 5-celled, seated on the disk. Capsule 2-4-5-celled; cells 1-2-seeded. Leaves alternate, simple.

30 Choi'sya. Calyx of 5 sepals. Petals 5. Stamens 10,

unequal. Ovaries 5, connected, inserted in the disk, each containing 2 ovulæ. Leaves opposite, ternate.

TRIBE VI.

CUSPARIE'Æ. *Flowers regular or anomalous. Petals 5, free, but usually joined into a bilabiate, campanulate, or funnel-shaped corolla. In the polypetalous flowers the stamens are free. In the monopetalous ones they adhere to the tube of the corolla. Filaments sometimes all fertile, sometimes 2 or 3 of them are sterile. Disk urceolate, girding the ovaries. Ovaries equal in number with the petals, distinct, rarely connected, each containing 2 ovulæ. Styles connected at the top or bottom, but usually in one. Albumen wanting. Trees and shrubs, rarely herbs, with alternate, rarely nearly opposite leaves; these are sometimes simple, but are usually trifoliate. Flowers disposed in terminal or axillary racemes.*

31 SPIRANTHE'RA. Calyx 5-cleft. Petals 5, free. Stamens 5. Anthers at length spirally revolute. Ovaries 5, villous, connected. Styles 5, joined. Leaves ternate.

32 GALÌPEA. Calyx 5-toothed. Petals 5, connected at the base. Filaments 5, rarely 6-8, 2-4 of which are sterile. Ovaries 5, connected. Styles 5, distinct, partly connected at the base, or joined in one. Fruit only of 1-2 carpels from abortion. Leaves simple and ternate.

33 ALMEÌDEA. Calyx 5-toothed. Petals 5, distinct. Stamens 5. Ovaries 5, connected at the base. Fruit only of 1-2 1-2-seeded carpels. Leaves simple.

34 DIGLÓTTIS. Calyx 5-cleft. Petals 5, connected at the base. Filaments 5, 3 of which are sterile. Anthers terminated by a bearded ligula. Fruit of 5 1-seeded carpels. Leaves simple.

35 ERYTHROCHÌTON. Calyx tubular, 5-cleft, connected into 2 nearly equal lips. Petals 5, connected. Filaments 5, all fertile. Fruit of 5 1-seeded carpels. Leaves simple.

36 TICÒREA. Calyx 5-cleft. Petals 5, connected at the base. Filaments 5-7, rarely 8, 3 or 6 of which are sterile. Fruit of 5 connected, 1-seeded carpels. Leaves ternate, rarely simple.

37 MONNIE'RA. Calyx 5-parted. Petals 5, connected into a bilabiate limb, lower lip 4-lobed, upper one 1-lobed. Filaments 5, 3 of which are sterile. Fruit of 5 or fewer 1-seeded carpels. A villous herb, with opposite or alternate trifoliate leaves.

TRIBE VII.

ZANTHOXY'LEÆ. *This tribe differs from the two last in the flowers being of separate sexes.*

38 DICTYOLÒMA. Calyx 5-parted. Petals 5. Stamens 5, rising each from a woolly scale. Carpels 5, distinct, 2-valved, 3-4-seeded. Seeds kidney-shaped. Leaves pinnate. Male and female flowers intermixed.

39 GALVE'ZIA. Calyx 4-parted. Petals 4. Stamens 8, unequal. Styles 4, distinct at the base, but connected at the apex. Drupes 4, 1-seeded. Seeds egg-shaped. Leaves simple. Male and female flowers on distinct branches or trees.

40 BRU'CEA. Calyx 4-parted. Petals 4. Stamens 4. Styles 4, distinct. Drupes 4, 1-seeded. Leaves impari-pinnate.

41 BRUNE'LLIA. Calyx 4-5-parted. Petals wanting. Stamens 8-10. Styles 4-5, distinct. Carpels 4-5, distinct, 1-2-seeded. Leaves opposite or ternately verticillate, simple, trifoliate, and impari-pinnate.

42 ZANTHÓXYLUM. Calyx 3-4-5-parted, with an equal number of petals and stamens. Styles equal in number to the carpels, distinct, or connected at the apex. Carpels 1-5, sessile or stipitate, 2-valved, 1-2-seeded. Leaves simple, ternate, abruptly and impari-pinnate.

43 BÓYMIA. Male flowers unknown. Calyx 5-cleft. Petals 5. Styles 5, joined in one. Carpels 5, connected at the base, diverging at the top, 1-seeded.

44 TODDA'LIA. Calyx 5-toothed. Petals 5. Stamens 5. Stigma almost sessile, peltate. Fruit fleshy, 5-furrowed, 5-celled; cells 1-seeded. Leaves trifoliate. Male and female flowers on different branches.

45 VE'PRIS. Calyx 4-parted. Petals 4. Stamens 8, unequal. Stigma sessile, convex, peltate. Fruit fleshy, 4-lobed, 4-celled; cells 1-seeded. Leaves trifoliate. Male and female flowers on different branches.

46 PTE'LEA. Calyx 4-5-parted. Petals 4-5. Stamens 4-5. Fruit compressed, 2-3-celled; cells 1-seeded, turgid in the centre, each cell expanded into an orbicular reticulated wing. Leaves of 3, rarely of 5 leaflets.

47 BLACKBU'RNIA. Calyx 4-toothed. Petals 4. Stamens 4. Style filiform, crowned by a simple stigma. Ovary conical, 1-seeded. Male and female flowers on distinct trees.

48 AILA'NTUS. Flowers polygamous. Calyx 5-cleft. Petals 5. Stamens 10, unequal. Styles 3-5, rising from the notches of the ovaries. Carpels 3-5, tongue-shaped, compressed, membranous, tumid in the middle, 1-celled, 1-seeded. Seeds compressed. Albumen wanting. Leaves abruptly or impari-pinnate.

† *Genera allied to Rutáceæ, but are not sufficiently known.*

49 POLE'MBRYUM. Fruit nearly sessile, echinated, of 5 carpels, which are connected together at the sides, at length separable, 2-valved, 1-seeded. Seeds ovate, furnished with a broad, entire, black spot at the base. Cotyledons fleshy, unequal.

50 PSEUDIÓSMA. Calyx 5-parted. Petals 5. Anthers 5, sessile, conniving. Ovary 5-lobed, girded by a crown-formed thick nectary. Carpels 5, each seated on a proper pedicel, rather kidney-shaped. Seeds solitary, not calyptrate. Leaves simple.

51 THYSA'NUS. Calyx of 5 sepals. Petals 5. Stamens 10, short. Styles 4, inserted in the sides of the ovaries, crowned by bifid stigmas. Drupes 4, oblong, recurved at the apex, woolly. Seeds solitary, ovate, involved at the base by a fringed fleshy tunic. Leaves pinnate.

52 TETRA'DIUM. Calyx 4-parted. Petals 4. Stamens 4, pilose. Ovary 4-lobed. Stigmas 4, awl-shaped. Capsules 4, roundish. Seeds solitary, arillate. Leaves impari-pinnate.

53 PHILAGÒNIA. Flowers dioecious. Calyx small, 4-toothed. Petals 4, valvate in the bud. Stamens 4. Style short, crowned by a large peltate stigma. Fruit capsular, 4-furrowed, 4-celled, 8-seeded. Seeds angular. Leaves impari-pinnate.

54 ASAPHE s. Calyx very short, 4-5-toothed. Petals 4-5, linear. Stamens 4-5. Styles and stigmas 3. Capsule pea-shaped, 4-furrowed, 4-celled, 4-valved, 4-seeded. Leaves ternate.

55 BARRALDE'IA. Calyx 5-cleft. Petals 5, bifid and unguiculate, Stamens 10. Ovary adhering to the tube of the calyx. Style 1. Leaves simple.

Tribe I.

RU'TEÆ (plants agreeing with *Rùta* in important characters). Andr. Juss. in mem. mus. 12. p. 461. Flowers regular. Calyx of 4 or 5 divisions. Petals equal in number with the divisions of the calyx. Endocarp not separable from the sarcocarp. Embryo within a fleshy albumen.—Shrubs or perennial herbs, with alternate simple or impari-pinnate leaves without stipulas.

I. PE'GANUM (from *πηγανον*, *peganon*, rue in Greek; resemblance). Lin. gen. 601. D. C. prod. 1. p. 712. Andr. Juss. in mem. mus. 12. p. 461. t. 16. no. 8.

LIN. SYST. *Dodecándria*, *Monogýnia*. Calyx 5-parted, permanent. Petals 5, almost equal. Stamens 15, shorter than the petals, some of them abortive; filaments smooth, dilated at the base. Anthers linear. Style simple, terminated by a trigonal stigma. Capsules substipitate, nearly spherical, 3-celled, 3-furrowed, 3-valved, many-seeded. Embryo straight.—Herbs with multifid leaves. Peduncles 1-flowered. Flowers white, with green veins. Every part of the plants has a strong unpleasant scent when bruised.

1 P. HA'RMALA (Lin. spec. 638.) ♃. H. Native of Spain, about Madrid, in sandy places, and of the Levant. Lam. ill. t. 401. Bull. herb. t. 343.—Blackw. t. 310. Root woody. Stem herbaceous. Leaves multifid into linear lobes. Flowers stalked. Calyxes entire.

Var. β, crithmifòlia (Retz. obs. 2. p. 34.) stem permanent; calyxes toothless. ♄. H. Native of Siberia, at the Caspian sea. Bieb. fl. taur. 1. p. 364. P. crithmifòlia, Georg. in herb. Willd.

Harmala or Syrian-Rue. Fl. July, Aug. Clt. 1570. Pl. 1 ft.

Cult. These plants will thrive well in any light sandy soil, and cuttings planted under a hand-glass will root freely. They will not flower unless they are planted in a warm situation, and they will require to be sheltered in severe weather in winter.

II. RU'TA (Du Theis observes that this word is not capable of explanation, being nearly the same in all the most ancient languages; viz. *ruz* in Runic; *rude*, *rata*, *ruta*, or *rutu* in Anglo-Saxon; *rutiza* in Sclavonian; *ruta* in Italian and Latin; *ruda* in Spanish; *ρυτη* in Greek; said to be from *ρυω*, to flow, in allusion to some reputed expelling qualities of the plants; hence *rue* in English and French.) Tourn. inst. t. 133. Lin. gen. no. 523. D. C. prod. 1. p. 709. Andr. Juss. in mem. mus. 12. p. 462. t. 17. no. 9.

LIN. SYST. *Octándria*, *Monogýnia*. Calyx short, 4-parted, falling off late. Petals 4, unguiculate, arched, for the most part jagged. Stamens 8, the 4 shortest opposite the petals; filaments awl-shaped, smooth; anthers ovate, blunt at the apex. Ovaries 4-lobed, seated on a short thick stipe, and surrounded by 8 nectariferous pores. Styles 4, constantly joined in one, terminated by a 4-furrowed stigma. Capsule subglobose, 4-celled, opening inwardly at the apex. Seeds angular-reniform, fixed to the inner angle of the cells. Albumen fleshy. Embryo arched, with a long radicle.—Perennial herbs or subshrubs, with pinnate or decompound, glaucous leaves. Flowers corymbose, greenish-yellow. Every part of the plants have a strong disagreeable smell.

§ 1. *Pinnàtæ. D. C. prod.* 1. *p.* 710. *Leaves truly pinnate; leaflets, especially the lateral ones, are jointed above the petiole. Fruit rather fleshy, indehiscent.—Rutèria, Medik. phil. bot.*

1 R. PINNA'TA (Lin. fil. suppl. 232.) stem arborescent; leaves impari-pinnate, floral ones reduced to the terminal leaflet; petals entire. ♄. G. Native of the Canary Islands, on rocks. Ker. bot. reg. t. 307. Leaflets entire or toothed.

Pinnate-leaved Rue. Fl. March, Aug. Clt. 1780. Shrub 6 feet.

§ 2. *Decompósitæ. D. C. prod.* 1. *p.* 710. *Leaves decompound and variously cut. Capsules dehiscent.*

* *Petals ciliated.*

2 R. BRACTEÒSA (D. C. prod. 1. p. 710.) leaves supra-decompound, hardly thrice as long as broad; leaflets oblong-cuneated, somewhat equal; bracteas large, somewhat cordate. ♄. F. Native of Sicily, about Palermo, and of the Island of Melos. R. Chalepénsis tenuifòlia, D'Urv. enum. p. 44.

Large-*bracted* Rue. Fl. June, July. Clt. 1819. Shrub 2 ft.

3 R. ANGUSTIFÒLIA (Pers. ench. 1. p. 462.) leaves supra-decompound, 4 times longer than broad; leaflets oblong-cuneated, almost equal; bracteas small, ovate. ♄. H. Native of the south of France, common among rocks in sunny situations. R. Chalepénsis, Vill. dauph. 4. p. 383. R. gravèolens *α*, Lin. spec. 548. R. Chalepénsis, var. *β*, Lin. mant. 69. Sims, bot. mag. t. 2311.—Mor. oxon. sect. 5. t. 35. f. 8. Leaflets narrow, very glaucous.

Narrow-leaved Rue. Fl. June, Sept. Clt. 1722. Shrub 2 ft.

4 R. MACROPHY'LLA (Sol. in bot. mag. t. 2018.) leaves pinnate; leaflets oblong, on short stalks, terminal one largest, lower ones cut into 3-5 leaflets. ♄. F. Native of the north of Africa, and about Aleppo. R. Chalepénsis, var. *α*, Lin. mant. 69.

Long-leaved Rue. Fl. June, Sept. Clt. 1772. Shrub 3 feet.

* * *Petals entire or somewhat toothed.*

5 R. MONTA'NA (Clus. hist. 2. p. 136.) leaves supra-decompound; leaflets all linear; petals entire. ♄. or ♃. H. Native of the south of Europe and north of Africa, among stones on dry hills. R. legítima, Jacq. icon. rar. 1. t. 76. R. sylvéstris, Mill. dict. no. 3. R. tenuifòlia, Desf. atl. 1. p. 336. This plant is corrosive, and has a very strong smell.

Mountain Rue. Fl. June, Sept. Clt. 1596. Pl. 2 or 3 ft.

6 R. GRAVE'OLENS (Lin. spec. 548. exclusive of var. *α* and *β*) leaves supra-decompound; leaflets oblong, terminal one obovate; petals entire or a little toothed. ♄. H. Native of the south of Europe, in sterile places. Very common in gardens. R. horténsis, Mill. dict. no. 1.—Duh. arb. 2. t. 61. Woodv. med. bot. 108. t. 37. Blackw. t. 7.—Plenck. icon. t. 332. The bruised leaves excoriate the lips and nostrils, if incautiously applied, as they often are, to counteract bad smells; *rue* being supposed powerfully to counteract contagion. Its internal use is unsafe, yet it has been known to be eaten with bread and butter in no small quantity, not altogether with impunity. *Rue* has a strong ungrateful odour, and a bitter, hot, penetrating taste; the leaves are so acrid as to irritate and inflame the skin, if they be much handled; it is said to possess these qualities more powerfully in an uncultivated state. Its virtues are extracted both by water and rectified spirit, but more powerfully by the latter. On instipating the spiritous tincture, very little of its flavour rises with the menstruum; most of the active parts of the rue being concentrated in the extract. In distillation with water, an essential oil separates, which is of a yellowish or brownish colour, a moderately acrid taste, and penetrating smell; the decoction instipated, yields a moderately warm, pungent, and bitterish extract. The seeds and capsules contain more oil than the leaves. From the experiments of Beaume, it appears that the recent herb contains but a very small portion of essential oil; thus from 21 lbs. of the leaves he scarcely obtained a drachm, while 10 lbs. of the seeds yielded 2 ounces. *Rue*

was much used by the ancients, who ascribed to it many excellent qualities. Hippocrates commends it as a resolvent and diuretic, and attributes to it the power of resisting contagion, and the action of other kinds of poisons; so that it was employed with this intention by Mithridates (see Pl. nat. hist. l. 28. c. 8.): this quality, though allowed by Boerhaave, is now generally discredited (Cullen. mat. med. 2. p. 365.). According to Bergius it is "alexiteria, pellens, emmenagoga, sudorifera, rubefaciens." It is, however, acknowledged to be a powerful astringent, and like other medicines of a fœtid kind, to possess attenuating, deobstruent, and anti-spasmodic powers, and to be peculiarly adapted to phlegmatic habits, or weak and hysterical constitutions, suffering from retarded or obstructed secretions. It is employed by some as a tea, and also externally in discutient and antiseptic fomentations. Among the common people the leaves are sometimes taken with treacle, on an empty stomach, as anthelmintic. A conserve, made by beating the fresh leaves with thrice their weight of fine sugar, is the most commodious form for using the herb in substance. The dose of the powdered leaves may be 15 to 20 grs. given twice or thrice a day. The officinal preparations "*oleum rutæ* and *extractum rutæ graveolens*," or oil of rue, is procured in the quantity of 59 grains of oil from 21 pounds of rue, which oil has the strong ungrateful odour and taste of the plant. When recently drawn, the colour is yellow, but by age it deepens to a brown, and deposits a brownish resinous sediment. It congeals at 40° Fahrenheit. This oil is stimulant, and antispasmodic; it is sometimes given in hysteria, and the convulsive affections of infants attendant on dentition, and is sometimes used as a rubefacient in palsy. The extract of *rue* is prepared like other simple extracts: it is inodorous, but has a bitter acrid taste. The medicinal properties are different from those of the plant, the stimulant and narcotic powers of which depend on the volatile oil it contains, which is dissipated during the instipation of the extract. The dose is from 10 to 15 grs. in pills. *Lewis*, *Woodville*, and *Thomson*.

"*Rue* was anciently also named *herb grace* or *herb of grace*, and it is to this day called *ave-grace* in Sussex, in allusion doubtless to *Ave-Maria, gratiâ plena;* and it is remarkable that Mary, in Hebrew, signifies bitter. Warburton says that *rue* had its name *herb of grace* from its having been used in exorcisms. When Ophelia, in Shakspeare's Hamlet, says to the Queen "There's rue for you and here's some for me; we may call it herb of grace o' Sundays:" the fair moralist has no reference to this plant being used in exorcisms, performed in churches on Sundays; but means only, that the Queen may with peculiar propriety on Sundays, when she solicits pardon for that crime which she has so much occasion to rue and repent of, call her rue *herb of grace*. It was, indeed, the common name for rue in Shakspeare's time; and Greene, in his Quip for an upstart Courtier, has this passage: "some of them smiled and said rue was called *herbegrace*, which though they scorned in their youth, they might wear in their age, and that it was never too late to say *miserere*." The gardener in Richard II. says of the Queen:

> "Here did she drop a tear; here in this place,
> I'll set a bank of rue, sour *herb* of *grace:*
> Rue even for ruth, here shortly shall be seen
> In the remembrance of a weeping queen."

Here the gardener plays upon the name, and might mislead an etymologist who knew no better. He might, with more truth, have called rue bitter than sour, and he whimsically enough makes it take the place of rosemary, which was the emblem of *remembrance*, as rue was of *grace*. Thus Perdita, in the Winter's Tale:

> "Reverend sirs,
> For you there's rosemary and rue, these keep
> Seeming and favour all the winter long:
> Grace and remembrance be to you both."

They are both evergreens, retaining their appearance and taste during the whole year, and therefore are proper emblems of remembrance and grace.

Rue seems to have been used formerly in nosegays; for the Clown in All's Well that End's Well, having said of the Countess, "she was the sweet-marjoram of the salad, or rather the herb of grace." Lafeu replies, "they are not salad-herbs, you knave, they are nose-herbs;" upon which the Clown, in character, remarks, "I am no great Nebuchadnezzar, sir, I have not much skill in grass:" thus punning upon the name of grace, as the gardener did upon the other name of rue. (Martyn).

Linnæus having observed that the *rue* moved one of its stamens every day to the pistil, Sir James Smith examined the *Rùta angustifòlia*, and found many of the stamens in the position which he describes, holding their anthers over the stigma; while those which had not come to the stigma were lying back upon the petals, as well as those which had already performed their office, had returned to their original situation. Trying with a quill to stimulate the stamens, he found them all quite devoid of irritability; they are strong, stout, conical bodies, and cannot, without breaking, be forced out of the position in which they happen to be. The same phenomenon has been observed in several other flowers, but it is no where more striking, or more easily examined than in the species of *rue*. Hence Sir James Smith concludes, that these plants are endued with a kind of spontaneous motion. This is not a very philosophical conclusion. To a similar cause we are taught to assign the same cause; and because we cannot excite the irritability, it does not therefore follow that the subject is not irritable.

Strong-scented or Common Rue. Fl. June, Sept. Clt. 1562. Shrub 3 feet.

7 R. divaricà'ta (Tenor. cat. hort. neap. 1819. p. 42. but not of Saltzm.) leaves supra-decompound; leaflets obovately cuneated, equal; petals entire or a little toothed. ♄. H. Native of the south of Italy, also of Greece and Tauria, among rocks exposed to the sun. Tenor. fl. nap. 1. t. 36. An intermediate plant between *R. gravèolens* and *R. angustifòlia*.—Lam. ill. t. 345. f. 1.

Divaricate Rue. Fl. May, Sept. Clt. 1820. Shrub 3 feet.

8 R. crithmifòlia (Moric. ined. D. C. prod. 1. p. 710.) leaves supra-decompound; leaflets oblong-linear, rather cuneated, about equal; petals entire or a little toothed. ♄. H. Native of Germany between Duino and Trieste, as well as of the Levant, on rocks.

Samphire-leaved Rue. Shrub 2 feet.

9 R. Córsica (D. C. prod. 1. p. 710.) leaves supra-decompound; leaflets obovate, almost equal; racemes almost simple; pedicels elongated, 1-flowered, stiffly divaricating; petals entire. ♄. F. Native of Corsica, on the mountains. R. montàna, spinòsa álba, Bocc. mus. p. 70. t. 59. R. divaricàta, Saltzm. in flora. 1821. p. 109. Corymbs bifid from the base; branches racemose. The old branches, if Bocconi's figure is to be depended upon, are spiny. Flowers yellow, but according to Bocc. they are white. Perhaps two distinct plants are here confused.

Corsican Rue. Fl. June, Sept. Clt. 1818. Shrub 2 feet.

10 R. albiflòra (Hook. exot. fl. 79.) leaves supra-decompound; leaflets obovate, glaucous, pubescent, somewhat auricled, terminal one large, obcordate; branches of panicle bracteate; petals entire, shorter than the stamens; ovary on a pedicel. ♄. G. Native of Nipaul. R. Dampàtis, Hamilt. mss. Flowers white. An elegant plant, clothed with glandular pubescence.

White-flowered Rue. Fl. July, Sept. Clt. 1823. Sh. 2 ft.

Cult. All the species of *rue* are of easy cultivation. They

will grow freely in any light rich soil; and cuttings, planted under a hand-glass, will soon strike root. They may be also obtained from seeds, which in many species ripen in abundance.

III. APLOPHY'LLUM (from *απλοος, aploos*, simple, and *φυλλον, phyllon*, a leaf; leaves simple, not compound, as in *Rue*). Andr. Juss. in mem. mus. 12. p. 464. t. 17. no 10.—Ruta, sects. 3 and 4. D. C. prod. 1. p. 711.

LIN. SYST. *Decándria, Monogýnia.* Calyx short, 5-parted, falling off late. Petals 5, unguiculate, flat, entire. Stamens 10, the 5 shortest opposite the petals; filaments dilated at the base and villous on the inside; anthers each furnished with a minute gland at the point. Ovary 5-lobed, surrounded by a nectariferous ring. Styles 5, constantly joined in one, dilated from the base to the apex, and terminated by a capitate papillose, 5-furrowed stigma. Capsules 5-celled, 5-furrowed, opening inwardly at the apex. Seeds reniform, scrobiculate, or tuberculate, fixed to the inner angle of the cells. Albumen fleshy. Embryo arched, with a long radicle.—Perennial herbs, rarely shrubs. Leaves simple, seldom ternate, glaucous. Flowers corymbose, yellow, rarely white. This genus has the strong disagreeable smell of *rue*, as well as possessing the same medical qualities, but in a lesser degree.

§ 1. *Trifòlia, D. C. prod.* 1. *p.* 711. *Leaves 3, together, approximate, quite entire, lower and uppermost ones solitary, undivided.*

1 A. PATAVÌNUM; middle leaves 3 together, linear, tapering to the base, quite entire; corymbs crowded; calyxes villous; petals entire. ♃. H. Native of the mountain Saxo-Nigro, at Arqua, near Padua. Rùta Patavìna, Lin. gen. 549.—Michel. gen. t. 19. Leaves furnished with a tooth or lobe at the base. Flowers yellow, with a green central rib.

Padua Aplophyllum. Fl. June, July. Clt. 1819. Pl. 1 ft.

2 A. DICHÓTOMUM; middle leaves 3 together, linear, tapering to the base, quite entire; corymbs loosely panicled, dichotomous; calyxes a little fringed. ♃. F. Native of Persia. Rùta dichótoma, D. C. prod. 1. p. 711. Flowers yellow. Stamens much dilated at the base.

Dichotomous Aplophyllum. Pl. 1 foot.

3 A. PUBE'SCENS; leaves nearly all 3 together, lanceolate, pubescent, entire, lateral ones very short; corymbs many-flowered; calyxes and ovaries villous. ♃. H. Native of Spain, near Aranjuez. R. pubéscens, Willd. enum. 446. R. Patavìna, Poir. dict. 6. p. 335. Lam. ill. t. 345. f. 2. Flowers yellow. Filaments a little fringed at the base, hardly dilated.

Pubescent Aplophyllum. Fl. June, Aug. Clt. 1816. Pl. 1 ft.

§ 2. *Integrifòlia. Leaves undivided, entire, solitary.*

4 A. CORDA'TUM; leaves entire, cordate, stem-clasping; corymbs many-flowered; petals oval-oblong, quite entire; filaments smooth. ♃. F. Native of Nipaul in Gosainsthan. Rùta cordàta, D. Don, prod. fl. nep. 206. Root thick, tuberous. Stem simple. Flowers small, yellow.

Cordate-leaved Aplophyllum. Pl. 1 foot.

5 A. FRUTICULÒSUM; leaves entire, ovate-lanceolate, bluntish, and are as well as the calyxes villous; corymbs few-flowered; petals oblong; filaments and calyxes ciliated at the base; ovaries smooth. ♄. ♃. F. Native about Damascus. R. fruticulòsa, Labil. syr. 1. p. 13. t. 4.—Buxb. cent. 2. p. 30. t. 28. f. 1. Flowers yellowish.

Shrubby Aplophyllum. Pl. 1 foot.

6 A. TUBERCULA'TUM (Andr. Juss. in mem. mus. 12. p. 528. t. 17. no. 10.) leaves entire, pilose, under surface as well as stems and capsules tuberculated; capsules rather pilose; cells 2-seeded. ♃. F. Native of Egypt and Nubia. Rùta tuberculàta, Forsk. descr. 86. Flowers small, yellow. Corymbs dichotomous. Petals oblong.

Var. α, Forskàhlii (D. C. prod. 1. p. 711.) leaves linear-lanceolate.

Var. β, Montbrètii (D. C. prod. 1. p. 711.) leaves obovately cuneated.

Tubercled Aplophyllum. Pl. 1 foot.

7 A. GLA'BRUM; leaves entire, oblong-linear, glandular beneath as well as the stems, smooth on both surfaces as well as the stems, calyxes, and capsules; petals oblong-linear. ♃. F. Native between Mosul and Bagdad. Rùta glàbra, D. C. prod. 1. p. 711. Corymbs dichotomous. Flowers yellowish. Filaments fringed.

Smooth Aplophyllum. Pl. 1 foot.

8 A. VILLÒSUM; leaves entire, lower ones oblong, the rest linear, and are as well as the stems pubescent; calyxes and ovaries hairy; petals oblong. ♃. H. Native of Caucasus and Iberia, in fields exposed to the sun. Rùta villòsa, Bieb. fl. taur. 1. p. 310. R. parviflòra, Desf. cor. Tourn. t. 54.—Buxb. cent. 2. t. 28. f. 2. Flowers small, yellowish, racemose.

Villous Aplophyllum. Fl. June, Aug. Clt. 1818. Pl. 1 ft.

9 A. LINIFÒLIUM; leaves entire, oblong-lanceolate, tapering to the base, and are as well as the stems, smoothish; calyxes very short, a little ciliated; ovaries villous; petals ovate. ♃. H. Native of Spain near Valentia, Cyprus, and various parts of Greece. Rùta linifòlia, Lin. spec. 549. Andr. bot. rep. t. 565. Smith, fl. græc. 370.—Bocc. mus. t. 73. f. 3. Flowers yellow, corymbose.

Flax-leaved Aplophyllum. Fl. Ju. Sept. Clt. 1752. Pl. 1 ft.

10 A. SUAVE'OLENS; leaves entire, spatulately-lanceolate, glaucous, smoothish; calyxes a little fringed; ovaries quite smooth; petals ovate. ♄. H. Native of Tauria and Bessarabia, in exposed places. Rùta suavèolens, D. C. prod. 1. p. 711. Rùta linifòlia, Bieb. fl. taur. 1. p. 309. Rùta linifòlia, var. grandiflòra, Sims, bot. mag. t. 2254. Flowers yellow, corymbose, having the smell of those of *Primula officinàlis*.

Var. β, congésta (D. C. prod. 1. p. 711.) flowers few, but crowded. ♃. H. Native on Mount Olympus. Flowers having the scent of those of the lemon.

Sweet-scented Aplophyllum. Fl. June, Sept. Clt. 1800. Shrub 2 feet.

11 A. BUXBAU'MII; leaves entire, lanceolate, tapering into the petiole, somewhat puberulous; branches of panicle dichotomously corymbose, divaricating, compressed at the forks; filaments fringed at the base. ♃. F. Native of Thrace, near Rodosto in fields, as well as of Troy and of Syria. Rùta Buxbaúmii, D. C. prod. 1. p. 711.—Buxb. cent. 2. t. 28. f. 2. Flowers yellowish. Petals oblong. Ovary smoothish.

Buxbaum's Aplophyllum. Pl. 1 foot.

12 A. ACUTIFÒLIUM; leaves entire, oblong, on very short stalks, acute at both ends, and are, as well as the stems, smooth; lower ones opposite; panicle corymbose, dichotomous; calyxes very acute, a little fringed; capsules smooth. ♃. F. Native of Persia, between Kermancha and Amadan. Rùta acutifòlia, D. C. prod. 1. p. 711. Flowers yellowish.

Acute-leaved Aplophyllum. Pl. 1 foot.

13 A. LINEA'RE; leaves entire, linear, smooth, dotted beneath; corymbs few-flowered, dichotomous; petals linear-oblong; capsules smooth, 3-lobed. ♃. H. Native of the south of Siberia. Rùta lineàris, D. C. prod. 1. p. 712. Flowers yellowish.

Linear-leaved Aplophyllum. Pl. 1 foot.

14 A. THESIOÌDES; leaves entire, linear-lanceolate, smooth; stems puberulous towards the top; corymbs crowded; sepals roundish; filaments dilated at the base and hairy inside. ♃. H. Native of the eastern shore of the Caspian sea. Rùta thesioìdes,

Fisch. in litt. D. C. prod. 1. p. 712. Flowers yellowish. Very like *A. Dahùricum*.

Thesium-like Aplophyllum. Pl. $\frac{1}{2}$ foot.

15 A. Dahu'ricum; leaves entire, linear-lanceolate, and are as well as the calyxes smooth; corymbs few-flowered; sepals and stamens a little fringed at the base; ovaries smooth; petals oblong. ♃. H. Native of Dahuria, in exposed fields. Rùta Dahùrica, D. C. prod. 1. p. 712. Péganum Dahùricum *β*, Lin. spec. 638.—Rùta, Gmel. sib. 4. t. 68. f. 2.—Amm. ruth. no. 92. Petals pale-yellow, sometimes 6 in number. Stamens double the number of the petals, not triple that number, as in *Péganum*. Root fusiform, with many simple stems rising from the neck. There is a variety of this plant with white flowers, mentioned in Amm. ruth. no. 91.

Dahurian Aplophyllum. Fl. July, Aug. Clt. 1816. Pl. 1 ft.

16 A. rosmarinifòlium (Pers. ench. 1. p. 465.) leaves linear, dotted beneath; stem very much branched; root fusiform. ♃. F. Native of Spain, according to the herbarium of Jussieu. Flowers yellowish.

Rosemary-leaved Aplophyllum. Pl. 1 foot.

Cult. These plants will grow in any light rich soil, but in a poor dry light soil they will endure our winter better. Cuttings planted under a hand-glass will root readily, and many of them may be increased by dividing the plants at the root, but by seeds is the best and surest method; these are sure to ripen in abundance if the summer proves favourable.

Genus allied to Rùteæ.

IV. CYMINO'SMA (from *κυμινον, kyminon*, cumin-seed, and *οσμη, osme*, smell; fruit smelling like cumin-seed). Gært. fruct. 1. p. 280. D. C. prod. 1. p. 722. Andr. Juss. in mem. mus. 12. p. 465. t. 17. no. 11.—Jambolífera, Lin. gen. no. 479. but not of Houtt. nor Gært. and excluding the synonym of Rumphius.

Lin. syst. *Octándria, Monogýnia.* Calyx of 4 orbicular sepals or deeply divided into 4 orbicular segments, 2 of which are rather smaller than the rest. Petals 4, narrow, lanceolate, revolute at the apex. Stamens 8, the 4 shortest are opposite the petals; filaments flat, awl-shaped, pilose at the base; anthers ovate, versatile. Ovary seated on a fleshy, octangular disk. Style 1, erect, smooth, terminated by a 4-furrowed stigma. Berry 4-celled; loculaments papery inside, 1-seeded. Embryo with a short radicle and elliptical cotyledons.—Trees with large, opposite, entire leaves, having the smell of the fruit. Flowers corymbose, white. Fruit smelling like cumin-seed. The species are insufficiently known.

1 C. pedunculà'ta (D. C. prod. 1. p. 722.) leaves elliptical-lanceolate, obtuse; petals linear-lanceolate, thrice as long as the calyx. ♄. S. Native of Ceylon. Jambolífera, Lin. fl. zeyl. 58. exclusive of the synonymes. Jambolífera pedunculàta, Vahl. symb. 3. p. 52. t. 61. Dryan. l. c. Perin-panel, Rheed. mal. 5. t. 15.? Gært. fruct. 1. p. 281. in a note. Corymbs trichotomous. Flowers white. The berries are called jambol; they are black and juicy, of a sweetish acid taste, esculent.

Stalked-fruited Cyminosma. Clt. 1800. Tree 20 feet.

2 C. Chine'nsis (Spreng. syst. 2. p. 216.) leaves ovate, emarginate; petals lanceolate, thrice as long as the calyx. ♄. G. Native of the south of China. Jambolífera pedunculàta, Lour. coch. p. 230. Corymbs racemose. Flowers white. Fruit ovate-oblong, almost cylindric, 1-seeded, blunt, black, juicy, sweetish-acid, esculent.

China Cyminosma. Tree 20 feet.

3 C. Ake'nda (Gært. fruct. 1. t. 58.) leaves? petals oblong, pubescent outside, a little longer than the calyx. ♄. S. Native of Ceylon. Ankœnda, Herm. mus. 73. Burm. fl. zeyl. 27. Oil of cumin is extracted from this tree.

Akenda Cyminosma. Tree 20 feet.

4 C. odora'ta (D. C. prod. 1. p. 722.) leaves ovate, obliquely truncate at the base, dotted beneath; corymbs terminal, racemose; berries 1-seeded from abortion. ♄. G. Native of Cochin-china, in gardens. Jambolífera odoràta, Lour. coch. 231. Calyptránthes odoràta, Martyn. Flowers white. Berries ovate, small, white. The leaves have the smell of cumin; the young leaves are put into salads, and are not unpleasant.

Sweet-scented Cyminosma. Clt. 1818. Shrub 6 feet.

5 C. resinòsa (D. C. prod. 1. p. 722.) leaves oblong; peduncles axillary, many-flowered; berries roundish, 4-celled. ♄. S. Native of Cochin-china. Jambolífera resinòsa, Lour. coch. 1. p. 284. Calyptránthes resinòsa, Martyn. A middle-sized tree, with tough, resinous bark. Flowers white. Berries roundish, small, black. The fishermen of Cochin-china dye their nets in a strong decoction of the roots, to prevent their rotting.

Resinous-barked Cyminosma. Tree 20 feet.

Cult. These trees will thrive well in a mixture of loam, peat, and sand; and ripened cuttings will strike root if planted in a pot of sand, placed under a hand-glass, in a moderate heat.

Tribe II.

DIO'SMEÆ-EUROPÆA'NÆ. Andr. Juss. in mem. mus. 12. p. 467. Flowers irregular. Disk wanting. Ovaries 5, distinct. Seeds covered with a thin, dark, shining testa. Embryo with a short radicle, and close, ovate, thick cotyledons. Albumen fleshy, white. European herbs with pinnate leaves.

V. DICTA'MNUS (an ancient name of what is supposed to be *Origànum Dictámnus, Fraxinélla* because the leaves resemble those of *Fráxinus*, the ash). Lin. gen. no. 522. D. C. prod. 1. p. 712. Andr. Juss. in mem. mus. 12. p. 467. t. 18. no. 12.

Lin. syst. *Decándria, Monogýnia.* Calyx deciduous, 5-parted, unequal. Petals 5, unguiculate, unequal. Stamens 10, declinate; filaments awl-shaped, filiform, unequal, with glandular tubercles at the apex; anthers roundish. Style 1, declinate, striated lengthwise, terminated by a papillose, blunt stigma. Capsule stipitate, composed of 5 carpels, which are connected on the inside, compressed, 2-seeded.—Strong smelling herbs, with impari-pinnate, exstipulate leaves, with 4-6 pairs of serrulate leaflets, full of pellucid dots. Racemes terminal. Stems glandular at the apex, as well as the pedicels, calyxes, and petals.

1 D. Fraxine'lla (Pers. ench. 1. p. 464.) leaflets 4-5 pairs, cordate at the base, acute at the apex, finely serrulated; racemes long; calyx unequal. ♃. H. Native of the south of Europe, particularly in Germany, France, Spain, Austria, and Italy. D. álbus, Lin. spec. 548. Jacq. austr. 5. t. 428. Woodv. med. bot. 316. t. 116. Lam. ill. t. 344. f. 1. Fraxinélla, Clus. pann. 54. It is called by Gerarde *Bastard or False Dittany*, and by Parkinson, *False White Dittany*. Seeds pear-shaped, black, shining. The whole plant, especially when gently rubbed, emits an odour like that of lemon-peel, but when bruised it has something of a balsamic scent. This fine scent is strongest in the pedicels of the flowers, which are covered with glands of a rusty-red colour, exuding a viscid juice or resin, which exhales in vapour, and in a dark place may be seen to take fire. The root was formerly used in medicine, and it is said with much success, as a drastic opiate. This plant, for its beauty and fine scent, deserves a place in every collection. The varieties are as follows:

Var. α, purpùrea (D. C. prod. 1. p. 712.) petioles obscurely edged; petals pale-purple, striped with deeper veins. D. rùbra, D. Fraxinélla, Link. enum. 1. p. 398.

Var. β, álba (D. C. prod. 1. p. 712.) petioles with rather broader edges; petals white. D. álbus, Link. enum. 1. p. 398.

Fraxinella. Fl. May, June. Clt. 1596. Pl. 1 to $1\frac{1}{2}$ foot.

2 D. angustifòlia (Sweet, fl. gard. n. s. t. 93.) leaflets 4-5 pairs, alternate, ovate-lanceolate, acuminated, finely serrulated; racemes long; calyx nearly equal. 4. H. Native of the Altaian mountains. Flowers purple.

Narrow-leaved Fraxinella. Fl. May, June. Clt. 1828. Pl. 2 feet.

Cult. The species of *Fraxinélla* will grow in any common garden-soil, and are easily increased by seeds, which ripen in abundance. They are well adapted for flower-borders, being very shewy.

Tribe III.

DIO'SMEÆ-CAPE'NSES. Andr. Juss. in mem. mus. 12. p. 469. Flowers regular. Petals 5, very rarely wanting. Disk adhering to the calyx. Stamens 5, perigynous. Ovaries 1-5, joined in one. Seeds covered with a thin shining testa, usually crested at the apex. Albumen very thin or wanting. Embryo with a short radicle and ovate cotyledons, not rarely multiple. Neat heath-like shrubs, with entire or crenated leaves. Natives of the Cape of Good Hope.

VI. CALODE'NDRON (from *καλος*, *kalos*, beautiful, and *δενδρον*, *dendron*, a tree; the leaves are permanent, and the flowers are flesh-coloured). Thunb. prod. 44. D. C. prod. 1. p. 712. Andr. Juss. in mem. mus. 12. p. 460. t. 19. no. 15.

Lin. syst. *Pentándria; Monogýnia.* Calyx short, 5-parted, deciduous. Disk short, tubular. Petals 5, lanceolate, inserted in the base of the disk, hispid from starry hairs. Stamens 10, 5 of which are sterile and petal-like, tubercled, ending in an ovate gland, these are opposite the petals; the 5 fertile ones bearing ovate anthers, which are glandular at the apex. Style oblong, deflexed, ending in a 5-furrowed stigma, which is hardly broader. Capsule tubercled, 5-angled, 5-celled, 5-valved; cells 2-seeded.—A tree with opposite, simple, crenated large leaves, and terminal panicles of flowers.

1 C. Cape'nsis (Thunb. prod. 44.). ħ. G. Native of the Cape of Good Hope. Lam. journ. hist. nat. 56. t. 3. Dictámnus calodéndron, Lam. ill. t. 344. f. 2. Poir. suppl. 2. p. 476. Dictámnus Capénsis, Lin. fil. suppl. 232. Pallàsia Capénsis, Houtt. Branches opposite, or 3 in a whorl. Panicle trichotomously divided. Pedicels compressed, dilated under the flower. Flowers flesh-coloured.

Cape Calodendron. Clt. 1789. Tree 20 feet?

Cult. This tree is supposed to be one of the finest at the Cape of Good Hope; its fruit resembles that of a chesnut. The plant will grow freely in a mixture of loam and peat; and ripened cuttings will strike root readily, if planted in a pot of sand, and placed under a hand-glass, but care must be taken to plant them soon enough to be rooted before they drop their leaves (the tree being deciduous) or they will not root (Sweet).

VII. ADENA'NDRA (from *αδην*, *aden*, a gland, and *ανηρ ανδρος*, *aner andros*, a male; the anthers terminate in a globose gland). Willd. enum. 256. Bartl. and Wendl. ex Andr. Juss. in mem. mus. 12. p. 470. t. 19. no. 16.—Glandulifòlia, Wendl. coll. 1. t. 10. O'ckia and Okènia, Dietr. Diósma spec. of authors. Hartògia spec. of Berg.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted, dotted. Disk adhering to the bottom of the calyx, bearing the stamens on the margin. Petals 5, with short claws, spreading. Filaments 10, hispid, the 5 opposite the petals sterile, each ending in a thickened, concave, or globose gland, the 5 fertile ones shortest, terminated by large, egg-shaped anthers, each furnished at the apex with a shell-like, or rarely globose, pedicellate gland, which is at first erect, then refracted. Style shorter than the calyx, dilated at the apex into a depressed-globose 5-lobed stigma. Carpels 5, compressed, joined together, covered with stipitate tubercles or glands, shorter than the calyx. Seeds 1 or 2 in each carpel.—Small, heath-like shrubs, with alternate, rarely opposite, flat, coriaceous leaves, full of glandular dots, and appear as if they were crenated on the margins, callose at the apex, on short stalks, which are furnished with two glands at their base. Flowers whitish, flesh-coloured, or reddish, large, usually solitary at the tops of the branches, seldom umbellate, usually with 2 opposite bracteas below each flower.

§ 1. *Flowers nearly sessile. Glands of anthers shell-formed.*

1 A. coria'cea (Licht. in Rœm. et Schult. syst. 5. p. 452.) leaves scattered, oblong, obtuse, revolute, quite smooth; flowers large, usually solitary on the tops of the branches; segments of calyx blunt, crenulated. ħ. G. Native of the Cape of Good Hope. Diósma coriàcea, D. C. prod. 1. p. 713. Spreng. syst. 1. p. 784.

Coriaceous-leaved Adenandra. Fl. April, July. Clt. 1720. Shrub 1 to 2 feet.

2 A. biseria'ta (Meyer. in Bartl. et Wendl. dios.) leaves crowded, oblong, with a recurved mucrone, revolute, scabrous from 2 rows of glands beneath; calyxes very villous; flowers on very short peduncles. ħ. G. Native of the Cape of Good Hope. Diósma biseriàta, Spreng. syst. 1. p. 784. Flowers large, smooth, pink?

Two-rowed-glanded Adenandra. Shrub 1 to 2 feet.

3 A. uniflòra (Willd. enum. 256.) leaves scattered, oblong-lanceolate, somewhat pointed, revolute, smooth, dotted beneath; flowers solitary, terminal; calyxes ciliated; petals obovate. ħ. G. Native of the Cape of Good Hope. Diósma uniflòra, Lin. spec. 287. Schrad. sert. hann. 1. t. 8. Curt. bot. mag. 273. Hartògia uniflòra, Berg. cap. 71. Eriostèmon uniflòra, Smith in Rees' cycl. 13. no. 4. Flowers large, white inside, and pinkish outside. Filaments very hairy. The flowers are sometimes only 4-petalled and 4-anthered.

One-flowered Adenandra. Fl. April, July. Clt. 1775. Shrub 1 to 2 feet.

4 A. acumina'ta (Sweet, hort. brit. p. 88.) leaves scattered, roundish, ovate, rather cordate, acuminated, ciliated, spreading; peduncles terminal, umbellate. ħ. G. Native of the Cape of Good Hope. Diósma acuminàta, Lodd. bot. cab. t. 493. Agathósma acuminàta, Willd. enum. p. 260. Búcco acuminàta, Wendl. coll. 1. p. 79. t. 28. Flowers large, white; filaments very hairy.

Acuminate-leaved Adenandra. Fl. April, July. Clt. 1812. Shrub 1 to 2 feet.

5 A. amœ'na (Sweet, hort. brit. p. 88.) leaves scattered, oblong or oval, bluntish, smooth, dotted beneath; flowers solitary, sessile, terminal; calyxes a little ciliated; petals orbicular, a little mucronate. ħ. G. Native of the Cape of Good Hope. Diósma amœ'na, Lodd. bot. cab. t. 161. Ker. bot. reg. t. 553. Flowers large, smooth, whitish above, and reddish beneath. Glandulifòlia uniflòra ovàta, Lich. in Wendl. coll. 1. t. 33.? Adenándra glandulòsa, Lich. in Rœm. et Schult. syst. 5. p. 450.?

Pleasing Adenandra. Fl. April, July. Clt. 1798. Shrub 1 to 2 feet.

6 A. speciòsa (Link. enum. 1. p. 256.) leaves scattered, oblong or obovate, revolute, dotted beneath, smooth, but a little fringed on the edges; flowers terminal, umbellate; calyxes fringed; petals with smooth margins. ħ. G. Native of the Cape of Good Hope. Diósma speciòsa, Sims, bot. mag. t. 1271. Diósma cistoìdes, Lam. dict. 2. p. 288.? Flowers pink, large.

Var. a, multiflòra (D. C. prod. 1. p. 713.) flowers from 1 to 12; branches ascending.

Var. β, *pauciflòra* (D. C. prod. 1. p. 713.) flowers 1 to 2; branches erect.

Shewy Adenandra. Fl. April, July. Clt. 1790. Sh. 1 to 2 ft.

7 A. umbella'ta (Willd. enum. 257.) leaves oblong or obovate, dotted beneath, fringed on the edges; calyxes smooth; petals fringed. ♄. G. Native of the Cape of Good Hope. Glandulifòlia umbellàta, Wendl. coll. 1. t. 10. Delaun. herb. amat. t. 163. Hartògia umbellàta, Bergius. Flowers pink, terminal, umbellate.

Umbel-flowered Adenandra. Fl. April, July. Clt. 1790. Shrub 1 to 2 feet.

8 A. villòsa (Licht. in Rœm. et Schult. syst. 5. p. 452.) leaves crowded, ovate-oblong, fringed, pubescent and glandular beneath; flowers terminal, umbellate; calyxes, petals, and stamens fringed. ♄. G. Native of the Cape of Good Hope. Diósma villòsa, Thunb. prod. p. 43. Hartògia villòsa, Berg. cap. 70. Flowers pink.

Villous Adenandra. Fl. April, July. Clt. 1786. Sh. 1 to 2 ft.

9 A. cuspida'ta (Meyer in Rœm. et Schult. syst. 5. p. 452.) leaves crowded, upper ones very densely imbricated, ovate, acuminated, quite smooth; flowers almost sessile; calyxes and petals fringed. ♄. G. Native of the Cape of Good Hope. Diósma cuspidàta, Spreng. syst. 1. p. 785. Flowers pink.

Pointed-leaved Adenandra. Fl. April, July. Clt.? Shrub 1 to 2 feet.

§ 2. *Flowers on long peduncles. Glands of filaments globose.*

10 A. fra'grans (Rœm. et Schult. syst. 5. p. 451.) leaves scattered, spreading very much, ovate-oblong, glandular, a little crenulated; pedicels clammy, aggregate, umbellate, almost twice as long as the leaves; calyxes reflexed; petals crenulate. ♄. G. Native of the Cape of Good Hope. Diósma fràgrans, Sims, bot. mag. t. 1519. Flowers rose-colour.

Sweet-scented Adenandra. Fl. May, July. Clt. 1812. Shrub 1 to 2 feet.

11 A. margina'ta (Rœm. et Schult. syst. 5. p. 452.) leaves scattered, smooth, diaphanous, cordate, lower ones ovate, upper ones lanceolate; umbels terminal; sterile stamens bearded. ♄. G. Native of the Cape of Good Hope. Diósma marginàta, Thunb. prod. 1. p. 713. Flowers pale flesh-coloured.

Marginate-leaved Adenandra. Fl. April, July. Clt. 1806. Shrub 1 to 2 feet.

12 A. linea'ris (Andr. Juss. mem. mus. 12. p. 470.) leaves opposite, linear, obtuse, spreading; branches and pedicels smooth; flowers terminal, on long, usually solitary pedicels. ♄. G. Native of the Cape of Good Hope. Diósma lineàris, Thunb. fl. cap. 2. p. 136.

Linear-leaved Adenandra. Fl. April, July. Clt. 1800. Shrub 1 foot.

13 A. rosmarinifòlia (Andr. Juss. mem. mus. 1. c.) leaves lanceolate-linear, revolute, smooth; peduncles axillary and terminal; capsules very blunt. ♄. G. Native of the Cape of Good Hope. Diósma rosmarinifòlia, Lam. ill. 2. p. 81. Flowers reddish.

Rosemary-leaved Adenandra. Shrub 1 to 2 feet.

Cult. This is a genus of beautiful little greenhouse shrubs; they will thrive best in a mixture of sand and peat, with a little turfy loam. The young tops, before they begin to throw out their buds, made into cuttings, and planted neatly in a pot of sand, with a bell-glass placed over them, will root without heat.

VIII. COLEONE'MA (from κολεος, *koleos*, a sheath, and νημα, *nema*, a filament; the filaments are fixed into a sheath-like recess of the petals). Bartl. et Wendl. dios. ex Andr. Juss. in mem. mus. 12. p. 471. t. 19. no. 17. Diósma, spec. of authors. Adenándra, spec. Rœm. et Schult. syst. 5.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Disk adnate to the base of the calyx, with a 5-lobed margin. Petals 5, with a spreading border. Filaments 10, the 5 sterile ones shortest, and opposite the petals, and adnate to their base, and fitted into a channel, tapering at the top into a gland; the 5 alternate ones opposite the lobes of the disk; anthers roundish, each furnished at the apex with a minute sessile gland. Style about the length of the stamens, terminated by a capitate, papillose, obscurely 5-furrowed stigma. Fruit of 5 joined carpels, each furnished with a little horn on the outside at the apex, compressed, rugged with dots. Seeds 1 or 2 in each carpel.—Small heath-like shrubs, with short, linear, scattered, very acute leaves, which are beset with glandular dots. Flowers white, axillary towards the tops of the branches, solitary, on short peduncles, furnished with many sepal-like, close-pressed bracteas.

1 C. a'lba (Bartl. et Wendl. l. c. Andr. Juss. l. c.) leaves linear, keeled, mucronate, with cartilaginous scabrous margins; sterile filaments fitted into the plaits of the petals. ♄. G. Native of the Cape of Good Hope. Diósma álba, Thunb. fl. cap. 2. p. 126. Adenándra álba, Rœm. et Schult. syst. 5. p. 451. Diósma rùbra, Hortul. Flowers white. Calyxes and bracteas fringed.

White-flowered Coleonema. Fl. April, July. Clt. 1800. Shrub 1 to 2 feet.

2 C. filifórmis (Andr. Juss. l. c.) ♄. G. Native of the Cape of Good Hope. Diósma filifórmis, D. C. herb. ex Andr. Juss. We know nothing of this plant.

Filiform Coleonema. Shrub 1 to 2 feet.

3 C. aspalathoìdes (Andr. Juss. l. c.) leaves oblong or linear, triquetrous, dotted beneath, hooked at the apex; flowers nearly sessile, solitary, or twin. ♄. G. Native of the Cape of Good Hope. Diósma aspalathoìdes, herb. Burm. but not of Lam. Flowers white.

Aspalathus-like Coleonema. Shrub 1 foot.

Cult. These beautiful little shrubs will grow best in a mixture of peat and sand, with the addition of a little loam. The young tops taken off, and made into cuttings, and planted neatly in a pot of sand, and a bell-glass placed over them, will root without heat.

IX. DIO'SMA (from διος, *dios*, divine, and οσμη, *osme*, smell; the bruised leaves have an exquisite smell). Bergius, cap. Willd. enum. p. 257. Bartl. et Wendl. dios. Wendl. coll. 1. p. 1. Diósma, sect. 5. Eudiòsma, D. C. prod. 1. p. 716. exclusive of no. 42, 43. and 53.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Disk adnate to the bottom of the calyx, with a free glandular 5-furrowed, 5-lobed margin; lobes alternating with the segments of the calyx. Petals 5, entire. Stamens 5, alternating with the petals, and shorter; filaments smooth, filiformly-subulate; anthers roundish, each furnished with a sessile gland at the apex. Style short, usually a little arched, smooth, ending in a capitate stigma, which is scarcely broader. Fruit of 5 joined carpels, each furnished with a short horn on the outside at the apex. Seeds 1-2 in each carpel, sometimes furnished with a jagged-crested appendix at the apex, especially *D. hirsùta* (see Gært. fruct. 1. p. 82. t. 94.).—Small heath-like shrubs, with scattered or opposite, linear-acute, channelled, sharply serrulated or fringed leaves, which are covered with glandular dots. Flowers white or red, sometimes solitary at the tops of the branches, sometimes corymbosely-aggregate; pedicels short, furnished with minute bracteas, which are sometimes opposite.

* *Flowers sub-corymbose. Leaves opposite.*

1 D. succule'nta (Wendl. coll. 1. t. 1.) leaves imbricate, in 4 rows, opposite, linear, keeled, acute, thickish, ciliated; corymbs few-flowered, terminal. ♄. G. Native of the Cape

of Good Hope. D. pinifòlia, Fisch. D. decussàta, Lam. 2. p. 283.? D. rigídulum, Willd.? Hartógia succulénta, Berg. cap.—Pluk. t. 279. f. 4.—Comm. rar. t. 1. and Seb. thes. 2. t. 40. f. 5. Flowers white.

Succulent Diosma. Fl. April, June. Shrub 2 feet.

2 D. oppositifòlia (Thunb. fl. cap. 2. p. 132.) leaves opposite, trigonal, blunt, fringed; corymbs terminal, few-flowered. ♄. G. Native of the Cape of Good Hope. Lin. spec. 286. Flowers white.

Opposite-leaved Diosma. Fl. Feb. July. Clt. 1774. Shrub 1 to 2 feet.

3 D. recu'rva (Nees in Schlecht. Linnæa. 5. p. 51.) smooth, erect, branched; branches very leafy; flowers dichotomous, rarely somewhat umbellate or cymose, sessile; leaves nearly opposite, linear-lanceolate, recurved at the apex, almost sessile, flat above, but convex beneath, glandular on the margins and mid-rib beneath; petals and filaments smooth. ♄. G. Native of the Cape of Good Hope. Flowers small. Petals ovate, concave, erect, twice the length of the calyx. Stamens length of calyx; sterile stamens opposite the petals.

Recurved-leaved Diosma. Shrub 1 to 2 feet.

* * *Flowers sub-corymbose. Leaves scattered.*

4 D. pectina'ta (Thunb. fl. cap. 2. p. 127.) leaves scattered, trigonal, acute, dotted, ciliated, spreading; corymbs terminal, few-flowered; branchlets pubescent. ♄. G. Native of the Cape of Good Hope. Flowers white.

Pectinated Diosma. Fl. April, June. Clt. 1812. Sh. 1 to 2 ft.

5 D. subula'ta (Wendl. coll. 1. p. 31. t. 8.) leaves scattered, linear, keeled, acuminated, fringed, erect, sometimes opposite; corymbs terminal, few-flowered. ♄. G. Native of the Cape of Good Hope. Petals bluish, shorter than the acute calyx.

Subulate-leaved Diosma. Fl. March, July. Clt. 1812. Shrub 1 to 2 feet.

6 D. aspalathoìdes (Lam. dict. 2. p. 286.) leaves scattered, trigonal, linear, erect, ending at the apex in a hooked point, smooth, dotted beneath; peduncles and calyxes quite smooth; flowers usually corymbose. ♄. G. Native of the Cape of Good Hope. D. glabràta, Meyer. Flowers white.

Aspalathus-like Diosma. Shrub 1 to 2 feet.

7 D. hirsu'ta (Thunb. fl. cap. 2. p. 128.) leaves scattered, linear, keeled, mucronate, villous; branches and calyxes hairy; peduncles terminal, 1-flowered, sub-corymbose. ♄. G. Native of the Cape of Good Hope. Wendl. coll. 1. t. 27.—Comm. rar. t. 3. Flowers white, with a bluish or pinkish tinge.

Hairy Diosma. Fl. Feb. May. Clt. 1731. Shrub 2 to 4 feet.

8 D. virga'ta (Thunb. fl. cap. 2. p. 129.) leaves scattered, trigonal, obtuse, dotted, smooth; flowers somewhat racemose, fastigiate. ♄. G. Native of the Cape of Good Hope. Flowers white, smooth.

Twiggy Diosma. Fl. March, Ju. Clt. 1820. Shrub 1 to 2 ft.

9 D. ru'bra (Lin. spec. 287.) leaves scattered, linear, keeled, mucronate, smooth, fringed at the base, bifariously dotted beneath; flowers terminal, somewhat umbellate; calyxes fringed; carpels with straight horns. ♄. G. Native of the Cape of Good Hope. Ker. bot. reg. t. 563. D. ericifòlia, Andr. bot. rep. t. 451.—Mill. fig. t. 125. f. 1.?—Comm. rar. t. 2. Calyxes reddish. Petals white. The leaves when bruised emit a strong balsamic scent, as well as all the other species.

Red-calyxed Diosma. Fl. Feb. May. Clt. 1752. Shrub 1 to 4 feet.

10 D. ambi'gua (Lodd. bot. cab. t. 461.) leaves scattered, linear, pointed, keeled, fringed, erectish; flowers sub-corymbose; peduncles short, pubescent; horns of carpels spreading, a little recurved. ♄. G. Native of the Cape of Good Hope. Flowers white.

Ambiguous Diosma. Fl. April, July. Clt. 1810. Sh. 1 to 3 ft.

11 D. longifòlia (Wendl. coll. 1. p. 61. t. 19.) leaves scattered, linear, pointed, long, smooth, glandular, spreading, fringed; corymbs terminal, few-flowered; horns of carpels hooked. ♄. G. Native of the Cape of Good Hope. D. rùbra, Lam. dict. Flowers white, tinged with blue.

Long-leaved Diosma. Fl. May, June. Clt.? Shrub 1 to 3 ft.

12 D. tenuifòlia (Willd. enum. p. 258.) leaves linear, keeled, mucronate, ciliated; peduncles 1-2-flowered, corymbose, terminal. ♄. G. Native of the Cape of Good Hope. D. linifòlia, Hort. Flowers white.

Fine-leaved Diosma. Fl. April, June. Clt.? Shrub 1 to 2 ft.

13 D. umbella'ta (Thunb. fl. cap. 2. p. 133.) leaves scattered, trigonal, obtuse, dotted, ciliated; umbels many-flowered, terminal. ♄. G. Native of the Cape of Good Hope. Peduncles purple. Corolla white.

Umbellate Diosma. Shrub 1 to 3 feet.

14 D. tenui'ssima (Lodd. in Link, enum. 1. p. 257.) leaves scattered, somewhat triquetrous, smooth, remotish, scarcely 2 lines long; flowers sub-corymbose? ♄. G. Native of the Cape of Good Hope. Flowers white.

Very slender Diosma. Fl. April, July. Clt. 1820. Shrub 1 to 2 feet.

15 D. thyoìdes (Willd. in Rœm. et Schult. syst. 5. p. 462.) leaves scattered, linear, smooth, close-pressed; branches whorled; flowers terminal, umbellate; peduncles pubescent. ♄. G. Native of the Cape of Good Hope. Flowers white.

Cupressus-like Diosma. Shrub 2 feet.

16 D. parviflòra (Willd. in Rœm. et Schult. syst. 5. p. 462.) leaves scattered, awl-shaped, triquetrous, acute, smooth; flowers in terminal umbels; pedicels pubescent. ♄. G. Native of the Cape of Good Hope. Flowers small, white.

Small-flowered Diosma. Shrub 1 to 3 feet.

* * * *Flowers stalked, usually solitary.*

17 D. ustula'ta (Thunb. fl. cap. 2. p. 132.) leaves ovate, trigonal, umbricated, smooth; flowers terminal, solitary. ♄. G. Native of the Cape of Good Hope. Leaves covered with dark dots above. Flowers white.

Dark-dotted Diosma. Shrub 1 to 2 feet.

18 D. sca'bra (Lam. dict. 2. p. 283.) leaves opposite, decussate, linear, keeled, scabrous, fringed, with a recurved point; peduncles twin, 1-flowered, terminal. ♄. G. Native of the Cape of Good Hope. Flowers white.

Scabrous Diosma. Shrub 1 to 2 feet.

19 D. ericoìdes (Thunb. fl. cap. 2. p. 130.) leaves crowded, trigonal, blunt, smooth, dotted; flowers terminal, usually solitary. ♄. G. Native of the Cape of Good Hope. Sims, bot. mag. t. 2332. Mill. fig. t. 124. f. 2.—Pluk. alma. t. 179. f. 3. Flowers small, white, with a tinge of red on the upper surface. The leaves emit a strong penetrating smell when bruised. The Hottentots use the leaves of this and other species to scent their ointments. It is a low bushy shrub.

Heath-like Diosma. Fl. Feb. Jul. Clt. 1756. Sh. 1 to 3 ft.

20 D. linea'ris (Thunb. fl. cap. 2. p. 136.) leaves opposite, linear, obtuse, spreading; branches and pedicels smooth; flowers terminal, usually solitary. ♄. G. Native of the Cape of Good Hope. Flowers white?

Linear-leaved Diosma. Fl. Mar. July. Clt. 1800. Shrub 1 to 2 feet.

* * * * *Flowers almost sessile.*

21 D. Meyeria'na (Spreng. syst. 1. p. 783.) leaves crowded, linear, pointed, upright, pressed, with scabrous edges; flowers

terminal, glomerate. ♄. G. Native of the Cape of Good Hope. D. virgàta, Meyer. Flowers small, white.

Meyer's Diosma. Shrub 1 to 3 feet.

22 D. RAMOSÍSSIMA (Bartl. dios. Spreng. syst. 1. p. 783.) leaves crowded, linear, trigonal, very blunt, upright, smooth; flowers usually solitary; petals blunt. ♄. G. Native of the Cape of Good Hope. D. cupréssina, Lam. Flowers white.

Much-branched Diosma. Shrub 1 to 3 feet.

23 D. CUPRE'SSINA (Thunb. fl. cap. 2. p. 136.) leaves opposite, imbricated in 4 rows, oblong-lanceolate, close-pressed, with scabrous margins, keeled, acute; flowers terminal, usually solitary. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. t. 303. Wendl. coll. 2. t. 61.—Pluk. alm. t. 279. f. 2. D. dichótoma, Berg. cap. p. 63. Brùnia unifiòra, Lin. spec. 289. Flowers white, tinged with pink.

Cypress-like Diosma. Fl. June, July. Clt. 1790. Shrub 1 to 2 feet.

Cult. *Diósma* is a genus of beautiful heath-like shrubs; they will thrive best in a mixture of peat and sand, with the addition of a little turfy loaf; and youngish cuttings, planted in a pot of sand, and a bell-glass placed over them, will strike root freely without heat.

X. EUCHÆ'TIS (from *ευ*, *eu*, well, and *χαιτη*, *chaite*, a head of hair; in allusion to the petals being bearded inside). Bartl. et Wendl. diosm. Andr. Juss. in mem. mus. 12. p. 472.—Diósma spec. Meyer.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-parted. Disk adnate to the base of the calyx, with a free, short margin, which is somewhat 5-crenate. Petals 5, a little longer than the calyx, hardly unguiculate, transversely bearded in the middle on the inside. Stamens 5, opposite the segments of the calyx, and shorter than them; anthers roundish, each furnished at the apex with a minute, rather globose gland. Style shorter than the stamens, erect, quite smooth, dilated at the apex into a capitate stigma. Capsule of 5 joined carpels, each furnished with a little horn at the apex on the outside.—A shrub with scattered, lanceolate, keeled leaves, with 2 rows of glands on the keel, and serrulated, scabrous, ciliated margins, without dots. Flowers white, glomerate at the tops of the branches; peduncles very short, each furnished with 2 opposite bracteas. This genus differs from *Acmadènia*, in the sterile filaments being sometimes almost wanting.

1 E. GLOMERA'TA (Bartl. et Wendl. diosm. p. 15. t. A. f. 1.) leaves crowded, acute, close-pressed; flowers glomerate, terminal. ♄. G. Native of the Cape of Good Hope. Diósma glomeràta, Meyer. Flowers white.

Glomerate-flowered Euchætis. Shrub 2 feet.

Cult. See *Diósma* for cultivation and propagation.

XI. ACMADE'NIA (from *ακμη*, *acme*, a point, and *αδην*, *aden*, a gland; in allusion to the anthers being terminated by pointed glands). Bartl. et Wendl. diosm. p. 16. Andr. Juss. in mem. mus. 12. p. 473. t. 18. no. 14.—Diósma, species of authors.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-parted. Disk adnate to the base of the calyx, with a free, spreading, entire margin. Petals 5, with long claws; claws bearded on the inside. Filaments 10, enclosed, the 5 sterile ones opposite the petals and inserted in the margin of the disk, or almost wanting, the 5 fertile ones are longest; anthers ovate, each furnished with a conical gland at the apex. Style shorter than the filaments, dilated at the apex into a capitate, obscurely 5-furrowed stigma. Capsules of 5 compressed carpels, each bearing a horn at the apex on the outside.—Small, heath-like shrubs, with opposite, thickish, keeled, and hence somewhat trigonal leaves, which are imbricated in 4 rows and dotted beneath. Flowers white or red, terminal, solitary, almost sessile, furnished with imbricate sepal-like bracteas.

1 A. JUNIPE'RINA (Bartl. et Wendl. diosm. ex Spreng. l. c.) leaves crowded, trigonal, linear, acute, on very short petioles; flowers solitary, terminal; sterile filaments very short. ♄. G. Native of the Cape of Good Hope. Diósma junipérina, Spreng. syst. 1. p. 784. Diósma ulícina, Lodd. cat. 1824.? Flowers red?

Juniper-like Acmadenia. Fl. April, July. Clt. 1823. Shrub 1 to 2 feet.

2 A. OBTUSA'TA (Bartl. et Wendl. diosm. ex Spreng. l. c.) leaves crowded, somewhat trigonal, linear-lanceolate, obtuse, fringed; branches pubescent; flowers sessile, solitary; calyxes and petals fringed; sterile filaments very short. ♄. G. Native of the Cape of Good Hope. Diósma obtusàta, Wendl. coll. 3. p. 7. t. 76. Flowers pale-red.

Obtuse-leaved Acmadenia. Shrub 1 to 2 feet.

3 A. LÆVIGA'TA (Bartl. et Wendl. diosm. ex Spreng. l. c.) leaves ovate, keeled, obtuse, smooth, fringed; flowers sessile, terminal, solitary; sterile filaments very short. ♄. G. Native of the Cape of Good Hope. Diósma tetragòna, Thunb. fl. cap. 1. p. 133. voy. 4. t. 5. Diósma lævigàta, Spreng. syst. 1. p. 784. Búcco tetragòna, Rœm. et Schult. syst. 5. p. 444. Adenándra tetragòna, Sweet, hort. subur. lond. p. 45. Flowers white.

Smoothed Acmadenia. Fl. July, Aug. Clt. 1789. Shrub 1 to 2 feet.

4 A. ALTERNIFÒLIA (Nees, in Schlecht. Linnæa. 5. p. 52.) branched, densely leafy; leaves linear, triquetrous, keeled, acute, rough from glandular dots beneath; flowers somewhat umbellate, terminal, few, sessile; sepals ovate, acuminated, ciliated at the base; petals wedge-shaped, ciliated; stigma capitate. ♄. G. Native of the Cape of Good Hope.

Alternate-leaved Acmadenia. Shrub 1 to 2 feet.

5 A. PU'NGENS (Bartl. et Wendl. diosm. ex Spreng. l. c.) leaves oblong, acuminated, smooth; flowers solitary, sessile. ♄. G. Native of the Cape of Good Hope. Diósma púngens, Spreng. syst. 1. p. 784. Flowers white.

Pungent-leaved Acmadenia. Shrub 1 to 2 feet.

6 A. TETRAGÒNA (Bartl. et Wendl. diosm. ex Spreng. l. c.) leaves roundish-rhomboidal, with scabrous margins, floral ones dilated at the apex; flowers large, sessile, solitary; sterile filaments awl-shaped. ♄. G. Native of the Cape of Good Hope. Diósma tetragòna, Lin. syst. 239. Flowers white.

Tetragonal Acmadenia. Shrub 1 to 2 feet.

Cult. This is a beautiful genus of little shrubs, differing from all the Cape *Diosmæ* in the leaves being closely imbricated in four rows, covering the stem. These require the same treatment as that recommended for *Diósma*, which see.

XII. BARO'SMA (from *βαρυς*, *barys*, heavy, and *οσμη*, *osme*, smell; all the species have a heavy smell). Willd. enum. 257. Bartl. et Wendl. diosm. ex Andr. Juss. in mem. mus. 12. p. 474. t. 29. no. 18.—Baryósma, Rœm. et Schult. syst. 5. p. 448. but not of Gært.—Parapetalífera, Wendl. coll. 1. p. 92.—Diósma spec. of authors.—Hartògia, spec. Berg. 69.—Búcco. spec. Rœm. et Schult. syst. 5. p. 438.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-cleft or 5-parted, dotted. Disk covering the bottom of the calyx, with the margin for the most part very short, and hardly prominent above. Petals 5, with short claws. Filaments 10, the 5 opposite the petals sterile, petal-like, not unguiculate, obscurely glandular at the apex, fringed; the 5 alternate ones longest, smooth, or a little hispid, awl-shaped, capillary, bearing egg-shaped anthers, each furnished with a minute gland at the apex, rarely without. Style about the length of the petals, a little arched.

smooth or hispid at the base, tapering to the top into a minute 5-lobed stigma. Capsule of 5 joined carpels, each furnished with an auricle at the top on the outside, and with glandular dots on the back.—Small, heath-like shrubs, with opposite or scattered, coriaceous, flat, dotted leaves, with their margins sometimes glandularly serrulated, sometimes almost entire or revolute. Flowers white or red, solitary or in threes; pedicels short, furnished with close-pressed, imbricate, sepal-like bracteas. In B. trichópodis, Bartl. the flowers are in fascicles on 1-flowered pedicels, rising from the minute, many-leaved, axillary buds.

* *Leaves glandularly serrulated.*

1 B. serratifòlia (Willd. enum. p. 257.) leaves nearly opposite, lanceolate, stalked, glandularly serrulated, smooth; peduncles axillary, subdivided. ♄. G. Native of the Cape of Good Hope. Diósma serratifòlia, Curt. bot. mag. t. 456. Lodd. bot. cab. t. 373. Burch, voy. 1. p. 476. with a figure. Parapetalífera serràta, Wendl. coll. 1. t. 34. Adenándra cordàta, Link. enum. 1. p. 236. Petals white.

Serrate-leaved Barosma. Fl. Mar. June. Clt. 1789. Shrub 1 to 3 feet.

2 B. odora'ta (Willd. enum. p. 257.) leaves opposite, ovate-oblong, crenated, smooth, glandular; pedicels axillary, solitary. ♄. G. Native of the Cape of Good Hope. Diósma odoràta, D. C. prod. 1. p. 714. D. latifòlia, Lodd. bot. cab. t. 290. Parapetalífera odoràta, Wendl. coll. 1. t. 15. Branches tetragonal. Peduncles sometimes 2-flowered. Flowers white.

Sweet-scented Barosma. Fl. Mar. June. Clt. 1789. Shrub 2 to 4 feet.

3 B. betu'lina (Bartl. et Wendl. diosm. ex Juss. l. c.) leaves opposite, obovate, serrulated, sessile, spreading much, covered with glandular dots beneath; flowers axillary, solitary. ♄. G. Native of the Cape of Good Hope. Diósma betùlina, Thunb. fl. cap. 2. p. 139. Hartògia betùlina, Berg. cap. 69. Búcco betùlina, Rœm. et Schult. syst. 5. p. 443. Diósma orbiculàris, Hort. Flowers white.

Birch-like Barosma. Fl. Feb. Sept. Clt. 1790. Sh. 1 to 3 ft.

4 B. latifòlia (Rœm. et Schult. syst. 5. p. 449.) leaves opposite, ovate-oblong, sessile, serrulated, smoothish, without glandular dots; branches villous; flowers usually solitary, lateral. ♄. G. Native of the Cape of Good Hope. Diósma latifòlia, Thunb. fl. cap. 2. p. 139. Lin. fil. suppl. 154. Andr. bot. rep. t. 33. Flowers white.

Broad-leaved Barosma. Fl. Jul. Aug. Clt. 1789. Sh. 1 ft.

5 B. pulche'lla (Bartl. et Wendl. diosm. ex Juss. l. c.) leaves crowded, ovate, quite smooth, with thickened, crenate-glandular margins; peduncles axillary, usually solitary, exceeding the leaves. ♄. G. Native of the Cape of Good Hope. Diósma pulchélla, Lin. spec. 288. Sims, bot. mag. t. 1357. Hartògia pulchélla, Berg. cap. 69. Búcco pulchélla, Rœm. et Schult. syst. 5. p. 442. Flowers pale-red. The Hottentots use the leaves of this plant, dried and powdered, under the name of Bucku, to mix with the grease with which they anoint themselves. It gives them so rank an odour, that Thunberg says he could not bear the smell of the men who drove his waggon.

Neat Barosma. Fl. Feb. Sept. Clt. 1789. Sh. 1 to 3 feet.

6 B. crena'ta (Sweet, hort. brit. p. 89.) leaves usually opposite, ovate, acute, dotted, with glandularly-crenated margins; pedicels solitary, 1-flowered. ♄. G. Native of the Cape of Good Hope. Diósma crenàta, Lodd. bot. cab. t. 404. Probably the same as *Diósma crenàta* of Lin. and Thunb. but the leaves are said to be scattered, not opposite. Flowers white. The leaves are used like the last.

Crenate-leaved Barosma. Fl. Jan. April. Clt. 1774. Shrub 1 to 2 feet.

7 B. pu'lchra (Nees, in Schlecht. Linnæa. 5. p. 53.) like *B. pulchélla* but larger in every part; fertile filaments ciliated at the base, but the sterile ones all over; petals full of glandular dots. ♄. G. Native of the Cape of Good Hope.

Fair Barosma. Shrub 1 to 2 feet.

** *Leaves entire or revolute.*

8 B. ova'ta (Bartl. et Wendl. diosm. ex Juss. l. c.) leaves nearly opposite, ovate, oval, obovate or ovate-roundish, smooth, entire, beset with rusty dots beneath; flowers axillary, stalked. ♄. G. Native of the Cape of Good Hope. Diósma ovàta, Thunb. prod. 43. Sims, bot. mag. t. 1616. Búcco ovàta, Wendl. coll. t. 20. Flowers white.

Ovate-leaved Barosma. Fl. Feb. Sept. Clt. 1790. Shrub 1 to 3 feet.

9 B. grave'olens; leaves ovate, quite entire, imbricate, smooth; peduncles axillary, solitary. ♄. G. Native of the Cape of Good Hope. Diósma gravèolens, Licht. in Rœm. et Schult. syst. 5. p. 461.

Strong-scented Barosma. Shrub 1 to 2 feet.

10 B. oblónga (Bartl. et Wendl. diosm. ex Juss. l. c.) leaves scattered, obovate-oblong, coriaceous, shining, with thickened, revolute, glandularly-crenated margins; branches pubescent; peduncles axillary, exceeding the leaves. ♄ G. Native of the Cape of Good Hope. Diósma oblónga, Thunb. fl. cap. 2. p. 139. D. lanceolàta, var. β et γ, Thunb. prod. 43. Flowers white.

Oblong-leaved Barosma. Shrub 1 to 3 feet.

11 B. dioi'ca (Bartl. et Wendl. diosm. ex Juss. l. c.) leaves scattered, upper ones tern, lanceolate, tapering to both ends, full of glandular dots, spreading; peduncles axillary, usually in threes, shorter than the leaves; flowers dioecious from abortion. ♄. G. Native of the Cape of Good Hope. Diósma dioíca, Ker. bot. reg. t. 502. Diósma linifòlia, Lodd. bot. cab. t. 400. but not of Licht. Stamens a little exserted. Petals purplish.

Dioecious Barosma. Fl. April, Jul. Clt. 1816. Sh. 1 to 2 ft.

12 B. angustifòlia (Bartl. et Wendl. diosm. ex. Juss. l. c.) leaves opposite, linear, truncate, revolute, quite smooth, with pellucid, glandularly crenate dots on the margins; flowers axillary, aggregate, on short peduncles. ♄. G. Native of the Cape of Good Hope. Diósma stenophýlla, Spreng. syst. 1. p. 785. Flowers white?

Narrow-leaved Barosma. Shrub 1 to 3 feet.

13 B. fœtidi'ssima (Bartl. et Wendl. l. c.) leaves linear, very blunt, revolute, usually tern; flowers terminal, somewhat umbellately aggregate. ♄. G. Native of the Cape of Good Hope. Diósma fœtidíssima, Spreng. syst. 1. p. 785. Flowers white.

Very-fetid Barosma. Fl. Feb. July. Clt. 1824. Sh. 1 to 3 ft.

14 B. tricho'podis (Bartl. et Wendl. diosm. ex Juss. l. c.) flowers in fascicles, on 1-flowered pedicels, rising from the minute, many-leaved, axillary buds. ♄. G. Native of the Cape of Good Hope.

Hairy-stalked Barosma. Shrub 1 to 3 feet.

Cult. Barósma is a genus of pretty little shrubs, which thrive best in a mixture of sand, peat, and a little turfy loam; and cuttings taken off from ripened wood, and planted in a pot of sand, with a bell-glass placed over them, will strike root readily.

XIII. AGATHO'SMA (from *αγαθος, agathos*, good, and *οσμη, osme*, smell; the plants contained in this genus have a pleasant smell). Willd. enum. 259. Bartl. et Wendl. diosm. ex Andr. Juss. in mem. mus. 12. p. 475. t. 20. no. 19. Búcco, Wendl. coll. 1. p. 13. Diósma, species of authors. Hartògia species, Lin. et Berg.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Disk short, glandular, adnate to the bottom of the calyx, usually

pressed to the ovaries. Petals 5, longer than the calyx, unguiculate; claws long, narrow, usually hispid, with a broad, entire, spreading limb. Filaments 10, the 5 opposite the petals shorter than them, petal-like, hispid at the base, but dilated at the apex into a spatula, which is obscurely glandular-dotted, the 5 alternate ones somewhat terete, usually unequal, bearing subglobose anthers, each furnished with a minute globular gland at the apex. Style about the length of the stamens, tapering to the apex into a 2-3-lobed stigma. Fruit of 2 or 3 joined carpels, each furnished with a horn at the apex on the outside.—Small, heath-like shrubs, with scattered, short, narrow leaves, usually with revolute edges, somewhat trigonal, sometimes flat, entire, or with glandular teeth, for the most part dotted. Flowers reddish or lilac, but usually white, aggregate at the tops of the branches in heads or umbels. Peduncles 1-flowered, furnished with scale-like bracteas at their base, and for the most part furnished with 2 alternate, bristle-like bracteas in the middle.

§ 1. *Flowers terminal, subumbellate.*

* *Leaves linear-trigonal.*

1 A. BISU'LCA; leaves scattered, trigonal, linear, erect, with an acute, recurved apex, hairy, keeled beneath from 4 rows of dots; petals pilose. ♄. G. Native of the Cape of Good Hope. Diósma bisúlca, Thunb. prod. 1. p. 84. D. bifúrca, Willd. spec. 1. p. 1136. Leaves with a glandular point, and with 2 furrows beneath. Flowers white.

Two-furrowed-leaved Agathosma. Shrub 1 to 2 feet.

2 A. HÍSPIDA (Bartl. et Wendl. diosm. p. 16.) leaves crowded, linear, trigonal, blunt, spreading, hispid, keeled, and 2-furrowed beneath; pedicels and calyxes pubescent; petals quite smooth. ♄. G. Native of the Cape of Good Hope. Diósma híspida, Thunb. fl. cap. 2. p. 129. Hartògia Capénsis, Lin. spec. 288. Búcco híspida, Rœm. et Schult. syst. 5. p. 446. Flowers white.

Hispid Agathosma. Fl. June, Aug. Clt. 1786. Shrub 1 ft.

3 A. PA'TULA; leaves somewhat linear-trigonal, blunt, quite smooth above, but rough from furrows beneath; peduncles and calyxes pubescent. ♄. G. Native of the Cape of Good Hope. Diósma pàtula, Spreng. syst. 1. p. 786. Flowers white.

Spreading Agathosma. Shrub 1 to 2 feet.

4 A. ERE'CTA (Bartl. et Wendl. diosm. ex Juss.) leaves imbricate, trigonal, blunt, dotted beneath, a little fringed; peduncles villous, short. ♄. G. Native of the Cape of Good Hope. Diósma brevifòlia, Lam. dict. 2. p. 285. Búcco brevifòlia, Rœm. et Schult. syst. 5. p. 446. Flowers pale-violet.

Erect Agathosma. Fl. April, June. Clt. 1818. Sh. 1 to 2 ft.

5 A. REFLE'XA (Link. enum. 238.) leaves linear, acute, a little reflexed at the apex, with rows of glands on the margin and beneath; branches smooth. ♄. G. Native of the Cape of Good Hope. Diósma refléxa, Lodd. cat. D. C. prod. 1. p. 716. Flowers pale-violet?

Reflexed-leaved Agathosma. Fl. April, June. Clt. 1820. Shrub 1 to 2 feet.

6 A. TENUÍSSIMA; leaves scattered, erect, triquetrous, bluntish, smooth; peduncles elongated, and are as well as the petals quite smooth. ♄. G. Native of the Cape of Good Hope. Diósma tenuíssima, Lodd. in Link. enum. 1. p. 257. Flowers white.

Slenderest Agathosma. Fl. April, July. Clt. 1820. Shrub 1 to 2 feet.

7 A. THYOÌDES; leaves imbricate, linear-trigonal, smooth, blunt; branches in whorls; peduncles pubescent, aggregate, terminal. ♄. G. Native of the Cape of Good Hope. Diósma thyoìdes, Willd. in Rœm. et Schult. syst. 5. p. 462. Flowers lilac?

Cupressus-like Agathosma. Fl. Apr. Jul. Clt.? Sh. 1 to 2 ft.

8 A. VIRGA'TA; shrub quite smooth, and much branched; leaves trigonal, blunt, erect, very narrow; keeled beneath. ♄. G. Native of the Cape of Good Hope. D. virgàta, Lam. dict. 2. p. 286. Búcco Lamarkiàna, Rœm. et Schultz. syst. 5. p. 447. Flowers white.

Twiggy Agathosma. Fl. Mar. Jul. Clt. 1820. Sh. 1 to 2 ft.

9 A. PARVIFLÒRA; leaves scattered, linear-trigonal, mucronate, smooth, obsoletely dotted; pedicels aggregate, pubescent. ♄. G. Native of the Cape of Good Hope. Diósma parviflòra, Willd. in Rœm. et Schult. syst. 5. p. 462. Flowers small, white.

Small-flowered Agathosma. Shrub 1 to 2 feet.

10 A. BRUNIA'DES; leaves scattered, linear-trigonal, awl-shaped, dotted, and a little fringed; branches hairy; peduncles fastigiate, elongated. ♄. G. Native of the Cape of Good Hope. Diósma bruniàdes, Link. enum. 237. A. cuspidàta, Bartl. et Wendl. diosm. ex Juss. Flowers lilac or white.

Brunia-like Agathosma. Fl. April, June. Clt. 1820. Shrub 1 to 2 feet.

11 A.? TERETIFÒLIA; leaves linear, convex above, channelled beneath, blunt, and are as well as the margins pubescent. ♄. G. Native of the Cape of Good Hope. Diósma teretifòlia, Link. enum. 1. p. 237. Flowers unknown.

Terete-leaved Agathosma. Shrub 1 to 3 feet.

** *Leaves broader, flattish.*

12 A. THUNBERGIA'NA; leaves imbricate, lanceolate, keeled, fringed, incurved at the apex; peduncles hairy, aggregate, terminal. ♄. G. Native of the Cape of Good Hope. Diósma ciliàta, Thunb. D. Thunbergiàna, Spreng. syst. 1. p. 786. Flowers white?

Thunberg's Agathosma. Shrub 1 to 2 feet.

13 A. BÍFIDA (Bartl. et Wendl. diosm. ex Spreng.) leaves somewhat imbricate, linear-oblong, obtuse, fringed, keeled beneath, dotted, smooth; peduncles quite smooth, crowded; petals deeply divided into 2 linear lobes. ♄. G. Native of the Cape of Good Hope. Diósma bífida, Jacq. coll. 3. p. 278. t. 20. f. 1. Dichósma bífida, G. Don, in Loud. hort. brit. p. 85. Flowers white.

Bifid-petalled Agathosma. Fl. April, Jul. Clt.? Sh. 1 to 2 ft.

14 A. LINIFÒLIA (Licht. in Rœm. et Schult. syst. 5. p. 448. sub. *Búcco,*) leaves rather linear, acute, roughish, fringed, full of pellucid dots; peduncles quite smooth. ♄. G. Native of the Cape of Good Hope. Diósma linifòlia, Spreng. syst. 1. p. 786. Flowers white?

Flax-leaved Agathosma. Fl. April, June. Clt. 1823. Shrub 1 to 2 feet.

15 A. BLÆRIOÌDES (Nees, in Schlecht. Linnæa. 5. p. 55.) erect; branches densely leafy, pilose at the apex; flowers rather umbellate, terminal; leaves elliptical, obtuse, coriaceous, with glandular, revolute margins; bracteas minute; peduncles hairy, bractless; calyx hairy at the base; petals obovate; fertile stamens smooth, sterile ones petaloid and ciliated. ♄. G. Native of the Cape of Good Hope.

Blæria-like Agathosma. Shrub 1 foot.

16 A. MU'NDTII (Nees, in Schlecht. Linnæa. 5. p. 56.) much branched; branches slender, densely leafy; flowers rather umbellate, terminal; leaves spreading, on short footstalks; bracteas minute, form of an involucre to the flower; peduncles smooth, filiform, naked; sepals ovate, bluntish, smooth and finely ciliated; petals oblong, obtuse, with the claws pubescent; fertile stamens smooth, sterile ones narrow, petaloid, and ciliated. ♄. G. Native of the Cape of Good Hope.

Mundt's Agathosma. Shrub 1 to 2 feet.

17 A. PROLÍFERA (Bartl. et Wendl. diosm. ex Juss. l. c.) leaves spreading, lanceolate, cuspidate, keeled; keel and edges fringed, dotted; branches whorled, proliferous; pedicels some-

what fastigiate, pubescent; calyxes smooth. ♄. G. Native of the Cape of Good Hope. Búcco prolífera, Wendl. coll. 3. t. 77. Diósma prolífera, Spreng. syst. 1. p. 786. Flowers white.

Proliferous-branched Agathosma. Fl. April, Aug. Clt. 1790. Shrub 1 to 3 feet.

18 A. SERPYLLA'CEA (Licht. in Rœm. et Schult. syst. 5. p. 447. under *Búcco,*) leaves crowded, erect, linear-lanceolate, with thickened, revolute, fringed, glandular margins; branches and pedicels hairy. ♄. G. Native of the Cape of Good Hope. Diósma serpyllàcea, D. C. prod. 1. p. 719. Diósma strícta, Willd. in Rœm. et Schult. syst. 5. p. 462. Flowers probably white.

Wild Thyme-leaved Agathosma. Shrub 1 to 2 feet.

19 A. CILIA'TA; leaves scattered, lanceolate, acute, with toothletted-fringed, revolute edges, dotted beneath, and bearing hairs on the middle nerve, becoming at length reflexed; pedicels smoothish? ovaries hairy at the apex. ♄. G. Native of the Cape of Good Hope. D. capitàta, Dum. Cours. bot. cult. 2d. ed. 5. p. 405. Diósma ciliàta, Lin. spec. 287. Flowers white.

Fringed-leaved Agathosma. Fl. April, Aug. Clt. 1774. Shrub 1 to 2 feet.

20 A. CEREFÒLIA; leaves crowded, lanceolate, acute, spreading, keeled, fringed; pedicels and calyxes beset with glandular hairs; ovaries smooth. ♄. G. Native of the Cape of Good Hope. Diósma cerefòlium, Vent. malm. t. 93. Búcco cerefòlium, Rœm. et Schult. syst. 5. p. 439. The leaves of this plant smell like *chervil* when bruised. Flowers small, white.

Chervil-leaved Agathosma. Fl. April, Aug. Clt. 1790. Shrub 1 to 2 feet.

21 A. E'LEGANS (Nees, in Schlecht. Linnæa. 5. p. 54.) much branched, and densely leafy; branches very hairy at the apex; flowers racemosely-corymbose; leaves spreading, stalked, ovate, or oblong, revolute, hairy, with the margins beset with hairs and inconspicuous glands; bracteas oblong, pubescent; calyx pubescent; sepals ovate, keeled, finely ciliated; petals elliptical, obtuse, ciliated at the claws. ♄. G. Native of the Cape of Good Hope. Fertile stamens smooth; sterile ones ciliated to the middle, villous.

Elegant Agathosma. Shrub 1 to 2 feet.

22 A. VENTENATIA'NA; leaves scattered, lanceolate, keeled, hairy beneath, erect; peduncles pilose; ovaries bearing 2 glands at the apex. ♄. G. Native of the Cape of Good Hope. Diósma hírta, Vent. malm. t. 72. D. purpùrea, Hortul. Diósma Ventenatiàna, Spreng. syst. 1. p. 786. Búcco Ventenatiàna, Rœm. et Schult. syst. 5. p. 442. Diósma glandulòsa, Thunb. fl. cap. 2. p. 145.? Flowers pale-purple.

Var. β, *exsiccàta* (Lam. dict. 2. p. 286. ill. t. 127. f. 3.) flowers whitish.

Ventenat's Agathosma. Fl. April, July. Clt. 1794. Shrub 1 to 2 feet.

23 A. LA'XA; leaves imbricate, incurved at the apex, lanceolate, keeled, pubescent beneath; branches loose; peduncles elongated, pubescent. ♄. G. Native of the Cape of Good Hope. Diósma láxa, Spreng. syst. 1. p. 787. Flowers purple?

Loose-branched Agathosma. Shrub 1 to 2 feet.

24 A. LASIOPHY'LLA; leaves imbricate, linear-lanceolate, incurved at the apex and bluntish, hairy beneath; branches a little whorled; pedicels unequal, short, pubescent; calyxes smoothish. ♄. G. Native of the Cape of Good Hope. A. villòsa, Willd. enum. 259. A. hírta, Ker. bot. reg. t. 369. Búcco villòsa, Wendl. coll. 1. p. 14. t. 2. exclusive of the synonyme of Thunberg. Flowers purple. Leaves clothed with glandular villi.

Woolly-leaved Agathosma. Fl. April, July. Clt. 1794. Shrub 1 to 2 feet.

25 A. PUBE'SCENS; leaves lanceolate, trigonal, mutic, with the margins and rib ciliated; umbels terminal; peduncles and calyxes villous. ♄. G. Native of the Cape of Good Hope. Diósma pubéscens, Thunb. prod. 43. fl. cap. 134. Flowers white.

Pubescent Agathosma. Fl. April, July. Shrub 1 to 2 feet.

26 A. GLABRA'TA (Bartl. et Wendl. diosm. ex Spreng.) plant quite smooth; leaves imbricate, oblong-lanceolate, thickish, convex beneath, with a trigonal gibbosity at the apex; peduncles rather elongated. ♄. G. Native of the Cape of Good Hope. Diósma leiophýlla, Spreng. syst. 1. p. 787. Flowers purple?

Smooth Agathosma. Shrub 1 to 2 feet.

27 A. HY'BRIDA; leaves spreading, oblong, obtuse, keeled, with a trigonal gibbosity at the apex; keel and margins fringed; peduncles and calyxes quite smooth. ♄. G. Native of the Cape of Good Hope. Diósma hýbrida, Spreng. syst. 1. p. 787. Flowers white?

Hybrid Agathosma. Fl. April, July. Clt. 1820. Shrub 1 to 2 feet.

28 A. RUGÒSA (Link. enum. 238.) leaves spreading, oblong or ovate, blunt, keeled, wrinkled, villous beneath, reflexed; pedicels capillary, clothed with glandular hairs; calyxes pubescent. ♄. G. Native of the Cape of Good Hope. Diósma rugòsa, Thunb. fl. cap. 2. p. 138. A. móllis, Bartl. et Wendl. diosm. ex Spreng. Flowers white.

Wrinkled Agathosma. Fl. April, Aug. Clt. 1790. Shrub 1 to 2 feet.

29 A. OBTU'SA (Bartl. et Wendl. diosm. ex Spreng. l. c.) leaves scattered, spreading, oblong-lanceolate, blunt, somewhat keeled; keel and margins fringed; pedicels elongated, beset with glandular hairs; ovaries smooth. ♄. G. Native of the Cape of Good Hope. Diósma ciliàta, Lam. dict. 2. p. 287. Lodd. bot. cab. t. 210. D. thymifòlia, Willd. in Rœm. et Schult. syst. 5. p. 462. Búcco obtùsa, Rœm. et Schult. syst. 5. p. 438. Flowers white and purplish.

Var. α, *ovàta* (D. C. prod. 1. p. 714.) leaves ovate, crowded, upper ones bearing glandular hairs on the edges and on the middle nerve beneath. Wendl. coll. 1. t. 13. A. pubéscens, Willd. enum. p. 259.

Var. β, *oblónga* (Wendl. coll. 1. t. 14.) leaves oblong, upper ones bearing glandular hairs on the edges, as well as on the middle nerve beneath.

Var. γ, *lanceolàta* (Ker. bot. reg. t. 476.) leaves lanceolate, fringed; pedicels slenderer. Hartògia lanceolàta, Lin. syst. ed. 12. vol. 2. p. 625.

Blunt-leaved Agathosma. Fl. April, Aug. Clt. 1774. Shrub 1 to 2 feet.

30 A. MICROPHY'LLA (Meyer in Bartl. et Wendl. diosm. ex Spreng.) plant quite smooth; leaves spreading, oblong, obtuse, keeled; peduncles and petals elongated. ♄. G. Native of the Cape of Good Hope. Diósma microphýlla, Spreng. syst. 1. p. 787. Flowers reddish?

Small-leaved Agathosma. Shrub 1 to 2 feet.

31 A. ORBICULA'RIS; leaves scattered, spreading, orbicular, ovate or reniform, smooth, reflexed, small, thickish, without any dots beneath; branches villous; pedicels pubescent. ♄. G. Native of the Cape of Good Hope. Diósma orbiculàris, Thunb. fl. cap. 2. p. 146. Flowers white. Stamens twice as long as the corolla.

Orbicular-leaved Agathosma. Fl. April, Aug. Clt. 1790. Shrub 1 to 2 feet.

32 A. WENDLANDIA'NA; leaves oblong, acute, channelled, imbricate, dotted, smooth, young ones rather pubescent; umbels 2-3-flowered; pedicels pilose; calyxes dotted, and petals smooth. ♄. G. Native of the Cape of Good Hope. Búcco erécta, Wendl. coll. 1. p. 17. t. 3. Flowers white.

Wendland's Agathosma. Fl. Ap. Jul. Clt. 1816. Sh. 1 to 2 ft.

33 A.? SPICA'TA (Licht. spic. fl. cap. mss.) leaves linear, with revolute edges, crowded in whorls; flowers capitately-spiked.

ħ. G. Native of the Cape of Good Hope. Búcco spicàta. Rœm. et Schult. 5. p. 448.

Spike-flowered Agathosma. Shrub 1 to 2 feet.

34 A.? corymbòsa; leaves ovate-lanceolate, fleshy, entire. ħ. G. Native of the Cape of Good Hope. Diósma corymbòsa, Mont. in Act. Lund. 1, 2. no. 11.

Corymbose Agathosma. Shrub 1 to 2 feet.

35 A. puncta'ta; leaves orbicular, quite entire, 5-nerved, dotted beneath. ħ. G. Native of the Cape of Good Hope. Diósma punctàta, Lich. in Rœm. et Schult. syst. 5. p. 461.

Dotted-leaved Agathosma. Shrub 1 to 3 feet.

36 A.? perfora'ta; leaves lanceolate, acuminate, a little fringed, the dots on the margin pellucid, and somewhat perforated; umbels terminal. ħ. G. Native of the Cape of Good Hope. Diósma perforàta, Lam. ill. 2. p. 82.

Perforated Agathosma. Shrub 1 to 3 feet.

37 A. myrsinìtes; leaves lanceolate, flat, fringed; umbels terminal; peduncles smooth. ħ. G. Native of the Cape of Good Hope. Diósma myrsinìtes, Lam. ill. 2 .p. 82.—Seba, 2. t. 96. f. 6.?

Whortle-berry-like Agathosma. Shrub 1 to 2 feet.

* * * *Flowers terminal, subcapitate.*

38 A. squammòsa; leaves closely imbricated, roundish-ovate, blunt, concave, smooth, minutely fringed, with tubercles or scales beneath. ħ. G. Native of the Cape of Good Hope. Diósma squammòsa, Willd. in Rœm. et Schult. syst. 5. p. 462. Flowers white.

Scaly-leaved Agathosma. Fl. April, July. Clt. 1818. Shrub 1 to 2 feet.

39 A. vestìta; leaves closely imbricated, ovate, acuminated, keeled, fringed; pedicels quite smooth. ħ. G. Native of the Cape of Good Hope. Búcco vestìta, Licht. in Rœm. et Schult. syst. 5. p. 447. Diósma vestìta, Spreng. syst. 1. p. 787. Flowers lilac.

Clothed Agathosma. Shrub 1 to 2 feet.

40 A. imbrica'ta (Willd. enum. p. 260.) leaves imbricate, crowded, ovate, acuminated, dotted, fringed; pedicels pubescent; calyxes smoothish; petals and stamens bearded on the inside at the base. ħ. G. Native of the Cape of Good Hope. Diósma imbricàta, Thunb. fl. cap. 2. p. 145. Búcco imbricàta, Wendl. coll. 1. t. 9. Hartògia imbricàta, Lin. mant. 124. Petals pale-purple, with a roundish limb.

Imbricate-leaved Agathosma. Fl. April, Aug. Clt. 1774. Shrub 1 to 2 feet.

41 A. acumina'ta (Willd. enum. p. 260.) leaves ovate, somewhat cordate, long-acuminated, fringed, at length spreading; peduncles villous; calyxes smooth, glandular. ħ. G. Native of the Cape of Good Hope. Búcco acuminàta, Wendl. coll. 1. t. 28. Flowers white or pale-blue.

Acuminated-leaved Agathosma. Fl. April, July. Clt. 1812. Shrub 1 to 2 feet.

42 A. lycopodioìdes; leaves closely imbricate, ovate, cuspidate, downy beneath; stem dichotomous; pedicels pubescent; petals roundish. ħ. G. Native of the Cape of Good Hope. Diósma lycopodioìdes, Willd. in Rœm. et Schult. 5. p. 461. Flowers white?

Lycopodium-like Agathosma. Shrub 1 to 2 feet.

43 A. apicula'ta (Meyer in Bartl. et Wendl. diosm. ex Spreng.) leaves crowded, much spreading, and somewhat reflexed, ovate, somewhat cordate, awned, revolute, quite smooth, without dots; segments of the calyx ovate, cuspidate. ħ. G. Native of the Cape of Good Hope. Diósma apiculàta, Spreng. syst. 1. p. 787. Flowers white or lilac?

Pointed-leaved Agathosma. Shrub 1 to 2 feet.

44 A. rufe'scens; leaves crowded, somewhat trigonal, awl-shaped, smooth, with thickened revolute margins; pedicels and calyxes rufescent; segments of calyx linear-lanceolate. ħ. G. Native of the Cape of Good Hope. A. rùbrum, Willd. herb. Diósma rufèscens, Spreng. syst. 1. p. 787. Flowers lilac.

Rufescent Agathosma. Shrub 1 to 2 feet.

45 A. hi'rta; leaves somewhat imbricate, linear, awl-shaped, channelled, hairy on the back, decurrent; flowers densely capitate. ħ. G. Native of the Cape of Good Hope. Diósma hírta, Lam. dict. 2. p. 286. Petals white, bearded at the claws.

Hairy Agathosma. Shrub 1 to 2 feet.

46 A. obtusa'ta; leaves aggregate, rather trigonal, obtuse, short, dotted, scabrous, rather imbricated; flowers umbellate; calyx scabrous, as well as the peduncles; ovaries scabrous. ħ. G. Native of the Cape of Good Hope. Búcco obtusàta, Wendl. coll. 3. p. 7. t. 76. Rœm. et Schult. 5. p. 444. Flowers pale-flesh-coloured.

Obtuse-leaved Agathosma. Shrub 1 to 2 feet.

Cult. These beautiful heath-like shrubs thrive best in a mixture of sand and peat, with the addition of a little turfy loam; and young cuttings will strike root freely in a pot of sand, under a bell-glass, without heat.

XIV. MACRO'STYLIS (from μακρος, *macros*, long, and στυλος, *stylos*, a style; style very long). Bartl. et Wendl. diosm. ex Andr. Juss. in mem. mus. 12. p. 476. t. 20. no. 20.—Diósma species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Disk adnate to the base of the calyx, with a free thickened margin. Petals 5, gradually tapering into a broad claw, which is bearded on the inside. Stamens 5, alternating with the petals, exserted; anthers globose, each furnished with a minute gland at the apex. Style oblong, exserted, tapering to the top into a minute 3-lobed stigma. Capsule of 3 conniving carpels, tapering at the top into a compressed horn each.—Small shrubs, with scattered, rarely opposite, dotted, somewhat keeled leaves. Flowers reddish, sub-umbellately aggregate at the tops of the branches. Peduncles short or very short, with bracteas at their base.

1 M. lanceola'ta (Bartl. et Wendl. diosm. ex Spreng.) leaves crowded, lanceolate, erect, acutish, smooth; flowers capitate. ħ. G. Native of the Cape of Good Hope. Diósma barbàta, Spreng. syst. 1. p. 783. Agathósma barbàta, Spreng. pug. 1. p. 20. Flowers white.

Lanceolate-leaved Macrostylis. Fl. April, July. Clt. 1810. Shrub 1 to 2 feet.

2 M. barbi'gera (Bartl. et Wendl. diosm. ex Spreng.) leaves opposite, cordate, stem clasping, acute, smooth; corymbs terminal, almost sessile. ħ. G. Native of the Cape of Good Hope. Diósma barbígera, Thunb. prod. 43. Lin. fil. suppl. 155. Flowers reddish, with a white beard.

Beard-bearing Macrostylis. Shrub 1 to 2 feet.

3 M.? corda'ta; leaves somewhat cordate, oblong, acute, fringed, recurved, imbricated. ħ. G. Native of the Cape of Good Hope. Diósma cordàta, Mart. hort. erl. enum. 67. Flowers white or reddish.

Cordate-leaved Macrostylis. Fl. April, July. Clt. 1823. Sh. 1 to 2 feet.

4 M. obtu'sa (Bartl. et Wendl. diosm. ex Spreng. l. c.) leaves crowded, ovate, obtuse, much spreading, smooth; flowers capitate. ħ. G. Native of the Cape of Good Hope. Diósma obtùsa, Meyer ex Spreng. syst. 1. p. 783. Flowers reddish.

Obtuse-leaved Macrostylis. Shrub 1 to 2 feet.

5 M. squarròsa (Bartl. et Wendl. diosm. ex Spreng.) leaves scattered, ovate, obtuse, smoothish, squarrosely recurved. ħ. G. Native of the Cape of Good Hope. Diósma squarròsa, Wendl. Flowers reddish.

Squarrose-leaved Macrostylis. Shrub 1 to 2 feet.

Cult. These pretty little shrubs require the same treatment as that recommended for *Agathósma*.

XV. EMPLEU'RUM (from εν, *en*, in, and πλευρον, *pleuron*, the pleura or membrane which envelopes the lungs; the seeds are attached to a sort of coriaceous membrane). Sol. in hort. kew. 3. p. 340. D. C. prod. 1. p. 718. Andr. Juss. in mem. mus. 12. p. 476. t. 20. no. 21.

Lin. syst. *Monoe'cia, Tetrándria.* Flowers monoecious or polygamous from abortion. Calyx permanent, 4-cleft. Disk and petals wanting. Filaments 4, awl-shaped; anthers thick, longer than the filaments, each furnished with an immersed gland at the apex. Carpel 1, rarely 2, ending in a long horn, furnished on the inner side with the cylindrical tooth-like style and stigma, at length becoming like a legume, 2-valved, 1-seeded from abortion. Seed shining.—A shrub, with alternate, linear-oblong, smooth leaves, which are covered with glandular dots beneath, and in the same way crenulated on the margins. Flowers axillary, solitary, twin or in threes; peduncles short, furnished with bracteas at their base.

1 E. serrula'tum (Sol. l. c. Smith, exot. bot. 2. t. 63.) ♄. G. Native of the Cape of Good Hope. E. Aitòni, Gmel. syst. 1. p. 268. Diósma unicapsulàris, Lin. fil. suppl. 155. D. ensàta, Thunb. prod. 43.

Serrulate-leaved Empleurum. Fl. June, July. Clt. 1774. Shrub 2 to 3 feet.

Cult. This shrub will grow freely in a mixture of sand and peat; and cuttings will readily strike root if planted in a pot of sand, with a bell-glass placed over them, without heat.

Tribe IV.

DIO'SMEÆ-AUSTRALA'SICÆ. Andr. Juss. in mem. mus. 12. p. 477. Flowers regular. Petals free. Filaments free. Disk wanting. Stamens double the number of the petals, never abortive. Ovaries distinct. Seeds with a thickish cover. Embryo slender, terete, within a dense albumen, with a straight radicle and linear cotyledons.—Trees, but usually shrubs, with opposite and alternate, simple, ternate, but rarely impari-pinnate leaves, for the most part flat. Flowers axillary or terminal, sometimes, but rarely, sessile, within an involucre, usually stalked. Peduncles one or many-flowered, furnished with bracteas. Different parts of the plants are beset with scales or stellate hairs. All natives of New Holland and Van Diemen's Land.

XVI. CORRÆ'A (in honour of Joseph Correa de Serra, a learned Portuguese, who, without publishing much, was one of the most profound theoretical botanists of the age). Smith in Lin. trans. 4. p. 219. D. C. prod. 1. p. 719. Andr. Juss. in mem. mus. 12. p. 478. t. 21. no. 22.

Lin. syst. *Octándria, Monogýnia.* Calyx cup-shaped, 4-toothed or entire, permanent. Petals 4, somewhat connivent at the base or joined into a long tube. Stamens 8, equal or longer than the petals; the 4 opposite them shortest; filaments smooth, awl-shaped, or dilated above the base. Ovary 4-lobed, densely beset with stellate hairs, and as if it were furnished with a calyptra. Style 4-furrowed, smooth, terminated by a 4-lobed stigma. Fruit of 4 capsular carpels; cells truncate, compressed. Seeds 2 or 3 in each cell, shining, fixed to the inside.—Shrubs, with opposite entire leaves, clothed with starry hairs. Pedicels 1-flowered, solitary, twin or tern, axillary.

* *Breviflòræ. D. C. prod.* 1. *p.* 719. *Petals more or less distinct, hardly half an inch long.*

1 C. a'lba (Andr. bot. rep. t. 18.) leaves ovate, downy beneath; teeth of calyx small, acute, distant. ♄. G. Native of New South Wales. Vent. malm. t. 13. C. cotinifòlia, Sal. par. lond. t. 100. Corolla white. Leaves white or rufous beneath, and rather whitish above.

Var. β, rotundifòlia (D. C. prod. 1. p. 719.) leaves ovate-roundish. C. rùfa, Vent. malm. 13. in a note, no. 2.

White-flowered Correa. Fl. April, July. Clt. 1793. Shrub 10 feet.

2 C. ru'fa (Gært. fruct. 3. p. 155. t. 210.) leaves ovate, or somewhat oblong, downy beneath; teeth of calyx broad, very blunt. ♄. G. Native of New South Wales. Mazeutóxeron rùfum, Lab. voy. 2. p. 11. t. 17. Leaves clothed with rufous down beneath, and obscurely green above. Flowers white.

Rufous-leaved Correa. Fl. April, July. Clt. 1819. Shrub 6 ft.

** *Longiflòræ. D. C. prod.* 1. *p.* 719. *Petals joined into a long, cylindrical, 4-toothed corolla.*

3 C. speciòsa (Andr. bot. rep. t. 653.) leaves ovate, blunt, clothed with rusty down beneath; flowers erect; calyx truncate. ♄. G. Native of New Holland, on the eastern coast. Ker. bot. reg. t. 26. Sims, bot. mag. t. 1746. Lois. herb. amat. t. 309. C. rùbra, Smith, exot. bot. 2. no. 26. C. revolùta, Vent. malm. no. 4.? Corolla scarlet, yellowish-green inside. This is a truly shewy shrub, but now very common in gardens.

Shewy Correa. Fl. year. Clt. 1806. Shrub 2 to 6 feet.

4 C. pulche'lla (R. Br. mss. Sweet, fl. austr. t. 1.) leaves ovate, cordate, obtuse, waved, beset with stellate pubescence; adult ones smooth; flowers solitary, pendulous; calyx truncate, entire; corolla tubular, with the throat ciliated. ♄. G. Native of Kangaroo Island, on the south coast of New Holland. Lindl. bot. reg. 1224. Corolla of a bright-salmon colour.

Neat Correa. Fl. April, July. Clt. 1824. Shrub 6 feet.

5 C. vi'rens (Smith, exot. bot. 2. p. 25. t. 72.) leaves ovate-oblong, somewhat cordate, a little toothletted, beset with glandular tomentum; flowers pendulous; calyx with 4 acute teeth. ♄. G. Native of New Holland, on the eastern and southern coast. C. viridiflòra, Andr. bot. rep. t. 436. C. refléxa, Pers. ench. 1. p. 419. Mazeutóxeron refléxum, Lab. voy. 2. p. 66. t. 19. Corolla greenish, an inch or an inch and a half long.

Green-flowered Correa. Fl. Nov. July. Clt. 1800. Shrub 3 to 8 feet.

Cult. Corræ'a is a genus of very shewy flowering shrubs. They will thrive well in an equal mixture of loam and peat, and ripened cuttings will strike root freely if planted thinly in a pot of sand, and a bell-glass placed over them, without heat. They are also increased by inarching the rarer on the commoner sorts.

XVII. DIPLOLÆ'NA (from διπλοος, *diploos*, double, and χλαινα, *chlaina*, a cloak; in allusion to the double involucrum). R. Br. gen. rem. 14. Desf. in mem. mus. 3. p. 449. D. C. prod. 1. p. 719. Andr. Juss. in mem. mus. 12. p. 479.

Lin. syst. *Decándria, Monogýnia.* Involucrum double, outer one 5-lobed, inner 10-15-parted, longer than the outer one, imbricate, containing many flowers. Flowers sessile, furnished with a 5-leaved chaffy calyx or involucel, or a 5-petalled corolla, naked or fringed. Stamens 10, exserted; the 5 opposite the petals or sepals shortest; filaments awl-shaped, fringed at the base; anthers oblong. Style 5-furrowed, terminating in a blunt 5-lobed stigma. Fruit of 5 distinct, 2-valved, 1-seeded carpels, transversely striated. Seeds oblong, cylindrical, almost like those of *Corræ'a*.—Shrubs, with alternate oval leaves, full of glandular pellucid dots, and are, as well as the branches, peduncles, and leaflets of involucre, closely covered with starry down. The many-flowered involucre appears like one terminal pedicellate flower.

1 D. grandiflòra (Desf. in mem. mus. 3. t. 19.) leaves oval, emarginate, hoary on both surfaces. ♄. G. Native of New Hol-

land, on the western coast in Endracht Land, in the sand. Heads of flowers 2 inches in diameter.

Great-flowered Diplolæna. Shrub 4 feet?

2 D. Dampie'ri (Desf. l. c. t. 20.) leaves obovate-oblong, emarginate, green, and smooth above, hoary beneath. ♄. G. Native along with the preceding.—Dampier, voy. 4. p. 141. t. 3. f. 3.

Dampier's Diplolæna. Shrub 4 feet?

Cult. These singular shrubs, none of which have as yet been introduced into our gardens, will perhaps grow freely in a mixture of sand and peat; and ripened cuttings will probably strike root, if planted in a pot of sand with a bell-glass placed over them, without heat.

XVIII. PHEBA'LIUM (from φιβαλεη, *phibalee*, a myrtle; habit of plants). Vent. malm. no. 102. D. C. prod. 1. p. 719. Andr. Juss. in mem. mus. 12. p. 479.—Eriostèmon, spec. Labill.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-cleft or 5-toothed (f. 123. *a.*), permanent. Petals 5, spreading (f. 123. *b.*). Stamens 10 (f. 123. *d. c.*), the 5 opposite the petals shortest; filaments smooth, filiform or awl-shaped; anthers versatile. Style 5-furrowed, smooth, terminated by an equal or broader 5-furrowed stigma (f. 123. *a. e.*). Carpels 5 (f. 123. *f.*), capsular, girded by the calyx; carpels 2-valved, 1-seeded. Ovaries smooth or densely clothed with scales or hairs, calyptrate.—Trees, but usually shrubs, with alternate, simple, subovate or linear leaves, entire, or a little crenated, full of pellucid dots. Flowers corymbose, terminal, and axillary; pedicels bracteate. Flowers small, yellowish. Divers parts of plants covered with scales or starry down. Petals in the bud valvate.

1 P. correæfòlium (Andr. Juss. in mem. soc. hist. nat. par. vol. 2. t. 10.) leaves lanceolate, ovate, scabrous above, but clothed with starry down beneath; peduncles axillary, tern. ♄. G. Native of New Holland. P. ovàtum, Sieb. pl. exsic.

Corræa-leaved Phebalium. Shrub 4 to 5 feet.

2 P. hexape'talum (Andr. Juss. in mem. soc. hist. nat. vol. 2. t. 11. f. 1.) leaves oblong, obtuse, clothed with starry hairs on both surfaces; peduncles terminal, crowded; flowers 6-petalled, 12-anthered. ♄. G. Native of New Holland.

Six-petalled Phebalium. Shrub 4 feet.

3 P. squamulòsum (Vent. malm. t. 102.) leaves linear-lanceolate, acute, scaly beneath, as well as the flowers; flowers terminal, umbellate; stamens exserted. ♄. G. Native of New Holland, on mountains on the eastern coast. Eriostèmon lepidòtum, Spreng. syst. 2. p. 322.

Scaly Phebalium. Fl. April, July. Clt. 1824. Shrub 3 feet.

4 P. a'nceps (D. C. prod. 1. p. 720. Andr. Juss. l. c. t. 12. f. 2.) leaves spatulate-lanceolate, smoothish, obtuse, young ones covered with scales on both surfaces, adult ones nearly naked; flowers terminal, corymbose, scaly; stamens not exserted. ♄. G. Native of New Holland, on the eastern coast. Eriostèmon ánceps. Spreng. syst. 2. p. 164.

FIG. 123.

Two-edged Phebalium. Shrub 4 to 5 feet.

5 P. Billardie'rii (Andr. Juss. in mem. soc. hist. nat. par. vol. 2. p. 12.) leaves lanceolate, quite entire, covered with rufous or silvery scales beneath; branches angular; peduncles axillary, trifid, 3-flowered; stamens exserted. ♄. G. Native of New Holland. Eriostèmon squámmeum, Labill. nov. holl. 1. p. 111. t. 141. P. eleagnoìdes, Sieb. pl. exsic.

La Billardier's Phebalium. Fl. April, Aug. Clt. 1822. Shrub 5 to 7 feet.

6 P. eleagnifòlium (Andr. Juss. in mem. soc. hist. nat. par. vol. 2. t. 11. f. 2.) leaves linear, blunt, with rows of dots above, and covered with rufous silvery scales beneath; peduncles terminal and axillary, umbellate; stamens exserted. ♄. G. Native of New Holland. P. ánceps, Sieb. pl. exsic.

Eleagnus-leaved Phebalium. Shrub 3 to 5 feet.

7 P. salicifòlium (Andr. Juss. in mem. soc. hist. nat. vol. 2. t. 12. f. 1.) leaves linear-lanceolate, crenated, covered beneath with starry powdery down; flowers axillary, umbellate; stamens exserted. ♄. G. Native of New Holland.

Willow-leaved Phebalium. Clt. 1824. Shrub 3 to 4 feet.

8 P. phylicoìdes (Sieb. pl. exsic. in Spreng. syst. app. p. 164.) leaves linear, short, obtuse, rough, revolute beneath; branches straight, hispid; flowers in terminal fascicles; stamens exserted. ♄. G. Native of New Holland. P. diósmeum, Andr. Juss. in mem. soc. hist. nat. vol. 2. t. 11. f. 3.

Phylica-like Phebalium. Shrub 2 to 3 feet.

9 P. au'reum (Cuningh. in Field's new south wales, p. 331. with a figure,) leaves linear-oblong, narrow, obtuse, a little emarginate, revolute, covered with rusty scales beneath; corymbs terminal and lateral; peduncles and branchlets rusty. ♄. G. Native of New South Wales, on the Blue Mountains, in bleak exposed situations. Shrub branching. Flowers golden.

Golden Phebalium. Fl. April, July. Clt. 1823. Shrub 6 ft.

10 P. lachnoìdes (Cuningh. in Field's new south wales, p. 332.) leaves scattered, linear, even, hooked, acutish, white beneath, with revolute edges; flowers axillary, disposed in heads near the extremities of the branches. ♄. G. Native of New Holland, on Blackheath in the Blue Mountains, in bare rocky situations. A tall, handsome shrub. Flowers yellow.

Lachnæa-like Phebalium. Fl. April, July. Clt. 1824. Shrub 6 feet.

11 P. ela'tum (Cuningh. in Field's new south wales, p. 331.) leaves lanceolate or ovate-lanceolate, acuminated, silvery beneath; corymbs axillary, divided, stalked; branches covered with rusty scales. ♄. G. Native of New South Wales, on shaded declivities in the vicinity of Spring Wood. A slender arborescent plant. Flowers yellow.

Tall Phebalium. Clt. 1825. Shrub 10 feet.

Cult. An equal mixture of sandy loam and peat is the best soil for the plants belonging to this genus, but care must be taken not to over water them; they delight in an airy situation, and not to be crowded among other plants. Cuttings will strike root freely in a pot of sand, with a bell-glass placed over them, without heat.

XIX. PHILOTHE'CA (from ψιλος, *psilos*, [error φιλος,] smooth, and ϑηκη, *theke*, a sheath; in allusion to the tube of the stamens being smooth). Rudge in Lin. trans. 11. p. 298. D. C. prod. 1. p. 721. Andr. Juss. in mem. mus. 12. p. 480. t. 21. no. 23.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-parted. Petals 5, unguiculate. Stamens 10, the 5 opposite the petals shortest, all a little shorter than the petals, flat, joined from the base to the middle into a smoothish tube, but hairy in the free part; anthers heart-shaped, oscillatory, each furnished with a short appendage at the apex. Style 5-furrowed, somewhat spindle-shaped, hispid, terminated by a capitate 5-furrowed stigma. Fruit of 5 1-seeded carpels, joined together on the inside.—Heath-like shrubs, with alternate, linear, short, simple, dotted leaves, which are somewhat umbricate, and convex beneath. Peduncles solitary, axillary or terminal, 1-flowered, furnished with minute scale-like bracteas.

1 P. austra'lis (Rudge in Lin. trans. 11. p. 298. t. 21.)

leaves very numerous, linear, somewhat imbricate, convex beneath; pedicels axillary. ♄. G. Native of New South Wales, about Port Jackson. Eriostèmon salsolifòlia, Smith in Rees' cycl. 13. no. 3. Flowers pale-red.

Southern Philotheca. Fl. April, June. Clt. 1822. Shrub 2 to 3 feet.

2 P. Gaudicha'udii; leaves scattered; peduncles terminal? ♄. G. Native of New Holland.

Gaudichaud's Philotheca. Shrub 2 feet.

Cult. These pretty shrubs require the same treatment as that recommended for *Phebàlium*.

XX. CRO'WEA (in honour of James Crowe, of Norwich, an excellent British botanist, and a great collector of willows). Smith, in Lin. trans. 4. p. 220. D. C. prod. 1. p. 720. Andr. Juss. in mem. mus. 12. p. 481. t. 21. no. 24.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-parted, permanent. Petals 5, sessile. Stamens 10, the 5 opposite the petals shortest, all shorter than the petals, linear, fringed, lying close together so as to form a tube; anthers oblong, cordate, adnate, drawn out at the apex into a long, bearded appendage. Style 5-furrowed, smooth, terminated by a capitate, 5-furrowed stigma. Fruit of 5 joined, 1-seeded carpels.—Shrubs with alternate, quite entire, lanceolate leaves, running down the stem a little at the base, and full of pellucid dots. Branches triquetrous. Peduncles axillary, 1-flowered, furnished with minute, imbricate bracteas at their base. Calyx and petals convolute in the bud.

1 C. salígna (Andr. bot. rep. t. 79.) leaves lanceolate. ♄. G. Native of New South Wales. Sims, bot. mag. t. 989. Vent. malm. t. 7. Corolla pale-purple or rather pink. Calyx and petals smooth.

Willow-leaved Crowea. Fl. July, Dec. Clt. 1790. Shrub 1 to 2 feet.

2 C. latifo'lia (Lodd. cat. 1824.) leaves ovate-lanceolate. ♄. G. Native of New Holland. Flowers pale-purple or pink.

Broad-leaved Crowea. Fl. Jul. Dec. Clt. 1824. Sh. 1 to 2 ft.

Cult. These beautiful shrubs require the same treatment as that recommended for *Phebàlium*.

XXI. ERIOSTE'MON (from *εριον, erion,* woolly, and *στημων, stemon,* a stamen; stamens woolly). Smith, in Lin. trans. 4. p. 221. D. C. prod. 1. p. 720. Andr. Juss. in mem. mus. 12. p. 481. t. 21. no. 25.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-parted, permanent. Petals 5, marcescent as well as the stamens. Stamens 10, the 5 opposite the petals shortest, all shorter than the petals, free, flat, hispid, fringed, tapering to the apex into a thread, which bears the anthers; anthers heart-shaped, appendiculate at the apex. Style 5-furrowed, very short, hispid or smooth, terminated by a capitate, 5-furrowed stigma. Fruit of 5 carpels, which are joined together at the base, each containing 1, rarely 2 seeds.—Shrubs with alternate, entire, simple leaves, sometimes ending in a callose point, full of pellucid dots. Peduncles axillary, 1-flowered, covered with imbricate bracteas, or furnished with opposite or whorled ones on the middle. Sometimes the peduncles are divided into 2-5 pedicels, furnished with bracteas at their base. Calyx and petals convolute in the bud.

1 E. buxifòlium (Smith, in Rees' cyclo. 13. no. 2.) leaves elliptical, smooth; middle nerve very prominent, and is drawn out at the apex into a strong, recurved mucrone; branches round, pilose; flowers axillary, almost sessile, smooth; filaments hispid. ♄. G. Native of New Holland, about Port Jackson. Flowers pink or rose-coloured.

Var. α, obovàtum; leaves obovate, tapering to the base, glandularly crenated.

Var. β, ellípticum; leaves broadly elliptical, cordate at the base, somewhat stem-clasping, usually entire, and glandular.

Box-leaved Eriostemon. Fl. April, July. Clt. 1822. Shrub 1 to 2 feet.

2 E. salicifòlium (Smith, in Rees' cycl. 13. no. 1.) leaves linear-lanceolate, entire, smooth; branches triquetrous; flowers axillary, almost sessile, solitary; calyxes and petals hoary on the outside; filaments hispid. ♄. G. Native of New Holland, about Port Jackson. Rudge, in Lin. trans. 11. t. 26. Hook, bot. mag. 2854. Flowers pink. Habit of *Cròwea*. Cròwea scàbra, Graham, in edinb. phil. journ. 1827. p. 174.

Willow-leaved Eriostemon. Fl. April, July. Clt. 1822. Shrub 2 to 3 feet.

3 E. myoporoìdes (D. C. prod. 1. p. 720.) leaves linear-lanceolate, quite entire, smooth, dotted with glands, and terminated by a callose mucrone; branches round; peduncles axillary, trifid, 3-flowered; calyxes and petals smooth; filaments a little fringed on the margin. ♄. G. Native of New Holland, on the eastern coast. Flowers rose-coloured.

Myoporum-like Eriostemon. Clt. 1824. Shrub 1 to 2 feet.

4 E. linearifòlium (D. C. prod. 1. p. 720.) leaves linear, obtuse, quite entire, smooth, covered with glandular dots; peduncles axillary and terminal, 3-flowered. ♄. G. Native of New Holland. Flowers rose-coloured.

Linear-leaved Eriostemon. Fl. April, Aug. Clt. 1823. Shrub 1 to 2 feet.

5 E. obova'le (Cuningh. in Field's new south wales, p. 331.) leaves oboval, wedge-shaped, or broadly spatulate, retuse, concave, stalked, smooth, fleshy, terminating in a short mucrone; flowers solitary, terminal, or axillary. ♄. G. Native of New Holland, on the verge of the Regent's Glen, Blue Mountains. Flowers rose-coloured.

Oboval-leaved Eriostemon. Fl. May, July. Clt. 1824. Shrub 1 to 2 feet.

6 E. cuspida'tum (Cuningh. in Field's new south wales, p. 331.) leaves oblong-lanceolate, acute, rather glaucous, ending in a hooked mucrone; racemes umbellate, 4-5-flowered, axillary or terminal. ♄. G. Native of New Holland, on rocky hills at Cox's River. Lodd. bot. cab. t. 1247. Flowers rose-coloured or pink. A shrub of strong growth.

Pointed-leaved Eriostemon. Fl. Jul. Oct. Clt. 1823. Shrub 2 to 4 feet.

7 E. neriifòlium (Sieb. ex Spreng. syst. app. p. 164.) leaves lanceolate, marginate, mucronate, dotted; peduncles axillary, 3-flowered; filaments bearded. ♄. G. Native of New Holland. Flowers rose-coloured or pink.

Oleander-leaved Eriostemon. Shrub 3 feet.

8 E. hispídulum (Sieb. ex Spreng. l. c.) leaves somewhat spatulate, mucronate, callosely crenate, hispid above, and clothed with starry villi beneath; peduncles 1-flowered. ♄. G. Native of New Holland. Flowers rose-coloured or pink.

Hispid-leaved Eriostemon. Shrub 1 to 3 feet.

9 E. corymbòsum (Labill. nov. cal. p. 59. t. 58.) leaves large, oblong, silky as well as covered with brown scales beneath; corymbs terminal; filaments hairy; anthers naked at the apex. ♄. G. Native of New Caledonia. Flowers dark-coloured.

Corymbose-flowered Eriostemon. Tree 18 to 24 feet.

10 E. lanceola'tum (Gært. fruct. 3. p. 154. t. 210.) leaves lanceolate, rather wrinkled. ♄. G. Native of New Holland. E. australásicum, Smith, in Lin. trans. 4. p. 221. Flowers rose-coloured.

Lanceolate-leaved Eriostemon. Clt. 1823. Shrub 1 to 3 ft.

Cult. Eriostèmon is a genus of beautiful shrubs with pink flowers, which deserve to be cultivated in every collection of greenhouse shrubs. They require the same treatment as that recommended for *Phebàlium*, see p. 791.

XXII. BORO'NIA (named after Francis Borone, an Italian servant of Dr. Sibthorp, who perished from an accident at Athens, he collected specimens of many of those plants which are figured in the Flora Græca). Smith, tracts, p. 285. D. C. prod. 1. p. 721. Andr. Juss. in mem. mus. 12. p. 483. t. 22. no. 26.

Lin. syst. *Octándria, Monogýnia.* Calyx 4-parted or 4-cleft, permanent. Petals 4, marcescent. Stamens 8, the 4 opposite the petals shortest, all shorter than the petals, free, fringed, or tubercled, linear, usually dilated at the top, whence a very short thread rises, bearing the anther; anthers heart-shaped, usually with a short appendage at the apex. Styles 4, erect, smooth, approximate or joined together, terminated by an equal or capitate 4-furrowed stigma. Fruit of 4 2-valved carpels. Seeds ovate, compressed, usually one in each carpel.—Shrubs with opposite, simple, or impari-pinnate leaves, entire, or a little serrulated, full of pellucid dots. Peduncles terminal but usually axillary on the extreme branches, 1 to many-flowered. Pedicels furnished at the base and middle with 2 opposite, short bracteas, jointed, commonly dilated under the calyx. Flowers rose, purplish, or reddish, with a pleasant sweet scent.

* *Leaves impari-pinnate, terminal leaflet sessile.*

1 B. pinna'ta (Smith, l. c. t. 4.) leaflets 2-3-4 pairs, linear, acute, quite smooth; peduncles dichotomous; flowers octandrous. ♄. G. Native of New Holland, about Port Jackson. Andr. bot. rep. t. 58. Vent. malm. t. 38. Sims, bot. mag. t. 1763. Lodd. bot. cab. t. 473. Flowers pink, with a scent like that of hawthorn.

Pinnate-leaved Boronia. Fl. Feb. May. Clt. 1794. Shrub 1 to 3 feet.

2 B. psoraleòides (D. C. prod. 1. p. 721.) leaflets 1 or 2 pairs, and are as well as the branches quite smooth, but beset with glandular dots, linear, obtuse; peduncles short, 1-flowered; flowers tetrandrous. ♄. G. Native of New Holland, on the south coast. Flowers small, pale-red.

Psoralea-like Boronia. Shrub 1 to 3 feet.

3 B. tetra'ndra (Labill. nov. holl. 1. p. 98. t. 125.) leaflets 4 or 5 pairs, linear, obtuse, smooth; branches pilose; pedicels short, 1-flowered; flowers tetrandrous. ♄. G. Native of New Holland, in Van Leuwin's Land. Flowers pale-purple.

Tetrandrous-flowered Boronia. Clt. 1824. Shrub 1 to 4 ft.

4 B. Cando'llii; leaflets 5 or 6 pairs, smooth; petioles a little winged; leaflets oblong-oval, blunt, toothed at the apex. ♄. G. Native of New Holland. Zanthóxylum oppositifòlium, D. C. prod. 1. p. 728. Flowers red.

De Candolle's Boronia. Shrub 1 to 3 feet.

5 B. pilòsa (Labill. nov. holl. 1. p. 97. t. 124.) leaflets 2 to 5 pairs, linear, approximate, and are as well as the branches rather pilose; peduncles 1-flowered; flowers octandrous. ♄. G. Native of New Holland at Cape Van Diemen. Flowers rose-coloured, full of pellucid dots.

Pilose Boronia. Shrub 1 foot.

6 B. ala'ta (Smith, in Lin. trans. 8. p. 283.) rachis winged; leaflets 3-5 pairs or more, crenate, revolute, pilose on the nerves beneath, as well as the rachis; peduncles dichotomous, usually 3-flowered; bracteas fringed; flowers octandrous. ♄. G. Native of New Holland, on the western coast. Sweet, fl. austr. 48. Flowers small, of a dirty pale-rose colour, tipped with green.

Winged-petioled Boronia. Fl. May, July. Clt. 1823. Shrub 2 to 6 feet.

7 B. floribu'nda (Sieb. pl. exsic. ex Spreng. syst. app. p. 148.) rachis margined; leaflets 3 pairs, linear-lanceolate, mucronate, serrulated; peduncles tern. ♄. G. Native of New Holland. Flowers rose-coloured.

Bundle-flowered Boronia. Shrub 1 to 6 feet.

8 B. microphy'lla (Sieb. pl. exsic. ex Spreng. syst. app. p. 148.) leaflets 6 pairs, minute, obovate, mucronate; peduncles tern. ♄. G. Native of New Holland. Flowers pink.

Small-leaved Boronia. Shrub 1 to 3 feet.

** *Leaves trifoliate or trifid.*

9 B. triphy'lla (Sieb. pl. exsic. ex Spreng. syst. app. p. 148.) leaves ternate; leaflets linear, revolute, downy beneath; peduncles axillary, 1-flowered. ♄. G. Native of New Holland. Flowers rose-coloured.

Three-leaved Boronia. Shrub 1 to 3 feet.

10 B. anemonifòlia (Cuningh. in Field's new south wales, p. 330.) leaves stalked, trifid; segments narrow, wedge-shaped, furnished with 2 or 3 teeth at the apex or quite entire; petioles channelled; peduncles axillary, solitary, 1-flowered; filaments blunt at the apex; anthers spurred. ♄. G. Native of New Holland, on the verge of the Regent's Glen, Blue Mountains. Flowers pink.

Anemone-leaved Boronia. Shrub 1 to 3 feet.

*** *Leaves variable.*

11 B. paradóxa (D. C. prod. 1. p. 722.) leaves simple, trifoliate and pinnate, lanceolate, with revolute edges, hairy beneath. ♄. G. Native of New Holland, about Port Jackson. Eriostèmon paradóxum, Smith, in Rees' cyclop. 13. no. 6. Flowers rose-coloured, copious, on axillary, solitary, 1-flowered peduncles, which are shorter than the leaves, angular, covered with rusty, starry scales or pubescence. Petioles winged; leaflets sessile. It is doubtful whether the simple, ternate, and pinnate leaves are to be found on the same plant; we presume they belong to distinct species, and are probably identical with some of those described above.

Paradoxical Boronia. Shrub 1 to 3 feet.

**** *Leaves simple.*

12 B. serrula'ta (Smith, in Lin. trans. 8. p. 284. tracts, t. 5.) leaves trapeziform, acute, serrulated in front, smooth, full of glandular dots; peduncles aggregate, terminal. ♄. G. Native of New Holland, about Port Jackson. Flowers of a deep-rose colour, very fragrant. Filaments hispid at the base. Anthers hispid. Stigma sessile, capitate, 4-furrowed. Lindl. bot. reg. 842. Lodd. bot. cab. t. 998. Sweet, fl. austr. t. 19.

Serrulate-leaved Boronia. Fl. June, July. Clt. 1816. Shrub 1 to 6 feet.

13 B. crenula'ta (Smith, in Lin. trans. 8. p. 284.) leaves obovate, mucronulate, crenulated; pedicels axillary and terminal, 1-flowered; filaments obtuse and glandular at the apex. ♄. G. Native of New Holland, at King George's Sound. Flowers small, red, with a fringed calyx. Anthers nearly terminal.

Crenulate-leaved Boronia. Shrub 1 to 4 feet.

14 B. denticula'ta (Smith, in Lin. trans. 8. p. 284.) leaves linear, retuse, toothletted, terminated by a small point; peduncles corymbose; filaments blunt and glandular at the apex. ♄. G. Native of New Holland at King George's Sound. Lindl. bot. reg. t. 100. Flowers rose-coloured. Bracteas deciduous. Anthers on lateral, horizontal stalks.

Toothletted-leaved Boronia. Fl. March, Aug. Clt. 1823. Shrub 2 to 6 feet.

15 B. parviflòra (Smith, in Lin. trans. 8. p. 285. tracts, t. 6.) leaves obovate-lanceolate, obsoletely-crenulated; peduncles 1-flowered, bracteolate; filaments oblong and glandular at the

apex. ♄. G. Native of New Holland, about Port Jackson. Flowers rose-coloured. Habit of *B. denticulàta*, but smaller in all its parts.

Small-flowered Boronia. Shrub 3 feet.

16 B. TETRATHECOÌDES (D. C. prod. 1. p. 722.) leaves linear, quite entire, smooth, rather acute at both ends, and somewhat revolute on the edges; peduncles axillary, 1-flowered, short, each bearing 2 bracteas; filaments hispid. ♄. G. Native of New Holland, on the eastern coast. Tetrathèca oppositifòlia, Pers. ench. 1. p. 419. Flowers rose-coloured.

Tetratheca-like Boronia. Shrub 1 to 3 feet.

17 B. PILONE'MA (Labill. nov. holl. 1. p. 98. t. 126.) leaves oblong-lanceolate, quite entire, acutish at both extremities; peduncles terminal, solitary, somewhat turbinate; filaments smooth, shortened at the apex. ♄. G. Native of New Holland at Cape Van Diemen. Flowers rose-coloured.

Cap-stamened Boronia. Fl. Mar. July. Clt. 1826. Shrub ½ to 1 foot.

18 B. POLYGALÆFÒLIA (Smith, in Lin. trans. 8. p. 285. tracts, t. 7.) leaves linear-lanceolate, quite entire; peduncles axillary, solitary, 1-flowered; filaments shortened at the apex. ♄. G. Native of New Holland, about Port Jackson. B. hyssopifòlia, Sieb. Flowers red. Leaves opposite, alternate, and 3 in a whorl.

Milkwort-leaved Boronia. Fl. March, July. Clt. 1824. Shrub 1 to 3 feet.

19 B. LEDIFÒLIA (Gay, diss. lasiop. p. 20. D. C. prod. 1. p. 722.) leaves linear-lanceolate, quite entire, downy beneath; peduncles axillary, 1-flowered, each bearing 2 bracteas in the middle; filaments hispid. ♄. G. Native of New Holland, on the eastern coast. Lasiopétalum ledifòlium, Vent. malm. no. 59. in a note. Flower-bud quadrate. Flowers red.

Ledum-leaved Boronia. Fl. Mar. April. Clt. 1814. Shrub 1 to 2 feet.

Cult. This is an elegant genus of small greenhouse shrubs, which deserve to be cultivated by every lover of plants. They thrive best in sandy peat, and the pots should be well drained with potsherds. Cuttings, taken off at a joint, and planted in a pot of sand, with a bell-glass placed over them, and then set in a frame, will strike root with care, the glass should be taken off occasionally, to allow the cuttings to dry, otherwise they are liable to damp.

XXIII. ZIE'RIA (in honour of Mr. John Zier, a learned and industrious Polish botanist, who assisted Mr. Dickson in his Cryptogamia). Smith, in Lin. trans. 4. p. 216. D. C. prod. 1. p. 722. Andr. Juss. in mem. mus. 12. p. 483. t. 22. no. 27.

LIN. SYST. *Tetrándria, Monogýnia.* Calyx 4-parted. Petals 4, inserted in a hypogynous disk. Stamens 4, alternating with the petals, exserted; filaments awl-shaped, smooth, each furnished with a simple gland on the inside at the base; anthers heart-shaped, oscillatory. Disk surrounding the ovaries and connected with the calyx. Style 4-furrowed, short, smooth, terminated by a 4-lobed capitate stigma. Carpels 4, connected into a 4-lobed, 4-celled capsule; lobes divaricate, with a solitary, compressed-ovate seed in each cell or carpel.—Trees or shrubs, with opposite, stalked, usually trifoliate leaves, but sometimes with simple ones on the same plant, smooth or pilose, full of pellucid dots. Peduncles axillary, rarely terminal, 1, but usually 2, 3, or many-flowered, bearing 2 opposite bracteas at the divisions and jointed. Flowers small, white. Hairs stellate.

1 Z. LANCEOLA'TA (Rr. Br. in Rees' cyclo. no. 1.) branches pubescent; leaflets lanceolate, flat, acute, full of pellucid dots; peduncles trichotomous, length of leaves. ♄. G. Native of New Holland, about Port Jackson. Lodd. bot. cab. 878. Z. Smíthii, Andr. bot. rep. t. 606. Curt. bot. mag. 1395. Bonpl. nav. t. 24. Peduncles panicled, many-flowered. Flowers small, white, with yellow anthers.

Lanceolate-leaved Zieria. Fl. April, Jul. Clt. 1808. Shrub 2 to 3 feet.

2 Z. MACROPHY'LLA (Bonpl. nav. p. 64. ?) branches powdery; leaflets oblong, flat, smooth, acute at both extremities, full of pellucid dots; racemes trichotomous, shorter than the leaves. ♄. G. Native of New Holland, about Port Jackson. This plant is commonly found in herbarii under the false name of *Fagàra evòdia*, Lin. or *Evòdia horténsis*, Forst. Flowers numerous, white.

Long-leaved Zieria. Fl. April, July. Clt. 1820. Sh. 4 ft.

3 Z. OBCORDA'TA (Cuningh. in Field's new south wales, p. 330.) shrubby, pilose; leaflets obovate, obcordate, retusely emarginate; flowers axillary, solitary. ♄. G. Native of New Holland, on hills on the Macquarie River. Flowers white.

Obcordate-leafletted Zieria. Fl. April, July. Clt. 1824. Shrub 1 to 2 feet.

4 Z. REVOLU'TA (Cuningh. l. c.) leaflets linear, revolute, acute; racemes axillary, and terminal. ♄. G. Native of New Holland, on the verge of the Regent's Glen, Blue Mountains. Flowers white.

Revolute-leaved Zieria. Fl. April, July. Clt. 1824. Shrub 2 to 3 feet.

5 Z. LÆVIGA'TA (Smith, in Rees' cycl. no. 2.) branches smooth; leaflets linear, revolute, acute, smooth, longer than the petioles; peduncles bifid or trifid, usually shorter than the leaves. ♄. G. Native of New Holland, about Port Jackson. Z. lævigàta, Bonpl. nav. p. 64. has the peduncles as long as the leaves, therefore it is probably a distinct plant. Flowers white, downy, like a piece of woollen cloth.

Smooth Zieria. Fl. April, July. Clt. 1822. Shrub 2 to 3 ft.

6 Z. CYTISOÌDES (Smith, in Rees' cycl. no. 4.) branches downy; leaflets obovate, downy on both surfaces; peduncles trifid, bearing leaves. ♄. G. Native of New South Wales. Flowers white. Leaflets entire, slightly revolute. Petals downy.

Cytisus-like Zieria. Tree 24 feet.

7 Z. ARBORE'SCENS (Sims, bot. mag. 1398. in a note) stem arboreous; leaflets downy beneath, without dots; peduncles longer than the petioles. ♄. G. Native of New Holland. Flowers white.

Arborescent Zieria. Tree 20 feet.

8 Z. MICROPHY'LLA (Bonpl. nav. p. 64.) branches silky; leaflets linear, revolute, smooth above but silky beneath; peduncles usually 3-flowered. ♄. G. Native of New Holland. Flowers white.

Small-leaved Zieria. Fl. April, Jul. Clt. 1822. Sh. 2 to 3 ft.

9 Z. PAUCIFLÒRA (Smith, in Rees' cycl. no. 3.) branches and petioles hairy; leaflets linear-obovate, sometimes with revolute edges; peduncles 1 or 3-flowered; lobes of calyx lanceolate, acute. ♄. G. Native of New Holland, about Port Jackson. Flowers small, white. Petals dotted with starry hairs.

Few-flowered Zieria. Fl. April, Jul. Clt. 1822. Sh. 1 to 2 ft.

10 Z. PILÒSA (Rudge, in Lin. trans. 10. p. 293. t. 17. f. 2.) leaflets lanceolate, hairy beneath; peduncles 1-flowered. ♄. G. Native of New Holland, about Port Jackson. Flowers white.

Pilose-leaved Zieria. Fl. April, Jul. Clt. 1822. Sh. 1 to 3 ft.

11 Z. HIRSU'TA (D. C. prod. 1. p. 723.) branches, petioles, and capsules hairy; leaflets oblong-linear, 3-times longer than the petioles, hairy beneath, and slightly revolute on the edges; peduncles 1-flowered. ♄. G. Native of New Holland on the Blue Mountains. Flowers white.

Hairy Zieria. Shrub 2 to 4 feet.

12 Z. OCTA'NDRA (Sweet, fl. aust. icon. ined.) stem arborescent, leaflets obovate, thickish, smooth; peduncles axillary, co-

rymbose. ♄. G. Native of New Holland. Flowers green, octandrous, by which it differs from the rest.

Octandrous Zieria. Fl. April, June. Clt. ? Tree 12 feet.

Cult. Many of the species of *Zièria* are very pretty. An equal mixture of loam and peat suits them best; and young cuttings, planted in a pot of sand, with a bell-glass placed over them, will strike root freely.

Tribe V.

DIO'SMEÆ-AMERICA'NÆ. Andr. Juss. in mem. mus. 12. p. 484. Flowers regular. Petals free. Stamens equal or double the number of the petals. Disk surrounding the ovaries or wanting. Embryo with the radicle pointing towards the hylum, short, straight, with large, ovate cotyledons. Albumen fleshy, rarely wanting.—Trees and shrubs, with opposite or alternate, simple, bifoliate, or ternate leaves. Flowers axillary or terminal, panicled, racemose, or corymbose.

XXIV. MELI'COPE (from μελι, *meli*, honey, and κοπη, *kope*, a division; in allusion to the 4 didymous honey-glands at the base of the ovaries). Forst. gen. no. 28. D. C. prod. 1. p. 723. Andr. Juss. in mem. mus. 12. p. 485. Entóganum, Banks, Gært.

Lin. syst. *Octándria*, *Monogýnia*. Calyx 4-parted, permanent. Petals 4, spreading, unguiculate. Stamens 8, shorter than the petals; filaments awl-shaped; anthers rather heart-shaped. Ovaries 4, ovate, girded at the base by 4 large, didymous glands. Styles 4, connected together, terminated by a thickish, tetragonal stigma. Fruit of 4 1-seeded carpels.—A shrub with opposite, ternate leaves, full of pellucid dots.

1 M. ternà'ta (Forst. gen. no. 28. Lam. ill. t. 245.). ♄. G. Native of New Zealand. Entóganum lævigàtum, Gært. fruct. 1. p. 331. t. 68. Flowers white.

Ternate-leaved Melicope. Clt. 1822. Shrub 6 feet.

Cult. This shrub will grow freely in a mixture of loam and peat; and young cuttings will root, if planted in a pot of sand, with a hand-glass placed over them.

XXV. EVO'DIA (from εvοδια, *evodia*, a sweet smell). Forst. gen. t. 7. H. B. et Kunth, nov. gen. amer. 6. p. 1 and 6 in a note. Andr. Juss. mem. mus. 12. p. 485. t. 22. no. 28.

Lin. syst. *Tetrándria*, *Monogýnia*. Calyx 4-parted, permanent. Petals 4, shorter than the sepals; filaments awl-shaped; anthers heart-shaped, oscillatory. Ovaries 4, smooth, surrounded at the base by a cup-shaped, 4-lobed disk. Styles 4, connected together, short, terminated by a 4-lobed stigma. Fruit of 4 capsular, 2-valved, 1-seeded carpels, but usually fewer than 4 from abortion.—A shrub with a grateful smell. Leaves opposite, sometimes simple, sometimes trifoliate on the same branch, full of pellucid dots. Flowers minute, white ? disposed in oblong, axillary panicles; pedicels furnished with bracteas. Petals valvate in the bud.

1 E. horte'nsis (Forst. gen. p. 14. t. 7.) leaves simple or trifoliate; leaflets lanceolate, pubescent as well as the branches; panicles longer than the petioles and leaves. ♄. G. Native of the Friendly Islands and the New Hebrides. Fagàra Evòdia, Lin. fil. suppl. 125.

Garden Evodia. Shrub 6 feet.

2 E. drupa'cea (Lab. nov. cal. p. 73. t. 75.) leaflets 3, sessile, obovate-oblong, smooth; drupe 4-seeded; corymbs axillary, dichotomous. ♄. G. Native of New Caledonia. Calyx 4-toothed. Petals 4.

Drupaceous Evodia. Shrub 6 feet.

Cult. These shrubs are worth cultivating for their grateful scent. They will thrive well in a mixture of loam, peat, and sand; and young cuttings will strike root if planted in a pot of sand, with a hand-glass placed over them, in heat.

XXVI. ESENBE'CKIA (in honour of Nees Von Esenbeck, Professor of Botany at Bonn). H. B. et Kunth, nov. gen. amer. 7. p. 246. t. 655. Andr. Juss. in mem. mus. 12. p. 486.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-parted, permanent. Petals 5, spreading, inserted under the disk. Stamens 5, inserted with the petals, shorter, and alternating with them; filaments awl-shaped, smooth; anthers heart-shaped. Ovary sessile, tubercled, 5-lobed, 5-celled, surrounded by a fleshy, cup-shaped disk at the insertion of the stamens; each cell containing 2 ovulæ, only one of which comes to perfection. Styles 5, connected together, rising from between the lobes of the ovary, terminated by a somewhat capitate stigma.—Trees with alternate, simple, or ternate, quite entire leaves, full of pellucid dots. Racemes axillary and terminal, compound; peduncles and pedicels furnished with bracteas. Flowers full of glandular dots. Petals imbricate in the bud.

1 E. pilocarpoìdes (H. B. et Kunth, l. c.) leaves simple, oblong-lanceolate, acute; petioles margined; racemes compound, pubescent; petals roundish, full of glandular dots; ovary tubercled. ♄. S. Native of New Andalusia. Pilocárpus Humbóldtii, Spreng. syst. app. 126.

Pilocarpus-like Esenbeckia. Tree 60 feet.

2 E. febri'fuga (St. Hil. pl. usu. bras. t. 4. fl. bras. 1. p. 79. under *Evòdia*,) stem arboreous; leaves trifoliate; leaflets lanceolate-elliptic, rather acuminated; panicle terminal, pubescent; flowers 5-petalled; ovary simple, warted. ♄. S. Native of Brazil, in the province of Minas Geraes, where it is called *Tres Folhas vermelhas* and *Larangeira do Mato*. The bark is febrifugal, and answers as well as Peruvian bark.

Febrifugal Esenbeckia. Fl. Feb. Tree 40 feet.

Cult. The species will grow well in a mixture of sandy loam and peat; and cuttings will strike root if planted in a pot of sand, placed under a hand-glass, in heat.

XXVII. METRODO'REA (in memory of Metrodoro Sabino, who was the first, according to Pliny, to illustrate plants by figures). St. Hil. fl. bras. 1. p. 81. t. 16. Andr. Juss. in mem. mus. 12. p. 487.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-cleft. Petals 5, much longer than the calyx, spreading, inserted beneath the disk. Stamens 5, inserted in the disk, very short; filaments awl-shaped, reflexed; anthers heart-shaped. Ovary buried in the disk, and confused in its substance, tubercled, 5-lobed, 5-celled, each cell containing 2 ovulæ. Style rising from between the lobes of the ovary, very short, dilated at the apex into a blunt stigma.—A shrub, with simple, rarely bifoliate, opposite, entire leaves, full of pellucid dots, with appendages at the base of the petioles. Panicles terminal or lateral; partial peduncles and pedicels furnished with bracteas. Flowers small, full of glandular dots, dark-purple. Edges of petals bent inwards.

1 M. nìgra (St. Hil. l. c.) ♄. S. Native of Brazil, in the province of Rio Janeiro. Leaves repand, tapering to both ends.

Black-flowered Metrodorea. Shrub 6 feet.

Cult. See last genus for cultivation and propagation.

XXVIII. PILOCA'RPUS (from πιλος, *pilos*, a cap, and καρπος, *karpos*, a fruit; shape of fruit). Vahl, eclog. 1. p. 29. St. Hill. bull. philom. 1823. p. 130. Nees et Mart. nov. act. bonn. xi. p. 176. t. 19. f. 1. D. C. prod. 1. p. 728. Andr. Juss. in mem. mus. 12. p. 488. t. 22. no. 29.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx small, 5-toothed. Petals 5, broadest at the base, reflexed, inserted round the base of the disk. Stamens 5, inserted a little higher up than the

petals, and longer; filaments awl-shaped, reflexed. Anthers roundish. Ovaries 5, minute, connected, smooth. Styles 5, rising from beneath the top of the ovaries, connected at the top into a 5-lobed broader stigma. Fruit of 5 small 1-seeded carpels, immersed in the base of the gynophore, and has the appearance of a single ovary; but there are sometimes fewer than 5 from abortion. Albumen wanting. Cotyledons thick, with a short radicle.—Shrubs of humble growth, with alternate or opposite, simple, bi or trifoliate leaves. Racemes terminal, or at last lateral; pedicels spreading, furnished with bracteas. Flowers greenish or purplish, full of glandular dots. Petals valvate in the bud.

1 P. racemòsa (Vahl. eclog. 1. p. 29. t. 10.) smooth; leaves crowded, elliptical, rounded at the apex; flowers disposed in a terminal raceme. ♄. S. Native of the island of Montserrat, on the mountains.—Plum. ed. Burm. p. 119. t. 127. Branches pendulous. Flowers greenish.

Racemose-flowered Pilocarpus. Shrub 6 feet.

2 P. spica'ta (St. Hil. in bull. philom. 1823. p. 131. pl. rem. bras. p. 146. t. 16.) smooth; leaves oblong-lanceolate, or elliptical-lanceolate, bluntly acuminated; flowers spiked, somewhat approximate, on very short pedicels. ♄. S. Native of Brazil, at Cabo Frio in woods. P. pariflòrus, Nees et Mart. in nov. act. bonn. xi. p. 177. t. 30. Flowers small, pale.

Spiked-flowered Pilocarpus. Shrub 4 feet.

3 P. pauciflòra (St. Hil. bull. philom. 1823. p. 131. pl. rem. bras. p. 147. fl. bras. 1. p. 83. t. 17.) leaves lanceolate, obtuse, acuminated; petioles thickened, jointed; racemes few-flowered; rachis, pedicels, and bracteas puberulous. ♄. S. Native of Brazil, in the province of St. Catharine. St. Hil. pl. rem. bras. 1. p. 147. Flowers purplish.

Few-flowered Pilocarpus. Shrub 4 feet.

Cult. See *Esenbéckia* for cultivation and propagation.

XXIX. HO'RTIA (in honour of the Count de Horta, a Portuguese nobleman). Vand. in Rœm. script. bras. 188. D. C. prod. 1. p. 732. St. Hil. pl. usu. bras. p. 17. Andr. Juss. in mem. mus. 12. p. 489. t. 22. no. 30. St. Hil. fl. bras. 1. p. 80.

Lin. syst. *Pentándria, Monogýnia.* Calyx cup-shaped, bluntly 5-toothed, permanent. Petals 5, bearded above the base on the inside, uncinately acuminated at the apex, and reflexed, inserted in the disk. Stamens 5, inserted above the petals, and scarcely longer; filaments erect, covered with glandular tubercles; anthers linear-ovate, adnate. Ovary smooth, pentagonal, 5-celled, seated on the disk, which is broader, depressed, and glandular. Style conical, thickest at the apex, terminated by a coloured 5-furrowed stigma. Capsule 5-4-2-celled; cells 1-2-seeded. Embryo slender, straight, in a fleshy albumen, with large, obovate cotyledons, and a short superior radicle.—A small shrub, having the appearance of *Dáphne Laurèola*, with large, alternate, simple leaves, full of pellucid dots, as well as the petals. Branches terminal, corymbosely many-flowered; peduncles thick, and are, as well as the pedicels, furnished with bracteas. Flowers cymose, terminal, rose-coloured. Petals convolute in the bud.

1 H. Brasilia'na (Vand. l. c.) ♄. S. Native of Brazil, where it is commonly called *Quina*. The bark is bitter and astringent, and is used for the same purposes as Peruvian bark.

Brazilian Hortia. Shrub 2 to 4 feet.

Cult. See *Esenbéckia* for cultivation and propagation.

XXX. CHOI'SYA (in honour of M. Choisy, a Genevese botanist, author of several papers in De Candolle's Prodromus). H. B. et Kunth, nov. gen. amer. 6. p. 4. t. 513. D. C. prod. 1. p. 724. Andr. Juss. in mem. mus. 12. p. 490.—Plénckia, Moc. et Sesse, fl. mex. icon. ined. but not of Rafin.

Lin. syst. *Decándria, Monogýnia.* Calyx of 5 deciduous sepals. Petals 5, somewhat unguiculate. Stamens 10, shorter than the petals; filaments awl-shaped, the 5 shortest opposite the petals; anthers heart-shaped, blunt. Ovaries 5, connected, pubescent, inserted in the gynophore, each containing 2 ovulæ. Styles 5, connected, hispid, shorter than the stamens, terminated by a 5-lobed capitate stigma.—A shrub, with opposite, ternate, stalked leaves, full of pellucid dots; petioles channelled beneath. Peduncles axillary at the tops of the branches, simple, trifid, or somewhat umbellately few-flowered, bearing large deciduous bracteas at the base, and at the divisions under the pedicels. Corolla white, and is, as well as the calyx, full of glandular dots.

1 C. terna'ta (H. B. et Kunth, l. c. t. 513.) ♄. S. Native of Mexico. In Kunth's specimen, the ovaries are truly connected, but in that of Andr. Juss. they are partly distinct.

Ternate-leaved Choisya. Clt. 1825. Shrub 6 feet.

Cult. This beautiful shrub will grow freely in a mixture of loam, sand, and peat; and rather ripened cuttings will strike root if planted thinly in a pot of sand under a hand-glass, in heat.

Tribe VI.

CUSPARIE'Æ (plants agreeing with *Cuspària* in important characters). D. C. in mem. mus. 9. p. 141.—Fraxinéllæ, Nees et Mart. in nov. act. bonn. vol. xi. Andr. Juss. mem. mus. 12. p. 490. Flowers regular or usually anomalous. Petals 5, free, but usually connected into a labiate, campanulate, or funnel-shaped corolla. In the polypetalous flowers the stamens are alternate with the petals, and free; in the monopetalous flowers the filaments are free, but usually adhering to the tube of the corolla, sometimes all bearing anthers, sometimes 2-5 of which are barren. Disk urceolar, girding the ovaries at the base. Ovaries equal in number to the petals, distinct, rarely connected in one, each containing 2 ovulæ. Styles connected at the top or middle, or in one. Seeds with a thin covering. Embryo destitute of albumen, with large, short, or usually corrugated cotyledons, the outer one wrapped round the inner one, bearing 2 auricles on each side, and covering the radicle.—Trees and shrubs, rarely herbs. Leaves alternate, rarely nearly opposite, simple, but usually trifoliate; leaflets lanceolate and obtuse, quite entire. Flowers disposed in terminal or axillary racemes. Diverse parts frequently bitter.

XXXI. SPIRANTHE'RA (from σπειρα, *speira*, a spire, and ανθηρα, *anthera*, an anther; anthers spirally twisted). St. Hil. bull. philom. 1823. p. 130. pl. rem. bras. 1. p. 148. t. 17. D. C. prod. 1. p. 728. Andr. Juss. in mem. mus. 12. p. 491. t. 23. no. 32.—Terpnánthus, Nees et Mart. nov. act. bonn. xi. p. 152. and 177. t. 19. f. K.

Lin. syst. *Pentándria, Monogýnia.* Calyx short, 5-cleft. Petals 5, very long, free, linear, somewhat falcate, rather unequal. Stamens 5, a little shorter than the petals, free; filaments filiform, tubercled; anthers linear, at length becoming spirally revolute. Ovaries 5, villous, connected at the base, and stipitate, girded by the bell-shaped disk. Styles 5, rising from the inner angles of the ovaries, joined in one, longer than the petals, hispid at the base, terminated by a 5-lobed capitate stigma. Fruit of 5, or fewer carpels, connected at the base.—A small shrub, with alternate, stalked, ternate, exstipulate leaves. Peduncles axillary at the tops of the branches, naked below, but trifid and 3-flowered at the top, or terminal corymbose; pedicels furnished with 1 or 3 bracteas. Flowers shewy, white, with a tinge of rose-colour, very sweet-scented.

1 S. odorati'ssima (St. Hil. l. c.) ♄. S. Native of Brazil. Terpnánthus Jasminodòrus, Nees et Mart. in act. bonn. xi. p.

178. t. 31. The flowers have the scent of those of *Jasmìnum officinàle.*

Very-sweet-scented Spiranthera. Clt. 1823. Shrub 3 or 4 ft. *Cult.* See *Choísya* for cultivation and propagation.

XXXII. GALI'PEA (the name of *G. trifoliàta* in Guiana). Aubl. guian. 2. p. 662. St. Hil. bull. philom. 1823. p. 131. D. C. prod. 1. p. 730. Andr. Juss. in mem. mus. 12. p. 493. t. 23. no. 34.—Galìpea and Cuspària, D. C. mem. mus. 9. p. 142 and 148.—Cuspària, Humb.—Bonplándia, Willd. but not of Cav.—Angostùra and Rapùtia, Rœm. et Schult.—Conchocárpus, Mik.—Obentònia, Vel.—Arùba spec, Nees et Mart.—Lasiostèmon, Nees et Mart.—Ràvia, Nees et Mart.

Lin. syst. *Tri-Pentándria, Pentagýnia.* Calyx short, cup-shaped, 5-toothed or 5-cleft. Petals 5, rather unequal, connected at the base into a half monopetalous, somewhat campanulate corolla, with a short, usually pentagonal tube, and a spreading 5-cleft limb. Filaments adhering to the tube of the corolla, and longer than it (nevertheless enclosed), usually flattened and downy, sometimes 5, rarely 6-8, 2 or 4 of which are sterile, sometimes 5, all fertile; anthers oblong-heart-shaped, rarely appendiculate at the base, sometimes revolute after flowering. Ovaries 5, joined in one, or only at the base, surrounded by the cup-shaped disk, smooth or villous. Styles 5, rising from the tops of the ovaries, sometimes distinct, or only partly connected at the base, but usually joined together in one, terminated by a single blunt stigma. Fruit only of 1 or 2 carpels from abortion. —Trees or shrubs, with alternate, simple, ternate or quinate leaves, full of pellucid dots. Racemes axillary or terminal, simple or compound; peduncles and pedicels furnished with bracteas. Flowers greenish, white, or flesh-coloured.

* *Leaves compound.*

1 G. trifolia'ta (Aubl. guian. 2. p. 662. t. 269.) leaves trifoliate, smooth; flowers corymbose; peduncles shorter than the leaves; stamens 4, 2 of which are sterile. ♄. S. Native of Guiana, on the banks of the river Orapu. Sciùris corymbòsa, Spreng. syst. 1. p. 38. Flowers small, greenish. It is called *Inga* by the inhabitants of Guiana.

Three-leaved Galipea. Fl. Sept. Clt. 1823. Shrub 6 feet.

2 G. Ossa'na (D. C. mem. mus. 9. p. 149. t. 10.) leaves trifoliate, smooth; flowers panicled; peduncles longer than the leaves; calyx 5-parted; sterile stamens 5, fertile 2. ♄. S. Native of Cuba, about the Havannah. Flowers small, greenish.

De la Ossa's Galipea. Shrub 6 feet.

3 G. lasioste'mon (St. Hil. mss.) leaves trifoliate, full of glandular dots, young ones, petioles, and branches pubescent; racemes almost terminal, erect, pubescent; petals villous on the inside, and pubescent on the outside, as well as the calyx; stamens fringed, villous, 3 fertile, and 2 sterile. ♄. S. Native of Brazil, in woods at Ilheos. Lasiostèmum sylvéstre, Nees et Mart. in nov. act. bonn. xi. p. 171. t. 19. Flowers white.

Hairy-stamened Galipea. Shrub.

4 G. Cuspa'ria (St. Hil. mss.) leaves trifoliate; racemes stalked, almost terminal; calyx 5-toothed; sterile stamens 3. ♄. S. Native of South America. Cuspària febrífuga, Humb. tabl. geog. Bonplándia trifoliàta, Willd. act. acad. berl. 1802. p. 24. H. et B. pl. equin. 2. p. 59. t. 57. H. B. et Kunth, nov. gen. amer. 6. p. 8. Angostùra Cuspàre, Rœm. et Schult. syst. 4. p. 183. The Angostura bark of the shops is the produce of this tree. As an aromatic bitter it acts as a tonic and stimulant of the organs of digestion. It increases the appetite for food, removes flatulence and acidity, arising from dyspepsia, and is a very effectual remedy in diarrhœa, proceeding from weakness of the bowels, and in dysentery; and it possesses the singular advantage of not oppressing the stomach, as Peruvian bark is apt to do; but it does not cure intermittents. It is exhibited in powder, in doses of from 5 to 20 grains, either alone or with rhubarb, magnesia, or carbonate of lime. In infusion, a drachm to 4 ounces of water daily. In tincture, 1 or 2 drachms in dyspepsia. In watery extract, we are informed by Humboldt, that the Capuchins, who possess the missions of Carony, prepare with great care an extract of the bark, which they distribute to the convents of Catalonia. The natural history of this bark was long but imperfectly known. It is now fully established by the travels of Humboldt. The appearance of the bark varies according as it has been taken from larger or smaller branches. The tincture of which is of a deep yellow-colour, and becomes turbid and white on admixture with water. Dr. Rambach, of Hamburgh, first observed poisonous effects from some Angostura bark. The Austrian government on this account ordered all the Angostura bark in the kingdom to be destroyed, and interdicted its future importation; and other states have followed its example. This is in consequence of the Angostura bark of commerce being of different kinds, the most of which are spurious and poisonous. The false or fine Angostura bark, *Brùcea antidysentérica*, has been more recently analyzed by Pelletan and Caventou. They have discovered in it a new alkali, upon which its virulence depends, and to which they have given the name of Bruceæ. Its action on the living body is to produce tetanus, without affecting the intellectual faculties, in which respect it has a great analogy to strychnia, or nux vomica, but it is only about one-third of its strength. See *Brùcea.*

Cuspare or Angostura-bark. Tree 68 to 80 feet.

5 G. aroma'tica (Spreng. syst. app. p. 91.) leaves trifoliate, smooth; racemes spicate, axillary; sterile stamens 3, fertile 2. ♄. S. Native of Guiana, in woods of Orapu. Rapùtia aromática, Aubl. guian. 2. p. 670. t. 272. Sciùris aromàtica, Vahl. in Willd. spec. 1. p. 153. Flowers greenish. Bark of the trunk aromatic.

Aromatic-barked Galipea. Fl. Aug. Shrub 3 feet.

6 G. heterophy'lla (St. Hil. bull. philom. 1823. p. 131. pl. rem. bras. 131. t. 12.) leaves 3-4-5-foliate, on long petioles; leaflets lanceolate, rather pubescent on the middle nerve; racemes supra-axillary, on long peduncles; sterile stamens 2. ♄. S. Native of Brazil, in the province of Rio Janeiro.

Variable-leaved Galipea. Shrub.

* * *Leaves simple.*

7 G. penta'gyna (St. Hil. pl. rem. bras. p. 131. t. 11. A.) leaves long-lanceolate, very acute, quite smooth; racemes compound at the tops of the branches, axillary, or somewhat extra-axillary; peduncles flattened; sterile stamens 3; styles 5, quite distinct. ♄. S. Native of Brazil, in the province of Rio Janeiro.

Five-styled Galipea. Shrub.

8 G. resinòsa (St. Hil. pl. rem. bras. 1. p. 134.) leaves oblong, tapering to both ends, shining; glands on petioles very prominent, rough; corymbs terminal, stalked; corolla somewhat bilabiate; stamens 5, only 2 of which are fertile. ♄. S. Native of Brazil, in the province of Minas Geraes, and on the road to Felisbert. Ràvia resinòsa, Nees et Mart. in act. bonn. xi. p. 169. t. 19. f. E. and t. 23. Flowers white. Corymbs capitate. Shrub beset with resinous dots.

Resinous Galipea. Fl. Jan. Shrub 6 feet.

9 G. penta'ndra (St. Hil. pl. rem. bras. 1. p. 134. t. 13.) leaves lanceolate, acuminated, obtuse, but acute at the base, smooth; racemes axillary, simple, few-flowered; pedicels each furnished with 3 bracteas; stamens 5, all fertile. ♄. S. Native of Brazil, in the province of St. Paul.

Five-anthered Galipea. Shrub.

10 G. Fontanesia'na (St. Hil. pl. rem. bras. 1. p. 134. t. 14. B.) leaves lanceolate-oblong, acutish, quite smooth, very acute at the base; petioles smooth; racemes terminal, or somewhat extra-axillary, hardly branched at the base; calyx cup-shaped, smooth; sterile stamens 3; nectary 5-toothed. ♄. S. Native of Brazil, in the province of Rio Janeiro. Ràvia racemòsa, Nees et Mart. in nov. act. bonn. xi. p. 169. t. 24. Flowers white.

Desfontaine's Galipea. Fl. Jan. Shrub 6 feet.

11 G. Candollea'na (St. Hil. pl. rem. bras. 1. p. 135. t. 14. C.) leaves lanceolate, acuminated, quite smooth; racemes somewhat extra-axillary, very short; flowers crowded; sterile stamens 3; nectary entire. ♄. S. Native of Brazil, in the province of Rio Janeiro. Flowers white.

De Candolle's Galipea. Fl. Oct. Shrub 6 feet.

12 G. macrophy'lla (St. Hil. pl. rem. bras. 1. p. 132.) leaves long, linear-elliptic, stalked, rounded at the base, dotted with black opaque glands beneath; trunk simple, very slender; racemes extra-axillary, compound, interrupted; stamens 7, 1 or 2 of which are only fertile. ♄. S. Native of Brazil, in woods on the tops of the granite mountains at Rio Janeiro, and in the provinces of the mines. Conchocárpus macrophýlla, Mikan. del. bras. 1. t. 2. Nees et Mart. in nov. act. bonn. xi. p. 160. t. 18. f. B. Rapùtia conchocárpus, Schult. mant. 1. p. 126. Calyx bearded on the inside. Corolla funnel-shaped, beset with rusty glands, with a bilabiate limb.

Long-leaved Galipea. Fl. Oct. Nov. Shrub 6 feet.

13 G. cuneifòlia (St. Hil. pl. rem. bras. 1. p. 132.) leaves on short stalks, broad-lanceolate, tapering much to the base, cuneated, full of minute pellucid dots; racemes axillary, elongated, interrupted, about the length of the leaves; stamens 5, only 2 of which are fertile. ♄. S. Native of Brazil, in woods at the river Peruaquacu, in the province of Bahia. Conchocárpus cuneifòlia, Nees et Mart. in nov. act. bonn. xi. p. 162. t. 21. Corolla small, regular, white.

Wedge-leaved Galipea. Shrub 3 to 6 feet.

14 G. Gaudichaudia'na (St. Hil. fl. bras. 1. p. 89.) leaves spatulate, oblong, rounded at the apex, cuspidate; pedicels pubescent; sterile stamens 3 or 4; nectary entire; ovaries smooth. ♄. S. Native of Brazil, in the province of Rio Janeiro. Flowers white.

Gaudichaud's Galipea. Shrub.

15 G. Martia'na (St. Hil. fl. bras. 1. p. 90.) leaves large, lanceolate, tapering to both ends, quite smooth; petioles very short, puberulous; racemes terminal, simple, pubescent, as well as the campanulate, cup-formed calyx; sterile stamens 3; nectary entire. ♄. S. Native of Brazil, in the province of Rio Janeiro.

Martius's Galipea. Shrub 6 feet.

16 G.? e'legans (St. Hil. fl. bras. 1. p. 90.) leaves long, lanceolate-linear, acute at the base and apex, quite smooth; flowers racemose; axis triquetrous, pubescent. ♄. S. Native of Brazil, in the province of Rio Janeiro.

Elegant Galipea. Fl. Nov. Shrub 2 to 3 feet.

Cult. See *Choisya* for cultivation and propagation.

XXXIII. ALMEI'DEA (in honour of John Rodriguez Pereira de Almeida, who was of great assistance to St. Hilaire while on his travels in Brazil). St. Hil. bull. philom. 1823. p. 129. D. C. prod. 1. p. 729. Andr. Juss. in mem. mus. 12. p. 492. t. 23. no. 33. Arùba, Nees et Mart. in nov. act. bonn. xi. p. 152 and 172. t. 19. f. H. but not of Aubl. according to St. Hil.

Lin. syst. *Pentándria, Monogýnia.* Calyx short, 5-parted or 5-toothed. Petals 5, distinct, much longer than the calyx, equal, spatulate. Filaments 5, shorter than the petals, free, flattened, densely bearded above the middle, all bearing anthers; anthers linear, heart-shaped. Ovaries 5, girded beneath by the cup-shaped disk, connected together at the base, smooth. Styles 5, rising from the tops of the ovaries, joined in one, smooth, terminated by a single, capitate, 5-lobed stigma. Fruit of 1-2 1-2-seeded carpels.—Trees or shrubs, with alternate (but the upper ones are sometimes opposite), simple, quite entire, stalked, exstipulate leaves; petioles knotted above. Racemes terminal, simple, and naked beneath, but divided at the apex into compound thyrse-like panicles; peduncles and pedicels furnished with bracteas. Flowers white, lilac, red, and blue.

1 A. lila'cina (St. Hil. bull. philom. 1823. p. 129. pl. rem. bras. p. 144. t. 15. fl. bras. 1. p. 86.) leaves lanceolate, acute at the base; panicles pyramidal; peduncles puberulous; petals blunt. ♄. S. Native of Brazil, in the province of Rio Janeiro. Flowers lilac.

Lilac-flowered Almeidea. Shrub 8 feet.

2 A. ru'bra (St. Hil. l. c. pl. rem. bras. p. 144. fl. bras. 1. p. 86. t. 18.) leaves lanceolate, acute at the base; flowers racemose; racemes compound; peduncles smooth; petals very blunt. ♄. S. Native of Brazil, near Rio Janeiro. Flowers red.

Red-flowered Almeidea. Tree 12 feet.

3 A. longifòlia (St. Hil. pl. rem. bras. 1. p. 145. fl. bras. 1. p. 86.) leaves large, lanceolate-oblong, obtuse at the base, acute at the apex; flowers racemose, compound; peduncles pubescent; pedicels smooth; petals obtuse. ♄. S. Native of Brazil, in the province of Rio Janeiro. Flowers red.

Long-leaved Almeidea. Tree.

4 A. myriaca'ntha (Nees in Schlecht. Linnæa. 5. p. 56.) leaves scattered, elliptical-lanceolate, acuminate, on short stalks, veiny, and wrinkled; racemes axillary, simple, 5-10-flowered; veins of leaves scrobiculate in the axils; stamens 5, connected to the tube of the corolla; ovary clothed with stellate hairs. ♄. S. Native of Brazil, in the island of St. Catharine. Flowers white, and very fragrant.

Thousand-spined Almeidea. Tree 20 feet.

5 A. cæru'lea (St. Hil. mss.) leaves oblong, tapering to the base, obtuse at the apex, sometimes emarginate; racemes terminal; peduncles smooth; petals obtuse. ♄. S. Native of Brazil, in woods at the river Ilheos. Arùba cærùlea, Nees et Mart. nov. act. bonn. xi. p. 174. t. 27. Flowers blue.

Blue-flowered Almeidea. Tree 10 feet.

6 A. a'lba (St. Hil. mss.) leaves obovately wedge-shaped, with a blunt point; racemes terminal, bifid, secund; peduncles naked; petals obtuse. ♄. S. Native of Brazil, on the road to Felisbert. Arùba álba, Nees et Mart. in nov. act. bonn. xi. p. 175. t. 28. Flowers white.

White-flowered Almeidea. Fl. Dec. Shrub 6 feet.

7 A. acumina'ta (St. Hil. mss.) leaves oblong-lanceolate, acute at both ends; flowers terminal, racemosely panicled; peduncles pubescent; petals obtuse. ♄. S. Native of Brazil, in the province of the Mines, in woods. Flowers lilac.

Acuminate-leaved Almeidea. Fl. April. Tree 10 to 20 feet.

Cult. See *Choisya* for cultivation and propagation.

XXXIV. DIGLO'TTIS (from δις, *dis*, twice, and γλωττα, *glotta*, a tongue; the anthers 2, ending each in a tongue-shaped ligula). Nees et Mart. in nov. act. bonn. xi. p. 170. t. 19. f. F. D. C. prod. 1. p. 732. Andr. Juss. in mem. mus. 12. p. 494.

Lin. syst. *Diándria, Monogýnia.* Calyx 5-cleft. Petals 5, longer, about equal, joined together from the base to the middle into a monopetalous corolla. Filaments 5, shorter than the tube of the corolla, and adhering to its sides, flattened, bearded above, 3 sterile, and 2 bearing anthers; anthers heart-shaped, drawn out at the apex into an acute bearded ligula. Ovaries 5, surrounded at the base by the cup-shaped disk. Styles 5, con-

nected in one, very short, terminated by a single blunt stigma. Fruit of 5 1-seeded carpels.—A shrub, with alternate, long, ovate-lanceolate, quite entire leaves, full of pellucid dots. Flowers short, almost sessile, bracteated, disposed in a somewhat racemose panicle. Petioles inflated above.

1 D. obova'ta (Nees et Mart. l. c. t. 25.) ♄. S. Native of Brazil, in woods at the river Xipoto. Leaves obovate-oblong, rounded at the apex. Calyx pubescent. Petals acute, 3 lines long, white.

Obovate-leaved Diglottis. Fl. Dec. Shrub 5 feet.

Cult. See *Choísya* for cultivation and propagation.

XXXV. ERYTHROCHI'TON (from ερυθρος, *erythros*, red, and χιτων, *chiton*, an outer coat; in allusion to the calyx being red). Nees et Mart. in nov. act. bonn. xi. p. 165. t. 18. f. D. D. C. prod. 1. p. 732. Andr. Juss. in mem. mus. 12. p. 495.

Lin. syst. *Pentándria, Monogýnia.* Calyx large, tubular; tube compressed, 5-ribbed; limb of 5 segments, connected into 2 nearly equal lips, sometimes both entire, sometimes the lower one is trifid. Petals 5, longer than the calyx, connected into a half monopetalous funnel-shaped corolla, with a 5-cleft limb. Filaments 5, shorter than the tube of the corolla, and adhering to its sides, as well as being connected together, all bearing anthers; anthers lanceolate. Ovaries 5, surrounded by a longer pitcher-shaped glandular disk. Styles 5, connected in one, about the length of the tube of the corolla, terminated by a single, obtuse, 5-furrowed stigma. Fruit of 5 1-seeded carpels.—A small tree, with alternate, simple, stalked, lanceolate, very long, quite entire, smooth leaves. Axillary branches almost leafless, bearing the flowers at their ends, having the appearance of very long peduncles. Flowers large, in the axillæ of the bractea-like leaves, 2-4 or more in a cluster, on short pedicels, which are jointed at the base, each furnished with 2 bracteas. Calyx red. Corolla white.

1 E. Brasilie'nsis (Nees et Mart. l. c. p. 166. t. 22.) ♄. S. Native of Brazil, at the fort of St. John the Baptist, in the province of the Mines.

Brazilian Erythrochiton. Tree 10 feet.

Cult. See *Choísya* for cultivation and propagation.

XXXVI. TICO'REA (probably the name of the tree in Guiana). Aubl. guian. 2. p. 689. D. C. in mem. mus. 9. p. 144. St. Hill. bull. philom. 1823. p. 132. D. C. prod. 1. p. 730. Andr. Juss. in mem. mus. 12. p. 495. t. 23. no. 35.—Ozophýllum, Schreb. gen. no. 1105. Sciùris, Nees et Mart. in nov. act. bonn. xi. p. 155. t. 18. A.

Lin. syst. *Pent-Heptándria, Monogýnia.* Calyx small, 5-cleft or 5-toothed. Petals 5, much longer than the calyx, linear, connected together into a half-monopetalous, funnel-shaped corolla, with a 5-cleft, equal or unequal limb. Filaments flattened, adhering to the tube of the corolla, sometimes 5-7 in number, rarely 8, 3 or 6 of which are sterile, the rest fertile; anthers adnate. Ovaries 5, surrounded by a cup-shaped disk, smooth, usually connected together. Styles 5, rising from the tops of the ovaries, connected together in one, about equal in length to the tube of the corolla, terminated by a simple, 5-lobed stigma. Fruit of 5, connected, 1-seeded carpels.—Sweet-scented trees or shrubs, with alternate, simple, but usually ternate leaves; petioles jointed; leaflets lanceolate, entire, full of pellucid dots. Terminal branches almost leafless, floriferous, naked below, but divided at the apex into corymbs or panicles, or compound racemes; pedicels furnished with bracteas. Flowers white or cream-coloured, beset with pellucid or tubercled glands.

1 T. fœ'tida (Aubl. guian. 2. p. 689. t. 277.) leaflets 3, equal, almost sessile; corymb 6-7-flowered; flowers sessile along the branches; petals 6-times longer than the calyx. ♄. S. Native of Guiana in woods. Ozophýllum fœ'tidum, Martyn, in Mill. dict. Ozophýllum trifoliàtum, Willd. spec. 3. p. 585. Flowers white. The leaves, when bruised, emit a disagreeable smell, resembling that of *Stramònium*.

Fetid Ticorea. Fl. Feb. Shrub 10 feet.

2 T. pedicella'ta (D. C. mem. mus. 9. p. 145. t. 8.) leaflets 3, equal, almost sessile; corymbs 12-14-flowered; flowers stalked, disposed along the branches; capsule seated on a stipe. ♄. S. Native of French Guiana. Flowers white.

Stalked-flowered Ticorea. Shrub 10 feet.

3 T. longiflòra (D. C. mem. mus. 9. p. 145. t. 9.) leaflets 3, lateral ones on short stalks, middle one having a stalk 3-times longer than those of the lateral ones; corymb 15-20-flowered; flowers almost sessile, disposed along the branches; petals 10-times longer than the calyx or more. ♄. S. Native of French Guiana in woods. Flowers white. Fertile stamens 4.

Long-flowered Ticorea. Shrub 10 feet.

4 T. jasminiflòra (St. Hil. bull. philom. 1823. p. 132. pl. rem. bras. p. 141. t. 14. D.) leaflets 3, lanceolate, acuminated, tapering into the petiole; panicle rather loose; sterile stamens 3-6. ♄. S. Native of Brazil, near Rio Janeiro and in the province of Minas Geraes. Sciùrus multiflòra, Nees et Mart. nov. act. bonn. xi. p. 155. t. 18. f. A. Flowers white, sessile, along the branches of the panicle. The inhabitants of Brazil believe that the juice of the leaves boiled will cure frambesia.

Jasmine-flowered Ticorea. Fl. Sept. Tree 20 feet.

5 T. febri'fuga (St. Hil. pl. usu. bras. no. 16. D.) leaflets 3, lanceolate, acuminated, tapering into the petiole; panicle crowded; sterile stamens 3 or 6. ♄. S. Native of Brazil, in the province of Minas Geraes, where it is called *Quina* or *Folhas brancas*. The bark is very bitter and astringent, and would be a good substitute for Peruvian bark in intermittent fevers.

Febrifuge Ticorea. Tree 20 feet.

6 T. bractea'ta (St. Hil. mss. in D. C. prod. 1. p. 730.) leaflets 3, oblong, acuminated, tapering to the base; panicle somewhat spicate, many-flowered, glomerate, erect; calyx 5-cleft, with acuminated lobes; fertile stamens 2. ♄. S. Native of Brazil, in woods at Arassatiba. Sciùrus bracteàta, Nees et Mart. nov. act. bonn. 11. p. 156. t. 18. f. A. and t. 20. Bracteas under the branches of the panicle lanceolate, fringed. Flowers white.

Bracted Ticorea. Shrub 6 feet.

7 T. simplicifòlia (St. Hil. mss. in D. C. prod. 1. p. 730.) leaves simple, oblong-lanceolate, acuminated at both ends; racemes compound, many-flowered, erect; fertile stamens 2. ♄. S. Native of Brazil, in woods at the Fort of St. John the Baptist, in the province of Minas Geraes. Sciùrus simplicifòlia. Nees et Mart. nov. act. bonn. xi. p. 157. Flowers cream-coloured, pedicelled, with a short, linear-lanceolate bractea at the base of each pedicel.

Simple-leaved Ticorea. Shrub 10 feet.

Cult. A mixture of loam, sand, and peat will answer the species; and cuttings, taken from ripened wood, will root in a pot of sand, with a hand-glass placed over them, in heat.

XXXVII. MONNIE'RA (in honour of William le Monnier, once Professor of Botany in the Jardin du Roi, Paris. He published, in 1745, Observations upon the dangerous plants of the Pyrenees and Roussillon). Lin. gen. no. 850. Nees et Mart. nov. act. bonn. xi. p. 162. t. 18. f. C. D. C. prod. 1. p. 729. Andr. Juss. in mem. mus. 12. p. 496. t. 22. no. 31.

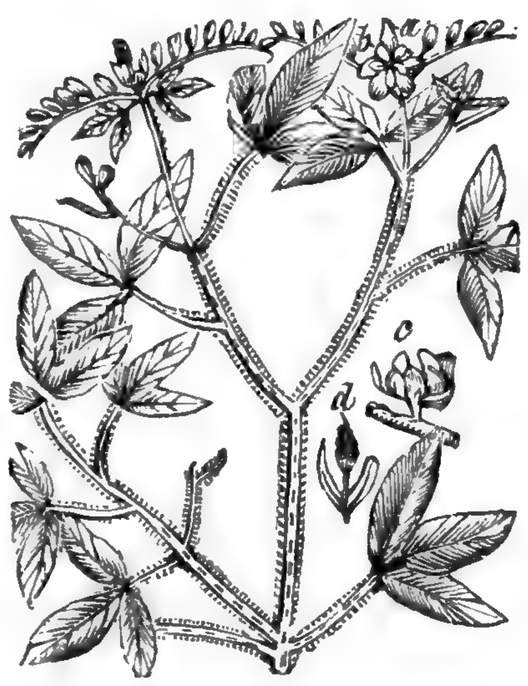
Lin. syst. *Diándria, Monogýnia.* Calyx 5-parted; segments very unequal, 2 of which are much longer than the corolla, and 3 much shorter, permanent. Petals 5, unequal, connected at the base into a half monopetalous corolla, with a curved

tube and a bilabiate limb, upper lip 1-lobed, lower one divided into 4-lobes. Filaments 5, adhering to the tube of the corolla and shorter than it, flattened, bearded in the middle, 3 sterile, 2 fertile; anthers adnate, oblong, heart-shaped. Ovaries 5, longer than the thickish hypogynous scales, which are bidentate at the apex, permanent and sessile, approximate, smooth, opposite the sterile stamens. Styles 5, rising from the tops of the ovaries, connected in one, terminated by a single, 5-lobed, capitate stigma. Fruit of 5 (but sometimes fewer from abortion) 1-seeded carpels. A villous herb, with opposite or alternate, stalked, ternate leaves, full of fine pellucid dots. Peduncles axillary, simple at the base, naked, but forked at the apex. Flowers small, white, on very short pedicels along the branches, secund.

1 M. trifòlia (Lin. spec. 986. Aubl. guian. 2. p. 730. t. 293. H. B. et Kunth, nov. gen. amer. 6. p. 9. Jaborándi, Marcg. bras. 36. with a figure. ⊙. S. Native of Guiana, Cayenne, and Brazil. Plant annual, naked at the base, but branched at the top.

Three-leaved Monniera. Fl. Ju. Jul. Clt. 1792. Pl. $\frac{1}{2}$ to 1 foot.

FIG. 124.



Cult. The seeds of this plant should be sown in a pot of light earth, placing it in a hot-bed, and when the plants are of sufficient size they should be planted into separate pots, and shaded until they have taken fresh root; after this they may be placed in the stove, where they will ripen their seed.

Tribe VII.

ZANTHO'XYLEÆ (plants agreeing with *Zanthóxylum* in important characters). Andr. Juss. in mem. mus. 12. p. 497. Flowers of separate sexes, regular. Calyx divided into 3, but usually 4-5. Petals equal in number, frequently longer, usually twisted in the bud, rarely wanting. Male flowers, with the stamens equal in number to the petals, rarely double that number, for the most part longer than them, inserted round the base of the gynophore. Female flowers with abortive stamens and a short style. Ovaries seated on the receptacle, equal in number to the petals or fewer, sometimes distinct or partly so, with 2 ovulæ in each. Styles equal in number to the ovaries, simple, sometimes free, sometimes joined, sometimes wanting. Stigma 2-5-lobed, or in the free styles simple. Fruit simple, baccate, or membranous, 2-5-celled, sometimes multiple. Seeds solitary or twin, pendulous, smooth, and shining. Albumen fleshy, with a superior radicle, and ovate, flat cotyledons.—Trees or shrubs, with alternate or opposite, simple, but more frequently abruptly or impari-pinnate, dotted or dotless leaves. Flowers axillary and terminal, variously disposed, male and female intermixed, sometimes on different branches, sometimes on different trees; pedicels bracteolate. Divers parts bitter and aromatic.

XXXVIII. DICTYOLO'MA (from δικτυον, *dictyon*, a net, and λωμα, *loma*, a fringe; in allusion to the seeds being expanded on the back into a netted wing). Andr. Juss. in mem. mus. 12. p. 499. t. 24. no. 36.

Lin. syst. *Monoècia, Pentándria.* Flowers of separate sexes. Calyx deeply 5-parted. Petals 5, longer. Male flowers, stamens 5, opposite the petals, about equal; filaments each rising from the back of a dense woolly scale, bearing 5 abortive, slender ovaries, shorter than the stamens. Female flowers bearing 5 productions like stamens, each terminated by a barren anther. Ovaries 5, joined in one, seated on a short gynophore, downy. Styles 5, connected into one, short, thick, terminated by a single 5-lobed stigma. Fruit of 5 distinct carpels, opening inwardly, 2-valved, 3-4-seeded. Seeds kidney-shaped, expanded on the back into an elegant netted wing. Embryo arched.—A little tree, with alternate, pinnate leaves; leaflets nearly opposite or alternate, unequal-sided, with glandular margins, without dots. Terminal branches bearing the flowers, dividing into a broad corymb; pedicels bracteate. Flowers downy-white, male and female intermixed.

1 D. Vandellia'na. ♄. S. Native of Brazil.

Vandelli's Dictyoloma. Tree 12 feet.

Cult. See *Ticòrea* for cultivation and propagation.

XXXIX. GALVE'ZIA (in honour of Joseph Galvez, minister of state under Charles III. of Spain). Ruiz et Pav. fl. per. but not of Dombey. Andr. Juss. in mem. mus. 12. p. 500. t. 25. no. 37.

Lin. syst. *Dioècia, Octándria.* Flowers of separate sexes. Calyx 4-parted. Petals 4, longer. Male flowers. Stamens 8, the 4 opposite the petals shortest; filaments awl-shaped, smooth, inserted round the base of the oblong gynophore. Ovaries 3-4, distinct, seated on the fleshy tetragonal receptacle. Styles 3-4, distinct at the base, but connected at the apex, terminated by a 4-lobed stigma. Drupes 4, or fewer from abortion, 1-seeded. Seeds egg-shaped. Embryo straight.—A tree with simple leaves, opposite, or 3 in a whorl, serrated, quite smooth, full of pellucid dots, with an aromatic smell. Peduncles axillary, trichotomously panicled, with 2 opposite bracteas at the divisions; pedicels bracteolate. Female flowers on distinct branches, and perhaps on distinct trees. Petals convolute in the bud.

1 G. puncta'ta (Ruiz et Pav. fl. per. 5 with a figure). ♄. G. Native of Chili, where it is called *Pitao.* Fruit fleshy, bitter.

Dotted Galvezia. Tree 20 feet.

Cult. See *Ticòrea* for cultivation and propagation.

XL. BRU'CEA (in honour of James Bruce, the celebrated traveller in Abyssinia). S. Mill. fasc. t. 25. Schreb. gen. 1508. Lher. stirp. 19. t. 10. Juss. gen. 373. Kunth, gen. tereb. 30. D. C. prod. 2. p. 88. Andr. Juss. in mem. mus. 12. p. 501.

Lin. syst. *Dioe'cia, Tetrándria.* Flowers of separate sexes. Calyx 4-parted. Petals 4, hardly equal the length of the calyx. Male flowers. Stamens 4, short, inserted round about a gland-like, central, 4-lobed body. Female flowers; stamens 4, sterile. Ovaries 4, seated on a 4-lobed receptacle, each terminated by a simple, acute, reflexed stigma. Drupes 4, 1-seeded.—Shrubs, with impari-pinnate leaves, with 6 pairs of opposite, entire, or serrated leaflets, without dots. Flowers small, purplish inside, disposed in interrupted glomerate spikes or racemes. Branches, peduncles, petioles, and nerves of leaves clothed with simple rufescent down. A fifth part is generally added to the flowers. Divers parts of the shrubs very bitter.

1 B. antidysente'rica (Mill. fasc. t. 25.) leaflets quite entire, clothed with rusty villi on the nerves beneath; racemes simple, spike-like. ♄. S. Native of Abyssinia. Woogi-noos, Bruce's trav. French ed. t. 43. Brùcea ferrugínea, Lher. stirp. t. 10. Drupe sometimes solitary, or perhaps connected together. Guers. in bull. philom. 3. no. 84. p. 182. This species is known in Abyssinia by the name of *Woodginoos.* The root is a specific in dysentery. It is a plain simple bitter, without any aromatic or resinous taste, leaving in the throat and palate something of roughness, resembling *Ipecacuanha.* The bark of this tree is sold under the name of Angostura bark. See *Galìpea Cuspària.*

Antidysenteric Brucea. Fl. May, June. Clt. 1775. Shrub 8 feet.

2 B. gra'cilis (D. C. prod. 2. p. 88.) leaflets serrated, downy on both surfaces; racemes simple, spike-like. ♄. S. Native of the East Indies. Ailántus gràcilis, Salisb. prod. 171. Stamens 5-6. Ovaries stiped.

Slender Brucea. Fl. May, June. Clt.? Shrub.

3 B. Sumatra'na (Roxb. fl. ind. 1. p. 469.) leaflets serrated, villous beneath; racemes usually compound; petals longer than the calyx. ♄. S. Native of Sumatra, Moluccas, China, and Cochin-china. Gònus amaríssimus, Lour. 658. B. Sumatrénsis, Spreng. pug. 2. p. 90.—Rumph. amb. 7. t. 15. Flowers dark-purple, usually hermaphrodite. From the sensible qualities of the green parts of this plant being somewhat fetid, and simply, though intensely, bitter, it promises to be as good an antidysenterical medicine as Bruce's Woodginoos. (Wall.)

Sumatra Brucea. Fl. May, June. Clt. 1822. Tree 20 ft.

4 B. Guinee'nsis; leaflets quite entire? and smooth; spikes panicled, branched; petals much longer than the calyx. ♄. S. Native of Sierra Leone, in the woods.

Guinea Brucea. Fl. Feb. May. Tree 14 feet.

Cult. These trees will thrive best in a loamy soil. Cuttings from ripened wood strike root freely in a pot of sand under a hand-glass, in a moderate heat.

XLI. BRUNE'LLIA (in honour of Gabriel Brunelli, professor of botany in the university of Bologna). Ruiz et Pav. fl. per. prod. p. 71. t. 12. H. et B. pl. equin. 1. p. 210. H. B. et Kunth, nov. gen. amer. 7. p. 42. D. C. prod. 2. p. 87. Andr. Juss. in mem. mus. 12. p. 501.

Lin. syst. *Dioe'cia, Octo-Decándria.* Flowers of separate sexes. Calyx 4-5-parted, clothed on the inside at the base, with a hairy depressed disk, which is 8-10-lobed. Petals wanting. Male flowers. Stamens 8-10, longer than the calyx, inserted in the sides of the disk, which bears the abortive ovaries. Female flowers. Stamens inserted in the disk, much shorter than the calyx; anthers barren. Ovaries equal in number with the segments of the calyx, distinct, hairy, each ending in a short acute style. Carpels distinct, opening lengthwise inwardly, each containing 1-2 seeds. Seeds egg-shaped or globose. Embryo straight.—Unarmed, rarely prickly trees. Leaves simple, ternate, or impari-pinnate, coriaceous, entire or crenated, without dots. Stipulas twin, small, caducous, petiolar. Flowers disposed in axillary or terminal corymbs, or panicles; pedicels furnished with bracteas. Parts usually clothed with rusty down. There are sometimes 7 segments to the calyx.

* *Leaves opposite, pinnate.*

1 B. aculea'ta (Ruiz et Pav. fl. per. syst. p. 127.) leaves abruptly-pinnate; leaflets quite entire; carpels smooth; branches prickly. ♄. S. Native of Peru, in groves. Stamens 10-14.

Prickly-branched Brunellia. Tree.

2 B. comocladifòlia (Humb. et Bonpl. pl. equin. 1. p. 211. t. 59.) leaves impari-pinnate, with 7 or 11 pairs of spiny-serrated leaflets; carpels 4, clothed with rufous down. ♄. S. Native of Peru, on the Andes, near Popayan. Stamens probably 8.

Comocladia-leaved Brunellia. Tree.

3 B. propi'nqua (H. B. et Kunth, nov. gen. amer. 7. p. 45.) leaves impari-pinnate; leaflets 3 or 4 pairs, oblong, rather obtuse, crenately-serrulated, clothed beneath with fine rufescent down; panicle branched, rusty. ♄. S. Native of South America. Stamens 12-14. Compare it with the following.

Allied Brunellia. Tree 20 feet.

4 B. ine'rmis (Ruiz et Pav. fl. per. prod. p. 71.) leaves impari-pinnate, and simple; leaflets serrated; carpels hispid. ♄. S. Native of Peru, in groves. Stamens 10-14. This is probably the same as *B. propinqua.*

Unarmed Brunellia. Tree.

* * *Leaves simple, 3 in a whorl.*

5 B. tomentòsa (Humb. et Bonpl. pl. equin. 1. p. 214. t. 60.) leaves oval-oblong, acute at both ends, serrated, reticulated with veins beneath; branches and carpels downy. ♄. S. Native of South America, near Almaguer, in cold places. Stamens 8-14.

Downy-branched Brunellia. Tree 20 feet.

6 B. ovalifòlia (Humb. et Bonpl. pl. equin. 1. p. 216. t. 61.) leaves roundish-oval, serrated, clothed beneath with very minute pubescence; heads of flowers axillary, stalked. ♄. S. Native of South America, on Mount Saraguru, near Loxa. Stamens 10.

Oval-leaved Brunellia. Tree 20 feet.

7 B. acuta'ngula (Humb. et Bonpl. pl. equin. 1. p. 216. t. 62.) leaves oval-lanceolate, covered with powdery-pubescence beneath; branches acutely triquetrous. ♄. S. Native of New Granada. Stamens 8-10.

Sharp-angled-stemmed Brunellia. Tree 20 feet.

N. B. There are several unpublished species of this genus from the Sandwich Islands.

Cult. See *Brùcea* for cultivation and propagation.

XLII. ZANTHO'XYLUM (from ξανθος, *xanthos*, yellow, and ξυλον, *xylon*, wood; the roots are yellow). H. B. et Kunth, nov. gen. amer. 6. p. 1. D. C. prod. 1. p. 725. Andr. Juss. in mem. mus. 12. p. 503. t. 25. no. 38.—Zanthóxylum et Fagàra, Lin. gen. no. 150. and 1109.—Xanthóxylum, Smith.—Aubértia, Bory.—Langsdórfia, Leandr. in akad. munch. 1819. p. 229.—Pohlàna, Nees et Mart. nov. act. bonn. xi. p. 185.—Ochróxylum, Schreb.—Pteròta, Adans.—Kampmánnia, Rafin.—Ampàcus, Rumph.—Evòdia, spec. D. C. prod. 1. p. 724.

Lin. syst. *Dioe'cia, Tri-Pentándria.* Flowers dioecious. Calyx short, 3-4-5-parted. Petals equal in number to the lobes of the calyx, but longer, very rarely wanting. Male flowers. Stamens equal in number with the petals, equal in length or longer than them, inserted around the base of a rudiment of a gynophore, bearing the rudiment of a simple or multiple pistil, which is shorter than the stamens. Female flowers. Stamens sometimes wanting, or very short, scale-like, and without anthers, or bearing abortive ones. Ovaries 5-1, sometimes equal in number to the petals, but usually fewer from abortion, seated on a subglobose, or subcylindrical torus, each containing 2 ovulæ, and with one style rising from the apex of each, free, or connected; the former with separate capitate stigmas; the latter crowned with a single lobed stigma. Capsules 1-5, sessile, or stalked, 2-valved, 1-2-seeded. Seeds globose, dark, shining. Embryo straight, but usually a little incurved.—Trees or shrubs, with the petioles, branches, and nerves, usually furnished with prickles. Leaves alternate and opposite, simple or ternate, but usually abruptly or impari-pinnate, and with the common petiole usually winged, for the most part full of pellucid dots. Flowers small, greenish, or whitish, axillary or terminal, fascicled, spiked, racemose, cymose, corymbose, or panicled, furnished with bracteas.

Sect. I. Zantho'xylum (see genus). Golden, Lin. Juss. et Schreb.—Xanthóxylum species, Nees et Mart.—Fagàra, Adans. but not of Lin. Calyx of 5 petal-like sepals, bearded at the apex. Petals wanting. Male flowers. Stamens equal in number to the petals, and alternating with them, inserted around the rudiment of a 5-lobed disk. Female flowers. Ovaries equal in number to the sepals, and opposite them, seated on a cylindrical torus, each furnished with a style, which are connected together

at the apex, ending in a clavate stigma. Sepals sometimes 6-9, according to Kunth, sometimes only 4.—Trees with impari-pinnate leaves.

1 Z. FRAXI'NEUM (Willd. spec. 4. p. 757.) leaves impari-pinnate, with 4 or 5 pairs of ovate, obsoletely-serrulated leaflets, which are equal at the base; petioles terete, unarmed; prickles stipular; corymbs axillary. ♄. H. Native of North America, from Canada to Virginia, and Kentucky, in woods near rivers. Z. ramiflòrum, Michx. fl. 2. p. 235. Z. clàva Hérculis var. Lin. spec. 1455. Lam. dict. 2. p. 38. Z. Americànum, Mill. dict. no. 2. Z. Caribæ'um, Gært. fruct. but not of Lam.—Duham. arb. 1. t. 97.—Catesb. carol. 1. t. 26. Sepals whitish; anthers red. The bark and capsules have a hot acrid taste, and are used for easing the tooth-ache; hence it is called *Tooch-ache-tree*. A tincture of them is also much commended for the cure of rheumatism.

Ash-like or Common Tooth-ache-tree. Fl. March, April. Clt. 1759. Tree 15 feet.

2 Z. MÌTE (Willd. enum. 1013.) unarmed; leaves impari-pinnate, pubescent beneath; flowers axillary. ♄. H. Native of North America. Sepals white; anthers red?

Mild Tooth-ache-tree. Fl. March, April. Clt. 1812. Tree 15 feet.

SECT. II. FAGA'RA (a name given to an aromatic plant by Avicennes). Jacq. Lin. Schreb. Nees et Mart.—Pteròta, P. Brown, Adans.—Fagàra species, Juss.—Xanthóxylum species, Nees et Mart. Calyx 4-parted. Petals and stamens 4. Ovaries 2 or 2-parted. Stigmas 2-lobed.

* *Flowers hermaphrodite.*

3 Z. PTERÒTA (H. B. et Kunth, nov. gen. amer. 6. p. 3.) prickly; leaves impari-pinnate; leaflets obovate, a little crenated; petioles with a narrow wing; prickles 2, stipular hooked. ♄. S. Native of Jamaica and Cuba. Fagàra Pteròta, Lin. amœn. 5. p. 391. Schìnus Fagàra, Lin. spec. ed. 1. p. 389. Fagàra lentiscifòlia, Willd. enum. 1. p. 166. Spikes axillary, shorter than the petioles. Flowers white.—Browne, jam. p. 146. t. 5. f. 1.—Sloan. jam. 2. p. 25. t. 168. f. 4.

Winged-petioled Tooth-ache-tree. Fl. Aug. Sept. Clt. 1768. Shrub 10 feet.

4 Z. CULANTRÌLO (H. B. et Kunth, nov. gen. amer. 6. p. 2.) unarmed; leaves trifoliate or impari-pinnate; leaflets oblong, somewhat emarginate, crenate; petioles obsoletely winged; peduncles axillary, branched, a little longer than the petioles. ♄. S. Native of South America, on the banks of the river Amazon, near Jaen-de-Bracamaros. Flowers white. *Culantrilo* is the vernacular name of the tree.

Culantrilo Tooth-ache-tree. Tree 24 feet.

5 Z. PRÆ'COX (St. Hil. fl. bras. 1. p. 76.) unarmed; leaves abruptly-pinnate, with lanceolate-elliptic, blunt, subretuse but acute at the base, almost entire, deciduous leaflets, which are pubescent beneath, full of pellucid dots; rachis hardly marginate; female flowers quadrifid, 4-petalled, disposed in racemose panicles; pistil solitary, rarely twin. ♄. S. Native of Brazil, in the province of Rio Janeiro, near Uba. Flowers greenish white. Ovary 1-2-valved.

Early Tooth-ache-tree. Fl. Oct. Tree 20 feet.

6 Z. HYEMA'LE (St. Hil. fl. usu. bras. t. 37. fl. bras. 1. p. 75.) armed, rather prickly, smooth; leaves impari-pinnate, with 3 or 6 pairs of obovate, blunt, crenate-serrated, nearly sessile leaflets, glandular on the margins; rachis hardly winged; flowers in racemose panicles, axillary, 4-petalled; style 1. ♄. S. Native of Brazil, in the provinces of St. Catharine and Rio Grande do Sul. Flowers white. The tree is called *Coentrilho* by the inhabitants, who pretend that the bark, reduced to a powder, is good against the ear-ache. The wood is excellent.

Winter Tooth-ache-tree. Tree.

7 Z. AFFI'NE (H. B. et Kunth, nov. gen. amer. 6. p. 3.) sparingly prickly; leaves impari-pinnate, with 7 or 9 oblong, blunt, smooth leaflets, which are crenate, and full of glandular dots on the edges; petioles hairy; spikes axillary, many-flowered. ♄. S. Native of Mexico, at Lake Cuiseo. Style 1? Flowers white?

Allied Tooth-ache-tree. Tree.

8 Z. PIPERÌTUM (D. C. prod. 1. p. 725.) prickly; leaves impari-pinnate; leaflets oblong, unequal at the base, crenate; petiole a little winged, jointed; prickles stipular. ♄. G. Native of Japan. Fagàra piperìta, Lin. spec. 172. Thunb. jap. 64? Flowers white, in terminal panicles. Ovary 1-2. Style 1. Seed 1.—Kœmpf. amœn. t. 893. The bark, leaves, and fruit of this shrub being aromatic are frequently used in soups instead of spice. The bruised leaves made into a cataplasm with meal of rice are laid upon the parts afflicted with rheumatism.

Pepper Tooth-ache-tree. Fl. Sept. Clt. 1773. Shrub 6 feet.

9 Z. PERROTE'TII (D. C. prod. 1. p. 726.) leaves impari-pinnate, with 7 or 9 pairs of sessile, elliptical-oblong, acuminated leaflets, which are toothed at the apex; petioles and branches unarmed; panicles subcorymbose. ♄. S. Native of French Guiana. Carpels at maturity twin or solitary from abortion. Flowers white? Petioles not margined.

Perrotet's Tooth-ache-tree. Tree.

10 Z. AVICE'NNÆ (D. C. prod. 1. p. 726.) prickly; leaves impari-pinnate; leaflets 9-13, lanceolate, smooth, almost entire, on short petioles; racemes panicled, shorter than the leaves. ♄. G. Native of China. Fagàra Avicénnæ, Lam. dict. 2. p. 445.—Lob. icon. 2. p. 133. f. 2. (fruct.) Flowers white?

Avicenna's Tooth-ache-tree. Clt. 1823. Shrub.

11 Z. BUDRU'NGA (D. C. prod. 1. p. 728.) armed with small incurved prickles; leaves abruptly or impari-pinnate, with 5 or 6 pairs of unequal, ovate-lanceolate, entire, acuminated, smooth leaflets; panicles terminal, crowded. ♄. S. Native of the East Indies, in Silhet, where it is called *Budrung* by the natives, who use the seeds medicinally, being of a warm spicy nature, with the fragrance of lemon-peel. Flowers white? Stamens much longer than the petals. Capsule single, drupaceous, about the size of a pea, the outer coat is marked with cells, filled with a fragrant balsam, containing a solitary shining seed, having 3 integuments.

Budrung Tooth-ache-tree. Fl. March, April. Clt. 1825. Tree 20 feet.

12 Z. RHE'TSA (D. C. prod. 1. p. 728.) armed with prickles; leaves abruptly pinnate, with 8 or 16 pairs of lanceolate, falcate, smooth, entire leaflets, all nearly equal in size; panicle terminal, frequently cross armed. ♄. S. Native of the East Indies, on the mountainous parts of the coast. Fagàra Rhétsa, Roxb. fl. ind. 1. p. 428. A large much-spreading tree. Flowers minute, yellow. Stamens shorter than the petals. Style thick, terminated by a tapering stigma. Capsule single, dry, 1-celled, 2-valved, about the size of a pea, containing a round, glossy, black seed. The unripe capsules are like small berries, they are gratefully aromatic, and taste like the skin of a fresh orange. The ripe seeds taste like black pepper, but weaker. The inner bark is also acrid, with a mixture of bitter. The tree is called in the Telinga language *Rhetsa-maun*. *Rhetsa* means a committee, or select number of men assembled to settle disputes, &c., and *maun* signifies trees of the largest size. Under the shade of this tree the hill people assemble to examine, agitate, and determine their matters of public concern, deliver discourses, &c.

Rhetsa-maun Tooth-ache-tree. Fl. Dec. Tree 50 feet.

13 Z. NI'TIDUM (D. C. prod. 1. p. 727.) branches, petioles,

and ribs armed with prickles; leaves impari-pinnate, with 2 or 3 pairs of oblong shining leaflets, which are remotely and glandularly crenated at the apex, rather long, and emarginate; racemes axillary. ♄. G. Native of China, about Canton, where it is called *Tcheum-tsew*. Fagàra nítida, Roxb. fl. ind. 1. p. 439. The flowers are 4-petalled as the other species of the Section, but the pistillum is 3 or 4-lobed, each lobe apparently ending in a 2-lobed stigma. Capsule single, 1-seeded.

Shining-leaved Tooth-ache-tree. Fl. Jan. Clt. 1823. Shrub 6 feet.

14 Z. Zeyla'nicum (D. C. prod. 1. p. 728.) capsule solitary, 2-celled, 1-seeded; the rest unknown. Lùnu Ankénda, Gært. fruct. 1. p. 334. t. 68. f. 9. Fagàra Zeylánica, Steud. nom. p. 331.

Ceylon Tooth-ache-tree. Shrub?

* * *Flowers dioecious.*

15 Z.? Tingoa'ssuiba (St. Hil. fl. bras. 1. p. 78.) unarmed, quite smooth; leaves impari-pinnate, with 2 pairs of obovate, obtuse, obsoletely-crenated, rather retuse, veiny, shining leaflets; calyx 4-parted; petals perhaps wanting. ♄. S. Native of Brazil, in the province of Rio Janeiro, at Cabo Frio, where it is called *Tingoassuiba*. The wood is yellow, and is used in various kinds of carpentering.

Tingoassuiba Tooth-ache-tree. Tree 50 feet.

16 Z. lu'cidum (St. Hil. fl. bras. 1. p. 92.) unarmed, quite smooth; leaves impari-pinnate, with 2-3 pairs of stalked, lanceolate, entire leaflets, which are obtuse and rather retuse at the apex, and acutish at the base; rachis wingless; panicles terminal; flowers of 4 petals. ♄. S. Native of Brazil, in the province of St. Paùl. Z. nítidum, St. Hil. fl. bras. 1. p. 77. Rudiment of ovary small.

Shining Tooth-ache-tree. Fl. Jan. Tree 20 feet?

Sect. III. Faga'ra (see last section). Lam. Swartz, Zanthóxylum, Nees et Mart. Flowers 3-petalled, triandrous. Ovaries 3, each terminated by a style.

17 Z. pimpinelloìdes (D. C. prod. 1. p. 726.) leaves impari-pinnate, with many pairs of roundish, acuminated, shining leaflets; petioles and ribs of leaves prickly; corymbs terminal. ♄. S. Native of St. Domingo.—Sloan. hist. 2. t. 174. f. 3-4? Fagàra pimpinelloìdes, Lam. ill. no. 1638. Calyx 5-cleft.

Pimpernel-like Tooth-ache-tree. Shrub 6 feet.

18 Z. terna'tum (Swartz, fl. ind. occ. 1. p. 570.) unarmed; leaves ternate; leaflets obovate, a little emarginate, shining, dotted beneath; racemes axillary, compound. ♄. S. Native of Dominique. Fagàra ternàta, Swartz, prod. 33. Flowers white.

Ternate-leaved Tooth-ache-tree. Shrub 6 feet.

19 Z. puncta'tum (West. st. cr. 236.) spiny; leaves trifoliate and pinnate, with oblong crenulated leaflets, dotted beneath. ♄. S. Native of Santa-Cruz. Flowers white.

Dotted-leaved Tooth-ache-tree. Shrub 6 feet.

20 Z. emargina'tum (Swartz, fl. ind. occ. 1. p. 572.) unarmed; leaves impari-pinnate, with 2 or 3 pairs of ovate, emarginate, veiny leaflets; racemes terminal. ♄. S. Native of Jamaica and Cuba, on the mountains. Fagàra emarginàta, Swartz, prod. 33.—Sloan. hist. 2. p. 24. t. 168. f. 4. Leaves sometimes abruptly pinnate. Branches inclined to the ground. Flowers white, resembling those of the elder-berry. Fruit round, the size of black pepper. The smoke of the wood in burning is odoriferous, and probably was the fine scent which Columbus found near the south shore of Cuba, on his discovery of that island.

Emarginate-leaved Tooth-ache-tree. Clt. 1739. Tree 20 ft.

21 Z. acumina'tum (Swartz, fl. ind. occ. 1. p. 575.) unarmed; leaves impari-pinnate, with 3 or 4 pairs of elliptical, acuminated, entire, shining, coriaceous leaflets; cymes terminal. ♄. S. Native of Jamaica, on the mountains. Fagàra acuminàta, Swartz, prod. p. 33. Flowers white.

Acuminated-leaved Tooth-ache-tree. Clt. 1818. Tree 20 ft.

22 Z. sapindoìdes (D.C. prod. 1. p. 728.) stem and branches full of spines; leaves abruptly pinnate, with 4 pairs of obtuse emarginate leaflets. ♄. S. Native of Jamaica.—Browne, jam. 207. t. 20. f. 2. Sapíndus spinòsus, Lin. spec. 526. Licca-tree, Lunan. jam. 1. p. 443. The flowers are very fragrant.

Sapindus-like Tooth-ache-tree. Shrub.

23 Z. spinòsum (Swartz, fl. ind. occ. 1. p. 574.) leaves pinnate, with 8 or 10 pairs of sessile ovate-acuminated leaflets, spiny beneath, as well as the petioles and branches; cymes terminal. ♄. S. Native of Jamaica, on arid mountains. Fagàra spinòsa, Swartz, prod. p. 33. Style wanting. Stigmas 3. Flowers white.

Spiny Tooth-ache-tree. Shrub 6 feet.

Sect. IV. Ochro'xylum (from ωχρος, *ochros*, yellow, and ξυλον, *xylon*, wood; roots yellow). Schreb. Nees et Mart.—Kampmánnia, Rafin.—Fagàra spec. Lam. Flowers dioecious. Calyx 5-parted. Petals 5. Stamens 5. Ovaries 3 (Schreb.), 1 to 5 (Mart.). Styles distinct.

* *Leaves simple.*

24 Z. ochróxylum (D. C. prod. 1. p. 725.) trunk prickly; leaves ovate, full of pellucid dots; ovaries 3, each terminated by a style. ♄. S. Native of the Caribbee Islands. Ochróxylum and Curtìsia, Schreb. no. 508. et emend. p. 826. Fagàra monophýlla, Lam. ill. no. 1643. Flowers white.

Yellow-wooded Tooth-ache-tree. Tree 20 feet.

25 Z. penta'nome (D. C. prod. 1. p. 725.) prickly; leaves alternate, oval, acuminated at both ends, quite entire; panicle terminal; ovaries 5, each bearing a style. ♄. S. Native of Mexico. Pentánome simplicifòlia, Moc. et Sesse, fl. mex. ined. icon.

Five-parted Tooth-ache-tree. Shrub.

* * *Leaves impari-pinnate.*

26 Z. trica'rpum (Mich. fl. bor. amer. 2. p. 335.) leaves impari-pinnate, with 3 or 5 pairs of oblong-oval, acuminated, serrulated leaflets, which are oblique at the base; petioles and branches prickly; panicle terminal. ♄. H. Native of Carolina and Florida in woods. Fagàra fraxinifòlia. Lam. ill. 1. t. 334.

Three-fruited Tooth-ache-tree. Fl. Jul. Clt. 1806. Sh. 6 ft.

27 Z. melanosti'ctum (Nees in Schlecht. Linnæa. 5. p. 37.) branches prickly; leaves impari-pinnate, with 1-2 pairs of stalked elliptic leaflets, which are acute at the base, and bluntly acuminated at the apex, entire, coriaceous, shining; panicle axillary, shorter than the leaves. ♄. S. Native of South America. Calyx 5-parted. Petals 5. Stamens 5.

Black-dotted-leaved Tooth-ache-tree. Tree.

28 Z. rhoifòlium (Lam. dict. 2. p. 39.) prickly; leaves impari-pinnate, with many pairs of lanceolate, serrulated, leaflets, which are nearly equal at the base; petioles pubescent, somewhat prickly; panicles lateral. ♄. S. Native of the East Indies.—Pluk. phyt. t. 329. f. 1.

Red-leaved Tooth-ache-tree. Tree 20 feet.

29 Z. tragòdes (D. C. prod. 1. p. 725.) prickly; leaves impari-pinnate; leaflets wedge-shaped, emarginate; petioles broadly-winged, nearly separable at the joints of the leaflets. ♄. S. Native of St. Domingo. Schìnus tragòdes, Lin. spec. ed. 1. p. 369. Fagàra tragòdes, Jacq. amer. 21. t. 14. pict. 16. t. 19. Hayne, term. bot. t. 14. f. 2. Flowers whitish.

Goat's-tooth-ache-tree. Clt. 1759. Shrub 6 feet.

30 Z. HERMAPHRODÌTUM (Willd. spec. 4. p. 756.) prickly; leaves impari-pinnate, with 5 pairs of oblong, quite entire, acuminated leaflets, which are almost equal at the base; petioles unarmed; panicles terminal. ♄. S. Native of Guiana, in woods. Ovaries 3-5, each terminated by a style. Fagàra pentándra, Aubl. guian. 1. p. 78. t. 30. Fagàra Guianénsis, Lam. dict. 2. p. 446. Wood hard, white, and durable. Flowers white. The tree is called *Cacatin* by the Caripous, and *Poivre des Negroes* by the Creoles.

Hermaphrodite Tooth-ache-tree. Fl. May. Tree 50 feet.

SECT. V. LANGSDÓRFIA (in honour of George Langsdorf, of Heidelberg, a great traveller and collector of plants). Leandr. but not of Rich.—Pohlàna, Nees et Mart.—Macquèria, Comm. Calyx 5-parted. Petals 5. Stamens 5. Ovaries 1. Style 1.

31 Z. LANGSDÓRFII (St. Hil. fl. bras. 1. p. 76.) prickly; leaves impari-pinnate; leaflets oblong-lanceolate, serrated, unequal at the base; petioles pubescent; flowers thyrsoid, lateral, and terminal. ♄. S Native of Brazil. Pohlàna Langsdórfii, Nees et Mart. in nov. act. bonn. 12. p. 17. Flowers green.—Langsdórfia, Leandr. de sacram. denkschr. der Akad. de W. zu Munchen 12. p. 29. t. 12.

Langsdorf's Tooth-ache-tree. Shrub 3 feet.

32 Z. MONO'GYNUM (St. Hil. in bull. philom. 1823. p. 129.) unarmed; leaves trifoliate; leaflets roundish-elliptical, sharply taper-pointed, obtuse, quite entire, smooth; common petiole and middle nerve of leaf puberulous; panicles terminal; pistils solitary, rarely twin. ♄. S. Native of Brazil, where it is commonly called *Ponta da Fruta* and *Larangeira braba*. Flowers green?

Monogynous Tooth-ache-tree. Shrub.

33 Z. SENEGALE'NSE (D. C. prod. 1. p. 726.) prickly; leaves impari-pinnate; leaflets obovate, quite entire, somewhat emarginate; petioles terete, and are as well as the nerves of the leaves prickly. ♄. S. Native of Senegal. Fagàra zanthoxyloìdes, Lam. dict. 2. p. 446. Flowers white.

Senegal Tooth-ache-tree. Shrub.

34 Z. HETEROPHY'LLUM (Smith, in Rees' cycl. no. 14.) prickly; leaves impari-pinnate, very long on young trees, with about 20 pairs of prickly leaflets, but they are much shorter on the adult trees, with about 4 pairs of unarmed leaflets; petioles round. ♄. S. Native of the Island of Bourbon, about Gol. Fagàra heterophýlla, Lam. dict. 2. p. 445. Macquèria, Comm. Flowers hermaphrodite, white.

Variable-leaved Tooth-ache-tree. Tree.

35 Z. SORBIFÒLIUM (St. Hil. fl. bras. 1. p. 75.) prickly; leaves pinnate, with 3-5 pairs of ovate-oblong, obtuse, rather retuse, crenate-serrated, smooth leaflets; peduncles rather prickly; rachis wingless; flowers panicled, 5-petalled; pistil solitary. ♄. S. Native of Brazil, near Rio Janeiro. Flowers greenish.

Mountain-ash-leaved Tooth-ache-tree. Fl. Aug. Tree.

36 Z. AUSTRALA'SICUM (Andr. Juss. in mem. mus. 12. p. 503.) branches tubercled; leaves simple, oblong-linear, obtuse, entire; peduncles terminal, few-flowered; ovaries 5, only one of which comes to maturity; styles joined. ♄. G. Native of New Holland. Eriostèmon linearifòlium, D. C. prod. 1. p. 720.

Australian Tooth-ache-tree. Shrub 6 feet.

SECT. VI. AUBE'RTIA (in honour of Aubert du Petit Thouars, a well known French botanist). Bory St. Vinc. voy. afr. 1. p. 256. t. 18. Calyx short, 4-parted. Petals 4, longer than the calyx. Stamens 4, very short; anthers barren. Ovaries 4, seated on a short gynophore. Capsules 4, or fewer from abortion, each containing 1-2-seeds.

37 Z. AUBE'RTIA (D. C. prod. 1. p. 725.) unarmed; leaves opposite, simple, ovate, obtuse, quite entire or emarginate, full of pellucid dots; flowers disposed in axillary racemes. ♄, S. Native of the Island of Bourbon, on the high plains called D'Afouge. Aubértia Borbónica, Bory, l. c.

Aubert du Petit Thouars' Tooth-ache-tree. Tree 20 feet.

38 Z. OBTUSIFÒLIUM; leaves trifoliate; leaflets oval, obtuse, smooth; panicles axillary, a little shorter than the leaves. ♄. S. Native of the Mauritius. Evòdia obtusifòlia, D. C. prod. 1. p. 724. Style simple, deeply 4-parted into revolute segments.

Blunt-leaved Tooth-ache-tree. Shrub.

SECT. VII. AMPA'CUS (Malay name of *Z. triphýllum*) Rumph. amb. 2. p. 188. 189. t. 61. t. 62. Evòdia, D. C. prod. 1. p. 724. Flowers hermaphrodite. Calyx 4-5-toothed. Petals 4-5. Glands 5, between the stamens and the ovary; ovaries 4, connected at the base, each containing 1 or 2 seeds.

39 Z. LATIFÒLIUM; unarmed; leaves opposite, trifoliate; leaflets ovate, acute, woolly beneath; panicles axillary, length of petioles. ♄. S. Native of Amboyna. Ampàcus latifòlia, Rumph. amb. 2. p. 186. t. 61. Evòdia latifòlia, D. C. prod. 1. p. 724. Leaflets 8 or 12 inches long. Flowers white.

Broad-leaved Tooth-ache-tree. Tree 20 feet.

40 Z. TRIPHY'LLUM; unarmed; leaves opposite, trifoliate; leaflets oblong, entire, smooth; panicles axillary, pyramidal, about the length of the petioles. ♄. S. Native of the East Indies, in the island of Pulo-Penang. Z. Lamarkiànum, Nees. Fagàra triphýlla, Lam. dict. 2. p. 447. Roxb. fl. ind. 1. p. 436. Evòdia triphýlla, D. C. prod. 1. p. 724. Ampàcus angustifòlia, Rumph. amb. ii. p. 188. t. 62. Flowers numerous, minute, white, scentless. Calyx 4-toothed. Petals 4, 4-times longer than the calyx. Stamens 4. Ovary roundish, woolly, 4-furrowed, the filaments resting in the furrows. Style 1, terminated by a 4-lobed stigma. Capsules 1-4, distinct, size of a field-bean, 1-celled, 2-valved, opening along the upper and inner margin, each containing 2 seeds.

Three-leaved Tooth-ache-tree. Shrub 4 feet.

† *The flowers of the following species being unknown, it is therefore doubtful to which of the sections they may belong. The leaves of all are impari-pinnate, and the flowers of most of them are probably dioecious.*

41 Z. RI'GIDUM (Humb. in Willd. spec. 4. p. 756. and H. B. et Kunth, nov. gen. amer. 6. p. 4.) prickly; leaflets 4 pairs, elliptical, quite entire, emarginate, mucronate, hairy on the veins beneath, with the middle rib and petioles prickly. ♄. S. Native of South America.

Stiff Tooth-ache-tree. Tree or shrub.

42 Z. JUGLANDIFÒLIUM (Willd. spec. 4. p. 756.) armed; leaflets oblong, acuminated, obsoletely serrated, unequal at the base, a little dotted; petioles prickly; panicles terminal. ♄. S. Native of St. Domingo.—Pluk. t. 239. f. 6. Leaflets stalked, alternate.

Var. β, Berteriànum (D. C. prod. 1. p. 727.) leaflets sessile, usually opposite; racemes and petioles pubescent. ♄. S.

Juglans-leaved Tooth-ache-tree. Tree.

43 Z. LANCEOLA'TUM (Poir. suppl. 2. p. 293.) armed; leaflets 6-7 pairs, elliptical-lanceolate, membranaceous, without dots, hairy beneath; petioles prickly; panicles terminal. ♄. S. Native of Porto Rico, where it is called *Cenizo*, and of Guadaloupe.

Lanceolate-leafletted Tooth-ache-tree. Tree?

44 Z. CLA'VA-HE'RCULIS (Lin. spec. 1455. exclusive of the synonyms) armed; leaflets 4 pairs, ovate, repandly-toothed, unequal at the base, quite smooth, sessile, full of pellucid dots; panicles terminal. ♄. S. Native of the Caribbee Islands.

Z. Caribæ'um, Lam. but not of Gært. Z. Caroliniànum, Gært. —Pluk. t. 239. f. 4.

Hercules'-club Tooth-ache-tree. Clt. 1739. Tree 50 feet.

45 Z. AROMA'TICUM (Willd. spec. 4. p. 755.) armed; leaflets 6 pairs, ovate-lanceolate, serrated, stalked, unequal at the base, smooth, full of pellucid dots; panicles terminal and axillary. ♄. S. Native of St. Domingo. Jacq. fil. eclog. 1. p. 103. t. 70. There is a variety with unarmed petioles.

Aromatic Tooth-ache-tree. Clt. 1824. Shrub.

46 Z. OBTUSIFÒLIUM (Poir. suppl. 2. p. 293.) prickly; leaflets usually 4-pairs, coriaceous, obversely subovate, rounded at apex, smooth, prickly beneath as well as the petioles; panicle terminal, dense. ♄. S. Native of the East Indies?

Obtuse-leaved Tooth-ache-tree. Shrub.

47 Z. ARMA'TUM (Roxb. hort. beng. p. 72.) armed with straight, spreading prickles; leaflets 2 pairs, oblong, acuminated at both ends, entire; petioles unarmed; panicles terminal or subaxillary. ♄. S. Native of the East Indies. Flowers dioecious.

Armed Tooth-ache-tree. Clt. 1816. Shrub 10 feet.

48 Z. ACANTHOPÒDIUM (D. C. prod. 1. p. 727.) armed with straight, spreading prickles; leaflets 4 pairs, oblong, acuminated at both ends; middle rib and petioles armed with strong spines; corymbs axillary, very short. ♄. S. Native of Nipaul. Habit of the preceding species.

Prickly-foot-stalked Tooth-ache-tree. Shrub.

49 Z. HÓRRIDUM (D. C. prod. 1. p. 728.) leaves alternate; leaflets ovate, crenate; branches spiny. ♄. G. Native of Japan. Fagàra hórrida, Thunb. in Lin. trans. 2. p. 329. Flowers and fruit unknown.

Horrid Tooth-ache-tree. Shrub.

50 Z. SPÍNIFEX (D. C. prod. 1. p. 728.) leaves alternate, in fascicles, impari-pinnate; petioles winged a little; leaflets elliptical, entire, somewhat emarginate; branches spiny. ♄. S. Native of Caraccas. Fagàra spínifex, Jacq. fragm. p. 10. t. 6. f. 2. Flowers unknown.

Spiny Tooth-ache-tree. Shrub.

51 Z. CRIBRÒSUM (Spreng. syst. 1. p. 946.) unarmed; leaflets 3-pairs, oblong, blunt, coriaceous, crenate, full of pellucid dots; petioles rough. ♄. S. Native of Hispaniola.

Sieve-leaved Tooth-ache-tree. Tree.

52 Z. SELLÓI (Spreng. syst. 1. p. 946.) unarmed; leaves abruptly-pinnate, with 4 pairs of ovate-oblong, blunt, shining, reticulated leaflets, full of pellucid dots; petioles pubescent. ♄. S. Native of Brazil.

Sello's Tooth-ache-tree. Tree.

Cult. The species of *Zanthóxylum* will grow freely in sandy loam; and cuttings will root, if planted in a pot of sand, and placed under a hand-glass; those of the stove species in heat. The hardy species, or those native of North America, will thrive in any common garden-soil; they are well adapted for ornamenting small shrubberies. Ripened cuttings of these will root, if planted under a hand-glass, or they may be increased by slips of the roots; if planted in pots and placed in a hot-bed, they will grow up to young plants.

XLIII. BO'YMIA (in honour of Michael Boym, who wrote on Chinese plants and animals, in 1650). Andr. Juss. in mem. mus. 12. p. 507. t. 25. no. 39.

LIN. SYST. *Dioècia.* Flowers of distinct sexes. Male ones unknown. Female flowers. Calyx short, 5-cleft. Petals 5, longer than the calyx. Ovaries 5, seated round the base of a 5-scaled gynophore, connected together at the base, and appearing like one, each divided lengthwise by a simple furrow, containing 2 ovulæ. Styles 5, joined in one, short, crowned by a simple 5-furrowed, peltate, broader stigma, deciduous. Capsules 5, connected at the base, but spreading at the apex, convex outside, but angular, and opening inwardly, each containing a solitary, globose, smooth seed. Shrubs with impari-pinnate leaves.

1 B. RUTÆCA'RPA (Juss. in mem. mus. 12. t. 25. no. 39.). ♄. G. Native of China, where it is called *Ou-tchou-yu.* The fruit, when infused in cold water, exhales a scent like *Ptelea.*

Rue-fruited Boymia. Shrub.

2 B. MARTINICE'NSIS; leaves impari-pinnate, prickly; leaflets alternate, oblong, quite entire; stigma peltate; flowers pentandrous. ♄. S. Native of Martinique. Zanthóxylum Martinicénse, D. C. prod. 1. p. 726. Fagàra Martinicénsis, Lam. ill. no. 1659.

Martinique Boymia. Shrub.

Cult. See *Zanthóxylum* for cultivation and propagation.

XLIV. TODDA'LIA (*Kaka-Toddali* is the Malabar name of *T. aculeàta*). Juss. gen. 371. Kunth, gen. tereb. p. 24. D. C. prod. 2. p. 83. Andr. Juss. in mem. mus. 12. p. 508. t. 26. no. 40.—Scopòlia, Smith, in Rees' cycl.—Cránzia, Schreb. no. 362. Vèpris, spec. Comm.

LIN. SYST. *Monœ'cia, Pentándria.* Flowers of separate sexes. Calyx short, 5-toothed. Petals 5, longer than the calyx, spreading much. Male flowers. Stamens 5, longer than the petals, inserted round about the base of the gynophore, bearing a prismatical 5-sided rudiment of a pistil. Female flowers. Filaments 5, very short, sterile. Ovary seated on a gland-like, short, 5-furrowed gynophore, simple, egg-shaped, fleshy, 5-celled, each cell containing 2 ovulæ. Stigma almost sessile, peltate, 5-lobed. Fruit fleshy, dotted, 5-furrowed, 5-celled, each cell containing 1 angular, kidney-shaped seed. Embryo arched.—Dwarf shrubs, with alternate, trifoliate leaves, full of pellucid dots. Panicles of flowers axillary, usually solitary, rarely twin; pedicels furnished with bracteas. Male and female flowers on different branches, never on separate trees. Branches, petioles, and peduncles, usually prickly. Number of parts of flowers sometimes in fours. Petals in bud convolute.

1 T. ACULEA'TA (Pers. ench. 249.) prickles on branches recurved; leaflets ovate-oblong. ♄. S. Native of the Mauritius and of the Indian archipelago. Paullínia Asiática, Lin. spec. 524. Scopòlia aculeàta, Smith, ined. 2. p. 34. T. Asiática, Lam. Flowers white, strong-scented.

Var. α, acanthophýlla (D. C. prod. 2. p. 83.) racemes shorter than the leaves; leaves prickly; leaflets ovate-lanceolate. ♄. S. Native of Malabar.—Rheed. mal. 5. t. 41.

Var. β, nítida (Lam. ill. t. 139. f. 1.) racemes longer than the leaves; leaflets ovate, unarmed. ♄. S. Native of Ceylon. Burm. zeyl. p. 28. t. 24.

Var. γ, rubricaúlis (Willd. in Rœm. et Schult. 5. p. 323.) branches pubescent; leaves unarmed; leaflets obovate, acuminated. ♄. S. Native of the East Indies.

Prickly Toddalia. Clt. 1790. Shrub 6 feet.

2 T. ANGUSTIFÒLIA (Lam. ill. no. 2759.) branches unarmed, pubescent; leaflets linear-lanceolate, shining, veined beneath; racemes lateral, shorter than the leaves. ♄. S. Native of the Mauritius and the East Indies. Rubéntia angustifòlia? Boj. Scopòlia angustifòlia, Spreng. syst. 1. p. 779. Flowers white.

Narrow-leaved Toddalia. Clt. 1824. Shrub 6 feet.

3 T. MEGAPOTA'MICA; unarmed; leaflets lanceolate, abruptly acuminated, quite entire, opaque, smooth; panicles axillary, divaricating. ♄. S. Native of Brazil, at Rio Grande. Scopòlia Megapotámica, Spreng. syst. app. p. 91. Flowers white.

Rio Grande Toddalia. Shrub 6 feet.

4 T. VENÒSA; leaflets spatulately-lanceolate, mucronate, quite smooth, shining above, veined beneath; branches warted;

branchlets smooth; racemes axillary. ♄. S. Native of Brazil, at Rio Grande. Scopòlia venòsa, Spreng. syst. app. p. 91.

Veiny-leaved Toddalia. Shrub 6 feet.

Cult. These shrubs thrive best in a mixture of loam, sand, and peat; and cuttings, planted in a pot of sand, will strike root readily, if placed under a hand-glass, in heat.

XLV. VE'PRIS (from *vepres*, a briar or bramble). Andr. Juss. in mem. mus. 12. p. 509. t. 26. no. 41. Toddàlia and Scopòlia, species of authors.

LIN. SYST. *Monœ'cia, Octándria.* Flowers of separate sexes. Calyx short, 4-parted. Petals 4, longer than the calyx, spreading much. Male flowers. Stamens 8, 4 of which are opposite the petals, and are shorter than the others, inserted around the base of the gynophore, which bears the rudiments of 4 ovaries. Female flowers. Ovary seated on a very short, gland-like, 8-lobed gynophore, surrounded by 8 very minute scales, simple, globose, fleshy, 4-celled, each cell containing 2 ovulæ. Stigma sessile, broad, convex, peltate, 4-lobed. Fruit fleshy, dotted, 4-furrowed, 4-celled; cells 1-seeded. Seed egg-shaped, 2-celled, one of which is abortive. Embryo a little arched.—Small trees, with alternate, trifoliate leaves; leaflets entire, quite smooth, reticulated, and full of pellucid dots. Flowers panicled, terminal, male and female on different branches, but not on different plants? Petals in the bud convolute.

1 V. LANCEOLA'TA; leaflets lanceolate, acuminated, shining; panicles terminal. ♄. S. Native of the Mauritius. Toddàlia lanceolàta, Lam. ill. no. 2760. Scopòlia lanceolàta, Spreng. syst. 1. p. 779. Flowers white.

Lanceolate-leaved Vepris. Shrub 6 feet.

2 V. OBOVA'TA; leaflets obovate, bluntish; petioles margined; panicle terminal, corymbose. ♄. S. Native of the Mauritius. Toddàlia paniculàta, Lam. ill. t. 139. f. 2. Scopòlia inérmis, Smith, icon. ined. 2. p. 34. Scop. paniculàta, Spreng. syst. 1. p. 779. V. inérme, Andr. Juss. l. c. t. 26. no. 41. Flowers white.

Obovate-leaved Vepris. Clt. 1824. Shrub 10 feet.

Cult. See *Toddàlia* for cultivation and propagation.

XLVI. PTE'LEA (πτελεα, *ptelea*, the Greek name of the elm, from πταω, *ptao*, to fly; in allusion to the winged fruit). Lin. gen. no. 152. Lam. ill. t. 84. Gært. fruct. 1. t. 40. Kunth, gen. tereb. p. 23. D. C. prod. 2. p. 82. Andr. Juss. in mem. mus. 12. p. 500. t. 26. no. 42. Bellùcia, Adans.

LIN. SYST. *Monoècia, Tetra-Pentándria.* Flowers of separate sexes. Calyx short, 4-5-parted. Petals 4-5, longer than the calyx, spreading much. Male flowers. Stamens 4-5, longer than the petals; filaments thickened below and hairy, inserted around the base of the gynophore, bearing an abortive pistil, much shorter than the stamens. Female flowers. Stamens 4-5, very short, bearing barren anthers. Ovary seated on a convex gynophore, compressed, 2-3-celled, each cell containing 2 ovulæ. Style short, terminated by a 2-3-lobed stigma. Fruit compressed, indehiscent, samara-like, turgid, 2-3-celled, each cell containing 1 seed expanded around into a membranous netted orbicular wing. Seeds oblong. Embryo straight.—Shrubs with alternate, simple, ternate, or quinate leaves, full of pellucid dots; lateral leaflets unequal-sided. Flowers greenish-white, corymbose; cormybs compound, in axillary or terminal panicles; pedicels furnished with bracteas. Male flowers sometimes with 6 or 7 anthers; stamens unequal. Female flowers sometimes with a 3-celled ovary and a 3-lobed stigma.

* *Leaves trifoliate.*

1 P. TRIFOLIA'TA (Lin. spec. 173.) leaflets ovate, acute, middle one tapering much to the base; flowers in corymbs, usually tetrandrous. ♄. H. Native of North America, from New York to Carolina in shady moist hedges, and on the edges of woods among rocks. Flowers small, greenish-white in corymbose clusters.

Var. β, pentaphy'lla (D. C. prod. 2. p. 83.) leaflets 5.

Var. γ, pubéscens (Pursh, fl. amer. sept. 1. p. 107.) leaves pubescent. ♄. H. Native of Pennsylvania.

Shrubby *Trefoil.* Fl. June, July. Clt. 1704. Shrub 10 to 15 feet.

2 P. PENTA'NDRA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 83.) leaflets oval, on short stalks, tapering to both ends; flowers panicled, pentandrous. ♄. G. Native of Mexico. Flowers greenish-white.

Pentandrous Shrubby Trefoil. Shrub 6 to 10 feet.

3 P. PODOCA'RPA (D. C. prod. 2. p. 83.) leaflets ovate, blunt at the base, sessile; corymbs few-flowered; fruit elliptical, on pedicels. ♄. G. Native of Mexico. Pt. trifoliàta, Moc. et Sesse. fl. mex. icon. ined. Flowers greenish-white.

Foot-fruited Shrubby Trefoil. Shrub 10 feet.

* * *Leaves simple.*

4 P. OVA'TA (Lour. fl. coch. 82.) leaves ovate; racemes short, scattered. ♄. G. Native of Cochin-china. Seríngia ovàta, Spreng. syst. 1. p. 441. Stigma simple. Flowers dioecious, the male only having been seen, therefore the genus is very doubtful.

Ovate-leaved Ptelea. Shrub 4 feet.

5? P. MONOPHY'LLA (Lam. dict. vol. 5.) leaves ovate-lanceolate, nearly sessile; flowers racemose; fruit 3-winged. ♄. H. Native of Carolina.

One-leaved Ptelea. Shrub 4 feet.

Cult. The hardy species of *Ptèlea* will grow in any common soil; they are well adapted for shrubberies, and they are generally increased by seeds, which should be sown in a light soil in April, they may also be increased by layers. The greenhouse kinds will thrive well in a mixture of loam and peat; and ripened cuttings will strike root, if planted in a pot of sand, with a hand-glass placed over them.

XLVII. BLACKBU'RNIA (in honour of John Blackburn, an English naturalist). Forst. gen. t. 6. D. C. prod. 2. p. 83. —Blackboúrnea, Kunth, gen. tereb. p. 24.

LIN. SYST. *Dioècia, Tetrándria.* Flowers of separate sexes. Calyx 4-toothed; teeth acute, horizontal. Petals 4, elliptical, hypogynous and valvate when in bud (Kunth). Stamens 4. Ovary conical, 1-seeded. Style filiform. Stigma simple. Berry? 1-seeded.—Treés, with simple or abruptly pinnate leaves. Flowers in axillary racemes or panicles.

1 B. PINNA'TA (Forst. gen. t. 6.) leaves pinnate; leaflets oblong, blunt, unequal at the base; panicles small, axillary. ♄. G. Native of Norfolk Island. Ptèlea pinnàta, Lin. fil. suppl. 126. Samàra Blackbúrnia, Spreng. syst. 1. p. 441. Leaves quite smooth, with 2 or 3 pairs of leaflets. Flowers yellow.

Pinnate-leaved Blackburnia. Tree 20 feet.

2 B. MONADE'LPHA (Roxb. fl. ind. 1. p. 435.) leaves alternate, lanceolate; filaments united at the base; nectary a staminiferous ring surrounding the base of the ovary; berry superior, 1-seeded; seed arillate. ♄. S. Native of the East Indies on the mountainous parts of the Circars. A large, erect, timber-tree; the wood is white, close-grained, and durable; and in the country of its natural growth is employed by the natives for a variety of purposes. Flowers small, yellow, disposed in an axillary, frequently compound raceme. Berry about the size of a cherry; when ripe it has a deep-purple bloom, which makes it very inviting to the eye. Seed of a lively purple colour.

Bark yellowish-green outside, but of a deep red on the inside, tinging the spittle with that colour. It is a strong astringent.

Monadelphous Blackburnia. Tree 60 feet.

Cult. These trees will do well in a mixture of loam, peat, and a little sand; and ripened cuttings will strike root if planted in a pot of sand, with a hand-glass placed over them, in a moderate heat.

XLVIII. AILA'NTUS (*Ailanto* is the name of *A. glandulòsa* in the Moluccas). Desf. in act. acad. par. 1786. p. 263. t. 8. Kunth, gen. tereb. p. 26. D. C. prod. 2. p. 88. Andr. Juss. in mem. mus. 12. p. 511. Pongèlion, Rheed.

Lin. syst. *Polygàmia, Monoècia.* Flowers polygamous. Male ones. Calyx 5-cleft. Petals 5, longer than the calyx, spreading. Stamens 10, the 5 opposite the petals shortest. Disk central, bearing the petals and stamens around its sides, drawn out above into a 5-plicate ring, with 5 minute, distinct ovaries, or fewer, immersed between the plaits of the disk. Hermaphrodite or female flowers, with the calyx, petals, and disk as in the male, but with fewer stamens. Ovaries 3-5, distinct, compressed, each rising from the inner notch of the style, terminated by a spreading stigma. Samaræ 3-5, oblong, tongue-shaped, compressed, membranous, netted, tumid in the middle, and 1-celled; cell 1-seeded; seed compressed. Albumen wanting. Embryo straight, with a short, superior radicle, and leafy cotyledons.—Tall trees, with abruptly or impari-pinnate leaves; leaflets opposite, unequal-sided, entire, or toothed, without dots. Flowers whitish-green or yellowish, disposed in large branched, terminal, fascicled panicles; pedicels furnished with bracteas. Petals twisted in the bud at the apex, the rest convolutely-valvate.

1 A. glandulòsa (Desf. l. c. Lher. stirp. t. 84.) leaves impari-pinnate; leaflets coarsely toothed at the base, furnished with glands beneath the teeth. ♄. H. Native of China and the Moluccas, where it is called *Ailanto.* Ailántus prócera, Sal. prod. 271. Rhus. hypsotodéndron, Mœnch. Rhus. cacodéndron, Ehrh. beitr. 2. p. 111. Rhus. Sinénse, l. c. Ellis. in phil. trans. 49. p. 870. t. 25. f. 5. and vol. 50. p. 446. t. 17. Flowers whitish-green, exhaling a disagreeable odour. Leaves 3 feet long. The tree grows very fast in England, and being handsome, is proper for ornamental plantations. If the bark be wounded, a resinous juice flows out, which hardens in a few days. The wood is hard, heavy, glossy like satin, and is susceptible of a very fine polish. With us the tree has hitherto produced only male flowers; at Paris and Leyden it has borne female flowers and fruit, but the fruit has not ripened. Some years it bears only male flowers, but about twice in ten years it bears both male and female flowers in France. Mr. Miller supposed this to be the *Fasi-no-ki* or spurious varnish-tree of the Japanese, but it is clear he was mistaken, because the leaves of that tree are entire.

Glandular-leaved or Chinese Ailanto. Fl. Aug. Clt. 1751. Tree 60 feet.

2 A. excélsa (Roxb. cor. 1. t. 23.) leaves abruptly pinnate; leaflets coarsely toothed at the base, without glands. ♄. S. Native of the East Indies, on the mountainous parts of the Circars. Flowers whitish-yellow. Leaves 3 feet long, having 10-14 pairs of leaflets. The wood is white and light, but it soon perishes; it is chiefly used to make cattamarans (rafts for fishermen to go a fishing on).

Tall Ailanto. Clt. 1800. Tree 66 feet.

3 A. Molucca'na (D. C. prod. 2. p. 89.) leaves abruptly pinnate; leaflets entire; samaræ acute at both ends, free from each other. ♄. S. Native of the Moluccas. A. integrifòlia var *a*, Lam. dict. 3. p. 417.

Molucca Ailanto. Tree 50 feet.

4 A. Malaba'rica (D. C. prod. 2. p. 89.) leaves abruptly pinnate; leaflets entire; samaræ blunt at both ends, connected together at the base. ♄. S. Native of Malabar. Pongèlion or Perimàrum, Rheed. mal. 6. t. 15. Tree 12 feet in diameter. The wood is made into sheaths for spears, &c. The bruised leaves give an elegant tinge to water. The fruit triturated with mango, and mixed with rice in decoction makes a good injection for *ophthalmia* and *aphalalgia.* There is a resinous juice flows from the bark when wounded.

Malabar Ailanto. Tree 50 feet.

Cult. The *A. glandulòsa* is a very desirable tree for plantations, or to stand singly on lawns; it is easily increased by slips of the roots. The others are stove trees; these will grow freely in a mixture of loam and peat; and the best way to increase these is by pieces of the roots, planted in a pot with their points above the ground, and placed in a hot-bed frame, where they will soon make fine plants.

† *The following genera are allied to Rutàceæ, but they are not sufficiently known to be placed in any particular situation.*

XLIX. POLE'MBRYUM (from πολυ, *poly*, many, and εμβρυον, *embryon*, an embryo; embryos numerous). Andr. Juss. in mem. mus. 12. p. 519. t. 28. no. 49.

Lin. syst. unknown. Fruit almost sessile, echinated, of 5 carpels, connected together by the sides, but at last becoming free. Endocarp cartilaginous, woody, with 2 elastic valves 1-seeded, sometimes probably 2-seeded, separable from the sarcocarp. Seed bluntly ovate or ovate-conical, each marked at the base by a large very black spot under a very thin testaceous integument, embracing the embryos, which are usually 3 in a whorl, inverted, unequal. Cotyledons fleshy, very thick, unequal, dotted, with the radicle hardly exserted. The rest unknown. This genus will probably come near to *Calodéndron*, with which it is commonly called *Wild Chesnut* by the natives of the Cape of Good Hope.

1 P. castaneæca'rpon (St. Hil. in mem. mus. 12. t. 28. no. 49.) ♄. G. Native of the Cape of Good Hope.

Chesnut-fruited Polembryum. Tree?

Cult. See *Calodéndron* for cultivation and propagation.

L. PSEUDIO'SMA (from ψευδης, *pseudes*, false; false Diósma). Andr. Juss. in mem. mus. 12. p. 519.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Petals 5, longer than the calyx. Anthers 5, sessile, connivent. Ovary 5-lobed, girded by a crown-like nectary. Style and stigma simple. Carpels 5, each seated on a separate stipe, somewhat kidney-shaped, each containing a solitary seed, but not calyptrate.—A little tree, with simple, lanceolate, quite entire, smooth, alternate leaves. Flowers yellow, disposed in almost terminal compound racemes.

1 P. Asia'tica. ♄. G. Native of Cochin-china, on mount Hon-chen. Diósma Asiática, Lour. fl. coch. 161.

Asiatic Pseudiosma. Shrub 6 feet.

Cult. This shrub will grow very well in a mixture of loam and peat; and young cuttings will root in a pot of sand under a hand-glass.

LI. THYSA'NUS (from θυσανος, *thysanos*, a fringe; in allusion to the red fringed coat of the seed). Lour. fl. coch. 281. D. C. prod. 2. p. 91. Andr. Juss. in mem. mus. 12. p. 521.

Lin. syst. *Decándria, Tetragýnia.* Calyx of 5 permanent sepals. Petals 5, oblong, equal in length to the calyx, spreading. Stamens 10, short, with reflexed filaments, and roundish erect anthers. Ovary tetragonal. Styles 4, filiform, inserted

in the 4 sides of the ovary, each terminated by a bifid stigma. Drupes 4, oblong, gibbous, recurved at the apex, opening on the side, clothed with wool, each containing a solitary, oblong-ovate, smooth nucleus, enwrapped in a fringed, red, fleshy coat.—An unarmed shrub, with pinnate leaves, and lateral, many-flowered peduncles. Flowers with a reddish calyx, and white petals.

1 T. COCHINCHINE'NSIS (D. C. prod. 1. p. 91.) ♄. G. Native of Cochin-china, in woods. T. Palàta, Lour. l. c. exclusive of the synonyme of Rumph. and therefore of the specific name. Leaflets 10 pairs, oblong, quite entire. The genus is probably allied to *Ailántus*.

Cochin-china Thysanus. Shrub 6 feet.

Cult. See *Ailántus* for cultivation and propagation.

LII. TETRA'DIUM (from τετραδιον, *tetradion*, quaternary; parts of flowers and fruit in fours). Lour. fl. cochin. p. 91. D. C. 2. p. 88. Andr. Juss. in mem. mus. 12. p. 529.

LIN. SYST. *Tetrándria, Tetragýnia*. Flowers hermaphrodite. Calyx short, 4-parted. Petals 4, longer than the calyx. Stamens 4, equal in length to the calyx; filaments thick, awl-shaped, hairy. Ovary 4-lobed. Style wanting. Stigmas 4, awl-shaped, erect. Capsules 4, roundish, opening at the apex. Seeds shining, arillate.—A tree, with impari-pinnate smooth leaves. Flowers whitish, disposed in large, subterminal, trichotomous panicles. This genus will probably come near to *Zanthóxylum*.

1 T. TRICHO'TOMUM (Lour. l. c.) ♄. G. Native of the mountains of Cochin-china. Brùcea trichótoma, Spreng. syst. 1. p. 441. Leaflets quite entire.

Trichotomous-racemed Tetradium. Fl. April, May. Clt. 1822. Tree 20 feet.

Cult. See *Brùcea* for cultivation and propagation.

LIII. PHILAGO'NIA (meaning unknown). Blume, ex Nees in flora, 1825. p. 125. D. C. prod. 2. p. 90. Andr. Juss. in mem. mus. 12. p. 521.

LIN. SYST. *Dioècia, Tetrándria*. Flowers dioecious. Calyx small, 4-toothed. Petals 4, 3 times longer than the calyx, spreading, inserted under the disk, valvate in the bud. Male flowers. Stamens 4, hypogynous, shorter than the petals. Disk annular, obsolete. Female flowers. Filaments 4, without anthers. Ovary depressed, globose, 4-celled, each cell containing 2 ovulæ. Style short, terminated by a large peltate stigma. Fruit capsular tetragonal, 4-furrowed, 4-celled, 8-seeded. Seeds angular.—A tree, with impari-pinnate leaves without dots. Bark and fruit aromatic. This genus will probably come near to *Toddàlia* and *Zanthóxylum*.

1 P. PRO'CERA (Blume, l. c.) ♄. S. Native of Java.

Lofty Philagonia. Tree 60 feet.

Cult. See *Toddàlia* for cultivation and propagation.

LIV. ASAPHE'S (from ασαφης, *asaphes*, obscure; the genus is not well known). D. C. prod. 2. p. 90. Bóscia, Thunb. nov. gen. ups. 1798. but not of Lam. Andr. Juss. in mem. mus. 12. p. 521.

LIN. SYST. *Tetra-Pentándria, Trigýnia*. Calyx very short, 4-5-toothed. Petals 4-5, linear. Stamens 4-5, hypogynous, shorter than the petals. Ovary free. Styles and stigmas 3. Capsules pea-shaped, umbilicate, 4-furrowed, 4-celled, 4-valved, 4-seeded.—A shrub, with the appearance of a Rhus. Leaves alternate, stalked, ternate, rarely binate, but more rarely with the lower ones simple, full of parallel nerves. Flowers panicled, terminal, very minute. This genus will probably come near to *Vèpris*.

1 B. UNDULA'TA (Thunb. fl. cap. 1. p. 576.) ♄. G. Native of the Cape of Good Hope.

Waved-leaved Asaphes. Shrub.

Cult. See *Toddàlia* for cultivation and propagation.

LV. BARRALDE'IA (meaning unknown.) Pet. Th. nov. gen. mad. p. 24. D. C. prod. 1. p. 732.—Baráultia, Steud. nom.

LIN. SYST. *Decándria, Monogýnia*. Calyx urceolar, 5-cleft. Petals 5, small, bifid, unguiculate, inserted in the segments of the calyx. Stamens 10; filaments dilated at the base, 5 of which are opposite the petals, and longer than them, with a glandular circle on the outside of the pistil. Ovary adhering to the tube of the calyx, or immersed in it. Style 1, longer than the stamens. Fruit unknown.—A shrub, with opposite jointed branches. Leaves opposite, smooth, full of pellucid dots, a little toothed. Peduncles short, bifid or trifid. Flowers small, globular, when in the bud abounding in resin. This genus probably comes near to *Calodéndron*.

1 B. MADAGASCARIE'NSIS (Pet. Th. l. c.) ♄. S. Native of Madagascar.

Madagascar Barraldeia. Shrub 6 feet.

Cult. A mixture of loam, peat, and sand will suit this shrub, and ripened cuttings will root in sand under a hand-glass, in heat.

ORDER LX. SIMARU'BEÆ (plants agreeing with *Simaruba* in important characters). Rich. anal. fru. p. 21. D. C. diss. ochn. in ann. mus. 17. p. 423. D. C. prod. 1. p. 733.—Rutàceæ, Tribe Simarùbeæ, Andr. Juss. in mem. mus. 12. p. 512.

Flowers hermaphrodite, rarely of separate sexes from abortion, regular. Calyx of 4 or 5 permanent sepals, hardly connected at the base. Petals 4 or 5, longer than the calyx, spreading, but sometimes conniving into a tube, twisted in the bud, alternating with the sepals, caducous. Stamens double the number of the petals, sometimes longer, at other times shorter, than them; filaments each rising from the back of a hairy hypogynous scale. Anthers birimose. Ovaries 4-5, seated on the gynophore, which bears the stamens at the base, each ovary containing only a single ovula. Styles 4-5, emanating from the tops of the ovaries, connected in one, terminated by a single 4-5-lobed stigma, with the lobes distinct or connate. Drupes 4-5, or fewer from abortion, disposed in a whorl on a common receptacle, indehiscent. Seeds pendulous with a membranous integument. Embryo without albumen, and with a short superior radicle retracted between the cotyledons. Trees or shrubs. Leaves without stipulas, alternate for the most part, pinnate, very rarely simple; leaflets alternate or opposite, without dots. Peduncles axillary or terminal; panicles racemose or umbellate; pedicels furnished with bracteas. Flowers white, greenish, or purplish. This order differs from *Rutàceæ* in the seeds being destitute of perisperm, with a membranous covering instead, and in the radicle being as if it were retracted between the thick cotyledons, and in each ovary containing only a single ovula. It differs from *Ochnàceæ* in having more styles than one, rising from the tops of the ovaries, and in the ovula being suspended, not erect from the base of the cell, as well as in the anthers opening by 2 chinks, not by 2 pores at the apex. All the plants belonging to this order have an intensely bitter bark, a milky juice, and pinnate leaves. The *Simarùba officinàlis* is well known as the most powerful bitter hitherto discovered, the

same property exists, but in a milder degree, in the rest of the order.

Synopsis of the genera.

1 QUA'SSIA. Flowers hermaphrodite. Petals 5, conniving into a tube. Stamens 10. Ovaries 5.

2 SIMARU'BA. Flowers monoecious. Petals 5, spreading. Stamens 5-10. Ovaries 5.

3 SIMA'BA. Flowers hermaphrodite. Petals 4-5, spreading. Stamens 8-10. Ovaries 4-5.

4 SAMADE'RA. Flowers hermaphrodite. Petals 4. Stamens 8. Ovaries 4, seated on a stipe-formed torus.

† *Genera allied to Simarùbeæ.*

5 NÌMA. Flowers hermaphrodite. Petals 5. Stamens 5. Ovaries 5, joined.

6 HARRISÒNIA. Flowers hermaphrodite. Petals 4. Stamens 8. Ovary simple, tapering to the base.

I. QUA'SSIA (Quassi, the name of a negro slave who first used the bark of *Q. amàra* as a febrifuge). D. C. diss. ochn. in ann. mus. 17. p. 423. prod. 1. p. 733. Andr. Juss. in mem. mus. 12. p. 513. t. 27. no. 44. Quássia, spec. Lin. Juss. Gært. Rich.

LIN. SYST. *Decándria, Pentagýnia.* Flowers hermaphrodite. Calyx small, short, 5-parted. Petals 5, much longer than the calyx, connected into a tube. Stamens 10, longer than the petals. Ovaries 5, seated on a broader gynophore. Styles 5, rather distinct at the base, but connected in one towards the top, very long, terminated by a 5-furrowed stigma. Fruit 5, drupaceous.—A tree with alternate, impari-pinnate, smooth leaves, quite entire, opposite leaflets, and winged petioles. Flowers large, scarlet, disposed in simple or branched terminal racemes; pedicels jointed a little under the apex, each bearing 2 bracteas.

1 Q. AMA'RA (Lin. fil. suppl. 235. Lodd. bot. cab. 172. Curt. bot. mag. t. 497. Woodv. med. bot. t. 77. Lin. amœn. acad. 6. p. 421. t. 429.) ♄. S. Native of Surinam, Guiana, Cayenne, Antilles, and the island of Trinidad, in woods. Petioles of leaves reddish. Flowers about an inch long. The bitter *Quássia* is the produce of this tree, whose wood is more powerful than any of the other genera belonging to this order; but being very rare and of small bulk, its place is usually supplied by *Simarùba excélsa*. The wood, bark, and root are all comprehended in the catalogues of the Materia Medica; and it is observed that the leaves, flowers, &c. possess similar qualities. The roots, being perfectly ligneous, may be considered medicinally in the same light with the wood, which is now most generally employed, and seems to differ from the bark in being less intensely bitter, so that the latter is thought to be a more powerful medicine. *Quássia* has no sensible odour; its taste is that of pure bitter, more intense and durable than that of any other substance, and imparts its virtues more completely to watery than to spirituous menstrua, and its infusions are not blackened by the addition of partial vitriol. When the infusion is evaporated to dryness, it leaves a brownish-yellow, somewhat transparent, brittle extract, which has been regarded as a vegetable constituent *sui generis*, and named the bitter principle. (Edinb. phil. trans. 3. p. 207.)

Quássia derived its name, as has been already observed, from a negro named Quassi (by Termin written Coissi, and by Rolander Quass) who employed the wood with uncommon success as a secret remedy in the malignant, endemic fevers, which frequently prevailed at Surinam. In consequence of a valuable consideration, this secret was disclosed to Daniel Rolander, a Swede, who brought specimens of the Quassia-wood to Stockholm in the year 1756; and since that time the effects of this drug have been very generally tried in Europe, and numerous testimonies of its efficacy published by many respectable authors. Its antiseptic powers have been submitted to various trials, from which it has been concluded that it has considerable influence in retarding the tendency to putrefaction; which, in Professor Murray's opinion, cannot be attributed to its sensible qualities, as it possesses no astringency whatever, nor to its bitterness, as Gentian is much more bitter, but less antiseptic. The medicinal virtues ascribed to *Quássia* are those of a tonic, stomachic, antiseptic, and febrifuge; it has been found very effectual in restoring the tone of the stomach, producing appetite for food, assisting digestion, expelling flatulency, and removing habitual costiveness, produced from debility of the intestines, common to a sedentary life. Dr. Lettsom observes, that in hysterical atomy, to which the female sex is so prone, the *Quássia* affords more vigour and relief to the system than the Peruvian bark, especially when united with the *vitriolum album*, and still more with the aid of some absorbent. In dyspepsia, arising from hard drinking, and also in diarrhœas, he exhibited the *Quássia* with great success. Although he does not concur in opinion with Linnæus, who says, "*me quidem judice chinchinam longé* superat," yet he has met with several instances of low remittent and nervous fevers, the symptoms of which the bark uniformly aggravated, though administered in intermissions the most favourable to its success, in which *Quássia* or Snake-root was successfully substituted. Dr. Cullen says (Mat. med. vol. 2. p. 174.) "I believe *Quássia* to be an excellent bitter, and that it will do all that any pure and simple bitter can do; but our experience of it in this country does not lead us to think that it will do more; and the extraordinary commendations given are to be ascribed to the partiality so often shewn to new medicines." It is said to have been given, combined with nitric acid, with evident benefit in typhus, and also in fluor-albus. It may be given in infusion or decoction, which is the best form of administering it; or in pills, made from the watery extract. The infusion is prepared by macerating for two hours, in a lightly covered vessel, a scruple of quassia-wood, chipped, in half a pint of boiling water, and straining it. In hysteria this may be combined with purgatives and tincture of valerian; in atonic gout, with aromatics; and in dyspeptic affections with chalybeates, sulphate of zinc, or mineral acids. The dose is from f. ʒj. to f. ʒiij.. given twice or thrice a-day. The tincture is prepared by digesting for seven days an ounce of chips of quassia-wood in two pints of proof spirit, and then straining. This may be used in the same cases as the infusion. It is asserted that the brewers have, of late years, used quassia-wood instead of hops. Beer made with it certainly does not keep, says Thompson, but soon becomes muddy and flat, has a mawkish taste, and runs into the acetous fermentation. It is consequently less nutritious and wholesome than that which is properly hopped. Woodv. mat. med. Thompson's lond. disp. It subjects those brewers who employ it to a heavy penalty. Quassia-wood evidently has a narcotic power, from its being used to poison flies.

Bitter Quassia. Fl. June, July. Clt. 1790. Tree 20 feet.

Cult. Loam and sand is the best mixture for this tree, and ripened cuttings, with the leaves not shortened, will root in sand, under a hand-glass, in heat.

II. SIMARU'BA (*Simarouba* is the Caribbean name of *S. officinàlis*). Aubl. guian. 2. p. 856. D. C. prod. 1. p. 733. Andr. Juss. in mem. mus. 12. p. 514. t. 27. no. 44.

LIN. SYST. *Monoècia, Octo-Decándria.* Flowers of separate

sexes. Calyx small, cup-shaped, 5-toothed. Petals 5, spreading. Male flowers. Stamens 10, rarely 8, equal in length to the petals, inserted around the base of a very minute gynophore. Female flowers. Ovaries 5, seated on an equal 5-lobed gynophore, which is surrounded at the base by short hairy scales, or abortive stamens. Styles 5, short, distinct at the base, but connected in one at the top, crowned by a single 5-lobed stigma. Fruit 5, drupaceous.—Trees with alternate, pinnate leaves, and alternate, quite entire leaflets, which are shining above. Racemules furnished each with a bractea-like leaf, disposed in axillary and terminal panicles; pedicels furnished with bracteas. Flowers small, hoary, or greenish, with their edges sometimes purple. Leaves, wood, bark, and root intensely bitter.

1 S. officina'lis (D. C. in annal. mus. 17. p. 424. no. 1.) flowers monoecious; male ones decandrous; stigma 5-lobed; leaves abruptly pinnate; leaflets on short petioles, pubescent beneath. ♄. S. Native of South America, particularly in Guiana, Cayenne, and some of the West India islands, in sandy places. Quássia Simarùba, Lin. suppl. 234. Woodv. med. bot. t. 76. Lam. ill. t. 343. f. 2. Simarùba amàra, Aubl. guian. t. 331. Flowers small, yellowish-white, monoecious, but some authors say dioecious. The tree is known in Jamaica by the names of *Bitter Damson*, *Mountain Damson*, and *Slave-wood*. Simarouba or Simaruba, in Materia Medica, is the bark of the roots of this tree; it was first imported into Europe in 1713. This bark, according to Dr. Wright's account of it, is rough, scaly, and warted, the inside, when fresh, is a full yellow, but when dry paler; it has but little smell; the taste is bitter, but not disagreeable. Macerated in water, or rectified spirits, it quickly impregnates both menstrua with its bitterness, and with a yellow tincture. It seems to give out its virtue more perfectly to cold than to boiling water; the cold infusion being rather stronger in taste than the decoction, which last is of a transparent yellow colour whilst hot, grows turbid and of a reddish-brown as it cools. The milky appearance, which Jussieu says it communicates to boiling water, Dr. Wright has not observed in the decoction of any of the specimens he has examined.

The bark was first sent from Guiana to France in 1713, to the Count de Pornchartrain, then secretary of state, as a remedy of great efficacy in dysentery. In the years 1718 and 1723, an epidemic flux prevailed very generally in France, which resisted all the medicines usually employed in such cases; small doses of ipecacuanha, mild purgatives, and all astringents, were found to aggravate, rather than to relieve, the disease; under these circumstances, recourse was had to the *cortex-simaruba*, which proved remarkably successful, and first established its medical character in Europe. Dr. Wright says, " most authors, who have written on the *Simarùba* agree, that in fluxes it restores the lost tone of the intestines, allays their spasmodic motions, promotes the secretions by urine and perspiration, removes the lowness of the spirits attending dysenteries, and disposes the patient to sleep; the gripes and tenesmus are taken off. In a moderate dose it occasions no disturbance or uneasiness, but in large doses it produces sickness at the stomach, and vomiting."

Modern physicians have found from experience, that this medicine is only successful in the third stage of dysentery, where there is no fever, where too the stomach is no way hurt, and where the gripes and tenesmus are only continued by a weakness of the bowels. In such cases Dr. Munro gave two or three drops of laudanum, and found it a very useful remedy. The late Sir J. Pringle, Dr. Huck Saunders, and many others prescribed the *Cortex-simaruba* in old and obstinate dysenteries and diarrhœas, especially those brought from warm climates. Fluxes of this sort, which were brought home from the siege of Martinique and the Havannah, were completely and speedily cured by this bark. Dr. James Lind, at Haslar Hospital, says that the *Cortex-simaruba* produced these effects sooner and more certainly than when given in such quantity as to nauseate the stomach. Dr. Huck Saunders remarks, that if the *Simarùba* did not give relief in three days, he expected little benefit from its further use; but others have found it efficacious in fluxes, after a continued use for several weeks. Sir James Smith's own experience convinces him of the efficacy of this medicine, and he hopes that the *Simarùba-bark* will soon be more generally used than it is.

Dr. Wright recommends two drachms of the bark to be boiled in twenty-four ounces of water to twelve; the decoction is then to be strained, and divided into three equal parts, the whole of which is to be taken in twenty-four hours, and when the stomach is reconciled to this medicine, the quantity of the bark may be increased to three drachms. To this decoction some join aromatics, others a few drops of laudanum to each dose.—Dr. Cullen says, that the virtues ascribed to *Simarùba* have not been ascertained by his own experience, or that of the practitioners of Scotland. Woodv. med. bot. It is given in powder, in doses of half a drachm or a whole drachm; but it is too bulky and very difficultly pulverizable. It is best exhibited in decoction. Two drachms of the bark may be boiled in two pounds of water to one, and the decoction drunk in cup-fulls in the course of the day. (Duncan, edin. disp. p. 452.)

Officinal Simaruba. Clt. 1789. Tree 60 feet.

2 S. glau'ca (D. C. in ann. mus. 17. p. 324. no. 2.) flowers monoecious; male ones decandrous; stigma 5-parted; leaves abruptly-pinnate; leaflets on short petioles, smooth, glaucous. ♄. S. Native of the Island of Cuba, by the sea-side. H. B. et Kunth, nov. gen. amer. 6. p. 16. This species is usually confused with the preceding. The glutinous juice of the bark is exhibited in cutaneous diseases.

Glaucous-leaved Simaruba. Tree 40 feet.

3 S. exce'lsa (D. C. in ann. mus. 17. p. 424. no. 3.) flowers polygamous, pentandrous, panicled; stigma trifid; leaves impari-pinnate; leaflets opposite, stalked. ♄. S. Native of Jamaica, in woods on the lower mountains, and of other West India islands. Quássia excélsa, Swartz in act. holm. 1788. p. 302. t. 8. Quássia polýgama, Wright in edinb. phil. trans. vol. 3. According to the specific character, this plant will probably constitute a distinct genus. The tree is lofty, with a very straight trunk; the wood whitish, moderately close-grained, very bitter, frequently sold by the druggists for the *Quássia amàra*, and found useful in intermittent fevers, debility of the stomach, worms, dropsy, and chlorosis. The wood is also used for making cabinets, for preserving insects, or other natural curiosities; being supposed inaccessible to insects and worms. Clusters panicled, bearing numerous small pale-flowers, some male, the rest hermaphrodite.

Lofty Simaruba. Clt. 1818. Tree 60 feet.

4 S. versi'color (St. Hil: pl. usu. bras. no. 5. and fl. bras. 1. p. 70.) flowers dioecious, decandrous, in loose terminal panicles; leaflets elliptical-oblong, very blunt, retuse, with the mid-rib pubescent. ♄. S. Native of Brazil, in the province of Minas Geraes, where it is called *Paraiba*. Quássia versícolor, Spreng. syst. app. p. 163. Petals greenish-yellow, with purple edges. The inhabitants of the Rio St. Francisco regard the bark as very bitter. It is employed with great success in curing the bites of serpents. It is also used to cure pediculous diseases, both in men and horses.

Party-coloured-flowered Simaruba. Tree 30 feet.

Cult. See *Quássia* for culture and propagation, p. 810.

III. SIMA'BA (the name of *S. Guianénsis* in Guiana). St. Hil. bull. phil. 1823. p. 129. D. C. prod. 1. p. 733. Andr. Juss. in mem. mus. 12. p. 515. t. 27. no. 45. Simàba et Arùba,

Aubl. guian. 1. p. 400 and 293. Zwingèra, Schreb. gen. no. 1752. Phyllostémma, Neck.—Quássia species, Rich.

Lin. syst. *Octo-Decándria, Monogýnia.* Flowers hermaphrodite. Calyx small, 4-5-parted, cleft or toothed. Petals 4-5, broad at the base, spreading, much longer than the calyx. Stamens 8-10, a little shorter than the petals. Ovaries equal in number to the petals, rarely fewer, seated on an equal or broader gynophore. Styles 4-5, distinct at the base, but connected at the top, terminated by a single 4-5-lobed, toothed, or furrowed stigma. Fruit 4-5, drupaceous; drupes usually dry, 1-seeded. —Trees or shrubs, with alternate, ternate, abruptly or impari-pinnate leaves, sometimes, but seldom, simple, on the same branch; leaflets opposite, rarely subalternate, quite entire, for the most part coriaceous, shining, seldom pubescent. Flowers whitish, greenish, or somewhat yellowish flesh-coloured, axillary, but usually terminal, racemose or panicled; pedicels furnished with bracteas. Bark, leaves, and fruit bitter.

1 S. Guiane'nsis (Aubl. guian. 1. p. 400. t. 153.) leaves impari-pinnate, with 1 or 2 pairs of oval-oblong leaflets, taper-pointed at both ends, and emarginate at the apex; racemes axillary. ♄. S. Native of Guiana, in woods. Zwingèra amàra, Willd. spec. 2. p. 569. Flowers white, usually 4-cleft. The bark of this tree is bitter, and most probably possesses the same medicinal qualities as *Quássia amàra*, and *Simarùba excélsa*.

Guiana Simaba. Fl. June. Clt. 1826. Shrub 8 feet.

2 S. Orinoce'nsis (H. B. et Kunth, nov. gen. amer. 6. p. 18. t. 514. *a* et b.) leaves sometimes trifoliate, with the leaflets rising sometimes from the top of the petiole, sometimes abruptly pinnate, with 1-3 pairs of oblong obtuse leaflets; racemes terminal. ♄. S. Native on the banks of the Orinoco, near Carichana.

Orinoco Simaba. Clt. 1818. Tree 20 feet.

3 S. floribu'nda (St. Hil. bull. phil. 1823. p. 129. pl. rem. bras. 1. p. 126. t. 10.) leaves impari-pinnate; leaflets lanceolate-elliptical, oblong, bluntish, smooth; panicle large, compound. ♄. S. Native of Brazil, in the province of Minas Novas.

Bundle-flowered Simaba. Shrub.

4 S. suave'olens (St. Hil. in bull. philom. p. 12. pl. rem. bras. 1. p. 128. t. 11. A.) leaves abruptly-pinnate, upper ones sometimes trifoliate and simple; leaflets elliptical or roundish-elliptical, smooth; flowers terminal, racemose; racemes compound. ♄. S. Native of Brazil, in the province of Minas Geraes.

Sweet-scented Simaba. Fl. March. Shrub.

5 S. ferrugi'nea (St. Hil. l. c. and pl. rem. bras. 1. p. 127. fl. bras. 1. p. 72. t. 14.) leaves impari-pinnate; leaflets elliptical, pubescent, nerved beneath; panicle compound, almost sessile, shorter than the leaves. ♄. S. Native of Brazil, in the province of Minas Geraes. Branches and leaves clothed with rusty pubescence.

Rusty Simaba. Fl. Sept. Tree 20 feet.

6 S. trichilioìdes (St. Hil. l. c. and pl. rem. bras. 1. p. 129. t. 11. B.) leaves impari-pinnate or abruptly pinnate; leaflets elliptical, very blunt, mucronulate at the apex, nerved, pubescent above, and somewhat tomentose beneath; panicle simple, much longer than the leaves, clothed with rufous down. ♄. S. Native of Brazil, in the province of Minas Geraes.

Trichilia-like Simaba. Fl. May. Shrub 8 feet.

7 S. Aru'ba (St. Hil. mss.) leaves trifoliate; leaflets lanceolate, acuminated; racemes terminal. ♄. S. Native of French Guiana. Arùba Guianénsis, Aubl. guian. 1. p. 293. t. 115. Flowers greenish, of 5 or 6 petals. Calyx 5-6-parted. Ovaries 3-6. Stamens 5-8.

Aruba Simaba. Fl. July. Shrub 6 feet.

Cult. The species of this genus are only worth cultivating on account of their medical properties; a mixture of light turfy loam and peat suits them well, and ripened cuttings will root if planted in a pot of sand with a hand-glass placed over them, in heat.

IV. SAMADE'RA (meaning unknown). Gært. fruct. 2. p. 352. t. 156. Andr. Juss. in mem. mus. 12. p. 516. t. 27. no. 46.—Samandùra, Lin. fl. zeyl.—Locándra, Adans.—Vittmánnia, Vahl. symb. 3. p. 51. t. 62.—Niòta, Lam. ill. t. 299. D. C. prod. 1. p. 592. but not of Adans. Biporèia, Pet. Th. gen. mad. p. 14.—Mauduíta, Comm. mss.

Lin. syst. *Octándria, Monogýnia.* Flowers hermaphrodite. Calyx short, 4-parted. Petals 4, much longer than the calyx. Stamens 8, shorter than the petals. Ovaries 4, seated on a narrower, short, stipe-like gynophore. Styles 4, distinct at the base, but connected in one at the apex, much longer than the petals, ending in a single acute stigma. Fruit 4, connected into one drupe.—Trees, with alternate, simple, veiny leaves. Peduncles axillary or terminal, pendulous, terminating in a 5-12-flowered umbel, involucrated, with minute bracteas at the base. Flowers largish, white outside, and blood-coloured on the inside. Divers parts bitter. A fifth part is sometimes added to the flower.

1 S. tetrape'tala; flowers 4-petalled, octandrous; leaves oblong, obtuse, somewhat coriaceous; pericarp compressed, capsule-like; peduncles few-flowered. ♄. S. Native of Madagascar. Niòta tetrapétala, Lam. ill. t. 299. S. Madagascariénsis, Andr. Juss. l. c. Mauduíta penduliflòra, Comm. ined. Vittmánnia ellíptica, Vahl. symb. 3. p. 51. t. 62. Peduncles lateral, bearing at the apex 5 or 6 1-flowered pedicels, disposed in an umbel.

Four-petalled Samadera. Shrub 10 feet.

2 S. pentape'tala; flowers 3-5-petalled, but usually 4-petalled, with an equal number of stamens; peduncles many-flowered, umbellate; pericarp very thick, drupe-like. ♄. S. Native of the East Indies, particularly of Malabar. Niòta pentapétala, Poir. dict. 4. p. 490.—Karin-njotti, Rheed. mal. 6. t. 18. Fruit intensely bitter, as well as the bark.

Five-petalled Samadera. Tree 40 feet.

Cult. See *Simàba* for culture and propagation.

V. NI'MA (the name of the tree in Nipaul). Hamilt. mss. in D. Don, prod. fl. nep. p. 248. Andr. Juss. in mem. mus. 12. p. 516. Simàba spec. D. Don, l. c.

Lin. syst. *Pentándria, Pentagýnia.* Flowers hermaphrodite. Calyx 5-parted, permanent. Petals 5, oblong. Stamens 5; filaments dilated at the base. Ovaries 5, connected together, pilose, seated on the thick disk beneath the petals. Styles 5, connected at the base, but distinct and revolute at the apex, each terminated by a stigma. Capsules 5, or fewer from abortion, roundish, 1-seeded. Embryo large, without albumen.—A tree, with alternate impari-pinnate leaves, having 4 pairs of serrated leaflets. Flowers disposed in panicled corymbs.

1 N. quassioìdes (Hamilt. mss.) ♄. G. Native of Nipaul, in a valley near the town called Thankot. Leaflets elliptical-oblong, acuminated, serrated. Corymbs trichotomous. Simàba quassioìdes, D. Don, prod. fl. nep. p. 248.

Quassia-like Nima. Fl. April. Tree.

Cult. See *Simàba* for cultivation and propagation.

VI. HARRISO'NIA (named after some botanist of the name of Harrison). R. Br. mss. Andr. Juss. in mem. mus. 12. p. 517. no. 47.

Lin. syst. *Octándria, Monogýnia.* Flowers hermaphrodite. Calyx short, 4-cleft. Petals 4, much longer than the calyx. Stamens 8; filaments each inserted on the back of a bifid, fringed scale. Ovary simple, tapering to the base into a stipe, 4-lobed

at the apex, 4-celled, each cell containing 1-ovula. Style rising from between the lobes of the ovary, divided in 4 at the base, but at length simple, terminated by a blunt stigma, which is obscurely 4-furrowed. Fruit baccate, globose, 4-lobed, 4-celled; each cell containing one seed, sometimes sterile. Seed subglobose, pendulous from the apex of the cell, having a double integument, marked at the hilum. Embryo green, with twisted cotyledons, without albumen.—A shrub, with alternate leaves, those at the top of the branches are simple, the rest are ternate; leaflets toothed at the base, lateral ones smallest, and unequal. Peduncles axillary, solitary, simple at the base, but divided at the top into a corymb; pedicels furnished with twin bracteas. Prickles scattered on the branches, rarely twin at the base of the petioles.

1 H. BRÓWNII (Andr. Juss. in mem. mus. 12. t. 28. no. 47.) ♄. S. Native of the island of Timor.

Brown's Harrisonia. Shrub 10 feet.

Cult. See *Simàba* for culture and propagation.

ORDER LXI. DIPTEROCA'RPEÆ (plants agreeing in character with *Dipterocárpus*). Blum. fl. jav. vol. 1. p. 1.—Guttiferàrum sectio Colebr. in asiat. res. 12.—Tiliàceæ, Spreng.

Calyx of 5 leaflets or segments, for the most part concrete at the base (f. 125. *a.*), rarely free, valvate or imbricate in æstivation. Petals 5 (f. 125. *b.*), hypogynous, joined into a subrotate corolla, twisted in æstivation (f. 125. *d.*). Stamens usually indefinite (f. 125. *c.*), hypogynous, free or connected a little at the base, sometimes irregularly polyadelphous; filaments dilated at the base; anthers erect, elongated (f. 125. *c.*), awl-shaped, 2-celled, bursting at the apex by 2 pores. Ovary one, free, few-celled; cells 2-ovulate. Ovulæ pendulous, fixed to the inner angle of the cells. Style 1, undivided, crowned by a simple stigma. Fruit girded by a thick corticate pericarp (f. 125. *e.*), and by a more or less extended calyx (f. 125. *f.*), 1-celled and 1-seeded from abortion, 3-valved, indehiscent. Seeds without albumen, umbilicate at the base. Embryo with chrysalis-like contortuplicate, or unequally and obliquely incumbent cotyledons, and an inferior or superior radicle.—Elegant trees, full of resinous turbid juice. Leaves stalked, alternate, entire, feather-nerved, articulately inserted, involute before expansion. Stipulas oblong, deciduous, convolute, as in *Ficus*, and therefore the branches are terminated by a conical acumen, which at length divides and falls off. Peduncles racemose, axillary, near the tops of the branches, or constituting a terminal racemose panicle. Flowers yellow or white, mixed with red. This order agrees with *Ochnàceæ* in the anthers being terminated by a beak, and opening by two pores, by their unilocular fruit, by the absence of albumen, and lastly by their alternate leaves, furnished with membranous caducous stipulas. The order is remarkable for containing the camphor tree of Sumatra, and many others of the species produce camphor, although of an inferior quality.

Synopsis of the Genera.

§ 1. *Radicle superior.*

1 DIPTEROCA'RPUS. Calyx 5-cleft (f. 125. *a.*), 2 of the segments are very large, long, and opposite (f. 125. *f.*). Petals 5 (f. 125. *b.*). Stamens numerous (f. 125. *c.*). Anthers long, linear (f. 125. *c.*). Fruit 1-seeded (f. 125. *e.*).

2 SHÒREA. Calyx of 5 sepals, all of which are extended into wings. Petals 5. Stamens 25-30. Anthers short. Fruit 1-seeded.

3 DRYOBA'LANOPS. Calyx 5-cleft, all the segments growing into broad reflexed wings. Petals 5. Anthers? Fruit 1-seeded.

4 HÒPEA. Calyx of 5 sepals, 2 of them lengthened into wings. Corolla 5-cleft. Stamens 10, inserted in the tube of the corolla, alternate ones bearing 2 anthers each. Anthers short. Capsule 1-seeded.

5 VATE'RIA. Calyx 5-cleft. Petals 5. Stamens 40-50. Anthers long, linear. Capsule 1-seeded.

§ 2. *Radicle inferior.*

6 LOPHÌRA. Calyx of 5 sepals, 3 small, and one very long, large, and strap-shaped, the one opposite this is 3 times smaller. Petals 5. Stamens numerous. Anthers linear? Fruit 1-seeded.

§ 1. *Dipterocárpæ. Radicle superior.*

I. DIPTEROCA'RPUS (from δις, *dis*, twice, and πτερυξ, *pteryx*, a wing, and καρπος, *karpos*, a fruit; in allusion to two of the segments of the calyx being extended into long wings (f. 125. *f.*). Gært. fruct. suppl. p. 50 and 52. Roxb. cor. 3. p. 10. Blum. fl. jav. vol. 1. Pterýgium, Corr. in ann. mus. 8. p. 397 and 398.

LIN. SYST. *Polyándria, Monogýnia.* Calyx irregularly 5-cleft (f. 125. *a.*), 2 of the segments are extended into long and ligulate wings (f. 125. *f.*). Petals 5 (f. 125. *b.*), convolute in æstivation (f. 125. *d.*). Anthers long, linear (f. 125. *c.*). Fruit rather woody (f. 125 *e.*), 1-celled, 1-seeded from abortion. Cotyledons leafy, contortuplicate. Large trees, containing resinous juice. Flowers shewy white, mixed with red.

1 D. TRINE'RVIS (Blum. fl. jav. 1. p. 11. t. 1. bijdr. 223.) leaves oval, acutish, rounded at the base, and are, as well as the linear attenuated buds, smooth; the two largest segments of the calyx very long, oblong-lanceolate, and obtuse. ♄. S. Native of Java.

Var. β, élegans (Blum. l. c.) leaves subcordate at the base, longer than the buds.

Var. γ, canéscens (Blum. l. c.) leaves smaller, hoary on the rib beneath; racemes elongated.

Three-nerved-leaved Dipterocarpus. Tree 150 to 200 feet.

2 D. RETU'SUS (Blum. fl. java, 1. p. 4. t. 2. bijdr. 223.) leaves oval, acute, pubescent on the rib beneath, as well as the petioles and branches; buds conically-subulate, villous; the 2 largest segments of the calyx oblong and retuse. ♄. S. Native of Java.

Retuse-winged Dipterocarpus. Tree 100 feet.

3 D. SPANO'GHEI (Blum. fl. jav. 1. p. 16. t. 3.) leaves ovate, bluntish, rounded at the base, pubescent on the ribs beneath, as well as the petioles and branches; buds conical, attenuated, villous; the 2 longest segments of the calyx oblong and obtuse. ♄. S. Native of Java.

Spanoghe's Dipterocarpus. Tree 100 feet.

4 D. LITTORA'LIS (Blum. fl. jav. 1. p. 17. t. 4. bijdr. 224.) leaves oval, acute, subcordate at the base, pubescent on the ribs; buds conically-oblong, silky-villous; the 2 longest segments of the calyx lanceolate and obtuse. ♄. S. Native of Java.

Shore Dipterocarpus. Tree 80 feet.

5 D. GRA'CILIS (Blum. fl. jav. 1. p. 20. t. 5. bijdr. 224.) leaves oval-oblong, acute, obtuse at the base, covered with stel-

late pubescence beneath; buds linear, tomentose; the 2 longest segments of the calyx obtuse. ♄. S. Native of Java.

Slender-budded Dipterocarpus. Tree 100 to 150 feet.

6 D. TURBINA'TUS (Roxb. cor. 3. p. 10. t. 213.) leaves ovate-oblong, entire or serrated, smooth and shining, acute, but rounded at the base; buds conically-lanceolate, downy; the 2 longest segments of the calyx lanceolate, obtuse. ♄. S. Native of Chittagong, Tepperah, and Pegu, and the countries northward of Bengal. Flowers white. This tree is famous over the eastern parts of India and the Malay islands, on account of its yielding a thin liquid balsam, commonly called *Wood-oil*, which is much used for painting ships and houses in India. A large notch is cut into the trunk of the tree near the earth, where a fire is kept until the wound is charred, soon after which the liquid begins to ooze out. A small gutter is cut in the wood to conduct the fluid into a vessel placed to receive it. These operations are performed during the months of November, December, January, and February; and should any of the trees appear sickly the following season, one or more years' respite is given them.

FIG. 125.

Turbinate Dipterocarpus. Tree 100 to 150 feet.

7 D. ALA'TUS (Roxb. hort. beng. 42.) leaves ovate-elliptic, tapering to both ends, pubescent on both surfaces as well as the branches and petioles; the 2 large segments of calyx lanceolate and obtuse. ♄. S. Native of Pegu.

Winged Dipterocarpus. Tree 100 feet.

† *Species only known by name from Roxburgh's hortus bengalensis, p. 42. and p. 93.*

8 D. COSTA'TUS (Roxb. l. c. p. 42.) ♄. S. Native of Chittagong.

9 D. INCA'NUS (Roxb. l. c.) ♄. S. Native of Chittagong.

10 D. TUBERCULA'TUS (Roxb. l. c. p. 93.) ♄. S. Native of Chittagong.

11 D. PILÒSUS (Roxb. l. c. p. 93.) ♄. S. Native of Mascal Island.

Cult. A mixture of loam, peat, and sand will suit these fine trees; and ripened cuttings will root if planted in a pot of sand with a hand-glass placed over them, in heat.

II. SHO'REA (named in honour of the Right Hon. Lord Teignmouth, late governor of Bengal). Gært. fruct. 3. p. 48. t. 186. Roxb. cor. 3. p. 10. t. 212.

LIN. SYST. *Polyándria, Monogýnia.* Calyx of 5 sepals, enlarging into 5 long wings. Petals 5, twisted in the bud, rather silky on the outside. Stamens 25-30, lower half broad and membranous. Anthers short. Fruit 1-celled, 3-valved, 1-seeded. Cotyledons fleshy, stalked, obliquely incumbent.—A large tree, with panicles of yellow flowers.

1 S. ROBU'STA (Roxb. l. c.) leaves cordate, oblong, entire, smooth, on short petioles; calyx pubescent, as well as the branches of the panicle. ♄. S. Native of the skirts of the northern mountains of India. The wood of this tree is in very general use near Bengal for beams, rafters, and various economical purposes; it is of an uniform light-brown colour, close grained, and heavy, but at the same time it does not appear to be very durable, and on that account greatly inferior to teak, but in strength it certainly surpasses it, and deserves to be considered the second timber tree of India, as the teak is considered the first. This tree yields large quantities of a resin commonly called *Dammer* in India, which is very generally used as a substitute for pitch in the marine yard. The best pieces are commonly used instead of the common incense (Benzoin) in the temples of the Hindoos.

Robust Shorea. Tree 100 to 150 feet.

2 S. ROXBU'RGHII; smooth; leaves coriaceous, oval, rather emarginate at the point; calyx smooth, as well as branches of panicle. ♄. S. Native of the East Indies. Differs from *S. robústa* in being smooth.

Roxburgh's Shorea. Tree 100 feet.

† *Species the names of which are only known from Roxburgh's hortus bengalensis.*

3 S. TUMBUGGA'IA (Roxb.) from Coromandel.

4 S. LONGISPE'RMA (Roxb.) from Prince of Wales Island.

5 S. TALU'RA (Roxb.) from Ballaghat?

Cult. See *Dipterocárpus* for culture and propagation.

III. DRYOBA'LANOPS (δρυον, *dryon*, a forest, and βαλανος, from βαλλω, *ballo*, to let grow, incense; the resin is used as incense). Gært. fruct.—Coleb. in asiat. res. 12. p. 535. with a figure.

LIN. SYST. *Polyándria, Monogýnia.* Calyx 5-cleft, all the segments growing into broad reflexed wings. Petals 5, convolute in the bud. Anthers? Fruit 3-valved, 1-celled, 1-seeded. Cotyledons fleshy, contortuplicate.—A large tree, with panicles of yellow flowers, and elliptic, obtusely acuminated, entire, coriaceous, shining leaves, lower ones opposite, on short stalks. Stipulas awl-shaped.

1 D. CA'MPHORA (Colebr. in asiat. res. l. c.) ♄. S. Native of Sumatra and Borneo. D. aromàtica, Gært. Shòrea camphorífera, Roxb. Camphor is extracted from the *Laúrus Cámphora*, with the aid of heat, but the natural camphor, in substance and of the greatest value, is furnished by this tree. Some of the trees are 6 or 7 feet in diameter, but it will produce camphor at a much earlier period, when the tree does not exceed 2 or $2\frac{1}{2}$ feet in diameter. The same tree which yields oil would have produced camphor if unmolested, the former being supposed to be the first stage of the latter forming, and is consequently found in younger trees. The natives have no certain means of ascertaining the tree which produces either the one or the other, although there are some men, styled Toongoo Nyr Cappoor, who pretend to that knowledge, but they cannot give any reason for their judgment, beyond favourable dreams which superstition has rendered infallible; but it must be admitted that this description of people succeed better than others who go in search of camphor. Both oil and camphor are found in the heart of the tree, occupying a vacuum, which in others is frequently filled with pitch; but it does not extend to the whole length, on the contrary they are found in small portions of a foot and a foot and a half long at certain distances. The method of extracting the oil is merely by making a deep incision with a Malay axe in the tree about 18 inches from the ground till near the heart, where a deeper incision is made, with a small aperture, and the oil, if any, in the tree gushes out, and is received in bamboos or any other utensil; in this manner a party proceeds through the woods wounding the camphor trees, till they attain their object. The camphor is pretty nearly obtained in the same way. The trees are cut to the heart about the same height from the ground, as in the former instance, till the camphor is seen; hundreds may be thus mutilated before the sought for tree is discovered. When attained, it is felled, and cut into junks of a fathom long, which are again split, and the camphor is found in the heart, occupying a space in circumference of the thickness of a man's

arm. The produce of a middle-sized tree is about 11 pounds, and of a large one double that quantity. The camphor thus found is called Se Tantong. It is often the case that the trees which have been thus cut, and left standing in that state, in 7 or 8 years after will again produce camphor, which is distinguished by the name of Oogar, but is inferior in appearance to the first, though of the same quality. The sorts of camphor called belly and foot are the scrapings of the wood which surrounds it. The camphor obtained from this tree is much more pure than that obtained from any other plant. Camphor is also obtained from the roots of the *Cinnamon*, *Alpìnia*, *Galánga*, *Amòmum Zedoària*, and several other plants; but as the *Laúrus Cámphora* furnishes nearly all the camphor of the shops, we shall give the qualities and uses of camphor more particularly under that head.

Sumatra *Camphor*-tree. Tree 100 feet.

Cult. See *Dipterocárpus* for culture and propagation.

IV. HO'PEA (in honour of John Hope, M.D. once professor of botany at Edinburgh, who died in 1786; he was one of the earliest lecturers on vegetable physiology, as well as a profound practical botanist). Roxb. cor. 3. p. 9. t. 210.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx of 5 sepals, 2 of which are extended into wings. Corolla 5-cleft, convolute in æstivation. Stamens 10, inserted in the throat of the corolla, alternate ones bearing each 2 anthers. Anthers short. Fruit of a tender texture, 1-celled, 1-seeded.—A large tree, with terminal panicles of small, fragrant, yellow flowers.

1 H. odora'ta (Roxb. l. c.) ♄. S. Native of Chittagong. Leaves on short stalks, ovate-oblong, shining, bifarious, waved, smooth, of a deep green. Flowers secund along the ramifications of the panicle.

Sweet-scented Hopea. Tree 80 feet.

† *Species only known by name from Roxb. hort. beng. p. 42. and 93.*

2 H. Sca'phula (Roxb. hort. beng. p. 93.) ♄. S. Native of Mascal Island.

3 H. eglandulòsa (Roxb. l. c. p. 42.) ♄. S. Native of Tipperah.

Cult. See *Dipterocárpus* for propagation and cultivation.

V. VATE'RIA (in honour of Abraham Vater, once professor of medicine at Wirtemberg, author of some botanical dissertations on the balsam of Mecca; he died in 1751). Lin. gen. 269. Roxb. cor. 3. p. 86. t. 288.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx 5-cleft; segments at length reflexed. Petals 5, oval, emarginate, twisted in the bud. Stamens 40-50, short, inserted between the petals and the base of the germ. Anthers long, linear. Capsule 3-valved, 1-celled, and 1-seeded. Cotyledons stalked.—Large trees, with entire, smooth, coriaceous leaves, and terminal panicles of white flowers. Anthers yellow.

1 V. I'ndica (Lin. spec. 734. Roxb. cor. l. c.) leaves oblong; flowers rather remote on the ramifications of the panicle; stipulas oblong. ♄. S. Native of Malabar. Elæocárpus copallíferus, Retz, obs. fasc. 4. p. 27.—Rheed. mal. 4. p. 33. t. 15. In the Bidinose country this tree is called *Dammer-tree*. When wounded it discharges a clear, pellucid, fragrant resin, acrid and bitter to the taste, at length becoming yellow and brittle like glass. This, according to König, is one kind of copal. Persons experienced in the use of this gum, so useful for varnishing anatomical preparations, know that there are several different things imported under the same name, which are not all equally soluble even in oil of lavender. The true gum copal is not from this tree, but it generally goes under that name in India; the best specimens of the gum are employed as ornaments under the name of amber (Kahroba), to which it bears exterior resemblance. In its recent and fluid state it is used as a varnish in the south of India, and dissolved by heat in closed vessels it is employed for the same purpose in other parts of India.

Indian Copal-tree. Tree 80 feet.

2 V. lanceæfòlia (Colebr. asiat. res. 12. p. 538.) leaves lanceolate. ♄. S. Native of the East Indies. This tree affords a resin, from which, as from other resins, the Indians prepare one of the materials of their religious oblations.

Lance-leaved Copal-tree. Tree 60 feet.

Cult. See *Dipterocárpus* for cultivation and propagation.

§ 2. *Lophìræ. Radicle inferior.*

VI. LOPHI'RA (from λοφος, *lophos*, a crest; in allusion to one of the sepals being extended out into a ligulate wing or crest). Gært. fruct. 3. p. 52 and 53. t. 188. Pers. ench. 2. p. 80.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx of 5 sepals, 3 of which are very small, one very large, and ligulate with the one opposite it, 3 times smaller than it. Corolla of 5 petals. Stamens numerous. Anthers short? Fruit 1-celled, 1-seeded, indehiscent, fleshy, soft.—Shrubs and trees, with long leathery pale-green leaves, resembling those of *Theophrásta*, with terminal and axillary short racemes of white flowers.

1 L. Africa'na (Gært. l. c.) leaves long-lanceolate, emarginate. ♄. S. Native of Sierra Leone, very common in dry places near Freetown, where it is called *Scurby* or *Scruby oak*. A small branching tree.

African Scruby-oak. Fl. Feb. Clt. 1822. Tree 10 to 15 ft.

2 L. si'mplex; leaves long, lanceolate, obtuse at the apex. ♄. S. Native of Sierra Leone, on the mountains. This tree grows with a tall, straight, slender trunk, without branches, but with a tuft of leaves at the apex.

Simple-stemmed Scruby-oak. Tree 30 feet.

Cult. A mixture of loam and sand will suit these fine trees. The species have got tap roots, therefore they should be planted in as deep pots as possible, in order to give room to the roots to descend, or they will not live; at the same time they require to be kept rather dry. Ripe cuttings will probably root in sand under a hand-glass, in heat.

Cohort IV. *Fruit gynabasic, inserted in a fleshy receptacle, with which the style is continuous.*

Order LXII. OCHNA'CEÆ (plants agreeing with *Ochna* in important characters). D. C. ann. mus. 17. p. 398. rec. mem. 1813. no. 5. D. C. prod. 1. p. 735.

Calyx of 5 sepals, which are hardly connected at the base, permanent (f. 126. *b.*), imbricate in the bud. Petals 5, hypogynous (f. 126. *d.*), caducous alternating with the sepals, rarely 10, spreading, imbricate in the bud. Stamens 5, alternating with the petals, or 10, or indefinite (f. 126. *c.*), inserted in the hypogynous disk, usually permanent; anthers bilocular, inserted by the base. Ovaries equal in number to the petals. Style 1, filiform, permanent, widened at base, bearing the ovaries on the subglobose fleshy disk (f. 126. *e.*) called a gynobase. Carpels 1-seeded, indehiscent, inserted round the base of the style in a whorl (f. 126. *b.*), somewhat drupaceous. Seeds without albumen. Embryo straight, with a short radicle, and 2 thick cotyledons.—Tropical smooth trees and shrubs abounding in a watery juice. Leaves alternate, simple, feather-nerved, entire, or toothed, with 2 caducous stipulas at the base of each. Flowers

racemose, for the most part yellow; pedicels jointed in the middle or beneath the middle, rarely solitary. The roots and leaves of *Walkèra serràta* are used in Malabar in decoction, either in milk or water, as a tonic, stimulant, stomachic, and anti-emetic.

Synopsis of the genera.

1 O'chna. Petals 5-10. Stamens numerous; filaments filiform; anthers linear or ovate, bursting lengthwise by 2 chinks.

2 Go'mphia. Petals 5. Stamens 10; filaments almost wanting; anthers long, erect, bursting by 2 pores at the apex.

3 Walke'ra. Petals 5. Stamens 5. Anthers ovate.

4 Elva'sia. Sepals and petals 4. Stamens 8; filaments longish; anthers opening by 2 pores at the apex.

5 Caste'la. Calyx 4-toothed. Petals 4. Stamens 8. Anthers inverted.

I. O'CHNA (from *οχνη, ochne*, the Greek name for the wild pear; the present genus has some resemblance to a pear in foliage). Schreb. gen. no. 354. D. C. in mem. mus. 17. p. 410. prod. 1. p. 735.—O'chna, spec. Lin.

Lin. syst. *Polyándria, Monogýnia.* Petals 5-10. Stamens numerous; filaments filiform, permanent; anthers linear or ovate, opening from the base to the top by a double chink.—Buds scaly. Flowers all yellow, rising in racemes from below the leaves from the wood of the preceding year.

* *Stigmas capitate.*

1 O. obtusa'ta (D. C. in ann. mus. 17. p. 411. t. 1.) petals 8-10; leaves obovate, very blunt, serrated. ♄. S. Native of the East Indies. O'chna squarròsa, Lin. spec. 731.? Roxb. cor. t. 89. This tree is called *Bokaerae* in Ceylon, and *Yerrajuvre* by the Telingas. Flowers large, inodorous.

Obtuse-leaved Ochna. Fl. July, Aug. Clt. 1790. Tr. 12 ft.

2 O. lu'cida (D. C. l. c. no. 2.) petals 7-10; leaves obovate or oblong-ovate, acute, serrated. ♄. S. Native of the East Indies.

Var. α; leaves obovate. O. lùcida, Lam. ill. t. 472. f. 1.

Var. β; leaves oblong-ovate. O. squarròsa, Rottb. in act. dan. 2. p. 445. t. 6. exclusive of the synonyms.

Shining-leaved Ochna. Fl. July, Aug. Clt. 1819. Sh. 6 ft.

3 O. nítida (Thunb. prod. 67.) petals 5; leaves oblong, acute, serrated; racemes short, crowded. ♄. S. Native of the East Indies. D. C. l. c. no. 3. t. 2. Petals scarcely longer than the calyx.

Nitid-leaved Ochna. Clt. 1816. Shrub 6 feet.

4 O. multiflòra (D. C. l. c. no. 4. t. 3.) petals 5; leaves oval-oblong, acuminated, almost entire; racemes and pedicels very long. ♄. S. Native of Sierra Leone, in bushy places near the river-side, about Freetown.

Many-flowered Ochna. Fl. Feb. May. Clt. 1823. Sh. 6 ft.

5 O. cilia'ta (Lam. dict. 4. p. 511.) stigma a little lobed; petals 5; leaves oval-oblong, serrately-fringed; racemes short, few-flowered. ♄. S. Native of Madagascar.

Fringed-leaved Ochna. Shrub 6 feet.

6 O. atropurpu'rea (D. C. l. c. no. 5.) pedicels solitary, 1-flowered; petals 5? leaves ovate, acutely toothletted; lobes of calyx ovate. ♄. S. Native of the Cape of Good Hope.—Pluk. alm. t. 263. f. 1 and 2. Burch. cat. no. 4126. Calyx purple. Petals yellow.

Dark-purple-calyxed Ochna. Clt. 1816. Shrub 4 feet.

7 O. parvifòlia (Vahl. symb. 1. p. 33.) pedicels solitary, 1-flowered; leaves ovate, serrulated; petals 5? lobes of calyx oval-oblong. ♄. S. Native of Arabia Felix. D. C. l. c. no. 9. t. 19. Euónymus inérmis, Forsk. ægyp. t. 204.

Small-leaved Ochna. Shrub 5 feet.

8 O. lanceola'ta (Spreng. syst. 2. p. 597.) leaves lanceolate, crenated; peduncles usually solitary, shorter than the leaves. ♄. S. Native of Malabar.

Lanceolate-leaved Ochna. Shrub 6 feet.

9 O. pu'mila (Hamilt. in D. Don, prod. fl. nep. 224.) stigma capitate? flowers subumbellate, terminal; pedicels much longer than the peduncle, furnished with numerous bractea-like scales; stem simple, erect. ♄. G. Native of Nipaul, in a wood called Terriany.

Dwarf Ochna. Fl. Mar. Shrub 1 foot.

** *Stigmas many-parted.*

10 O. Mauritia'na (Lam. dict. 4. p. 522.) petals 5-6; leaves oblong-oval, acute, toothletted; petals 3-times longer than the calyx. ♄. S. Native of the Mauritius, where it is called *Bois de Jasmin.* D. C. l. c. no. 8. t. 5. Racemes short; pedicels long. An elegant shrub, with whitish flowers, resembling those of jasmine.

FIG. 126.

Mauritian Ochna. Clt. 1822. Shrub 6 feet.

11 O. Madagascarie'nsis (D. C. l. c. no. 7.) petals 5; leaves oblong, shining, a little serrated; petals equal in length to the calyx. ♄. S. Native of Madagascar. Racemes simple, many-flowered.

Madagascar Ochna. Shrub 6 feet.

12 O. arbo'rea (Burch. cat. ined. no. 4012. D. C. prod. 1. p. 736.) flowers solitary, or 2 or 3 in a raceme; petals 5; anthers linear, with 2 pores at the apex; leaves oval-oblong, almost entire. ♄. G. Native of the Cape of Good Hope.

Tree Ochna. Clt. 1823. Tree 20 feet.

Cult. Fine shrubs, bearing beautiful leaves and flowers, therefore the species are worth cultivating in every collection of stove plants. They will thrive well in a mixture of loam and peat; and cuttings will strike root if planted in a pot of sand, with a hand-glass placed over them, in a moderate heat.

II. GO'MPHIA (from *γομφος, gomphos*, a club; shape of fruit). Schreb. gen. p. 291. D. C. in mem. mus. 17. p. 414. prod. 1. p. 736.—Ochna species, Lin.

Lin. syst. *Decándria, Monogýnia.* Petals 5. Stamens 10; filaments almost wanting; anthers long, pyramidal, erect, opening at the apex by 2 pores.—Racemes simple or compound, terminal. Flowers of all yellow.

* *Leaves quite entire.*

1 G. grandiflòra (D. C. l. c. no. 19. t. 17.) leaves ovate-lanceolate, blunt at the base, long-acuminated; petals large, rather orbicular, a little longer than the calyx; racemes panicled. ♄. S. Native of Brazil at Rio Negro.

Great-flowered Gomphia. Shrub 4 feet.

2 G. aqua'tica (H. B. et Kunth, nov. gen. amer. 6. p. 14.) leaves oblong, acutish, rounded at the base, obsoletely veined; racemes elongated, almost simple; petals a little longer than the calyx. ♄. S. Native of South America, on the banks of the river Orinoco, near Javita. Cittorhynchus Javitènsis, Willd. herb.

Aquatic Gomphia. Tree 20 feet.

3 G. cassinefòlia (D. C. l. c. no. 21. t. 18.) leaves ovate,

somewhat cordate at the base, obtuse at the apex; racemes simple. ♄. S. Native of Brazil. Flowers yellow.

Cassine-leaved Gomphia. Shrub 6 feet.

4 G. laurifòlia (Swartz, fl. ind. occ. 2. p. 741.) leaves oblong, taper-pointed at both ends, shining. ♄. S. Native of Jamaica, on the mountains, and of Cayenne. Racemes panicled.

Laurel-leaved Gomphia. Clt. 1823. Shrub 8 feet.

5 G. oleæfòlia (St. Hil. bull. philom. 1823. p. 129.) leaves oblong-lanceolate, bluntish, pubescent, with revolute edges; flowers panicled; petals a little longer than the calyx. ♄. S. Native of Brazil. St. Hil. pl. rem. bras. 1. p. 124. t. 9.

Olive-leaved Gomphia. Shrub 10 feet.

6 G. longifòlia (D. C. l. c. no. 8. t. 10.) leaves lanceolate, acute, cordate at the base, very long, a little toothed at the apex; carpels globose; flowers crowded, panicled. ♄. S. Native of Guadaloupe. O'chna longifòlia, Lam. dict. 4. p. 511.

Long-leaved Gomphia. Shrub 6 feet.

7 G. Guiane'nsis (Rich. act. soc. nat. par. 1. p. 168.) leaves oblong, broad, blunt at both ends; carpels globose; racemes panicled; flowers crowded. ♄. S. Native of Guiana and Brazil. D. C. l. c. no. 7. t. 9. Ouratèa Guianénsis, Aubl. guian. 1. t. 152? Leaves a little serrated.

Guiana Gomphia. Shrub 6 feet.

8 G. obtusifòlia (D. C. l. c. no. 4. t. 8.) leaves lanceolate, very blunt, or emarginate at the apex, tapering to the base; stipulas intra-axillary, permanent; racemes panicled, with short somewhat angular branches. ♄. S. Native of Madagascar. O'chna lævigàta, Vahl. symb. 2. p. 49. O'chna obtusifòlia, Lam. dict. 4. p. 510.

Obtuse-leaved Gomphia. Shrub 6 feet.

9 G. parviflòra (D. C. l. c. no. 18. t. 16.) quite smooth; leaves oblong-lanceolate, acuminated, acute at both ends; panicle slender, rather loose, few-flowered; flowers small; petals oblong, a little longer than the calyx. ♄. S. Native of Brazil. Racemes panicled.

Small-flowered Gomphia. Shrub 6 feet.

* * *Leaves almost quite entire.*

10 G. parvifòlia (St. Hil. fl. bras. 1. p. 65.) leaves nearly sessile, small, ovate, very blunt at the base, hardly serrated at the apex, pubescent beneath as well as the branches and panicles; flowers crowded, bracteate; petals obovately orbicular. ♄. S. Native of Brazil, in the province of Minas Geraes.

Small-leaved Gomphia. Shrub 4 feet.

11 G. floribu'nda (St. Hil. fl. bras. 1. p. 64.) quite smooth; leaves crowded, imbricate, oblong, acutish at both ends, obsoletely serrated; racemes panicled, bracteate; flowers crowded; petals obovately-orbicular. ♄. S. Native of Brazil, in the province of Minas Geraes.

Var. β, màjor (St. Hil. l. c.) leaves longer and broader, less acute; flowers less numerous.

Bundle-flowered Gomphia. Shrub 3 to 4 feet.

12 G. suave'olens (St. Hil. fl. bras. 1. p. 63.) quite smooth; leaves oblong, acuminated, almost quite entire, nearly veinless; panicle terminal, compact; flowers very numerous, small; petals about the length of the calyx; anthers smooth. ♄. S. Native of Brazil. Flowers small, sweet-scented.

Sweet-scented Gomphia. Fl. March. Shrub 6 feet.

13 G. cuspida'ta (St. Hil. fl. bras. 1. p. 67.) quite smooth; leaves large, oblong, blunt, cuspidate, obsoletely serrated, lower ones quite entire; racemes terminal; anthers wrinkled transversely. ♄. S. Native of Brazil, in the province of Rio Janeiro.

Pointed-leaved Gomphia. Fl. Oct. Shrub 10 feet.

* * * *Leaves subserrated, serrated, toothed, and toothletted.*

14 G. Zeyla'nica (D. C. l. c. no. 1.) leaves oblong, acuminated at both ends, a little toothletted; racemes elongated; carpels globose. ♄. S. Native of Ceylon.—Burm. zeyl. 123. t. 26. O'chna Zeylánica, Lam. dict. 4. p. 612. In Ceylon this shrub is called *Bokæræ*.

Ceylon Gomphia. Clt. 1823. Shrub 5 feet.

15 G. depe'ndens (D. C. l. c. no. 2. t. 6.) leaves oblong-lanceolate, a little toothed, acuminated at both ends; stipulas intra-axillary, permanent; racemes very long, simple, dependent. ♄. S. Native of Madagascar.

Dependent-racemed Gomphia. Shrub 6 feet.

16 G. angula'ta (D. C. l. c. no. 3. t. 7.) leaves oblong, somewhat cuneated, narrow at the base, and a little cordate, distantly serrated, on very short stalks; stipulas intra-axillary, permanent; racemes panicled; branches angular. ♄. S. Native of Madagascar.

Angular-branched Gomphia. Shrub 6 feet.

17 G. Malaba'rica (D. C. l. c. no. 5.) leaves oval-oblong, acute at both ends, toothletted, nerveless, shining; racemes panicled. ♄. S. Native of Malabar, on rocks about Kandenate.—Rheed. mal. 5. t. 52.

Malabar Gomphia. Shrub.

18 G. Sumatra'na (Jack, mss. Hook. bot. misc. 4th part. p. 77.) leaves lanceolate, or oblong-oval, acuminated, obtusely denticulated, shining, somewhat 5-nerved; stipulas intra-petiolar, deciduous; panicle terminal. ♄. S. Native of Sumatra.

Sumatra Gomphia. Shrub 8 feet.

19 G. angustifòlia (Vahl. symb. 2. p. 49.) leaves lanceolate, almost sessile, serrated at the apex, acute at both ends; petals longer than the calyx; lobes of calyx roundish. ♄. S. Native of the East Indies.

Narrow-leaved Gomphia. Shrub 4 feet.

20 G. castaneæfòlia (D. C. l. c. no. 9. t. 11.) leaves large, oblong, acuminated, coriaceous, shining, regularly and sharply serrated; racemes panicled; flowers crowded; petals a little longer than the calyx. ♄. S. Native of Brazil.

Chesnut-leaved Gomphia. Shrub 10 feet.

21 G. ilicifòlia (D. C. l. c. no. 10.) leaves oval-oblong, bearing on their edges a few large, spiny teeth; racemes panicled. ♄. S. Native of St. Domingo.

Holly-leaved Gomphia. Shrub.

22 G. Jabota'pita (Swartz, fl. ind. occ. 2. p. 740.) leaves ovate-lanceolate, tapering to both ends, serrated from the base to the top; petals 3-times longer than the calyx; carpels with their base immersed in the receptacle. ♄. S. Native of the Caribbee Islands. O'chna Jabotápita, Lin. spec. 731. Lam. ill. 472. f. 2.—Plum. amer. 42. icon. 153. Flowers very sweet, abundant on certain branchlets. Piso says the carpels of this shrub are astringent, and are not only eaten crude, but that an oil is expressed from them, which is used in salads.

Jabotapita Gomphia. Clt. 1820. Shrub 6 feet.

23 G. squamòsa (D. C. l. c. no. 12. t. 12.) leaves oval-lanceolate, tapering to both ends, a little serrated; stipulas broad at the base, awnedly-acute, permanent; petals somewhat orbicular, length of calyx; berries rather globose. ♄. S. Native of Tobago. Racemes panicled, simple, or forked.

Scaly Gomphia. Shrub 6 feet.

24 G. nítida (Swartz, fl. ind. occ. 2. p. 739.) leaves oval-lanceolate, acuminated, serrated at the apex; calyxes equal in length to the corolla; berries ovate. ♄. S. Native of Jamaica and St. Thomas, in woods. Racemes panicled. D. C. l. c. no. 13. t. 13. Panicle racemose.

Nitid-leaved Gomphia. Clt. 1803. Shrub 8 feet.

25 G. acumina'ta (D. C. l. c. no. 14. t. 14.) leaves oval-oblong, abruptly acuminated, serrated from the middle to the apex; petals about the length of the corolla. ♄. S. Native of Brazil. Racemes panicled.

Acuminated-leaved Gomphia. Shrub.

26 G. RETICULA'TA (Beauv. fl. d'ow. 2. p. 22. t. 722.) leaves lanceolate, serrated, acute, reticulately nerved; racemes panicled. ♄. S. Native of Guinea; very common among bushes.

Netted-leaved Gomphia. Fl. Feb. June. Shrub 3 to 4 feet

27 G. MEXICA'NA (Humb. et Bonpl. pl. equin. 2. p. 21. t. 74.) leaves oval-lanceolate, serrated, tapering to the base and apex; racemes short, crowded with flowers; petals orbicular, unguiculate, length of calyx. ♄. S. Native of Mexico, between Acapulco and Chilpancingo. H. B. et Kunth, nov. gen. amer. 6. p. 13.

Mexican Gomphia. Shrub 4 feet.

28 G. GLABE'RRIMA (Beauv. fl. d'ow. 2. p. 22. t. 71.) leaves lanceolate-oblong, very acute, shining, almost nerveless, serrated from the middle to the apex; racemes simple. ♄. S. Native of Guinea, in low bushy places.

Very-smooth Gomphia. Shrub 4 feet.

29 G. HEXASPE'RMA (St. Hil. pl. usu. bras. no. 38. fl. bras. 1. p. 61.) leaves oblong-lanceolate, acuminated, obsoletely serrated, but entire at the base and apex, veinless beneath; panicles terminal; ovaries 6-7. ♄. S. Native of Brazil, in the province of Minas Geraes. Stem arboreous, with corky bark. The inhabitants of Brazil employ the bark of this tree to cure wounds in cattle, occasioned by the bites of insects.

Six-seeded Gomphia. Tree.

30 G. OLIVÆFÓRMIS (St. Hil. fl. bras. 1. p. 67.) quite smooth; leaves broad, elliptic-lanceolate, acuminated, obsoletely serrated, entire at the base; flowers racemose, terminal; anthers smoothish; receptacle fleshy, turbinate. ♄. S. Native of Brazil, in the province of Rio Janeiro.

Olive-formed Gomphia. Shrub 15 feet.

31 G. CURVA'TA (St. Hil. fl. bras. 1. p. 68.) quite smooth; leaves large, nearly sessile, oblong-obovate, cuspidate, entire at the base and somewhat cuneated, veiny, serrated at the apex, very coriaceous, racemes compact, incurved; pedicels tubercled; petals longer than the calyx. ♄. S. Native of Brazil.

Curved-racemed Gomphia. Shrub 8 feet.

32 G. LU'CENS (H. B. et Kunth, nov. gen. amer. 7. p. 246.) leaves scattered, stalked, oblong-lanceolate, tapering to the base, remotely serrated, obsoletely veined, membranous, shining; racemes compound. ♄. S. Native of New Granada.

Shining-leaved Gomphia. Shrub 10 to 12 feet.

33 G. GLAUCE'SCENS (St. Hil. fl. bras. 1. p. 68. t. 13.) quite smooth; leaves nearly sessile, a little imbricate, subcordate, ovate or oblong-ovate, mucronate, hardly serrated at the apex, rather glaucous; racemes terminal, nearly simple; petals large, obovate, exceeding the calyx; anthers wrinkled transversely. ♄. S. Native of Brazil, in the province of Minas Geraes.

Glaucous Gomphia. Fl. Sept. Shrub 8 feet.

34 G. SEMISERRA'TA (Mart. in act. bonn. 12. p. 41.) leaves elliptical, serrated in front, coriaceous; flowers panicled; petals orbicular, length of calyx. ♄. S. Native of Brazil.

Half-serrated-leaved Gomphia. Shrub 5 to 6 feet.

35 G. PERSÍSTENS (St. Hil. fl. bras. 1. p. 62.) quite smooth; leaves oblong, acuminated, serrated, coriaceous, nearly veinless beneath; flowers panicled; calyx permanent; petals obovate, about the length of the calyx: anthers smooth. ♄. S. Native of Brazil, in the province of Minas Geraes.

Permanent-calyxed Gomphia. Shrub 5 to 6 feet.

36 G. NERVÒSA (St. Hil. l. c.) leaves elliptic-lanceolate, acuminate, serrulated, veiny beneath; racemes panicled; anthers transversely wrinkled. ♄. S. Native of Brazil, in the province of Goyaz. G. venòsa, Spreng. syst. app. p. 163.

Nerved-leaved Gomphia. Shrub.

37 G. HU'MILIS (St. Hil. l. c.) suffruticose, quite smooth; lower leaves ovate-oblong, obtuse at the base, upper ones oblong, acute at both ends, somewhat serrated; racemes panicled; petals obovate, emarginate, exceeding the calyx in length; anthers undulately wrinkled. ♄. S. Native of Brazil, in the province of Minas Geraes, and in the southern part of the province of Goyaz. Stems simple.

Humble Gomphia. Shrub 1 to 2 feet.

38 G. NA'NA (St. Hil. fl. bras. 1. p. 66. t. 12.) suffruticose, pubescent; leaves ovate-oblong, very blunt at the base, subcuspidate, serrated; stipulas permanent, nearly linear, acuminated; flowers axillary, racemose, and in terminal, panicled racemes; petals a little longer than the calyx; anthers wrinkled undulately. ♄. S. Native of Brazil, in the province of Minas Geraes. Stems simple.

Dwarf Gomphia. Shrub 1 to 2 feet.

39 G. CARDIOSPE'RMA (D. C. l. c. no. 22. t. 19.) leaves oval, acute, finely serrated; berries obcordately 2-lobed. ♄. S. Native of Guiana, in marshes. Ochna cardiospérma, Lam. dict. 4. p. 511. Flowers panicled.

Heart-seeded Gomphia. Shrub 4 feet.

Cult. *Gómphia* is a genus of most beautiful shrubs, which deserve to be cultivated in every collection of stove plants, for the elegance of their foliage and flowers; they will thrive well in a mixture of loam, peat, and sand; and ripened cuttings will strike root, if planted in a pot of sand, with a hand-glass placed over them, in a moist heat.

III. WALKE'RA (in honour of Richard Walker, D.D., founder of the Botanical Garden at Cambridge). Schreb. gen. p. 150. D. C. prod. 1. p. 737. in ann. mus. 17. p. 421. Meèsia, Gært. fruct. 1. p. 344. but not of Hedw.

LIN. SYST. *Pentándria*, *Monogýnia*. Petals 5. Stamens 5; anthers ovate. Drupe (ex Gært.) obovately kidney-shaped. Embryo inverted, with a hooked beak.

1 W. SERRA'TA (Willd. spec. 1. p. 1145.) leaves serrately crenate; racemes somewhat corymbose; lobes of calyx lanceolate. ♄. S. Native of Malabar and Ceylon. Meèsia serràta, Gært. fruct. 1. p. 344. t. 70. Tsjocatti, Rheed. mal. 5. t. 48. Flowers small, yellow. Drupes reddish. The roots and leaves are bitter, a decoction of them, either in water or milk, is used in Malabar as tonic, stomachic, and antiemetic.

Serrated-leaved Walkera. Clt. 1824. Shrub 12 feet.

2 W. INTEGRIFÒLIA (D. C. prod. 1. p. 737.) leaves entire; racemes simple, elongated; lobes of calyx very short. ♄. S. Native of French Guiana. Petals yellow, coriaceous. Berries 2-3, often abortive.

Entire-leaved Walkera. Shrub 8 feet.

Cult. See *Gómphia* for cultivation and propagation.

IV. ELVA'SIA (in honour of Francis Manoel d'Elvas, a Portuguese, who first illustrated the natural history of Brazil). D. C. in ann. mus. 17. p. 422. prod. 1. p. 738.

LIN. SYST. *Octándria*, *Monogýnia*. Calyx 4-parted. Petals 4. Stamens 8, 4 of which are opposite the petals, with longish filaments, and ovate, adnate anthers, which burst by 2 pores at the apex. Ovary seated on the columnar receptacle, 4-lobed, 4-celled, the lobes are neither distinct nor profound; cells 1-seeded. Ovula suspended from the inner angle.

1 E. CALOPHY'LLA (D. C. l. c. no. 1. t. 20.). ♄. S. Native of Brazil. Leaves oblong, quite entire, with the veins parallel with the middle nerve. Panicles terminal. Flowers small, yellow. Ovary of 4 tubercles.

Beautiful-leaved Elvasia. Shrub 6 feet.

Cult. See *Gómphia* for cultivation and propagation.

V. CASTE'LA (named by Turpin after M. Castel, author of a poem upon plants). Turp. ann. mus. 7. p. 78. t. 5. D.C. prod. 1. p. 738.

LIN. SYST. *Dioècia, Monogýnia.* Calyx small, 4-cleft. Petals 4, alternating with the teeth of the calyx. Male flowers; stamens 8, inserted with the petals and equal in length to them. Anthers inverse. Pistil abortive, minute. Female with 8 abortive stamens. Ovary 4-lobed, seated on a circular disk. Lobes 4, distinct, drupaceous, 1-seeded, rising from a fleshy gynobase. Style 1, or hardly any, crowned by 4 recurved stigmas. Drupes 4, at length free. Seed inverted, with a superior radicle and 2 leafy cotyledons. Albumen sparing.—Small shrubs with alternate branches, which are spiny at the apex, alternate entire leaves, and small, axillary, yellow flowers.

1 C. DEPRE'SSA (Turp. l. c. p. 79. t. 5. A.) leaves oval-oblong, sessile, somewhat cordate at the base; spines axillary. ♄. S. Native of St. Domingo between Monte Christi and St. Yago. Flowers purplish.

Depressed Castela. Shrub 2 feet.

2 C. ERE'CTA (Turp. l. c. p. 80. t. 5. B.) leaves lanceolate, stalked; spines infra-axillary. ♄. S. Native of Antigua.

Erect Castela. Shrub 2 feet.

3 C. NICHOLSÒNI (Hook. bot. misc. 3d part, p. 271. t. 54.) leaves elliptical, mucronulate, silky and hoary beneath, as well as the branches; spines axillary; stamens hairy. ♄. S. Native of Antigua, where it is called *Goat-bush* by the Negroes. Flowers small, copper-coloured, dioecious. The whole plant is very bitter.

Nicholson's Castela. Shrub 4 feet.

Cult. See *Gómphia* for culture and propagation.

ORDER LXIII. CORIARIE'Æ (plants agreeing with *Coriària* in important characters). D. C. prod. 1. p. 739.

Flowers hermaphrodite, monoecious or dioecious. Calyx (or perigone) of one campanulate 10-cleft sepal, the 5 outer lobes are ovate, larger than the 5 inner ones, which are callose, alternating with each other. Petals wanting. Stamens 10, protruding from the torus, 5 of which are between the outer lobes of the calyx and angles of the ovary; and the other 5 between the inner or callose lobes of the calyx, and the furrows of the ovary. Filaments filiform. Anthers oblong, 2-celled. Ovary seated on a thickish torus, 5-celled, 5-angled. Style wanting. Stigmas 5, long, awl-shaped, rising from the top of the ovary. Carpels 5, when at maturity almost free, approximate, indehiscent, 1-seeded, surrounded by large glandular lobes. Seed pendulous. Albumen wanting. Embryo straight, with a superior radicle, and 2 fleshy cotyledons.—Shrubs, with somewhat tetragonal, opposite or tern branches. Leaves opposite, simple, 3-nerved, entire, ovate or cordate. Leaf bud scaly. Racemes of flowers terminating the branches and branchlets, leafy at the base, simple: pedicels opposite or alternate at the tops of the racemes, furnished with bracteas at their base, and usually with two in their middle. The proper place which this order should occupy in the natural system is very doubtful. It has been referred to *Terebinthàceæ* by old authors, but on account of the hypogynous insertion of the stamens and straight embryo, it cannot belong to it. By Jussieu it was referred to *Atriplices*, on account of its want of petals, but it has no other analogy with that order.

I. CORIA'RIA (from *corium*, a hide. *C. myrtifòlia* is considerably astringent, and is used not only in tanning leather, but in dying black colours). Niss. in act. par. 1711. t. 12. D. C. prod. 1. p. 739.

LIN. SYST. *Dioe'cia, Decándria.* Character the same as that of the order.

1 C. MYRTIFÒLIA (Lin. spec. 1467.) leaves ovate-lanceolate, acute, triple-nerved, on short petioles, smooth; racemes rather erect. ♄. H. Native of the south of Europe and north of Africa, in hedges and bushy places. Lam. ill. t. 822. Duham. arb. 1. t. 73. Wats, dend. brit. t. 103. Flowers hermaphrodite, monoecious or dioecious, greenish. This shrub sends up many stems from the root, and is therefore useful to fill up vacancies in shrubberies and plantations.

Myrtle-leaved Coriaria. Fl. May, Aug. Clt. 1629. Shrub 4 to 6 feet.

2 C. MICROPHY'LLA (Poir. dict. 6. p. 87.) leaves ovate, bluntish, 5-nerved, almost sessile; racemes nodding. ♄. G. Native of Peru. Flowers greenish.

Small-leaved Coriaria. Shrub 3 to 6 feet.

3 C. SARMENTÒSA (Forst. prod. p. 377.) sarmentose, diffuse; leaves cordate-ovate, acuminated, quite entire, 5-nerved, on very short stalks; racemes nodding. ♄. G. Native of New Zealand. Hook. bot. mag. t. 2470. Flowers brownish-green.

Sarmentose Coriaria. Fl. May, Aug. Clt. 1823. Shrub 3 to 6 feet.

4 C. RUSCIFÒLIA (Lin. spec. 1467.) leaves cordate-ovate, acute, sessile, many-nerved; racemes nodding, cylindrical. ♄. G. Native of Peru, and of Chili, at Conception.—Feuill. per. 3. p. 17. t. 12. Leaves usually tern on the branches, but opposite on the branchlets. Flowers hermaphrodite, greenish.

Butcher's-broom-leaved Coriaria. Shrub.

5 C. PHYLICIFÒLIA (Humb. in Willd. spec. 4. p. 819.) leaves subcordate, oblong, acute, stalked, 3-nerved, veiny; peduncles hispid. ♄. G. Native of Peru. Flowers greenish.

Phylica-leaved Coriaria. Shrub.

6 C. THYMIFÒLIA (Humb. in Willd. spec. 4. p. 819.) leaves oblong, acute, stalked, 3-nerved; petioles and peduncles hispid. ♄. G. Native of Peru. Hardly distinct from the preceding.

Thyme-leaved Coriaria. Shrub.

7 C. ATROPURPU'REA (Moc. et Sesse, fl. mex. ined. D. C. prod. 1. p. 740.) leaves cordate, ovate, acute, sessile, 3-nerved; racemes terminal, cylindrical, simple. ♄. G. Native of Mexico. Flowers with 5 petals and 5 styles, dark-purple.

Dark-purple-flowered Coriaria. Shrub.

Cult. The hardy species, *C. myrtifòlia*, will thrive in any common soil, and is readily increased by cuttings of the roots or by suckers. The other species will all require the protection of a green-house; they will thrive very well in a mixture of sand, loam, and peat; and cuttings planted in the same kind of soil will readily strike root under a hand-glass.
